Abstract

The present study describes the Socio economic status of farmer of Bareli block, Raisen district of Madhya Pradesh, India. Total number of village in Bareli block of Raisen district of Madhya Pradesh is 111. Agriculture is the main profession of the area. The information was collected on the basis of personal interview to each of the farmer through specially prepared questionnaire. A total sample of 600 farmers was selected randomly from Twenty Five different village of the block during 2017-2018. The study revealed that they are very rich farmers with high literacy but least knowledge about agricultural methods and Integrated Pest Management practices. They grow rice, wheat or tomato as well as Gram and without any awareness about their improved Integrated Pest management practices. By introducing facilities of modern technology, their socioeconomic standard can be increased.

Keywords
Rice, Integrated Pest Management: Socio economic status

Introduction

Raisen District lies in the central part of Madhya Pradesh. The District is situated between the latitude 22 47' and 23 33' north and the longitude 7721' and 78 49' east. The total area of the District is 8,395 Sq. Km., which contains the 1.93 % of the State's area. Bareli has a tropical climate. When compared with winter, the summers have much more rainfall. The major crops grown in the district are rice, wheat or tomato and gram. The Köppen-Geiger climate classification is Aw. The average annual temperature is 25.5 °C in Raisen. In a year, the average rainfall is 1159 mm. The mean of production of paddy in the district was 845.32 thousand tonnes with high variability mainly due to high acreage variability followed by lower to moderate productivity. The production variability was as high as 70.66% in Bareli tehsil and it is least but still high in (21.41 q ha.-1), which was highest in Bareli tehsil (44.62 q ha-1).

The farmers are social group usually with a definite area, cultural similarity and uniting
social organization. As for education, nearly by two-thirds in the northern region were literate. Across farm size, large-scale farm household heads are better educated than small-scale household heads. The literacy ratio was higher in male-headed households compared to female-headed households in Baraily regions.

They differ widely among themselves in respect of the regions they live in, languages they speak, physical features they display, geographical terrain they inhabit, modes in which they make their living, levels of development at which they are placed and size of community they represent. Agriculture is the primary source of livelihood for the devastating majority of the population in the district. Majority of the population are engaged in agricultural and livestock rearing activities. Data pertaining to the contribution of various economic activities among the farmers is mandatory for any economic development programs for the farmers. Though various studies on socio-economic conditions of farmers were carried out in India, studies are limited with reference to the block farmers. Their lands are irrigated, alienated and have canal and tube well for irrigation facilities. They are utilizing chemical fertilizers, improved seeds, pesticides etc. in their lands. Area of Baraily is therefore somewhat different from other areas mainly on account of the difference in natural topography surrounded by hills and forest. And also the typical topography of undulating and hilly areas has made area agriculture profitable.

The present study reveals the socio economic status of the Baraily farmers of the district with the following objectives:

To assess the socio-economic condition of Baraily farmers in Raisen district of Madhya Pradesh

To study the current cropping and resource use patterns to locate the specific socio-economic weaknesses in their production organization.

To find the social restraints that inhibit the adoption of new technology.

Materials and Methods

The study was conducted with a sample of 600 farmers of 25 different villages of Baraily of Raisen district of Madhya Pradesh. A multistage purposive cum random sampling design was followed for selection of the respondents. The investigation was carried out with various problems faced by the Baraily block in the Raisen district. The data were collected by personal interview method using both structural schedule and semi-structured interview during 2017-18 by supplying the questionnaire mentioning the following salient points.

Population of the village
Family Structure
Educational Status of Family Members
Housing Conditions
Electricity Facility
Source of Water
Mode of Transportation
Occupational Pattern
Land Holdings
Source of Irrigation
Farm Mechanization
Livestock
Difficulties in Agriculture Improvement
Priorities for Future Investment
Source of Agricultural Information
Sources of Credit Supply
Cropping Pattern
Plant Protection
Dynamics of Crop Production
Marketing System of Agricultural Produce
Marketed Surplus of Farm Produce
Returns from Agricultural Produces
### Table 1: Base line information at Baraily block of Raisen District of Madhya Pradesh

Literacy rate (%) Cropping Pattern Soil type Av. Pesticide used (/ha) Knowledge about IPM

Filled in questionnaire were received and were analyzed to find out the socio economic condition of the farmers in the blocks.

**Results and Discussion**

After completion of survey, a total of 600 In the present study, it was observed that the
farmers are socio-economically progressive in area. Agriculture is the primary source of livelihood for the overwhelming majority of the farmers. So as to eradicate the problems of farmers, it is necessary for the policy makers to identify and quantify the socio-economic factors which are inhibiting their growth and development. The farmers owing to their lifestyle and community habits and habitats have not been able to keep pace with the modern society. Farmers are not as innovative as the people of rest of India. The base line information gathered as part of study is included in the Table 1

From the investigation it was observed that the average populations of Baraily blocks are 969 and 990, respectively. The majority of the farm families were nuclear in the blocks. As per the education status of the villagers the illiterate percentage was observed 68% in the block. The major occupations of the farmers were agriculture and livestock rearing. Majority of the land holdings are landless 9.45%, Marginal 45.65% and Small 44.90% in the block. The cropping pattern of the studied area includes rabi and kharif crops are respectively Wheat/Tomato and Rice in the block. More than 85 percent households are electrified in the block. The sources of irrigation available in the blocks were canal and tube wells etc. Likewise, the livestock populations in the blocks are cow, goat and poultry in the block. The major source of agricultural information in the studied area was Daawat rice (LT Foods), mass media and relatives. The banks were major source of credit supply in the area. Use of plant protection measures to save the crops from pests and diseases was observed higher in the blocks.
