Knowledge, Attitude and Practice of Birth Preparedness and Complication Readiness Amongst Pregnant Women in Eti-osa Lga, Lagos

Mbonu, Ebere Ogonna

Department of Community Health and Primary Care, College of Medicine, University of Lagos, Nigeria

Abstract

Background: Maternal mortality still remains a major challenge in developing countries. In sub-Saharan Africa, one out of every sixteen women dies of pregnancy-related causes. Birth preparedness and complication readiness is the process of planning for normal birth and anticipating the actions needed in case of an emergency. This is a study to assess the knowledge, attitude and practice of birth preparedness and complication readiness. Methodology: This is a descriptive cross-sectional study to assess the knowledge, attitude and practice of birth preparedness and complication readiness among antenatal care attendees in Eti-Osa local government area of Lagos State. A systematic sampling technique was used to select the respondents. The data used for this study were collected from pregnant women attending antenatal care in Six Primary Health Care centers in Eti-Osa local government area of Lagos State, using a structured pretested English language, interviewer-administered questionnaire. Results: The mean age of the respondents was 28.9 years, with standard deviation of 5.3 years. The proportion of respondents who have been prepared for birth and for its possible complication was 124 (33.4%). A higher proportion of the married women 212 (72.6%) were better prepared for birth and ready for its possible complication. 120 (83.9%) of pregnant women who had attended tertiary education were prepared for birth and for its complications (p=0.001) Conclusion: Few pregnant women had made adequate arrangements in anticipation for a safe normal delivery.

Keywords Birth Prepared Complication Ready, Pregnant Women, Antenatal Care, and Primary Health Care

1. Introduction

Pregnancy is the physical condition of a woman carrying unborn offspring inside her body, from fertilization to birth. Child birth is the processes of having a baby emerge from the womb. Under normal conditions, pregnancy and child birth are not a disease but a physiological process. There is, therefore, no need for any woman to die as a result of pregnancy or child birth. In developing countries of the world, many women face increased risk of morbidity from pregnancy and child birth [1].

Birth preparedness and complication readiness is the process of planning for normal birth and anticipating the actions needed in case of an emergency [2]. Responsibility for birth preparedness is shared among all the stakeholders of safe motherhood: policymakers, facility managers, providers, communities, families, and women, because a coordinated effort is needed to reduce the delays that contribute to maternal and newborn deaths [2]. Birth preparedness covers all aspects of pregnancy and child birth, including preconception care, antenatal care, and medical problems during pregnancy, disorder that might affect the unborn baby, complications arising during pregnancy, the induction of labor, and the care of the mother and child during childbirth [3]. It aids the pregnant woman in the identification of the risk factors that can lead to complications in pregnancy. These risk factors include: hemorrhage, infection, anemia, smoking, hypertension, poor diet, diabetes, etc. It involves adequate and proper planning for the physical, psychological, financial and emotional aspect that can affect the outcome of pregnancy. Despite the great potential of birth preparedness for reducing the maternal and newborn deaths, the success of this strategy is not well known in most of Sub-Saharan Africa [4].

Statement of the Problem

Maternal mortality remains a major public health challenge in the developing countries, and the little progress made towards the achievement of millennium
development goals, especially the goal of achieving three-quarter reduction in maternal mortality ratio by 2015 can essentially be attributed to the little achievements of low and middle income countries in this regard. A major strategy that can reduce the maternal mortality ratio is to making a birth plan or birth preparedness and complication awareness [4].

Lack of advance planning for accessing the services of a skilled birth attendant for normal births, and inadequate preparation for rapid intervention in the event of obstetric complications, are well documented factors contributing to delay in receiving skilled obstetric care. Globally, about 289,000 mothers die each year because of problems related to pregnancy and child birth. About 95% of these cases occur in developing countries, Sub-Saharan Africa (56%) and Southern Asia (29%) accounts for 85% of the global burden of maternal death [5]. With this disparity, the maternal mortality rate in developing countries is more than 15 times higher than in the developing regions [5]. While almost all developed countries have achieved the desired three-quarter reduction of maternal mortality by 2015, many of developing countries are still struggling. However, most of the resource limited countries in Sub-Saharan Africa have shown the slowest progress, with an average annual rate of decline of 2.6% [6].

Nigeria is one of the Sub-Saharan African countries with high maternal mortality ratio (MMR). The MMR in the Nigerian Demographic and Health Survey (NDHS) in 2015 was 560 per 100,000 live births, which had shown a slightly significant decline compared to 740 and 950 per 100,000 live births in NDHS surveys in 2005 and 2000, respectively [7]. As a result, improving maternal health status and with the intended target is among the top priority areas of the country.

Justification and Rationale of the Study

Maternal mortality is one of the key indices of the health state and quality of health care of a society. The public health burden of maternal mortality is huge, hence improving maternal health has received recognition at the global level as evidenced by its inclusion in millennium development goals. Owing to pregnancy-related complications, more than half a million women die each year worldwide [8]. Ninety-nine percent of maternal deaths occur in the developing world, and most of these deaths are preventable [9]. The chances of dying from maternal complications are 1 in 16 in developing countries, compared to 1 in 2800 in developed countries [10]. Each year, more than 50 million women give birth at home and without the help of a trained professional [11]. For every woman who dies during childbirth, another 30 women suffer injury, infection or complications [9].

Birth preparedness and complication readiness is a strategy to promote utilization of skilled maternal and neonatal care timely, based on the theory that preparing for childbirth and being ready for complications reduces delays in obtaining this care [12]. In a skilled care approach, birth preparedness includes identifying a skilled provider and making the necessary plans to receive skilled care for all births [13]. Complication readiness (emergency funds, transport, blood donor and designated decision maker) receive greater emphasis in emergency obstetric care programs.

Birth preparedness and complication readiness has been globally endorsed as an essential component of safe motherhood programs to reduce delays for care [13].

The research seeks to assess the knowledge, attitude and practice of birth preparedness and complication readiness and also factors that are associated with it. The findings from this study will provide information for informed public health actions targeted towards reduction of maternal mortality. It will also contribute to research in area of improvement of maternal health.

Study Objective

The general objective of this present research is to assess the knowledge, attitude and practice of Birth preparedness and complication readiness among antenatal care attendees in Eti-Osa Local Government Area of Lagos State.

The study has the following specific objectives:

1. To assess the Knowledge of Birth preparedness and complication readiness among antenatal care attendees in Eti-Osa Local Government Area of Lagos State.
2. To determine the attitude of pregnant women attending antenatal care in Eti-osha LGA to birth preparedness and complication readiness.
3. To identify the factors associated with birth preparedness and complication readiness among antenatal care attendees in Eti-Osa Local Government Area of Lagos State.

2. Materials and Method

This is a cross-sectional descriptive study, aimed at assessing the knowledge, attitude and practice of birth preparedness and complication readiness among antenatal clinic attendees in Eti-Osa Local Government Area of Lagos State.

The study was conducted amongst pregnant women attending primary health care in Eti-Osa local government area.

Only pregnant women, permanent residents, who attend ante-natal care in primary health care in Eti-Osaal local government area.

Those who failed to give consent and were temporary residents in the study area were excluded. These criteria were applied to ensure a uniform selection of study participants.

The minimum sample size was determined [14] by using the Cochrane formula for a population greater than 10,000.
222 Knowledge, Attitude and Practice of Birth Preparedness and Complication Readiness Amongst Pregnant Women in Eti-osa Lga, Lagos

\[
n = \frac{Z^2pq}{d^2}
\]

(1)

Where \( n \) = Minimum sample size required

\( Z \) = level of statistical significance at 95% confidence level i.e. 1.96

\( p \) = Awareness of birth preparedness and complication readiness (A study carried out in Ethiopia)

\( d \) = Acceptable margin of sampling error 0.05

\( q \) = 1-\( p \)

Therefore, by considering:

\( Z = 1.96 \)

\( p = 70.6\% \) to decimal = 0.706

\( q = 1 - 0.706 \)

The minimum number of patients included in this study resulted as

\[
0.294 = \frac{1.96 \times 0.706 \times 0.294}{0.05^2} = \frac{3.841 \times 0.706 \times 0.294}{0.0025} = 318.95
\]

If 10\% of the total number of respondents gave a non-valid response, then the minimum number of patients becomes:

\[
n = \frac{319 - 10\%}{0.90} = 354.4 = 360 \text{ to nearest whole number}
\]

Finally, the number of subjects of in this study was of 360 pregnant women.

**Sampling Technique**

A total of 360 pregnant women who attended antenatal clinic in the PHC were recruited for the study. A systematic sampling technique was used for selection of the subjects based on the monthly clinic attendance and using the antenatal care register obtained from the health care workers in each primary health care center. With a sampling interval of 2 (i.e., 120/60), 1 in every 2 antenatal care clients was selected until the required sample size was met. The starting point for selection was determined by picking a random number from the clinic register, between 1 and 2. Subsequent respondents were identified by adding the sampling interval to the preceding respondents' serial number on the ANC register until the required sample size was met.

After selecting a random starting point, the respondents in each primary health care center was selected until the desired sample size in each PHC was reached. The respondents were selected proportionally to client caseload per level of facility.

**Data Collection Tool**

The data in this study were collected using a structured pretested English language interviewer-administered questionnaire. A standard tool adapted from the safe motherhood questionnaire developed by maternal and neonatal health program of John Hopkins Program for International Education in Gynecology and Obstetrics (JHPIEGO) the affiliate of John Hopkins University [15]. The questionnaire was divided into four sections, namely: socio-demographics, knowledge, attitude and practice of birth preparedness and complication readiness among antenatal care. Prior to the actual study, the questionnaire was tested among pregnant women in Isolo LGA. Feedback from the pre-test was used to make appropriate corrections in the questionnaire.

**Data Collection and Analysis**

On the day of data collection, each pregnant woman in the selected PHC center was first informed of the reason and nature of the study. They were assured that information provided will be treated with strict confidentiality. All completed questionnaire was collected and appropriately coded immediately after. Prior to data analysis, the information was collected using Microsoft excel office software. It was imported into Statistical Package for Social Sciences (SPSS) version 21 software. The analysis was done using SPSS. Quantitative variables were expressed as means, standard deviation and qualitative variables as frequencies and percentages and test of association carried out using Chi-square and Fishers Exact with level of significance set as \( P < 0.05 \).

**Knowledge of Birth Preparedness and Complication Readiness:** A total of six questions was given to the respondents to assess their level of knowledge on Birth Preparedness and Complication Readiness. The questions were collated and graded as follows: those who scored between 3-6 marks (above 50\%) were said to have good knowledge, while those who scored between 0-2 marks (below 50\%) were said to have a poor knowledge of birth preparedness and complication readiness [16].

**Attitude towards Birth Preparedness and Complication Readiness:** A total of seven questions relating to the respondents attitude to birth preparedness and complication readiness. Each response was graded according to Likert scale. Each item score between 1 to 5 points. The options were: 5 points for ‘Strongly agree’, 4 points for ‘agree’, 3 points for ‘disagree’ 2 points for ‘strongly disagree’ 1 point for ‘undecided’. The answers collated were then converted to 1 (Agree and Strongly agree) and 0 (Undecided, Strongly disagree and Disagree). Those who scored between 7-14 marks (50 \% and above) were considered as having a positive attitude while those who scored between 0-6 marks (50\% and below) were considered as negative attitude towards birth preparedness and complication readiness [16].

**Practice of Birth Preparedness and Complication Readiness:** A total of five questions relating to the
respondents practice of birth preparedness and complication readiness (BPCR). A pregnant woman was considered “prepared” for birth and its complications if she reported to follow at least 3 of the 5 basic components of BPCR (that scores between 1-5 points) while those who scored between 0-3 points were considered as “not prepared” for birth and its complications [16,17].

Ethical Considerations

Ethical approval for this study was obtained from the Ethical and Research Committee of Lagos University Teaching Hospital. Institutional ethical clearance was obtained and assent granted by the Executive Chairman of the LGA, Medical Officer of Health and Officer In-Charge of the Primary Health Care Centers. The respondents were assured of their freedom to participate and also to withdraw from the study at any time they wished. Privacy and confidentiality of the respondents’ information’s was respected during and after the interview. Data were kept secure.

3. Results

The result of 360 subjects, representing the responses of all the pregnant women in the study as presented in Tables 1-8.

Table 1. Socio-demographic characteristics of respondents (N=360)

| Socio-demographic | No of Cases | Percentage of total of cases studied |
|-------------------|-------------|-------------------------------------|

| No                       | 357         | 99.2                                |

*Multiple responses allowed

Knowledge of birth preparedness and complication readiness was considered, based on the components of the birth preparedness and complication readiness concept. This means, those who knew the components as a way of preparing for birth and ready for the complications.

| Level of knowledge towards dangers signs of pregnancy | No of Cases | Percentage of total of cases studied |
|------------------------------------------------------|-------------|-------------------------------------|
| Poor (0-49%)                                         | 261         | 72.5                                |
| Good (50-100%)                                       | 99          | 27.5                                |

| Level of knowledge towards birth preparedness and complication readiness | No of Cases | Percentage of total of cases studied |
|-------------------------------------------------------------------------|-------------|-------------------------------------|
| Poor (0-49%)                                                            | 131         | 36.4                                |
| Good (50-100%)                                                          | 229         | 63.6                                |

A total of 229 (63.6 %) respondent have a good knowledge of birth preparedness and complication readiness while 128 (35.6 %) of the respondents have a poor knowledge of birth preparedness and complication readiness.

1- Strongly Agree, 2-Agree, 3- Strongly Disagree, 4-Disagree, 5-Undecide

Data presented on this table are number of subjects (n) and proportions (%) of individual and their attitude towards birth preparedness and complication readiness.

Table 6. Attitude score TOWARDS birth preparedness and complication readiness RESPONDENTS (n=360)

| Attitude  | No of Cases | Percentage of total of cases studied |
|-----------|-------------|--------------------------------------|
| Positive (<50) | 271     | 75.3 |
| Negative (>50) | 89      | 24.7 |

Majority of the respondents 271 (75.3 %) of the respondents in this study, showed a positive attitude towards birth preparedness and complication readiness.

Table 7. Frequency Distribution of respondents by number of antenatal visits during pregnancy

| Total number times for antenatal care visits during pregnancy | No of Cases | Percentage of total of cases studied |
|-------------------------------------------------------------|-------------|--------------------------------------|
| ONE                                                         | 8           | 2.2                                  |
| TWO                                                         | 10          | 3.0                                  |
| THREE                                                      | 187         | 51.9                                 |
| FOUR OR MORE                                               | 143         | 39.7                                 |

Means of transportation during delivery

| Private care | 69 | 19.2 |
| Taxi/bus     | 134 | 37.2 |
| Motorbike    | 84  | 23.3 |
| Boat          | 12  | 3.3  |
| On foot       | 10  | 2.8  |
| Tricycle      | 51  | 14.2 |

Time of first ANC registration/visit

| First trimester | 126 | 35.0 |
| Second trimester| 162 | 45.0 |
| Third trimester | 61  | 16.9 |

Practice of BPCR

| Identified skilled provider | 159 | 34.2 |
| Saved money for childbirth | 286 | 79.4 |
| Arranged for transport to place of childbirth | 152 | 42.2 |
| Identified blood donor     | 43  | 11.9 |

Practice of Birth preparedness and complication readiness

| Prepared (>50) | 124 | 34.4 |
| Not prepared (<50) | 236 | 65.6 |
Data presented on this table, shows the percentage of cases who have made adequate preparations for child birth.

4. Discussion

The study results showed that 236 (65.6%) of the respondents were aware of birth preparedness and complication readiness, this results is similar to the 655 (70.6%) from a study carried out in southeastern Nigeria on Awareness of birth preparedness and complication readiness [18]. This could be because; most of the respondents in both studies were educated and informed.

The results obtained in this study show a lower value, compared with 546 (87.4%) in a study done Edo State Nigeria on the assessment of birth preparedness and complication readiness [19]. The reason for this disparity could be due to the fact that most of the respondents in the study done in Edo state were more aware of the components of birth preparedness and complication readiness and hence seem to be more knowledgeable.

In this study, the two key danger signs during pregnancy which were spontaneously mentioned by the respondents were severe vaginal bleeding 312 (86.7%) and convulsion 291 (80.8%). During labour the danger signs mostly mentioned by the respondents were severe vaginal bleeding 269 (74.7%) and severe headache 229 (63.6%), this is high when compared results form a study done in Jimma Ethiopia, were severe vaginal bleeding 212 (49.5%) and convulsion 120 (16.3%) were mentioned spontaneously as danger signs during labour and childbirth [8]. This difference maybe because the Jimma Ethiopia is a rural area and as such the respondents are likely to be less exposed and illiterate.

In this study only 16 (4.4%) of respondents had knowledge of financial support systems provided in the community. Community resources were poorly known or recognized by the majority of women, which corroborates with earlier studies in Abia, Nigeria and contrary to what was reported in West Bengal [12, 20]. This could be due to the fact that these studies were unavailable or because information about them was not made available to the mothers. The approach to tackling this problem is to involve and obtain the commitment of local government chairpersons, local community, and opinion leaders, with the aim of strengthen the existing service; so as to be able to provide local transport, blood donors and emergency funds through community health funds. The local media, grass-root faith-based organizations, and nongovernmental agencies can be involved to carry out information dissemination as well.

In this study, 271 (75.3%) of the respondents had a positive attitude towards birth preparedness and complication readiness. This is in contrast to a study done in India where 453 (53.3%) of the respondents showed a favorable attitude to birth preparedness and complication readiness. This disparity could be because the respondents in the study done in India were less educated and as such will likely show a negative attitude to birth preparedness and complication readiness [21].

The overall result of birth preparedness and complication readiness index was graded as prepared for birth and its complications and not prepared for birth and its complications. In this study, 124 (34.4%) of the respondents were prepared for birth and its complications. This is in contrast to a study done in Indore, India, where 321 (47.8%) of the respondents were well-prepared for birth and its complications [22]. In a community based cross-sectional study done in Chamwino district, in Tanzania, 234 (58.2%) of the respondents were considered as prepared for birth [16]. There is also similarity seen in a study done in Mbarara district Uganda where 128 (35%) of the respondents were well prepared [5].

In this study, factors associated with birth preparedness and complication readiness are: level of education (p=0.0001), history of still birth (p=0.0001), and Parity (p=0.0001) which emerged as the predictors of the respondents’ readiness for complications. This finding agrees with that of Hiluf and Fantahun from Ethiopia, where preparation for birth and its complication was found higher among literate mothers, women with parity range of 2 to 4, women with history of stillbirth, and those who were advised about birth preparedness during their antenatal care follow-up [13].

5. Conclusions

Generally, a number of 229 (63.6%) of the respondents in this study, have a good knowledge of birth preparedness and complication readiness components. This study showed that the number respondents 271 (75.3%) had a positive attitude to birth preparedness and complication readiness components. The practice of birth preparedness and complication readiness components at 12 4(34.4%) shows that despite the respondents good knowledge and positive attitude, they still do not practice birth preparedness and complication readiness. This study revealed that the proportion of pregnant women who prepared for birth and were ready for its complications was not satisfactory. Repeated awareness programs should be initiated at the Primary Health Care centers towards community participation so that Birth Preparedness and Complication Readiness status improves for these women. This will be a positive step toward achieving the millennium development goal 5, of safe motherhood and reduction in maternal mortality. Birth preparedness and complication readiness, as components of focus antenatal care are an important concept that will significantly reverse the current trend of maternal morbidity and mortality.
experienced in our community if strictly followed. Birth preparedness and complication readiness involves not only the pregnant woman, but also her family, community, and the available health care providers. Therefore, they need to collaborate in their efforts to support this group of people, for a robust, effective and efficient health care delivery. Therefore, to reduce the economic implications as a result of maternal death in Nigeria, health and policy stakeholders, together with the community must take adequate steps to ensure early education among the girls at young age, providing adequate blood bank services and engaging in constant researches in the field of birth preparedness and complication readiness.

Acknowledgements

My profound thanks and gratitude goes to the Almighty God who in his infinite mercy and guidance saw me through this training programme. I wish to express my sincere thanks and appreciation to my supervisor Prof. A. T Onajole for his diligent direction, constructive criticism, suggestion, corrections and final approval.

My special appreciation goes to Dr Ayela, for granting me the approval to embark on data collection. I am greatly indebted to Mrs Ann Oru for her assistance in aspects of data management. I wish to appreciate my research assistants for their very useful services in the Conduct of this research. I will not fail to thank all the pregnant women who participated in the project, for their understanding, patience and cooperation throughout the period of the research. My sincere appreciation goes to my lovely parents Sir and Lady S.C Metu and my siblings Chisom, Muanya, Oby, Goodluck, Esther and Amara for their support and prayers.

Finally, I acknowledge with much pleasure the kind cooperation, endurance, understanding and support of my husband Prince Fred Mbonu and my children: Stephanie, Jennifer and Jessica. May the Almighty God bless, guide and protect you all abundantly for your different contributions towards the successful completion of this project.
