Abstract

In this paper we consider the solution formula for Stokes equation system without surface tension in half-space. More precisely, we deal with the solution of velocity and density for the model problem. This result is the basic step to estimate the solution operator of the model problem. We investigate the solution operator for the model problem in N-Dimensional Euclidean space ($\mathbb{N} \geq 2$)

Keywords: Stokes equation, half-space, N-Dimensional Euclidean space, surface tension.

1 Introduction

Fluid and flows are pervading our daily lifes without our conscious perception. For examples the air we breathe, the shower in the bathroom with the shampoo, coffee or tea, the blood in our vascular tree including the heart and the brain, the ingredients of food like mayonnaise, oil, vinegar, yogurt, etc. The design and the engineering of new material like polymers, plastics, ceramics, foam, etc have produced complex fluids because the material processing based on extrusion, molding, blowing etc., is using them in the fluid state.

Studying about fluid motion is very interesting point in fluid dynamics. Recently, there has been increasing amount of literature on fluid flow. Many researchers investigated about this material. However, many of them conducted in numerical analysis and rarely of them investigated fluid motion in the mathematical analysis approach. In fluid mechanics, the flow of incompressible fluid which is described as Navier-Stokes equation (NSE). Meanwhile, in mathematics, NSE can be written in the partial differential equations. NSE is firstly introduced by Swiss mathematician Leonhard Euler in 18th century. He investigated the flow of the incompressible and frictionless fluids. The linearize of the NSE we known as Stokes equations.

Historically, as far as we know that the Stokes flow is the linearized form of the Navier-Stokes equations in the limit of small Reynold number. Stokes' formula is the basis method to measure the unit charge. The pioneer using this formula is Millikan to measure the charge on the electron [1]. In these experiments fine droplets produced by an oil spray were placed in the space
between horizontal plates forming a plane capacitor. The droplets have a charge owing to electrification in the spraying process or absorption of ions from the air. By observing under a microscope the rate of fall of a droplet by the effect of its weight alone, we can use Stokes’ formula to calculate the radius and hence the mass of the drop (whose density is known). Then, by applying a suitable potential difference across the capacitor, we can bring the droplet to rest, the downward force of gravity being balanced by the upward electrical force on the charged droplet. Knowing the weight of the droplet and the electric field strength, we can calculate the charge on the droplet. Such measurements show that the charge on the droplets is always an integral multiple of a certain quantity, which is evidently the unit charge.

Several recent studies investigating this model problem have been carried out not only on to find the solution formula but also to estimate the operator solution families of the model problem. In 2015 Murata [2] has been investigated the Stokes equation with slip boundary condition. She investigated not only the local well-posedness of the model problem, but also global well-posedness. The regularity of the model problem approached using the $\mathcal{R}$-boundedness of the solution operator.

Afterward, Maryani [3] concerned to study the compressible fluid motion for the Oldroyd-B Model. She investigated the local well-posedness of the non-Newtonian compressible barotropic flow in the maximal $L_p - L_q$ regularity class in bounded and unbounded domain. Meanwhile, Maryani and Saito [4] studied the $\mathcal{R}$-boundedness of the solution operator families for two phase problem of Stokes equation in half-space. On 2020 Inna et.al [5] considered the half-space model problem for the compressible fluid motion of the Korteweg type.

In this paper we consider the solution formula of the Stokes equation in half-space without surface tension using Fourier transform. As we know that the Stokes formula is usually used to determine the viscosity of a liquid or gas from a measurement of the rate of fall of a solid sphere in it. The viscosity may also be assigned by means of Poiseuille's formula, by measuring the rate of outflow of a liquid from a pipe along which it is impelled by a given pressure difference.

To introduce our main result, first of all we introduce the notation. For a scalar-valued function $v = v(x)$ and vector-valued function $\mathbf{v} = \mathbf{v}(x) = (v_1(x), \ldots, v_N(x))^T$, we set for $\partial_k = \frac{\partial}{\partial x_k}$, $(k = 1, \ldots, N)$

$$\nabla u = (\partial_1 u, \ldots, \partial_N u)^T, \quad \Delta u = \sum_{k=1}^{N} \partial_k^2 u, \quad \Delta \mathbf{v} = (\Delta v_1, \ldots, \Delta v_N)^T,$$

$$\text{div} \mathbf{v} = \sum_{k=1}^{N} \partial_k v_k, \quad \nabla \mathbf{v} = \{ \partial_k v_{\ell} | k, \ell = 1, 2, 3, \ldots, N \}, \quad \nabla^2 \mathbf{v} = \{ \partial_k \partial_\ell v_m | k, \ell, m = 1, 2, 3, \ldots, N \}.$$

The set of all natural number is denoted by $\mathbb{N}$ and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$. Let $\mathcal{F}_x = \mathcal{F}$ and $\mathcal{F}_\xi^{-1} = \mathcal{F}_x.$
\( \mathcal{F}^{-1} \) denote the Fourier transform and the Fourier inverse transform, which defined by

\[
\mathcal{F}_\mathcal{X}\{f(x)\} = \int_{\mathbb{R}^N} e^{-i\mathcal{X} \cdot \xi} f(x) \, dx, \quad \mathcal{F}_\mathcal{X}^{-1}\{g(\xi)\} = \frac{1}{(2\pi)^N} \int_{\mathbb{R}^N} e^{i\mathcal{X} \cdot \xi} g(\xi) \, d\xi,
\]

respectively. We also write \( \hat{f}(\xi) = \mathcal{F}_\mathcal{X}\{f(x)\} \).

Let \( \mathcal{L} \) and \( \mathcal{L}^{-1} \) denote the Laplace transform and the Laplace inverse transform, which defined by

\[
\mathcal{L}\{f(t)\}(s) = \int_{-\infty}^{\infty} e^{-s t} f(t) \, dt = \mathcal{F}_\mathcal{X}\{e^{-\gamma t} f(t)\}(s),
\]

\[
\mathcal{L}^{-1}\{g(t)\}(s) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{s t} g(t) \, dt = e^{\gamma t} \mathcal{F}_\mathcal{X}^{-1}\{g(t)\}(s),
\]

with \( \lambda = \gamma + i \tau \in \mathbb{C} \), respectively.

### 2 Literature Review

Let \( u \) and \( \rho \) be the velocity and density field, respectively. We consider the Stokes equation system without surface tension in bounded domain in half-space. We define \( \mathbb{R}_+^N \) and \( \mathbb{R}_0^N \) by

\[
\mathbb{R}_+^N = \{x = (x_1, x_2, \ldots, x_N) \in \mathbb{R}^N \mid x_N > 0\},
\]

\[
\mathbb{R}_0^N = \{x = (x_1, x_2, \ldots, x_N) \in \mathbb{R}^N \mid x_N = 0\}. \tag{1}
\]

The resolvent problem of Stokes equations are being described by the set of equations,

\[
\begin{cases}
\lambda \rho + \gamma \text{div} u = f, & \text{in } \mathbb{R}_+^N \\
\lambda u - \text{Div} S(u, \rho) = g, & \text{in } \mathbb{R}_+^N \\
S(u, \rho) \mathbf{n} = h, & \text{on } \mathbb{R}_0^N,
\end{cases} \tag{2}
\]

where \( f, g \) and \( h \) are scalar vector and \( S(u, \rho) \) is the stress tensor which is defined by

\[
S(u, \rho) = 2\alpha D(u) + (\beta \text{div} u - \gamma \rho) I,
\]

and \( \mathbf{n} = (0,0, \ldots, -1) \) stands for the unit outer normal to \( \mathbb{R}_+^N \). The doubled deformation \( D(u) \) tensor whose \((i, j)\) components are \( D_{ij}(u) = \partial_i u_j + \partial_j u_i \) (\( \partial_i = \partial / \partial x_i \)), \( I \) the \( N \times N \) identity matrix, \( \alpha, \beta \) and \( \gamma \) are positive constants and also \( \text{div} u = \sum_{j=1}^N \partial_j u_j \).

Before we state the main result, first of all we introduce the definition of sobolev space \( W_p^m(\Omega) \) is defined by

\[
W_p^k(\Omega) = \{ (\rho, u) \mid \rho \in W_p^k(\Omega), u \in W_p^m(\Omega) \}.
\]

**Definition 1** (Adams and Fournier, [6])

Let \( k \in \mathbb{N} \cup \{0\} \) and \( p \in [1, \infty) \) then the Sobolev Space \( W_p^m(\Omega) \) is defined by

\[
W_p^m(\Omega) = \{ u \in L_p(\Omega) \mid D^\alpha u \in L_p(\Omega), \forall \alpha \text{ with } |\alpha| \leq m \}.
\]

Furthermore, we state the main theorem of this paper

**Theorem 2.** Let \( N < q < \infty, 2 < p < \infty \) then there exists Lopatinski matrix \( L \) i.e
\[ L = \begin{pmatrix} L_{11} & L_{12} \\ L_{21} & L_{22} \end{pmatrix} \]

with

\[ L_{11} = \alpha B - (\alpha + |\xi'|)A, \quad L_{12} = 2AB(\alpha + |\xi'|^2) + |\xi'| \]
\[ L_{21} = -\frac{(2\alpha + \beta + \gamma)A^2 + 2B(\beta + \delta)|\xi'|^2}{|\xi'|^2}, \quad L_{22} = \frac{(2\alpha + \beta + \gamma)(2A^2 B + B|\xi'|^2) - 2(\beta + \delta)B|\xi'|^2}{|\xi'|^2}, \]

and

\[ \det L = L_{11}L_{22} - L_{12}L_{21}. \]

Then problem (2) admits a unique solution formula of \((\rho, u) \in W^1_2(\Omega)\) with

\[ \tilde{u}_j(\xi', x_N) = \sum_{k=1}^{N-1} \frac{\eta(i\xi_j)(i\xi_k)(L_{22} + 2BL_{21})}{B(B + A) \det L} \frac{|\xi'|^2 + A \left( -Be^{-AXN} + 2Ae^{-BXN} \right)}{|\xi'|^2} \begin{pmatrix} \frac{L_{11} e^{-AXN} - L_{21} e^{-BXN}}{(B - A)} \end{pmatrix} \tilde{h}_k(\xi', 0) \]
\[ + \frac{\eta(i\xi_j)}{B(B + A) \det L} \frac{|\xi'|^2 + A \left( Be^{-AXN} - 2Ae^{-BXN} \right)}{|\xi'|^2} \tilde{h}_N(\xi', 0) \]
\[ - \sum_{k=1}^{N-1} \frac{(i\xi_j)(i\xi_k)L_{21}}{\det L} e^{-BXN} \tilde{h}_k(\xi', 0) + \frac{(i\xi_j)L_{11}}{\det L} e^{-BXN} \tilde{h}_N(\xi', 0) \]
\[ + \frac{1}{AB} e^{-BXN} \tilde{h}_k(\xi', 0) \]

for \(j = 1, \ldots, N - 1\) and

\[ \tilde{u}_N(\xi', x_N) = \sum_{k=1}^{N-1} \frac{(i\xi_k)}{\det L} \frac{\eta(L_{22} + 2BL_{21})A}{(B^2 - A^2)} \frac{|\xi'|^2 + A \left( -e^{-AXN} - L_{21} e^{-BXN} \right)}{|\xi'|^2} \tilde{h}_k(\xi', 0) \]
\[ - \frac{1}{\det L} \left( \frac{\eta A(L_{12} + 2BL_{11})}{(B^2 - A^2)} \frac{|\xi'|^2 + A \left( -e^{-AXN} - L_{11} e^{-BXN} \right)}{|\xi'|^2} \tilde{h}_N(\xi', 0) \right) \]

with \(A^2 = |\xi'|^2 + \alpha^{-1} \lambda\), \(B^2 = |\xi'|^2 + (2\alpha + \beta + \delta)^{-1} \lambda\) and \(\delta = \gamma^2 \lambda^{-1}\).

### 3 Research Methodology

In this research methodology, we use literature review of the related articles, especially [7]. In this paper, we put the different approach of the general solution of velocity as in [7]. This research focus on considering the solution formula of the compressible Stokes equation system (2) without surface tension by using Fourier transform. First of all we construct the compressible Stokes equation without surface tension in half-space case. Then, by applying the Fourier transformation to model problem, we get new equation system. Finally, the solution formula of the model problem are furnished.
4 Research and Discussion

Reduce System

In this section, we formulated the model problem (2) and state our main result. Let $\mathbb{R}_+^N$ and $\mathbb{R}_0^N$ as defined in (1). We consider for $\lambda \neq 0$, inserting $\rho = \lambda^{-1}(f - \gamma \text{div} \mathbf{u})$ to the second and third equation of (2), then we have

$$\left\{ \begin{array}{l}
\lambda \mathbf{u} - \alpha \Delta \mathbf{u} - (\alpha + \beta + \delta) \text{div} \mathbf{u} = \mathbf{F} \text{ in } \mathbb{R}_+^N \\
\alpha(\partial_i u_N + \partial_N u_i) = -h_j \text{ on } \mathbb{R}_0^N, \\
2\alpha \partial_N u_N + (\beta + \delta) \text{div} \mathbf{u} = -h_N \text{ on } \mathbb{R}_0^N
\end{array} \right. \quad (5)$$

for $j = 1, \ldots, N - 1$ and $\mathbf{F} = \mathbf{g} - \lambda^{-1} \gamma \nabla f$.

Moreover, we derive a solution formula of (5). For this purpose, applying the partial Fourier transform to (5) i.e

$$\hat{u} = \hat{u}(x_N) = \hat{u}(\xi', x_N) = \int_{\mathbb{R}^{N-1}} e^{-ix' \cdot \xi'} u(x', x_N) \, dx'$$

$$\mathcal{F}_{\xi}^{-1}[\hat{u}(\xi', x_N)](x') = \frac{1}{(2\pi)^{N-1}} \int_{\mathbb{R}^{N-1}} e^{ix' \cdot \xi'} \hat{u}(\xi', x_N) \, d\xi',$$

where $\xi' = (\xi_1, \ldots, \xi_{N-1}) \in \mathbb{R}^{N-1}$, we have

$$\left\{ \begin{array}{l}
\alpha(\alpha^{-1}\lambda + |\xi'|^2)\hat{u}_j - \alpha \partial_N^2 \hat{u}_j + (\alpha + \beta + \delta)i\xi_j(\text{div} \hat{u}' + \partial_N \hat{u}_N) = 0 \quad (x_N > 0) \\
\alpha(\alpha^{-1}\lambda + |\xi'|^2)\hat{u}_N - \alpha \partial_N^2 \hat{u}_N + (\alpha + \beta + \delta)\partial_N (\text{div} \hat{u}' + \partial_N \hat{u}_N) = 0 \quad (x_N > 0) \\
2\alpha \partial_N u_N + (\beta + \delta)(\text{div} \hat{u}' + \partial_N \hat{u}_N) |_{x_N=0} = -\vec{h}_N(\xi', 0)
\end{array} \right. \quad (6)$$

for $j = 1, \ldots, N - 1$ and $i\xi' \cdot \hat{u}' = \sum_{k=1}^{N-1} i\xi_j u_k$.

Let $\hat{u} = (\hat{u}_1, \ldots, \hat{u}_N)$ have general formula in the following

$$\hat{u}_\ell = P_{\ell}e^{-Ax_N} + Q_{\ell}e^{-Bx_N}, \quad (7)$$

then we get

$$\partial_N \hat{u}_N = -AP_N e^{-Ax_N} - BP_N e^{-Bx_N}, \quad (8)$$

$$\partial_N^2 \hat{u}_N = A^2 P_N e^{-Ax_N} + B^2 P_N e^{-Bx_N}, \quad (9)$$

$$i\xi' \cdot \hat{u}' = \sum_{k=1}^{N-1} i\xi_j (P_j e^{-Ax_N} + Q_j e^{-Bx_N}). \quad (10)$$

Applying div to first equation of (5) we have

$$(\lambda - (2\alpha + \beta + \delta)\Delta) \text{div} \mathbf{u} = 0. \quad (11)$$

Multiplying (5) by $(\lambda - (2\alpha + \beta + \delta)\Delta)$ then using (11), we have

$$(\lambda - \alpha \Delta)(\lambda - (2\alpha + \beta + \delta)\Delta) \mathbf{u} = 0. \quad (12)$$
Applying Fourier transform to (12), we have formula

\[ A^2 = |\xi'|^2 + (2\alpha + \beta + \delta)^{-1} \lambda \quad \text{and} \quad B^2 = |\xi'|^2 + \alpha^{-1} \lambda. \quad (13) \]

Substituting (7), (8), (9) and (10) to equation system of (6) and equating the coefficients of \( e^{-AXN} \) and \( e^{-BXN} \), we have new equation system

\[
\begin{align*}
\alpha(B^2 - A^2)P_j - (\alpha + \beta + \delta)i\xi_j(i\xi' \cdot P' - AP_N) &= 0 \\
\alpha(B^2 - A^2)P_N + (\alpha + \beta + \delta)A(i\xi' \cdot P' - AP_N) &= 0 \\
i\xi' \cdot P' + i\xi' \cdot Q' - 2BQ_N &= 0 \\
\alpha(AP_j + BQ_j - i\xi_j(P_N + Q_N)) &= \tilde{h}_j(\xi', 0) \\
(2\alpha + \beta + \delta)(AP_N + BQ_N) - (\beta + \delta)(i\xi' \cdot P' + i\xi' \cdot Q') &= \tilde{h}_N(\xi', 0).
\end{align*}
\] (14)

Let \((i\xi' \cdot P' - AP_N) = K\), so that from first and second equation of (14), we have the formula of \( P_j \) and \( P_N \)

\[
P_j = \frac{(\alpha + \beta + \delta)i\xi_j}{\alpha(B^2 - A^2)} K \quad \text{and} \quad P_N = -\frac{(\alpha + \beta + \delta)A}{\alpha(B^2 - A^2)} K, \quad (15)
\]

respectively.

Therefore, we have the new solution formula of \( K \),

\[
K = \frac{\alpha(B^2 - A^2)}{(\alpha + \beta + \delta)|\xi'|^2} (i\xi' \cdot Q' - 2BQ_N). \quad (16)
\]

By using equation (16), we can find the new formula of \( P_j \) and \( P_N \)

\[
P_j = \frac{i\xi_j}{|\xi'|^2} (i\xi' \cdot Q' - 2BQ_N) \quad \text{and} \quad P_N = -\frac{A}{|\xi'|^2} (i\xi' \cdot Q' - 2BQ_N), \quad (17)
\]

respectively. Multiplying both side of the fourth equation of (14) by \( \sum_{j=1}^{N-1} i\xi_j \), we have

\[
\alpha \left( A \sum_{j=1}^{N-1} i\xi_j P_j + B \sum_{j=1}^{N-1} i\xi_j Q_j - \sum_{j=1}^{N-1} i\xi_j i\xi_j (P_N + Q_N) \right) = \sum_{j=1}^{N-1} i\xi_j \tilde{h}_j(\xi', 0)
\]

\[
\alpha (A i\xi' \cdot P' + B i\xi' \cdot Q' - |\xi'|^2 (P_N + Q_N)) = i\xi' \cdot \tilde{h}'(\xi', 0). \quad (18)
\]

Combining equation (18) with last equation of (14) and (17), we have a linear system

\[
L \begin{pmatrix} i\xi' \cdot Q' \\ Q_N \end{pmatrix} = \begin{pmatrix} i\xi' \cdot \tilde{h}'(\xi', 0) \\ \tilde{h}_N(\xi', 0) \end{pmatrix}, \quad (19)
\]

with \( L \) adalah \( 2 \times 2 \) of Matrix Lopatinski with entries are

\[
L_{11} = \alpha B - (\alpha + |\xi'|)A, \quad L_{12} = 2AB(\alpha + |\xi'|^2) + |\xi'| \\
L_{21} = -\frac{(2\alpha + \beta + \delta)(\alpha B + B|\xi'|^2 - 2(\beta + \delta)B|\xi'|^2)}{|\xi'|^2}, \quad L_{22} = \frac{(2\alpha + \beta + \delta)(2A^2 B + B|\xi'|^2)^2 - (\alpha B + B|\xi'|^2)^2}{|\xi'|^2}. \quad (20)
\]

By using Cramer’s rule, from (19), we obtain the formula of \( i\xi' \cdot Q' \) and \( Q_N \),

\[
\begin{align*}
i\xi' \cdot Q' &= \frac{L_{22} i\xi' \cdot \tilde{h}(\xi', 0) - L_{12} \tilde{h}_N(\xi', 0)}{\det L}
\end{align*}
\]
and
\[ Q_N = \frac{L_{11} \hat{h}_N(\xi', 0) - L_{21} i \xi' \cdot \tilde{h}(\xi', 0)}{\det L}, \]
respectively, with
\[ \det L = L_{11}L_{22} - L_{12}L_{21}, \]
formula \( L_{11}, L_{12}, L_{21} \) and \( L_{22} \) as in (20). Moreover, we have
\[ P_j = -\frac{\eta(i\xi_j)(|\xi'|^2 + A)}{(B^2 - A^2)|\xi'|^2 \det L} \left\{ (L_{22} + 2BL_{21})i \xi' \cdot \hat{h}(\xi', 0) - (L_{12} + 2BL_{11})\tilde{h}_N(\xi', 0) \right\}, \quad (21) \]
\[ P_N = \frac{\eta(i\xi_j)A(|\xi'|^2 + A)}{(B^2 - A^2)|\xi'|^2 \det L} \left\{ (L_{22} + 2BL_{21})i \xi' \cdot \hat{h}(\xi', 0) - (L_{12} + 2BL_{11})\tilde{h}_N(\xi', 0) \right\}, \quad (22) \]
\[ Q_j = \frac{(i\xi_j)}{\det L} \left( \frac{2\eta A(|\xi'|^2 + A)}{(B^2 - A^2)|\xi'|^2} (L_{22} + 2BL_{21}) - L_{21} \right) i \xi' \cdot \hat{h}(\xi', 0) + \frac{1}{aB} \hat{h}_j(\xi', 0), \quad (23) \]
\[ Q_j = \frac{(i\xi_j)}{\det L} \left( \frac{2\eta A(|\xi'|^2 + A)}{(B^2 - A^2)|\xi'|^2} (L_{22} + 2BL_{21}) - L_{21} \right) \hat{h}_j(\xi', 0), \quad (24) \]
\[ Q_N = \frac{L_{11} \hat{h}_N(\xi', 0) - L_{21} i \xi' \cdot \tilde{h}(\xi', 0)}{\det L}, \quad (25) \]
where
\[ \eta = \frac{\alpha + \beta + \delta}{\alpha}. \]
Substituting (21), (22), (23), (24) and (25) to (7), we obtain the formula of \( \tilde{u} = \hat{u}_j = \langle \tilde{u}_1, \tilde{u}_2, ..., \tilde{u}_{N-1} \rangle \) and \( \hat{u}_N \) in equation system of (5) which completes the proof of Theorem 2.

4 Conclusion

The conclusion of the article that we can find the solution formula of velocity \( \tilde{u} \) and density \( \rho \) of the model problem (2). We can see that for the further research, we can estimate the operator families of the solution.
