Abstract

The superalgebra eigenstates (SAES) concept is introduced and then applied to find the SAES associated to the $sh(2/2)$ superalgebra, also known as Heisenberg–Weyl Lie superalgebra. This implies to solve a Grassmannian eigenvalue superequation. Thus, the $sh(2/2)$ SAES contain the class of supercoherent states associated to the supersymmetric harmonic oscillator and also a class of supersqueezed states associated to the $osp(2/2) \supset sh(2/2)$ superalgebra, where $osp(2/2)$ denotes the orthosymplectic Lie superalgebra generated by the set of operators formed from the quadratic products of the Heisenberg–Weyl Lie superalgebra generators. The properties of these states are investigated and compared with those of the states obtained by applying the group-theoretical technics. Moreover, new classes of generalized supercoherent and supersqueezed states are also obtained. As an application, the superHermitian and $\eta$–pseudo–superHermitian Hamiltonians without a defined Grassmann parity and isospectral to the harmonic oscillator are constructed. Their eigenstates and associated supercoherent states are calculated.
1 Introduction

The algebra eigenstates (AES) associated to a real Lie algebra have been defined as the set of eigenstates of an arbitrary complex linear combination of the generators of the considered algebra\cite{7, 8}. According to the particular realization of the Lie algebra generators, the determination of the AES implies, for instance, to solve an ordinary or a partial differential equation, to apply the operator technics, etc. For example, in the case of the \( su(2) \) Lie algebra, different approaches have been used such as the constellation formalism\cite{4}, the ordinary first order differential equations\cite{8} or the operator method\cite{1}. The same methods have also been applied to find the AES for the \( su(1, 1) \) Lie algebra\cite{1, 8}. In the case of the two-photon AES, associated to the \( su(1, 1) \supset h(2) \) Lie algebra, used have been done of ordinary second order differential equation\cite{7}. More recently, the AES associated to the \( h(2) \oplus su(2) \) Lie algebra have been obtained using these types of methods\cite{2}. In particular\cite{8} it has been demonstrated that the generalized coherent states (GCS) associated to the \( SU(2) \) and \( SU(1, 1) \) Lie groups, based on group-theoretical approach\cite{21}, are subsets of the sets of AES associated to their corresponding Lie algebras. Moreover, the super coherent states of the supersymmetric harmonic oscillator\cite{10} as defined by Aragone and Zypmann\cite{3} and a new class of supercoherent and supersqueezed states regarded as minimum uncertainty states have been obtained\cite{2}. Generalized supercoherent states (GSCS) associated to Lie supergroups have also been calculated following a generalized group-theoretical approach. This is the case, for example, of the supercoherent states associated to the following supergroups: Heisenberg–Weyl (H–W) and \( OSp(1/2) \)[14], \( U(1/2) \)[15, 25], \( U(1/1) \)[20] and \( OSp(2/2) \)[13].

In the view of these approaches we ask the question of how we can generalize the AES concept valid for Lie algebras to Lie superalgebras. In general, as the even subspace of a Lie superalgebra is an ordinary Lie algebra, it is clair that the new concept must generalize in an appropriate form the AES concept. Indeed, the set of superalgebra eigenstates (SAES) associated to linear combinations of even generators of the Lie superalgebra must contain the AES associated to the Lie algebra generated by these generators. Moreover, we expect that the SAES associated to a certain class of superalgebras contain the GSCS of the related Lie supergroups. Another criterion to define the SAES concept start from the utility that we can give to this concept when we study a particular quantum system, more precisely when we want to know the eigenstates of a physical observable represented by a superHermitian operator.
formed by a linear combination of the superalgebra generators or by a suitable product of these
generators. According with these requirements, we propose the following definition of the
SAES concept.

**Definition 1.1** The SAES associated to a Lie superalgebra correspond to the set of eigenstates
of an arbitrary linear combination, with coefficients in the Grassmann algebra $CB_L$, of the super-
algebra generators. This means that if $L$ is a superalgebra generated by the set of even oper-
ators $\Phi(a_1), \Phi(a_2), \ldots \Phi(a_m)$ and the set of odd operators $\Phi(a_{m+1}), \Phi(a_{m+2}), \ldots \Phi(a_{m+n})$,
the SAES associated to $L$ are determined by the eigenvalue equation

$$
\left[ \sum_{i=1}^{m+n} B_i \Phi(a_i) \right] |\psi\rangle = Z |\psi\rangle,
$$

where $B_i \in CB_L$, $\forall i = 1, 2, \ldots, m + n$ and $Z \in CB_L$.

In general, the superstate $|\psi\rangle$ is a linear combination, with coefficients in $CB_L$, of the basis
vectors of a graded superHilbert space $W$, the representation space of the superalgebra on which
it acts.

Let us here mention that the Appendix A contains the notations and conventions used in the
context of Grassmann algebras, Lie superalgebras and supergroups. This will help for a good
understanding of this work.

From the preceding definition, we see that to know explicitly the SAES associated to a given
Lie superalgebra, we must analyze case by case the different possible solutions of the Grassman-
nian eigenvalue equation (1) taking into account both the domain of definition of the Grassmann
coefficients and the parity of them. In general, the calculations can be long and fastidious, but
in physical applications, some simplifications appear due to some constrains on the coefficients
like assuming a certain type of parity.

A natural generalization of the concept of AES to SAES starts with H–W superalgebra
$sh(2/2)$ generated by the bosonic operators $a, a^\dagger$ and $I$ and the fermionic ones $b$ and $b^\dagger$. We ex-
pect to recover the usual algebra eigenstates[2, 3, 19] but also supercoherent and supersqueezed
states based on a group theoretical approach[16, 18].

Let us remind that the well-known bosonic algebra is generated by the even operators $a, a^\dagger$
and $I$, that satisfy the usual non-zero commutation relation

$$
[a, a^\dagger] = I,
$$

(2)
and act on the usual Fock space \( \mathcal{F}_b = \{ |n\rangle, \ n \in \mathbb{N} \} \), as follows

\[
 a|n\rangle = \sqrt{n}|n-1\rangle, \quad a^\dag|n\rangle = \sqrt{n+1}|n+1\rangle, \quad n \in \mathbb{N}.
\] (3)

The operators \( a, a^\dag \) are the usual annihilation and creation operators of the harmonic oscillator, and \( I \) acts as the identity operator. The corresponding fermionic superalgebra is generated by the odd operators \( b, b^\dag \) and the even operator \( I \), which satisfy the non-zero super commutation relation

\[
 \{ b, b^\dag \} = I.
\] (4)

These operators act on the graded space \( \mathcal{F}_f = \{ |+\rangle, |\rightarrow\rangle \} \) as follows

\[
 b|+\rangle = |\rightarrow\rangle, \quad b|\rightarrow\rangle = 0, \quad b^\dag|+\rangle = 0, \quad b^\dag|\rightarrow\rangle = |+\rangle.
\] (5)

Taking the all set \( \{ a, a^\dag, I, b, b^\dag \} \) satisfying the non-zero supercommutation relations (2) and (4), we get the H–W superalgebra \( sh(2/2) \). Its acts naturally on the graded Fock space \( \mathcal{F}_b \otimes \mathcal{F}_f = \{ |n, \pm\rangle, \ n \in \mathbb{N} \} \). In order to compute the SAES of this superalgebra we will consider linear combinations over the field of Grassmann numbers. This means that, in general, we will deal with linear combinations of the bosonic (even) and fermionic (odd) operators with the coefficients taking values in the set \( \mathbb{C}B_L \).

The paper will be thus distributed as follows. In section 2, we will determine the SAES associated to the bosonic H–W Lie algebra. A significant difference with respect to the other approaches is now that linear combinations of generators is considered over the field of Grassmann numbers. Connections with preceding approaches will be made. In section 3, fermionic H–W Lie superalgebra will be considered. These special SAES cases will give a good understanding of the specificities induced by working with Grassmann valued variables and will help us to give a complete description of the SAES associated to the H–W Lie superalgebra in section 4. Finally, in section 5, Hamiltonians which are isospectral to the harmonic oscillator one will be constructed and their associated supercoherent states will be described. The notations and conventions used in this work will be revised in the Appendix A whereas the details of calculus of the SAES of section 4 will be presented in the Appendix B.
2 SAES associated to the Heisenberg–Weyl Lie algebra, generalized supercoherent and supersqueezed states

The SAES associated to the H–W Lie algebra will be obtained as the states $|\psi\rangle$ that verify the eigenvalue equation

$$[A_- a + A_+ a^\dagger + A_3 I]|\psi\rangle = Z|\psi\rangle,$$

where $A_\pm, A_3$ and $Z \in \mathbb{C}B_L$. From the structure of this equation, we expect to recover the usual results concerning, in particular, the eigenstates of $a$, i.e., the standard coherent states of the harmonic oscillator[21]. That is the reason why we begin our considerations by taking first $A_+ = A_3 = 0$. In this context, we will distinguish between the cases where $(A_-)_{\phi}$ is zero and not zero. Next, the general combination (6) will be considered with $(A_-)_{\phi} \neq 0$. This means that $A_-$ is an invertible Grassmann number and the relation (6) thus reduces to

$$[a + \beta a^\dagger]|\psi\rangle = z|\psi\rangle, \quad \beta, z \in \mathbb{C}B_L.$$ 

2.1 Generalized coherent states

If we take $A_+ = A_3 = 0$, the eigenvalue equation (6) thus writes

$$A_- a|\psi\rangle = Z|\psi\rangle.$$ 

Let us assume a solution of the type

$$|\psi\rangle = \sum_{n=0}^{\infty} C_n |n\rangle,$$

where

$$(9)$$

By inserting (9) in (8), applying (3) and using the orthogonality property of states $\{ |n\rangle \}_{n=0}^{\infty}$, we get to the following recurrence relation

$$A_- C_{n+1} = \frac{Z C_n}{\sqrt{n + 1}}, \quad n = 0, 1, \ldots.$$ 

Here we must consider two cases: the cases $(A_-)_{\phi} \neq 0$ and $(A_-)_{\phi} = 0$.

In the first case, $(A_-)_{\phi} \neq 0$ is thus an invertible quantity and we can isolate the coefficient $C_{n+1}$ in (10). It is easy to show that we get:

$$C_n = \left(\frac{(A_-)^{-1}Z}{\sqrt{n!}}\right)^n C_0, \quad n = 1, 2, \ldots.$$ 

(11)
The SAES associated to the operator $A_- a$ with eigenvalue $Z$ are then given by

$$|z\rangle = \sum_{n=0}^{\infty} \frac{z^n}{\sqrt{n!}} C_0|n\rangle = \sum_{n=0}^{\infty} \frac{(za^\dagger)^n}{n!} C_0|0\rangle = e^{za^\dagger} C_0|0\rangle,$$

(12)

where $z = (A_-)^{-1} Z$. As we are interested in normalized eigenstates, we take $(C_0)_{\phi} \neq 0$ and the eigenstates can be written as

$$|z\rangle = D(z_0) D(z_1)|0\rangle,$$

(13)

where

$$D(z_0) = \exp \left( z_0 a^\dagger - z_0^\dagger a \right), \quad D(z_1) = \exp \left( z_1 a^\dagger - z_1^\dagger a \right),$$

(14)

$z_0 = ((A_-)^{-1} Z)_0$ and $z_1 = ((A_-)^{-1} Z)_1$.

We notice that the generalized coherent states associated to the harmonic oscillator system, considered as eigenstates of the annihilation operator $a$, are here given by (13) when $A_- = \epsilon_{\phi}$, i.e., when $z_0 = Z_0$ and $z_1 = Z_1$. This states are obtained by applying successively the superunitary operators $D(Z_1)$ and $D(Z_0)$ to the fundamental state $|0\rangle$.

In the second case, that is when $(A_-)_{\phi} = 0$, we can not obtain a simple closed expression to describe all the algebra eigenstates. A class of solution is:

$$C_n = \frac{(C_1(C_0)^{-1})^n}{\sqrt{n!}} C_0, \quad n = 2, 3, \ldots,$$

(15)

together with

$$A_- C_1 = Z C_0$$

(16)

and $C_0$ is an arbitrary coefficient such that $(C_0)_{\phi} \neq 0$. The condition (16) implies that $Z_{\phi} = 0$ and is equivalent to the following system of superequations

$$(A_-)_0(C_1)_0 + (A_-)_1(C_1)_1 = Z_0(C_0)_0 + Z_1(C_0)_1,$$

(17)

$$(A_-)_0(C_1)_1 + (A_-)_1(C_1)_0 = Z_0(C_0)_1 + Z_1(C_0)_0,$$

(18)

where we have decomposed $A_-, C_0, C_1$ and $Z$ into their even and odd parts. This system can be solved to give $C_1$ in terms of $C_0$. A set of normalized eigenstates corresponding to the eigenvalue $Z = \alpha A_-$, $\alpha \in \mathbb{C}$, is given by the standard coherent states

$$|\alpha \epsilon_{\phi}\rangle = \exp \left( \alpha \epsilon_{\phi} a^\dagger - \bar{\alpha} \epsilon_{\phi} a \right) |0\rangle = D(\alpha \epsilon_{\phi})|0\rangle.$$

(19)

So, in the special case when $(A_-)_0 = 0$, the algebra eigenstates of the odd operator $(A_-)_1 a$ contain the set of coherent states of the standard harmonic oscillator.
2.1.1 Density of algebra

It is interesting to mention that we can interpret this last result in terms of the concept of density of algebra. Indeed, let us define the odd operators

\[ A_- = z_1^\dagger a, \quad A_+ = -z_1 a, \quad z_1 \in \mathbb{C}B_{L_1}. \]  

(20)

By integrating these operators with respect to the corresponding odd variable, we get

\[ a = \int A_- d z_1^\dagger, \quad a^\dagger = \int d z_1 A_+, \]  

(21)

i.e., \( A_- \) and \( A_+ \) fulfill the role of a linear density of the annihilation \( a \) and the creation \( a^\dagger \), respectively. We notice that

\[ [a, a^\dagger] = \int \{A_-, A_+\} dz_1^\dagger dz_1, \quad \{a, a^\dagger\} = \int [A_-, A_+] dz_1^\dagger dz_1, \]  

(22)

i.e., the commutator and anticommutator of the even operators \( a \) and \( a^\dagger \) are obtained by integrating, on the entire odd Grassmann space, the anticommutator and commutator of the odd operators \( A_- \) and \( A_+ \), respectively. This suggests the following definitions of the density of identity \( \mathbb{I} \) and of an energy type density \( \mathbb{H} \):

\[ \mathbb{I} = \{A_-, A_+\} = z_1 z_1^\dagger, \quad \mathbb{H} = [A_-, A_+] = \frac{w}{2} z_1 z_1^\dagger \{a, a^\dagger\}. \]  

(23)

As we know, the eigenstates of the annihilation operator corresponding to the complex eigenvalue \( \alpha \) are given by the standard harmonic oscillator coherent states \( |\alpha\rangle = D(\alpha)|0\rangle \). They verify the eigenvalue equation

\[ a|\alpha\rangle = \alpha|\alpha\rangle. \]  

(24)

Multiplying both sides of this equation by \( z_1^\dagger \), then integrating with respect to this Grassmann variable and finally using (21), we get

\[ \int A_- |\alpha\rangle d z_1^\dagger = \int \alpha z_1^\dagger |\alpha\rangle d z_1^\dagger, \]  

(25)

i.e., by comparing both sides of this last equation we conclude that a class of eigenstates of the odd operator \( A_- \) corresponding to the \( \alpha z_1^\dagger \) eigenvalue are given by the standard harmonic oscillator coherent states \( \epsilon_\phi |\alpha\rangle \).
2.2 Generalized supersqueezed states

Let us now solve the eigenvalue equation (7). A class of solutions can be constructed firstly, by expressing $|\psi\rangle$ in terms of a generalized $su(1,1)$ squeeze operator (the normaliser of the H–W algebra), following this way the construction of the standard squeezed states associated to the simple harmonic oscillator system[19]. Indeed, let us write

$$|\psi\rangle = S(X_0)\phi\rangle,$$  \hspace{1cm} (26)

where the squeeze operator $S(X_0)$ is given by

$$S(X_0) = \exp \left( \frac{X_0(a^\dagger)^2}{2} - \frac{X_0^2 a^2}{2} \right),$$  \hspace{1cm} (27)

with $X_0$ an even invertible Grassmann number, $X_0^\dagger$ its adjoint (see Appendix A).

Inserting (26) in (7), using the relation

$$S^\dagger(X_0)aS(X_0) = \cosh(\|X_0\|) a + \sqrt{X_0} \left( \sqrt{X_0^\dagger} \right)^{-1} \sinh(\|X_0\|) a^\dagger,$$  \hspace{1cm} (28)

where $\|X_0\| = \sqrt{X_0X_0^\dagger}$, and choosing $X_0$ in such a way that it satisfies

$$\sqrt{X_0} \left( \sqrt{X_0^\dagger} \right)^{-1} \sinh(\|X_0\|) + \beta_0 \cosh(\|X_0\|) = 0,$$  \hspace{1cm} (29)

we get the following eigenvalue equation for $|\phi\rangle$:

$$\left[ G(X_0, \beta) a + \beta_1 \cosh(\|X_0\|) a^\dagger \right] |\phi\rangle = z |\phi\rangle,$$  \hspace{1cm} (30)

where

$$G(X_0, \beta) = \cosh(\|X_0\|) + \beta \sqrt{X_0} \left( \sqrt{X_0^\dagger} \right)^{-1} \sinh(\|X_0\|).$$  \hspace{1cm} (31)

Let us notice that this last coefficient can be written on the form

$$G(X_0, \beta) = G(X_0, \beta_0) \left( \frac{\epsilon_\phi + \beta_1 (G(X_0, \beta_0))^{-1} \sqrt{X_0} \left( \sqrt{X_0^\dagger} \right)^{-1} \sinh(\|X_0\|) \right)$$  \hspace{1cm} (32)

where, taking into account (29),

$$G(X_0, \beta_0) = \left[ \epsilon_\phi - \beta_0^2 X_0^\dagger \right] \cosh(\|X_0\|).$$  \hspace{1cm} (33)

Multiplying both sides of the equation (30) by the inverse of $G(X_0, \beta)$ and taking into account (32), we get

$$[a + \hat{\beta}_1a^\dagger]|\phi\rangle = \hat{z}|\phi\rangle,$$  \hspace{1cm} (34)
where

$$\hat{\beta}_1 = \beta_1 (\mathcal{G}(\mathcal{X}_0, \beta_0))^{-1} \cosh(\|\mathcal{X}_0\|) \in \mathbb{C}B_{L_1},$$

(35)

and

$$\hat{r} = \left[ (\mathcal{G}(\mathcal{X}_0, \beta_0))^{-1} - \beta_1 \sqrt{\mathcal{X}_0} \right] \left( \sqrt{\mathcal{X}_0} \right)^{-1} \sinh(\|\mathcal{X}_0\|) z.$$

(36)

The equation (34) is thus simpler to solve than (7). Indeed, we can again try a solution of the type

$$|\varphi\rangle = \sum_{n=0}^{\infty} C_n |n\rangle, \quad C_n \in \mathbb{C}B_L.$$  

(37)

Inserting it in (34), using the raising and lowering properties of the operators $a^\dagger$ and $a$, and the orthogonality conditions of the states $\{|n\rangle\}$, we get the recurrence relation

$$C_{n+1} = \frac{[\hat{r}C_n - \sqrt{n}\hat{\beta}_1 C_{n-1}]}{\sqrt{n+1}}, \quad n = 2, \ldots,$$

(38)

with

$$C_1 = \hat{r}C_0,$$

(39)

and $C_0$ is an arbitrary constant. Proceeding by iteration we get

$$C_n = \frac{1}{\sqrt{n!}} \left( \hat{r}^n - \sum_{k=0}^{n-2} (k+1) \hat{r}^{n-2-k} (\hat{r}^*)^k \hat{\beta}_1 \right) C_0, \quad n = 2, 3, \ldots.$$

(40)

This expression may be written in a closed form. Indeed, as we can show that

$$\sum_{k=0}^{n-2} (k+1) \hat{r}^{n-2-k} (\hat{r}^*)^k = \frac{n(n-1)}{2!} (\hat{r}_0)^{n-2} - \frac{n(n-1)(n-2)}{3!} (\hat{r}_0)^{n-3} \hat{r}_1$$

(41)

$$= \frac{1}{2!} \frac{\partial^2}{\partial \hat{r}^2_0} (\hat{r}_0)^n - \frac{1}{3!} \frac{\partial^3}{\partial \hat{r}^3_0} (\hat{r}_0)^n \hat{r}_1,$$

(42)

the relation (40) becomes

$$C_n = \frac{1}{\sqrt{n!}} \left( \hat{r}^n - \left[ \frac{1}{2!} \frac{\partial^2}{\partial \hat{r}^2_0} (\hat{r}_0)^n - \frac{1}{3!} \frac{\partial^3}{\partial \hat{r}^3_0} (\hat{r}_0)^n \hat{r}_1 \right] \hat{\beta}_1 \right) C_0, \quad n = 2, 3, \ldots.$$  

(43)

which is also valid for $n = 1$. Finally, inserting this result into (37), and after some manipulations we obtain a general solution of (34), which is

$$|\varphi\rangle = e^{\hat{r} a^\dagger} - \hat{r} \hat{\beta}_1 (a^\dagger)^2 \frac{1}{2!} + \hat{r} \hat{\beta}_1 (a^\dagger)^3 \frac{1}{3!} e^{\hat{r}_0 a^\dagger} |0\rangle C_0.$$  

(44)

A normalized version of (44) is given by

$$|\varphi\rangle = \exp \left[ -\hat{r} \hat{\beta}_1 (a^\dagger)^2 \frac{1}{2} - \hat{r} \hat{\beta}_1 (a^\dagger)^3 \frac{1}{3} \right] \mathbb{D}(\hat{r}_0) \mathbb{D}(\hat{r}_1) |0\rangle \hat{C}(\hat{r}, \hat{\beta}_1),$$

(45)
where the operator \( \mathbb{D} \) has been defined in (14). The normalization constant \( \hat{C} \) is given by

\[
\hat{C}(\hat{z}, \hat{\beta}_1) = \left( \sqrt{\Gamma} \right)^{-1} \left[ \epsilon_\phi + \frac{1}{2} \left( \sqrt{\Gamma} \right)^{-1} \Omega \left( \sqrt{\Gamma} \right)^{-1} \right],
\]

with

\[
\Gamma(\hat{z}, \hat{\beta}_1) = \epsilon_\phi - \frac{1}{2} \left( (\hat{z}^\dagger)^2 \hat{\beta}_1 + (\hat{\beta}_1)^\dagger \hat{z}^2 \right) - \frac{1}{3} \left( (\hat{z}^\dagger)^2 \hat{z}_1 \hat{\beta}_1 + (\hat{\beta}_1)^\dagger (\hat{z}_1)^\dagger \hat{z}^3 \right)
\]

and

\[
\Omega(\hat{z}, \hat{\beta}_1) = \left[ \frac{1}{6} \left( (\hat{z}^\dagger)^3 \hat{z}_1 \hat{z}^2 + (\hat{z}^\dagger)^2 (\hat{z}_1)^\dagger \hat{z}^2 \right) + \left( (\hat{z}^\dagger)^2 \hat{z}_1 \hat{z} + (\hat{z}^\dagger) (\hat{z}_1)^\dagger \hat{z}^2 + (\hat{z}_1)^\dagger \hat{z} \right) - \frac{1}{4} \left( (\hat{z}^\dagger)^2 \hat{z}^2 + 4 \hat{z}^\dagger \hat{z} + 2 \right) \right] (\hat{\beta}_1)^\dagger \hat{\beta}_1
\]

\[
- \frac{1}{9} \left( (\hat{z}^\dagger)^2 \hat{z}^2 + 9 (\hat{z}^\dagger)^2 \hat{z}^2 + 24 \hat{z}^\dagger \hat{z} + 6 \right) (\hat{z}_1)^\dagger \hat{z}_1 (\hat{\beta}_1)^\dagger \hat{\beta}_1
\]

\[
- \left( (\hat{z}_0)^2 \hat{\beta}_1 + (\hat{\beta}_1)^\dagger (\hat{z}_0)^2 \right) (\hat{\beta}_1)^\dagger \hat{\beta}_1.
\]

From (26) and (45) we conclude that a class of normalized solutions of the eigenvalue equation (7), corresponding to the eigenvalue \( z \), is given by the generalized supersqueezed states

\[
|\psi\rangle = S(\mathcal{X}_0) \exp \left[ -\hat{\beta}_1 \frac{(a)^2}{2} - \hat{z}_1 \hat{\beta}_1 \frac{(a)^3}{3} \right] \mathbb{D}(\hat{z}_0) \mathbb{D}(\hat{z}_1) |0\rangle \hat{C}(\hat{z}, \hat{\beta}_1).
\]

Let us now give some examples of such states.

### 2.2.1 Standard supersqueezed states

The standard supersqueezed states are obtained from (48) when \( \beta_1 = 0 \) and \( z_1 = 0 \), i.e., when \( \hat{\beta}_1 = 0 \), \( \hat{z}_1 = 0 \) and \( \hat{z}_0 = (\mathcal{G}(\mathcal{X}_0, \beta_0))^{-1} z_0 \). They are given by

\[
|\psi\rangle = S(\mathcal{X}_0) \mathbb{D}(\hat{z}_0) |0\rangle,
\]

where \( \mathcal{X}_0 \) and \( \hat{z}_0 \) remain even Grassmann valued numbers.

### 2.2.2 A new class of supersqueezed states

Another class of supersqueezed states appears in (48), because of the possibility to choose in (7) a non zero odd component of the variable \( \beta \). For example, if we choose \( \beta_0 = 0 \), i.e., \( \mathcal{X}_0 = 0 \), \( \hat{\beta}_1 = \beta_1 \) and \( \hat{z} = z \), then from (48) we obtain the following class of states

\[
|\psi\rangle = \exp \left[ -\beta_1 \frac{(a)^2}{2} - z_1 \beta_1 \frac{(a)^3}{3} \right] \mathbb{D}(z_0) \mathbb{D}(z_1) |0\rangle \hat{C}(z, \beta_1).
\]
They are obtained by applying the operator
\[
\exp \left[ -\beta_1 \frac{(a^\dagger)^2}{2} - z_1 \beta_1 (a^\dagger)^3 \right]
\]
(51)
to the generalized coherent states (13) of \(a\). In the special case where \(z_1 = 0\), we get to the normalized supersqueezed states
\[
|\psi\rangle = \left[ \epsilon \phi + \frac{1}{4} \beta_1^2 \beta_1 \left( z_0^2 (z_0^\dagger)^2 + 4 z_0 z_0^\dagger + 2 \right) \right] \exp \left[ -\frac{1}{8} \beta_1^2 \beta_1 \left( a^\dagger (a^\dagger)^2 + (a^\dagger)^2 a^2 \right) \right] \\
\exp \left[ - \left( \frac{\beta_1 (a^\dagger)^2}{2} - \beta_1^2 a^2 \right) \right] \mathbb{D}(z_0) |0\rangle,
\]
(52)
which are written in terms of the superunitary operator \(S(-\beta_1)\) as defined in (27). Moreover, in the case where \(\beta_1 \in \mathbb{R}B_{L_1}\), this last equation becomes
\[
|\psi\rangle = S(-\beta_1) \mathbb{D}(z_0) |0\rangle,
\]
(53)
i.e., we are in the presence of a class of supersqueezed states which are constructed by applying the superunitary supersqueeze operator \(S(-\beta_1)\) to the standard harmonic oscillator coherent states.

### 3 SAES associated to the fermionic superalgebra

In this section, we will construct the SAES associated with the fermionic superalgebra generated by \(\{b, b^\dagger, I\}\) which satisfy the non-zero supercommutation relation (4). The general eigenvalue equation writes as
\[
[B_- b + B_+ b^\dagger + B_3 I]|\psi\rangle = Z|\psi\rangle, \quad B_\pm, Z \in \mathbb{C}B_L.
\]
(54)
Here we will distinguish again two cases: firstly when \(B_+ = B_3 = 0\) and secondly when \(B_-\) is invertible so that the equation (54) reduces to
\[
(b + \delta b^\dagger)|\psi\rangle = z|\psi\rangle, \quad \delta, z \in \mathbb{C}B_L.
\]
(55)

#### 3.1 The b-fermionic eigenstates

Let us solve
\[
B b |\psi\rangle = Z |\psi\rangle, \quad B, Z \in \mathbb{C}B_L.
\]
(56)
Since the fermionic graded Fock space is reduced to the vectors $|\rangle$ (even) and $\rangle$ (odd) which act as in (5), a solution of (56) writes as

$$|\psi\rangle = C|\rangle + D\rangle, \quad C, D \in \mathbb{C}B_L.$$ \hspace{1cm} (57)

Inserting (57) into (56) and using (5), we get

$$BD^*|\rangle = ZC|\rangle + ZD\rangle.$$ \hspace{1cm} (58)

The orthogonality of the states $|\rangle$ and $\rangle$ leads to the following set of algebraic equations

$$BD^* = ZC$$
$$ZD = 0,$$ \hspace{1cm} (59)

or by conjugation of the first one,

$$B^*D = Z^*C^*$$
$$ZD = 0.$$ \hspace{1cm} (60)

Let us mention that, when $B_\phi \neq 0$, we have evidently the normalized solution $|\psi\rangle = |\rangle$ when the eigenvalue $Z$ is zero, but due to the presence of Grassmann value quantities, when $B_\phi = 0$, we have a larger set of solutions. For instance, for $B = B_1$, we find, a solution of the form

$$|\psi\rangle = C|\rangle \pm B_1\rangle.$$ \hspace{1cm} (61)

Normalized eigenstates are given by

$$|\psi\rangle = \exp \left[ \pm \left( B_1b^d + B_1^d b \right) \right] |\rangle.$$ \hspace{1cm} (62)

When $Z \neq 0$, non-trivial solutions appears if and only if $Z_\phi = 0$. From (60), we have $D_\phi = 0$. To solve completely the system (60) we have to distinguish two cases.

If $B_\phi \neq 0$, we can solve $D$ from the first equation of (60)

$$D = (B^*)^{-1}Z^*C^* = (B^{-1}Z)^*C^* = z^*C^*,$$ \hspace{1cm} (63)

where $z = z_0 + z_1 = (B^{-1}Z)$. Now inserting (63) into the second equation of (60), we get

$$Zz^*C^* = 0.$$ \hspace{1cm} (64)
Normalized solutions will be obtained if $C_\phi \neq 0$ and we thus get

$$Z z^* = 0,$$

which can be written explicitly

$$z_0^2 = 0, \quad z_0 Z_1 = z_1 Z_0.$$  \hspace{1cm} (66)

The normalized eigenstates of $Bb$ with the eigenvalue $Z$ satisfying (66) are given by

$$|\psi\rangle = \left(|-\rangle + z^*|+\rangle\right) C,$$  \hspace{1cm} (67)

where $C$ is an arbitrary Grassmann number such that $C_\phi \neq 0$. They can be written as

$$|z_0; z_1\rangle = \mathbb{T}(z_1) \mathbb{T}(z_0) |-\rangle,$$  \hspace{1cm} (68)

where the superunitary operators $\mathbb{T}$ are given by

$$\mathbb{T}(z_1) = \exp \left(b^\dagger z_1 - z_1^\dagger b\right), \quad \mathbb{T}(z_0) = \exp \left(z_0 b^\dagger - z_0^\dagger b\right).$$  \hspace{1cm} (69)

The $b$–SAES are obtained from (68) when $B = \epsilon_\phi$, so that $z_0 = Z_0$ and $z_1 = Z_1$. We notice that when $z_0 = 0$, they reduces to the standard supercoherent states associated to the system characterized by the fermionic Hamiltonian $H = b^\dagger b - \frac{1}{2}$.

If $B_\phi = 0$, the problem is a little more tricky. We can write (59) explicitly as

$$B_0 d_0 - B_1 d_1 = Z_0 c_0 + Z_1 c_1$$  \hspace{1cm} (70)

$$B_1 d_0 - B_0 d_1 = Z_1 c_0 + Z_0 c_1$$  \hspace{1cm} (71)

$$Z_0 d_0 + Z_1 d_1 = 0$$  \hspace{1cm} (72)

$$Z_1 d_0 + Z_0 d_1 = 0,$$  \hspace{1cm} (73)

where we have taken $C = c_0 + c_1$ and $D = d_0 + d_1$. In this way, for instance, when $B_0 \neq 0$ and $(B_0)^2 \neq 0$, we can combine (70) and (71) to obtain

$$(B_0)^2 d_0 = (B_0 Z_0 - B_1 Z_1)c_0 + (B_0 Z_1 - B_1 Z_0)c_1,$$  \hspace{1cm} (74)

$$(B_0)^2 d_1 = (B_1 Z_0 - B_0 Z_1)c_0 + (B_1 Z_1 - B_0 Z_0)c_1$$  \hspace{1cm} (75)

and then combine this last system of equations with (72) and (73) to get

$$Z_0 (2B_1 Z_1 - B_0 Z_0) c_0 + B_1 (Z_0)^2 c_1 = 0,$$  \hspace{1cm} (76)

$$Z_0 (2B_1 Z_1 - B_0 Z_0) c_1 + B_1 (Z_0)^2 c_0 = 0.$$  \hspace{1cm} (77)
The systems (74-75) and (76-77) are equivalent to

\[(B_0)^2 D = BZ^*C^*\]  \hspace{1cm} (78)

and

\[Z_0 (2B_1Z_1 - B_0Z_0 + B_1Z_0) C = 0,\]  \hspace{1cm} (79)

respectively. As we search for normalized solutions, we must take \(C_\phi \neq 0\). This implies the following condition for the \(Z\) eigenvalue:

\[Z_0 (2B_1Z_1 - B_0Z_0) = 0\]  \hspace{1cm} (80)

\[B_1(Z_0)^2 = 0.\]  \hspace{1cm} (81)

Then, the normalized eigenstates of (56) corresponding to the \(Z\) eigenvalue satisfying (80-81) are given by (57), with \(C\) an arbitrary Grassmann number such that \(C_\phi \neq 0\), and \(D\) verifying (78).

Following a similar procedure, when \(B_0 = 0\) and \(B_1 \neq 0\), the normalized solutions of (56) corresponding to the \(Z\) eigenvalue satisfying the conditions

\[(Z_0)^2 = 0, \quad Z_0Z_1 = 0,\]  \hspace{1cm} (82)

are given by (57), with \(C_\phi \neq 0\), and \(D\) verifying

\[B_1D = -Z^*C^*.\]  \hspace{1cm} (83)

When \(B_0 \neq 0\) et \(B_1 = 0\), the solutions corresponding to the \(Z\) eigenvalue satisfying the conditions

\[(Z_0)^2 = 0,\]  \hspace{1cm} (84)

are given by (57), with \(C_\phi \neq 0\), and \(D\) verifying

\[B_0D = Z^*C^*.\]  \hspace{1cm} (85)

Other classes of solutions can be reached by imposing other conditions on the coefficient \(B\).

3.2 Supersqueezed states

Let us now solve the eigenvalue (55). If we assume again a solution of the type (57), then by inserting it in (55), using the raising and lowering properties (5) and the orthogonality between
the states $|-\rangle$ and $|+\rangle$, we get the following algebraic Grassmann equations for determining $C$ and $D$:

\[ D^* = zC, \]
\[ \delta C^* = zD. \]  (86)

By conjugating the equation (86) and then by inserting it in (87), we get

\[ (zz^* - \delta)C^* = 0. \]  (88)

As we are interested in normalized solutions, we must take $C_\phi \neq 0$, then (88) implies:

\[ z_0^2 = \delta, \]  (89)

that is, $\delta$ is an even Grassmann number. Inserting (86) in (57) and considering the conditions (89), we conclude that a set of normalized eigentates of the operator $(b + \delta_0 b^\dagger)$ corresponding to the eigenvalue $z = \pm \sqrt{\delta_0} + z_1$ is given by

\[ |\delta_0, z_1\rangle^\pm = \left( |-\rangle - \left( z_1 \mp \sqrt{\delta_0}\right)|+\rangle \right)C. \]  (90)

It is not too hard to show that the corresponding normalized supersqueezed states are given by

\[ |\delta_0, z_1\rangle^\pm = \exp\left( b^\dagger z_1 - z_1^\dagger b \right) \exp\left( \pm \sqrt{\delta_0} \left( b^\dagger + z_1^\dagger \right) \right) |\psi\rangle, \]  (91)

where the normalization constant $N^\pm$ is given by

\[ N^\pm(\delta_0, z_1) = \mathcal{F}^{-1}\left[ \epsilon_0 \mp \frac{1}{2} \mathcal{F}^{-1}\left( \sqrt{\delta_0 z_1^\dagger + (\sqrt{\delta_0})^\dagger z_1 \mp \sqrt{\delta_0}(\sqrt{\delta_0}) z_1^\dagger z_1^\dagger z_1^\dagger} \right) \mathcal{F}^{-1} \right], \]  (92)

with

\[ \mathcal{F}(\delta_0) = \sqrt{1 + \sqrt{\delta_0}(\sqrt{\delta_0})}. \]  (93)

We notice that in the limit $\delta_0 \rightarrow 0$ the supersqueezed states (91) becomes the eigenstates of the operator $b$ corresponding to the eigenvalue $z = z_1$.

4 SAES associated to the Heisenberg–Weyl Lie superalgebra

Let us now compute the SAES associated to the H-W Lie superalgebra generated by the set of generators $\{a, a^\dagger, I, b, b^\dagger\}$ whose non zero super-commutation relations are given by the relations (2) and (4). The eigenvalue equation is written as

\[ [A_- a + A_+ a^\dagger + A_3 I + B_- b + B_+ b^\dagger]|\psi\rangle = Z|\psi\rangle, \quad A_\pm, A_3, B_\pm, Z \in \mathbb{C}B_L. \]  (94)
Here we concentrate in the case where \((A_-)_\phi \neq 0\), i.e., \(A_-\) is an invertible Grassmann number. In this case, we can express (94) in the form
\[
[a + \beta a^\dagger + \gamma b + \delta b^\dagger]|\psi\rangle = z|\psi\rangle, \quad \beta, \gamma, \delta, z \in \mathbb{C} B_L.
\] (95)

Special cases of this problem have been considered in sections 2 and 3. Here we consider the cases where we have the presence of both bosonic and fermionic operators in the eigenvalue equation (95).

### 4.1 Generalized supercoherent states

First, we take the particular eigenvalue equation
\[
[a + \gamma b]|\psi\rangle = z|\psi\rangle, \quad \gamma, z \in \mathbb{C} B_L.
\] (96)

Let us assume a solution of the type
\[
|\psi\rangle = \sum_{n=0}^{\infty} \left( C_n |n; -\rangle + D_n |n; +\rangle \right),
\] (97)
where \(C_n, D_n \in \mathbb{C} B_L\). By inserting (97) in (96), using the lowering properties of operators \(a\) and \(b\), Eqs. (3) and (5), and the orthogonality properties of the graded Fock space basis \(|n; -\rangle, |n; +\rangle, n \in \mathbb{N}\}, we get the recurrence relations
\[
\sqrt{n+1} C_{n+1} + \gamma D_n^* = z C_n, \quad n = 0, 1, 2, \ldots \quad (98)
\]
\[
\sqrt{n+1} D_{n+1} = z D_n. \quad (99)
\]

From (99), it is easy to find the expression of the coefficients \(D_n\) in terms of an arbitrary constant \(D_0\):
\[
D_n = \frac{z^n}{\sqrt{n!}} D_0, \quad n = 1, 2, \ldots \quad (100)
\]

Then, by inserting (100) in (98), we get the following recurrence relation for the coefficients \(C_n\):
\[
C_{n+1} = \frac{1}{\sqrt{n+1}} \left[ z C_n - \gamma \frac{(z^*)^n}{\sqrt{n!}} D_0^* \right], \quad n = 0, 1, 2, \ldots \quad (101)
\]

Finally, proceeding by iteration we get
\[
C_n = \frac{1}{\sqrt{n!}} \left[ z^n C_0 - \sum_{k=0}^{n-1} z^{n-1-k} \gamma (z^*)^k D_0^* \right], \quad n = 1, 2, \ldots, \quad (102)
\]
where $C_0$ is an arbitrary constant. Since $C_0$ and $D_0$ are arbitrary constants, the equation (97) gives two independent solutions. The first one consists of the standard coherent states

$$|z; -⟩ = \sum_{n=0}^{∞} \frac{z^n}{\sqrt{n!}} C_0 |n; -⟩.$$  \hspace{1cm} (103)

To find the second one, we use the formula

$$\frac{1}{n+1} \sum_{k=0}^{n} z^{(n-k)} \gamma^* (z^*)^k = (\gamma_0 z_0^n + z^n \gamma_1).$$  \hspace{1cm} (104)

We thus get the generalized coherent states on the form

$$|z, \gamma; +⟩ = |z, \gamma_0, \gamma_1; +⟩ = D_0^* \left[ \sum_{n=0}^{∞} \frac{z^n}{\sqrt{n!}} |n; +⟩ - a^† \sum_{n=0}^{∞} \frac{(\gamma_0 z_0^n + z^n \gamma_1)}{\sqrt{n!}} |n; -⟩ \right].$$  \hspace{1cm} (105)

The normalized version of the states (103) is given by

$$|z; -⟩ = |z_0, z_1; -⟩ = D(z_0) D(z_1) |0; -⟩.$$  \hspace{1cm} (106)

It is similar to the one obtained in (13). A set of normalized generalized supercoherent states, orthogonal to (106) is given by the formula

$$|z, \gamma, +⟩ = |z_0, z_1, \gamma_0, \gamma_1; +⟩ = \frac{|z, \gamma_0, \gamma_1; +⟩ - |z; -⟩ \langle -; z |z_0, \gamma_0, \gamma_1; +⟩}{|| |z, \gamma_0, \gamma_1; +⟩ - |z; -⟩ \langle -; z |z_0, \gamma_0, \gamma_1; +⟩ ||}.$$  \hspace{1cm} (107)

After some calculations, we get the set of generalized supercoherent states

$$|z_0, z_1, \gamma_0, \gamma_1; +⟩ = D(z_0) D(z_1) \left\{ |0; +⟩ \right. \right.$$  \hspace{1cm} (108)

$$- \left[ \left( 1 - \frac{1}{2} z_1^† z_1 \right) D(-z_1) (a^† + z_0^†) \gamma_0 e^{z_1 z_0^†} + (1 + z_1^† z_1) a^† \gamma_1 \right. - \left. (1 - z_1^† z_1) z_0^† \gamma_0 e^{z_1 z_0^†} \right] |0; -⟩ \right\} N(z_0, z_1, \gamma_0, \gamma_1),$$

where the normalization constant $N$ is given by

$$N(z_0, z_1, \gamma_0, \gamma_1) = B^{-1} \left[ 1 - B^{-1} \left( \gamma_1^† \gamma_1 - \gamma_0^† \gamma_0 (z_0^† z_0)^2 \right) z_1^‡ z_1 B^{-1} \right],$$  \hspace{1cm} (109)

with

$$B(\gamma_0, \gamma_1) = \sqrt{1 + \gamma_0^† \gamma} = \sqrt{1 + \gamma_0^† \gamma_0 + \gamma_0^† \gamma_1 + \gamma_1^† \gamma_0 + \gamma_1^† \gamma_1}.$$  \hspace{1cm} (110)
4.1.1 Super coherent states

The supercoherent states (108) constitute a generalization of the super coherent states found by Aragone and Zypman[3]. Indeed, from equations (108-110)we see that, in the case where $\gamma_1 = 0$ and $z_1 = 0$, we have

$$|z_0, 0, \gamma_0, 0; +\rangle = \left(\sqrt{1 + \gamma_0^\dagger \gamma_0}\right)^{-1}\mathbb{D}(z_0) \left(|0; +\rangle - \gamma_0 a^\dagger|0; -\rangle\right).$$

(111)

4.1.2 Other classes of supercoherent states

Now if in (108-110), we take $\gamma_0 = 0$ and $z_0 = 0$, we get

$$|0, z_1, 0, \gamma_1; +\rangle = \left(1 - \frac{1}{2} \gamma_1^\dagger \gamma_1 - \gamma_1^\dagger \gamma_1 z_1^\dagger z_1\right)\mathbb{D}(z_1) \left(|0; +\rangle - (1 + z_1^\dagger z_1) a^\dagger \gamma_1|0; -\rangle\right).$$

(112)

We can also distinguish the case where $\gamma_1 = 0$ and $z_0 = 0$. We get

$$|0, z_1, \gamma_0, 0; +\rangle = \left(\sqrt{1 + \gamma_0^\dagger \gamma_0}\right)^{-1}\mathbb{D}(z_1) \left(|0; +\rangle + \gamma_0 \left[\left(z_1^\dagger z_1\right) - 1\right]\mathbb{D}(-z_1) a^\dagger + z_1^\dagger\right)|0; -\rangle\right).$$

(113)

4.1.3 Standard supercoherent states

In the case where $\gamma = 0$, (108) becomes the standard coherent states

$$|z; +\rangle = |z_0, z_1; +\rangle = \mathbb{D}(z_0)\mathbb{D}(z_1)|0; +\rangle.$$

(114)

By combining the two independent solutions (106) and (114), we can construct a solution of the type

$$|z; \rho, \tau\rangle = \rho|z; -\rangle + \tau|z; +\rangle,$$

(115)

where $\rho$ and $\tau$ are Grassmann numbers such that $\rho_1 z_1 = \tau_1 z_1 = 0$. Thus the states (115) are eigenstates of $a$ corresponding to the eigenvalue $z$. In particular, if we take for example $\rho = 1 - \frac{z_1^\dagger z_1}{2}$ and $\tau = -z_1$, then we obtain the supercoherent states

$$|z\rangle = \mathbb{D}(z_0)\mathbb{D}(z_1)\mathbb{T}(z_1)|0; -\rangle.$$

(116)

Moreover, if we take $z_1 = 0$, $\rho = 1 - \frac{\theta_0^\dagger \theta_0}{2}$ and $\tau = -\theta_1$, we get the standard supercoherent states associated to the supersymmetric harmonic oscillator [6, 14]

$$|z_0, \theta_1\rangle = \mathbb{D}(z_0)\mathbb{T}(\theta_1)|0; -\rangle.$$

(117)
4.2 Generalized supersqueezed states

Let us now find the SAES associated to the sub-superalgebra \{a, b, b^\dagger, I\}. If the coefficient of \(a\) in the linear combination is invertible the problem reduces to solve the eigenvalue equation:

\[
[a + \gamma b + \delta b^\dagger]|\psi\rangle = z|\psi\rangle, \quad \gamma, \delta \in \mathbb{C}B_L.
\]

(118)

We can show, see Appendix B section B.1, that two classes of independent solutions of the eigenvalue equation (118) exist and are given by

\[
|\psi; -\rangle = \left[ \sum_{\ell \text{ even}}^\infty \mathcal{O}_{a^\dagger}(\ell, \gamma^*, \delta^*, z_1) e^{za_1} |0; -\rangle - \sum_{\ell \text{ odd}}^\infty \mathcal{O}_{a^\dagger}(\ell, \delta, \gamma^*, z_1) e^{za_1} |0; +\rangle \right] C_0
\]

and

\[
|\psi; +\rangle = \left[ \sum_{\ell \text{ even}}^\infty \mathcal{O}_{a^\dagger}(\ell, \delta, \gamma^*, z_1) e^{za_1} |0; +\rangle - \sum_{\ell \text{ odd}}^\infty \mathcal{O}_{a^\dagger}(\ell, \gamma, \delta^*, z_1) e^{za_1} |0; -\rangle \right] D_0^*,
\]

(120)

where \(C_0\) and \(D_0^*\) are arbitrary and invertible Grassmann constants and

\[
\mathcal{O}_{a^\dagger}(\ell, \gamma, \delta, \gamma^*, \delta^*, z_1) = \frac{1}{\ell!} \left\{ \prod_{j=0}^{\ell} (\gamma^* \delta^* \gamma \delta \cdots) \left( (a^\dagger)^{\ell} - z_1 (a^\dagger)^{\ell+1} \right) \right. \\
+ \frac{1}{\ell + 1} \sum_{j=0}^{\ell} (-1)^{j+\ell} \left( \frac{\ell - j}{\ell - j + 1} \prod_{j=0}^{\ell} (\gamma^* \delta^* \gamma \delta \cdots) z_1 \right) \left( (a^\dagger)^{\ell+1} \right) \right\},
\]

(121)

where \(\ell = 0, 1, 2, \ldots\).

The superstates (119) and (120) can be written in the form of a supersqueeze operator acting on the supercoherent state, that is

\[
|\psi; -\rangle = \mathcal{O}_{\text{even}}(a^\dagger, \gamma, \delta^*, z_1) \exp \left[ -\mathcal{O}_{\text{even}}(a^\dagger, \gamma, \delta^*, z_1) \right]^{-1} \\
\left( \mathcal{O}_{\text{odd}}(a^\dagger, \delta, \gamma^*, z_1) \right) e^{2z_1a_1} b^\dagger \mathbb{D}(z_0) \mathbb{D}(z_1) |0; -\rangle \tilde{C}_0,
\]

(122)

\[
|\psi; +\rangle = \mathcal{O}_{\text{even}}(a^\dagger, \delta, \gamma^*, z_1) \exp \left[ -\mathcal{O}_{\text{even}}(a^\dagger, \delta, \gamma^*, z_1) \right]^{-1} \\
\left( \mathcal{O}_{\text{odd}}(a^\dagger, \gamma, \delta^*, z_1) \right) e^{2z_1a_1} b \mathbb{D}(z_0) \mathbb{D}(z_1) |0; +\rangle \tilde{D}_0^*,
\]

(123)

where

\[
\mathcal{O}_{\text{even}}(a^\dagger, \gamma, \delta^*, z_1) = \sum_{\ell \text{ even}}^\infty \mathcal{O}_{a^\dagger}(\ell, \gamma, \delta^*, \gamma^*, z_1)
\]

(124)

and

\[
\mathcal{O}_{\text{odd}}(a^\dagger, \gamma, \delta^*, z_1) = \sum_{\ell \text{ odd}}^\infty \mathcal{O}_{a^\dagger}(\ell, \gamma, \delta^*, \gamma^*, z_1).
\]

(125)
4.2.1 Standard superqueezed states

In the case where $\gamma$ and $\delta$ are odd Grassmann numbers, that is when $\gamma = \gamma_1$ and $\delta = \delta_1$, it is easy to see from (121) that, the non zero $O_{a\dagger}$ operators in (119) and (120) corresponds to

$$O_{a\dagger}(0, \gamma_1, -\delta_1, z_1) = 1,$$
$$O_{a\dagger}(1, \delta_1, -\gamma_1, z_1) = \delta_1 a\dagger - 2\delta_1 z_1(a\dagger)^2,$$
$$O_{a\dagger}(2, \gamma_1, -\delta_1, z_1) = -\frac{1}{2!}\gamma_1\delta_1(a\dagger)^2,$$ (126)

and

$$O_{a\dagger}(0, \delta_1, -\gamma_1, z_1) = 1,$$
$$O_{a\dagger}(1, \gamma_1, -\delta_1, z_1) = \gamma_1 a\dagger - 2\gamma_1 z_1(a\dagger)^2,$$
$$O_{a\dagger}(2, \delta_1, -\gamma_1, z_1) = -\frac{1}{2!}\delta_1\gamma_1(a\dagger)^2,$$ (127)

respectively. By inserting this results in (119) and (120), and after some simple manipulations, we get the supersqueezed states

$$|\psi; -\rangle = \exp\left(-\frac{1}{2}\gamma_1\delta_1(a\dagger)^2\right) e^{-\delta_1 a\dagger b\dagger} e^{z a\dagger} |0; -\rangle C_0,$$ (128)

and

$$|\psi; +\rangle = \exp\left(-\frac{1}{2}\delta_1\gamma_1(a\dagger)^2\right) e^{-\gamma_1 a\dagger b\dagger} e^{z a\dagger} |0; +\rangle D^*_{0},$$ (129)

which are eigenstates of $a + \gamma_1 b + \delta_1 b\dagger$. In these last expressions, we notice the action of an normalizer operator acting on the corresponding supercoherent states. The normalizer in equation (128) transforms the algebra element $a + \gamma_1 b + \delta_1 b\dagger$ into $a + \gamma_1 b$ whereas the normalizer in equation (129) transforms it into $a + \delta_1 b\dagger$. In fact, a complete reduction into the element $a$ only can be obtained. For instance, that is the case if we multiply the normalizer in equation (128) by the corresponding normalizer of the equation (105) in the special case where $\gamma_0 = 0$, that is, by $e^{-\gamma_1 a\dagger b\dagger}$. Moreover, if we consider the algebra element $a + \beta_0 a\dagger + \gamma_1 b + \delta_1 b\dagger$, a normalizer operator transforming it into the element $a$ is given by the standard supersqueeze operator[9]

$$G(\beta_0, \gamma_1, \delta_1) = \exp\left(-\beta_0 + \gamma_1\delta_1\right)\frac{(a\dagger)^2}{2} \exp\left(-\delta_1 a\dagger b\dagger\right) \exp\left(-\gamma_1 a\dagger b\right).$$ (130)

In this way, using the algebra eigenstates (117) of the $a$ annihilator, we observe that a class of superalgebra eigenstates of $a + \beta_0 a\dagger + \gamma_1 b + \delta_1 b\dagger$, corresponding to the eigenvalue $z_0$, is given by

$$G(\beta_0, \gamma_1, \delta_1) D(z_0) T(\theta_1) |0; -\rangle C_0.$$ (131)
We notice that, these supersqueezed states are obtained by acting with a supersqueeze operator that is an element of the $OSP(2/2)$ supergroup on the supercoherent states associated to the supersymmetric harmonic oscillator. In this way, these SAES of the algebra element $a + \beta_0 a^\dagger + \gamma_1 b + \delta_1 b^\dagger$, are comparable to the supersqueezed states for the supersymmetric harmonic oscillator $[16, 18]$.

### 4.2.2 Spin $\frac{1}{2}$ representation AES structure

Let us consider now the special case where both $\gamma$ and $\delta$ are even invertible Grassmann numbers. Let us write $\gamma = \gamma_0$ and $\delta = \delta_0$. In this case, from (121), we obtain

$$O_{a^\dagger}(\ell, \gamma_0, \delta_0, z_1) = \left\{ \frac{(a^\dagger)^\ell}{\ell!} (\gamma_0 \delta_0)^{\ell/2} \exp \left( -\frac{\ell}{\ell+1} z_1 a^\dagger \right), \quad \text{if } \ell \text{ is even} \right\} \times \left\{ \frac{(a^\dagger)^{\ell-1} (\gamma_0 \delta_0)}{(\ell-1)!} \exp \left( -z_1 a^\dagger \right), \quad \text{if } \ell \text{ is odd} \right\}$$

(132)

Thus, by inserting these results in (124) and (125), we get

$$O_{\text{even}}(a^\dagger, \gamma_0, \delta_0, z_1) = \sum_{\ell \text{ even}}^{\infty} \frac{\sqrt{\gamma_0 \delta_0}}{\ell!} \frac{(a^\dagger)^\ell}{\ell!} \exp \left( -\frac{\ell}{\ell+1} z_1 a^\dagger \right)$$

$$= \cosh(\sqrt{\gamma_0 \delta_0} a^\dagger) e^{-z_1 a^\dagger}$$

$$\exp \left[ z_1 \left( \sqrt{\gamma_0 \delta_0} \right)^{-1} \left( \cosh(\sqrt{\gamma_0 \delta_0} a^\dagger) \right)^{-1} \sinh(\sqrt{\gamma_0 \delta_0} a^\dagger) \right]$$

and

$$O_{\text{odd}}(a^\dagger, \gamma_0, \delta_0, z_1) = \left( \sqrt{\gamma_0} \right)^{-1} \sqrt{\gamma_0} \sum_{\ell \text{ odd}}^{\infty} \frac{(\sqrt{\gamma_0} \delta_0)}{\ell!} \frac{(a^\dagger)^\ell}{\ell!} \exp \left( -z_1 a^\dagger \right)$$

$$= \left( \sqrt{\gamma_0} \right)^{-1} \sqrt{\gamma_0} \sinh(\sqrt{\gamma_0 \delta_0} a^\dagger) e^{-z_1 a^\dagger} \exp (-z_1 a^\dagger) .$$

(133)

(134)

By inserting these results in (119) and (120) and after some manipulations, we get the set of independent eigenstates of $a + \gamma_0 b + \delta_0 b^\dagger$:

$$|\psi^-\rangle = \exp \left[ -z_1 \left( a^\dagger - (\sqrt{\gamma_0 \delta_0})^{-1} T_h(\gamma_0, \delta_0, a^\dagger) \right) \right] \cosh \left\{ \sqrt{\gamma_0 \delta_0} a^\dagger - \left( \sqrt{\gamma_0} \right)^{-1} \sqrt{\gamma_0} \left[ 1 + z_1 \left( 2a^\dagger - (\sqrt{\gamma_0 \delta_0})^{-1} T_h(\gamma_0, \delta_0, a^\dagger) \right) \right] b^\dagger \right\} e^{z a^\dagger} |0; -\rangle C_0$$

(135)

and

$$|\psi^+\rangle = \exp \left[ -z_1 \left( a^\dagger - (\sqrt{\gamma_0 \delta_0})^{-1} T_h(\gamma_0, \delta_0, a^\dagger) \right) \right] \cosh \left\{ \sqrt{\gamma_0 \delta_0} a^\dagger - \left( \sqrt{\delta_0} \right)^{-1} \sqrt{\gamma_0} \left[ 1 + z_1 \left( 2a^\dagger - (\sqrt{\gamma_0 \delta_0})^{-1} T_h(\gamma_0, \delta_0, a^\dagger) \right) \right] b \right\} e^{z a^\dagger} |0; +\rangle D_0^*.$$
where
\[ T_h(\gamma_0, \delta_0, a^\dagger) = \left( \cosh(\sqrt{\gamma_0 \delta_0} a^\dagger) \right)^{-1} \sinh(\sqrt{\gamma_0 \delta_0} a^\dagger). \] (137)

In the special case where \( z_1 = 0 \), (135) and (136) reduces to
\[
|\psi; -\rangle = \cosh\left[ \sqrt{\gamma_0 \delta_0} a^\dagger - (\sqrt{\delta_0})^{-1} \sqrt{\gamma_0} b^\dagger \right] e^{z_0 a^\dagger} |0; -\rangle C_0
\]
(138)
and
\[
|\psi; +\rangle = \cosh\left[ \sqrt{\gamma_0 \delta_0} a^\dagger - (\sqrt{\delta_0})^{-1} \sqrt{\gamma_0} b^\dagger \right] e^{z_0 a^\dagger} |0; +\rangle D_0^* \] (139)
respectively. By combining both equations (138) and (139), we can express the set of independent solutions in the form
\[
\tilde{|\psi; -\rangle} = \exp\left( \sqrt{\gamma_0 \delta_0} a^\dagger - (\sqrt{\delta_0})^{-1} \sqrt{\gamma_0} b^\dagger \right) e^{z_0 a^\dagger} |0; -\rangle \tilde{C}_0
\] (140)
and
\[
\tilde{|\psi; +\rangle} = \exp\left( \sqrt{\gamma_0 \delta_0} a^\dagger - (\sqrt{\delta_0})^{-1} \sqrt{\gamma_0} b^\dagger \right) e^{z_0 a^\dagger} |0; +\rangle \tilde{D}_0.
\] (141)

Thus, we recover the structure of the spin \( \frac{1}{2} \) representation algebra eigenstates associated to the subalgebra \( \{a, J_+, J_-\} \) of the \( h(2) \oplus su(2) \) Lie algebra [2].

### 4.3 The general case

Let us solve now the eigenvalue equation (95). The discussion at the end of section 4.2.1 shows that it can be reduced to a simpler one by expressing the eigenstate \( |\psi\rangle \) as:
\[
|\psi\rangle = G(\beta_0, \gamma_1, \delta_1)|\varphi\rangle.
\] (142)

Indeed, inserting (142) into (95) and multiplying by the inverse of the supersqueeze operator \( G(\beta_0, \gamma_1, \delta_1) \), we get
\[
[a + \hat{\beta}_1 a^\dagger + \gamma_0 b + \delta_0 b^\dagger]|\varphi\rangle = z|\varphi\rangle,
\] (143)
where
\[
\hat{\beta}_1 = \beta_1 + \delta_0 \gamma_1 + \gamma_0 \delta_1 \in \mathbb{C}B_{L_1}.
\] (144)
We can show that, see Appendix B section B.2, two classes of independent solutions of the eigenvalue equation (143) exit and are given by

\[ |\varphi; -\rangle = \left[ \sum_{\ell \text{ even}}^{\infty} \exp \left( -\frac{\hat{\beta}_1 (\gamma_0 \delta_0)^{-1}}{2} \ell \right) O_{a^\dagger}(\ell, \gamma_0, \delta_0, z_1) e^{za^\dagger} |0; -\rangle \right. \]

\[ - \sum_{\ell \text{ odd}}^{\infty} \exp \left( -\frac{\hat{\beta}_1 (\gamma_0 \delta_0)^{-1}}{2} (\ell - 1) \right) O_{a^\dagger}(\ell, \delta_0, \gamma_0, z_1) e^{za^\dagger} |0; +\rangle \bigg] C_0 \tag{145} \]

and

\[ |\varphi; +\rangle = \left[ \sum_{\ell \text{ even}}^{\infty} \exp \left( -\frac{\hat{\beta}_1 (\gamma_0 \delta_0)^{-1}}{2} \ell \right) O_{a^\dagger}(\ell, \delta_0, \gamma_0, z_1) e^{za^\dagger} |0; +\rangle \right. \]

\[ - \sum_{\ell \text{ odd}}^{\infty} \exp \left( -\frac{\hat{\beta}_1 (\gamma_0 \delta_0)^{-1}}{2} (\ell - 1) \right) O_{a^\dagger}(\ell, \gamma_0, \delta_0, z_1) e^{za^\dagger} |0; -\rangle \bigg] D_0^*, \tag{146} \]

where \( C_0 \) and \( D_0^* \) are arbitrary and invertible Grassmann constants.

Using the results (132) for the \( O_{a^\dagger}(\ell, \gamma_0, \delta_0, z_1) \) operator, we get

\[ |\varphi; -\rangle = \left[ \cosh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}) \left( 1 + T_h(\gamma_0, \delta_0, \hat{\beta}_1, a^\dagger) \sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 z_1} \right) e^{-za^\dagger} e^{za^\dagger} |0; -\rangle \right. \]

\[ - (\gamma_0)^{-1} \sinh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}) \sqrt{\gamma_0 \delta_0 + \hat{\beta}_1} e^{-za^\dagger} e^{za^\dagger} |0; +\rangle \bigg] C_0 \tag{147} \]

and

\[ |\varphi; +\rangle = \left[ \cosh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}) \left( 1 + T_h(\gamma_0, \delta_0, \hat{\beta}_1, a^\dagger) \sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 z_1} \right) e^{-za^\dagger} e^{za^\dagger} |0; +\rangle \right. \]

\[ - (\delta_0)^{-1} \sinh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}) \sqrt{\gamma_0 \delta_0 + \hat{\beta}_1} e^{-za^\dagger} e^{za^\dagger} |0; -\rangle \bigg] D_0^*, \tag{148} \]

where

\[ T_h(\gamma_0, \delta_0, \hat{\beta}_1, a^\dagger) = \left( \cosh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}) \right)^{-1} \sinh(\sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger}). \tag{149} \]

### 4.3.1 Generalized Spin \( \frac{3}{2} \) representation AES structure

In the special case where \( z_1 = 0 \), (147) and (148) reduces to

\[ |\varphi; -\rangle = \exp \left( -\frac{1}{2} (\gamma_0)^{-1} \hat{\beta}_1 a^\dagger b^\dagger \right) \]

\[ \cosh \left[ \sqrt{\gamma_0 \delta_0 - \hat{\beta}_1 a^\dagger - (\gamma_0)^{-1} \sqrt{\gamma_0 \delta_0 + \hat{\beta}_1 b^\dagger}} \right] e^{za^\dagger} |0; -\rangle C_0 \tag{150} \]
The state \( |\varphi; +\rangle \) is given by:

\[
|\varphi; +\rangle = \exp\left(-\frac{1}{2}(\delta_0)^{-1}\hat{\beta}_1 a^\dagger b\right)
\cosh\left[\sqrt{\gamma_0\delta_0 - \hat{\beta}_1 a^\dagger - (\delta_0)^{-1}\sqrt{\gamma_0\delta_0 + \hat{\beta}_1 b}}\right] e^{z_0 a^\dagger}|0; +\rangle D_0^* \tag{151}
\]

respectively. Thus, we get a set of generalized SAES that contains the set of AES associated to the spin \( \frac{1}{2} \) representation that we have studied in the section 4.2.2.

### 5 Isospectral harmonic oscillator Hamiltonians having odd interaction terms

In this section we search for some isospectral harmonic oscillator systems which are characterized by a Hamiltonian admitting an annihilation operator which is a Grassmannian linear combination of the generators of the H-W Lie superalgebra, i.e., of the form

\[
\mathcal{A} = a + \beta a^\dagger + \gamma b + \delta b^\dagger, \quad \beta, \gamma, \delta \in \mathbb{C}B_L. \tag{152}
\]

A family of non-equivalent such Hamiltonians \( \mathcal{H} \) can be constructed if first we consider a superHermitian Hamiltonian \( \mathcal{H}_0 \) such that the commutator is given by

\[
[\mathcal{H}_0, \mathcal{A}_0] = -\mathcal{A}_0, \quad \text{and} \quad \mathcal{A}_0|E_0; \pm\rangle = 0, \tag{153}
\]

where

\[
\mathcal{A}_0 = a + \hat{\beta}_1 a^\dagger + \gamma_0 b + \delta_0 b^\dagger, \quad \gamma_0, \delta_0 \in \mathbb{C}B_{L_0}, \tag{154}
\]

\( \hat{\beta}_1 \) is given by (144) and \( |E_0; \pm\rangle \) are the zero eigenvalue eigenstates of \( \mathcal{H}_0 \). In this way, \( \mathcal{A}_0 \) is effectively an annihilation operator and its associated superalgebra eigenstates a class of supercoherent states for the system characterized by the Hamiltonian \( \mathcal{H}_0 \). Second, according to the analysis of section B.2, it is possible to construct \( \mathcal{H} \) satisfying

\[
[\mathcal{H}, \mathcal{A}] = -\mathcal{A} \tag{155}
\]

by taking

\[
\mathcal{A} = G(\beta_0, \gamma_1, \delta_1)\mathcal{A}_0(G(\beta_0, \gamma_1, \delta_1))^{-1} \quad \text{and} \quad \mathcal{H} = G(\beta_0, \gamma_1, \delta_1)\mathcal{H}_0(G(\beta_0, \gamma_1, \delta_1))^{-1}, \tag{156}
\]
where $G(\beta_0, \gamma_1, \delta_1)$ is the standard supersqueeze operator defined in (130). We see that our original problem thus reduce to one of finding $H_0$. We observe that, the Hamiltonian $\mathcal{H}$ in (156) is not superHermitian but it belongs to a class of Hamiltonians that generalize the one of $\eta$–pseudo–Hermitian Hamiltonians[17]. Indeed, it satisfies the relation

$$\mathcal{H}^\dagger = \eta \mathcal{H} \eta^{-1},$$

where $\eta$ is the superHermitian operator

$$\eta = (G^{-1}(\beta_0, \gamma_1, \delta_1))^\dagger G^{-1}(\beta_0, \gamma_1, \delta_1).$$

Let us mention that a family of $H_0$–equivalent Hamiltonians can be obtained if we replace $G(\beta_0, \gamma_1, \delta_1)$ in (156) by a suitable $OSp(2/2)$ superunitary operator[9]

$$U(\chi_0, \Gamma_1, \Delta_1) = \exp \left( \chi_0 \frac{(a^\dagger)^2}{2} - \chi_0^\dagger a^2 + \Gamma_1 a^\dagger b^\dagger + \Gamma_1^\dagger ab + \Delta_1 a^\dagger b + \Delta_1^\dagger ab \right),$$

where $\chi_0 \in \mathbb{C}B_{L_0}$ and $\Gamma_1, \Delta_1 \in \mathbb{C}B_{L_1}$.

5.1 $h(2)$ generalized isospectral oscillator system

Let us here consider the particular case where $\gamma_0 = \delta_0 = 0$. In this case, the operator $A_0$ takes the simple form

$$A_0 = a + \hat{\beta}_1 a^\dagger$$

and the commutator (160) writes

$$[A_0, A_0^\dagger] = 1 - \hat{\beta}_1^\dagger \hat{\gamma}_1 \{a, a^\dagger\} + (\delta^\dagger_0 \delta_0 - \gamma^\dagger_0 \gamma_0)b^\dagger, b] + 2\hat{\beta}_1 \delta^\dagger_0 \delta_0 a^\dagger b - 2\delta^\dagger_0 \hat{\beta}_1 a b^\dagger + 2\hat{\beta}_1 \gamma^\dagger_0 a b^\dagger - 2\gamma_0 \hat{\beta}_1 a b$$

and we notice that, under the conditions $\gamma_0 = \delta_0 = 0$ or $\hat{\beta}_1 = 0$, the commutator (160) becomes a diagonal operator in the Fock vector basis $\{|n, \pm\}, n \in \mathbb{N}\}$.
We notice that we are in presence of a superHermitian Hamiltonian of the harmonic oscillator type with nilpotent interaction terms which contain odd contributions. We also notice that, this hamiltonian can be expressed in the form

\[ H_0 = \frac{N}{2} + M + Q_+ + Q_- , \]  

(164)

where

\[ N = 2 \hat{\beta}_1 (a^\dagger a + aa^\dagger) , \quad Q_+ = \hat{\beta}_1 (a^\dagger)^2 , \quad Q_- = \hat{\beta}_1 a^2 , \quad M = a^\dagger a - Q_+ Q_- . \]  

(165)

The non-zero super-commutation relations between these operators are given by

\[ [M, Q_{\pm}] = \pm 2 Q_{\pm} , \quad \{ Q_+, Q_- \} = N , \]  

(166)

i.e., they have almost the structure of \( u(1/1) \) superalgebra. Indeed, here \( N \) is an even nilpotent operator such that \( N^2 = 0 \).

According to (153) and (163), a class of superalgebra eigenstates of \( H_0 \) can be obtained by applying \( n \) times \( (n = 0, 1, 2, \ldots) \) the raising operator \( A_0^\dagger \) on the zero eigenvalue eigenstates of \( A_0 \). From (45), we deduce that these latter are given by

\[ |E_0; j\rangle = \left( 1 - \frac{1}{4} \hat{\beta}_1^2 \hat{\beta}_1 \right) \left[ |0; j\rangle - \frac{\hat{\beta}_1}{\sqrt{2}} |2; j\rangle \right] , \]  

(167)

where \( j \) corresponds to the set \( \{-, +\} \).

Then, as \( H_0 |E_0; j\rangle = 0 \), the generated energy eigenstates are given by

\[ |E_n; j\rangle \propto (A_0^\dagger)^n |E_0; j\rangle = \left( (a^\dagger)^n + \hat{\beta}_1 \sum_{k=0}^{n-1} (a^\dagger)^{n-1-k} a (a^\dagger)^k \right) |E_0; j\rangle \]  

(168)

and the corresponding energy eigenvalues are \( E_n^j = n \). An orthonormalized version of these states is given by

\[ |E_n; j\rangle = \left( 1 - \frac{1}{4} \hat{\beta}_1^2 \hat{\beta}_1 (2n + 1) \right) \left[ |n; j\rangle + \frac{\hat{\beta}_1}{2} \sqrt{n(n-1)} |n-2; j\rangle - \frac{\hat{\beta}_1}{2} \sqrt{(n+1)(n+2)} |n+2; j\rangle \right] , \]  

(169)

where \( n \in \mathbb{N} \). From (169), it is easy to calculate the action of \( A_0^\dagger \) and \( A_0 \) on the \( |E_n; j\rangle \) eigenstates, we get

\[ A_0^\dagger |E_n; j\rangle = \left( 1 - \frac{1}{2} \hat{\beta}_1^2 \hat{\beta}_1 (n + 1) \right) \sqrt{n+1} |E_{n+1}; j\rangle \]  

(170)
and
\[ A_0 |E_n; j\rangle = \left( 1 - \frac{1}{2} \beta_1^j \beta_1 n \right) \sqrt{n} |E_{n-1}; j\rangle. \] (171)

Thus, the orthonormalized energy eigenstates \( |E_n; j\rangle \) can be written in the standard form
\[ |E_n; j\rangle = \left( 1 + \frac{1}{4} \beta_1^j \beta_1 (n+1) \right) \frac{(A_0^j)^n}{\sqrt{n!}} |E_0; j\rangle. \] (172)

This is a complete set of states. Indeed, using (169), we can demonstrate the completeness property
\[ \sum_{j} \sum_{n=0}^{\infty} |E_n; j\rangle \langle E_n; j| = I \otimes I = \sum_{j} \sum_{n=0}^{\infty} |n; j\rangle \langle n; j|. \] (173)

On the other hand, we can express the \( |n; j\rangle \) states in the form
\[ |n; j\rangle = \left( 1 - \frac{1}{4} \beta_1^j \beta_1 (2n+1) \right) \left[ |E_n; j\rangle - j \sqrt{(n+1)(n+2)} |E_{n+2}; j\rangle \beta_1^j \beta_1 \right. \]
\[ + \left. j \sqrt{n(n-1)} |E_{n-2}; j\rangle \beta_1^j \right]. \] (174)

then, from (172) and after some manipulations, we get
\[ |0; j\rangle = \left( 1 - \frac{1}{4} \beta_1^j \beta_1 \right) \exp \left( \frac{(A_0^j)^2}{2} \beta_1 \right) |E_0; j\rangle. \] (175)

According to (45), the coherent states associated to a physical system characterized by the hamiltonian (163) can be written as:
\[ |\varphi; j\rangle = \exp \left[ -\beta_1 (a^\dagger)^2 / 2 - \hat{z}_1 \beta_1 (a^\dagger)^3 / 3 \right] \mathbb{D}(\hat{z}_0) \mathbb{D}(\hat{z}_1) \]
\[ \left( 1 - \frac{1}{4} \beta_1^j \beta_1 \right) \exp \left( \frac{(A_0^j)^2}{2} \beta_1 \right) |E_0; j\rangle \hat{C}(\hat{z}, \beta_1). \] (176)

5.2 Spin \( \frac{1}{2} \) generalized isospectral oscillator system

In the case where \( \beta_1 = 0 \) and \( \gamma_0^j \gamma_0 = \delta_0^j \delta_0 \), the operator \( A_0 \) takes the form
\[ A_0 = a + \gamma_0 b + \delta_0 b^\dagger \] (177)

and the commutator (160) writes
\[ [A_0, A_0^j] = 1. \] (178)
A class of Hamiltonian $\mathcal{H}_0$ satisfying (153) is given by

$$\mathcal{H}_0 = \mathcal{A}_0^\dagger \mathcal{A}_0 = a^\dagger a + \gamma_0^\dagger \gamma_0 + \gamma_0 a^\dagger b + \gamma_0^\dagger a b^\dagger + \delta_0^\dagger a b^\dagger + \delta_0^\dagger a b.$$  \hfill (179)

We notice that this is a superHermitian Hamiltonian, without defined parity, which is a linear Grassmann combination of generators of the $osp(2/2) \supset sh(2/2)$ Lie superalgebra. Then, in this aspect, the corresponding Hamiltonian $\mathcal{H}$ defined in (156), complement the classes of Hamiltonians considered by Buzano et al.[9].

By construction, the eigenstates of $\mathcal{A}_0$ corresponding to the eigenvalue $z = 0$ are eigenstates of $\mathcal{H}_0$ corresponding to the eigenvalue $E_0 = 0$. Let us to take these states to be the normalized version of states (140-141), when $z_0 = 0$, that is

$$|E_0, -\rangle = \left(\sqrt{1 + (\sqrt{\gamma_0})^{-1}((\sqrt{\gamma_0})^{-1})^\dagger \sqrt{\delta_0}(\sqrt{\delta_0})^\dagger}\right)^{-1} \mathbb{D}(\sqrt{\gamma_0 \delta_0}) \left[|0; -\rangle - (\sqrt{\gamma_0})^{-1} \sqrt{\delta_0} |0; +\rangle\right].$$  \hfill (180)

and

$$|E_0, +\rangle = \left(\sqrt{1 + (\sqrt{\delta_0})^{-1}((\sqrt{\delta_0})^{-1})^\dagger \sqrt{\gamma_0}(\sqrt{\gamma_0})^\dagger}\right)^{-1} \mathbb{D}(\sqrt{\gamma_0 \delta_0}) \left[|0; +\rangle - (\sqrt{\delta_0})^{-1} \sqrt{\gamma_0} |0; -\rangle\right].$$  \hfill (181)

Thus, from (153) and (178), we deduce that a class of orthonormalized eigenstates of $\mathcal{H}_0$ corresponding to the eigenvalue $E_n = n$ is given by ($n = 0, 1, 2, \ldots; j = -, +$)

$$|E_n, j\rangle = \frac{(\mathcal{A}_0^\dagger)^n}{\sqrt{n!}} |E_0, j\rangle.$$  \hfill (182)

Moreover, a class of normalized coherent states for this generalized harmonic system which are eigenstates of $\mathcal{A}_0$ corresponding to the eigenvalue $z = z_0$ is easily constructed as[2]

$$|z_0, j\rangle = \exp \left(z_0 \mathcal{A}_0^\dagger - z_0^\dagger \mathcal{A}_0\right) |E_0, j\rangle.$$  \hfill (183)

These coherent states are obtained from those of equations (140-141) by acting with the following superunitary transformation

$$\mathcal{U}(z_0; \gamma_0, \delta_0) = \exp \left[z_0 (\gamma_0^\dagger b^\dagger + \delta_0^\dagger b) - z_0^\dagger (\gamma_0 b + \delta_0 b^\dagger)\right].$$  \hfill (184)
6 Conclusions

In this paper we have generalized the AES[8] concept to the one of SAES. We have demonstrate that the SAES associated to the H–W Lie superalgebra contain the sets of standard coherent and supercoherent states associated to the usual and supersymmetric harmonic oscillator systems, respectively[2, 3, 14, 21]. Also, these SAES contain both the standard squeezed and super-squeezed states[18, 19] and the supersqueezed states associated to the spin–\(\frac{1}{2}\) representation of the AES of the \(h(2) \oplus su(2)\) algebra[2]. Let us mention that the introduction of Grassmann coefficients in the linear combination of the superalgebra generators helps us to understand the role played by the c-numbers (even Grassmann numbers) and d-numbers (odd Grassmann numbers) interaction coefficients, in the mentioned literature. Moreover, from the idea of giving to the SAES the interpretation of an operator associated to a physical system, we have constructed some classes of superHermitian and \(\eta\)–pseudo–superHermitian Hamiltonians[12, 17], isospectral to the standard harmonic oscillator hamiltonian. We have found their physical eigenstates and their associated supercoherent states. In this respect, we see that the SAES concept constitute an alternative and unified approach for the construction of generalized coherent and supercoherent and also squeezed and supersqueezed states for a given quantum system.

A Notations and conventions

In this appendix we want to fix the notations and conventions used in this work. They concern principally the concepts of Grassmann algebra, Lie superalgebra and their representations, superHermitian and superunitary operators, super Lie algebra and linear Lie supergroup.

Let us remind that a complex Grassmann algebra, \(\mathbb{C}B_L\), is a linear vector space over the field of complex numbers, associative and \(Z_2\) graded. It may thus be decomposed into \(\mathbb{C}B_{L_0} + \mathbb{C}B_{L_1}\), where the even space \(\mathbb{C}B_{L_0}\) is generated by the set of \(2^{L-1}\) linearly independent generators \(E_\mu\) of even level and the odd space \(\mathbb{C}B_{L_1}\) is generated by the set of \(2^{L-1}\) linearly independent generators \(E_\mu\) of odd level. Here, the index \(\mu\) represents either the empty set \(\phi\) or the
set \((j_1, j_2, \ldots, j_{N(\mu)})\) of \(N(\mu)\) integer numbers such that \(1 \leq j_1 < j_2 \cdots < j_{N(\mu)} \leq L\). \(N(\mu)\) is the level of the generator \(E_\mu\). The identity of the algebra is \(E_\emptyset = 1\) and \(E_\mu = E_{j_1} E_{j_2} \cdots E_{j_{N(\mu)}}\) is the ordered product of \(N(\mu)\) odd generators of level 1 taken among the set of basic generators \(\{E_j, j = 1, 2, \ldots, L\}\). The product of these generators is associative and antisymmetric. Moreover, any non zero product of the type \(E_{j_1} E_{j_2} \cdots E_{j_r}\) of \(r\) generators is linearly independent of the products containing less than \(r\) generators and we have \(E_\phi E_j = E_j E_\phi = E_j\), \(\forall j = 1, 2, \ldots, L\). The graduation is introduced by defining the degree of \(E_\mu\), that is

\[
\deg E_\mu = (-1)^{N(\mu)},
\]

with \(N(\phi) = 0\).

Any element \(B \in \mathbb{C}B_L\) can be written either in the form

\[
B = \sum_\mu B_\mu E_\mu, \quad B_\mu \in \mathbb{C}, \tag{186}
\]

or as the sum of its even part \(B_0\) and its odd part \(B_1\), i.e., \(B = B_0 + B_1\) with

\[
B_0 = \sum_{\text{even } N(\mu)} B_\mu E_\mu, \quad B_1 = \sum_{\text{odd } N(\mu)} B_\mu E_\mu. \tag{187}
\]

We also deduce the graded operations for the Grassmann algebra, i.e., for all \(B_0, Z_0 \in \mathbb{C}B_{L_0}, B_1, Z_1 \in \mathbb{C}B_{L_1}\), we have

\[
B_0Z_0 = Z_0B_0 \in \mathbb{C}B_{L_0}, \quad B_0Z_1 = Z_1B_0 \in \mathbb{C}B_{L_1}, \quad B_1Z_1 = -Z_1B_1 \in \mathbb{C}B_{L_0}. \tag{188}
\]

In particular, for all \(B = B_0 + B_1 \in \mathbb{C}B_L\) and \(Z_1 \in \mathbb{C}B_{L_1}\),

\[
BZ_1 = Z_1B^*, \quad Z_1B = B^*Z_1, \tag{189}
\]

where

\[
B^* = B_0 - B_1, \tag{190}
\]

is the conjugate of \(B\). The product of any two elements of the algebra, \(B\) and \(B'\), corresponds to

\[
BB' = \sum_\mu \sum_{\mu'} B_\mu B'_{\mu'} (E_\mu E_{\mu'}), \tag{191}
\]

with

\[
E_\mu E_{\mu'} = \pm E_\nu, \quad \text{where} \quad N(\nu) = N(\mu) + N(\mu'), \tag{192}
\]
when neither of the indices in the sets represented by \( \mu \) and \( \mu' \) are repeated, and \( \mathcal{E}_\mu \mathcal{E}_{\mu'} = 0 \), when at least one of the index in the set represented by \( \mu \) and \( \mu' \) is repeated. The sign \( \pm \) in (192) is determined by using the antisymmetric property of the basic generators \( \mathcal{E}_j \) when reordering the their product.

The identity component of the element \( B \), usually called the body, is denoted by \( \varepsilon(B) = B_\phi \in \mathbb{C} \), whereas the nilpotent quantity \( s(B) = B - B_\phi \mathcal{E}_\phi \), defines the soul of \( B \).

With respect to the complex conjugate of the element \( B \in \mathbb{C}B_L \), we follow the conventions of Cornwell[11] and thus write

\[
B = \sum_\mu \bar{B}_\mu \mathcal{E}_\mu, \tag{193}
\]

i.e., the basis elements \( \mathcal{E}_\mu \) are considered as the real Grassmann numbers. Also, the adjoint of \( B \) is defined by the relation

\[
B^\dagger = \sum_\mu \bar{B}_\mu \mathcal{E}_\mu^\dagger, \tag{194}
\]

where

\[
\mathcal{E}_\mu^\dagger = \begin{cases} \mathcal{E}_\mu, & \text{if } N(\mu) \text{ is even} \\ -i\mathcal{E}_\mu, & \text{if } N(\mu) \text{ is odd.} \end{cases} \tag{195}
\]

This adjoint operation have the same properties than the ones of the usual adjoint operation for complex matrices.

The inverse of a Grassmann number \( B \), denoted by \((B)^{-1}\) is defined as

\[
B(B)^{-1} = (B)^{-1}B = \varepsilon_\phi = 1. \tag{196}
\]

It is important to mention that \( B \) is invertible if and only if \( B_\phi \neq 0 \).

The integration with respect to an odd Grassmann variable, must be considered in the Berezin sense[5], i.e., if \( \eta \in \mathbb{C}B_{L_1} \), then

\[
\int d\eta = 0, \quad \int \eta d\eta = 1, \tag{197}
\]

where the integration is taken over all the domain of definition of \( \eta \).

Let us now recall some useful definitions and properties of Lie superalgebras, supergroups and associated representations.

**Definition A.1** A \((m/n)\) dimensional complex Lie superalgebra \( \mathcal{L}_s \), is a complex vector space, \( \mathbb{Z}_2 \) graded with respect to a generalized Lie product, formed from the direct sum of two subspaces, the even subspace of dimension \( m \geq 0 \), which we denotes by \( \mathcal{L}_0 \), and the odd subspace
of dimension $n \geq 0$ ($m + n \geq 1$), which we denotes by $\mathcal{L}_1$, such that, for all $a, b \in \mathcal{L}_s$, there exists a generalized Lie product (supercommutator) $[a, b]$ with the following properties:

1 ) $[a, b] \in \mathcal{L}_s$, for all $a, b \in \mathcal{L}_s$;

2 ) for all $a, b, c \in \mathcal{L}_s$ and any complex (real) numbers $\alpha$ and $\beta$,

$$[\alpha a + \beta b, c] = \alpha [a, c] + \beta [b, c];$$  \hfill (198)

3 ) if $a$ and $b$ are homogeneous elements of $\mathcal{L}_s$ then $[a, b]$ is also a homogeneous element of $\mathcal{L}_s$ whose degree is $(\deg a + \deg b) \mod 2$; that is, $[a, b]$ is odd if either $a$ or $b$ is odd, but $[a, b]$ is even if $a$ and $b$ are both even or if $a$ and $b$ are both odd;

4 ) for any homogeneous elements $a$ and $b$ of $\mathcal{L}_s$

$$[b, a] = -(-1)^{\deg a \deg b} [a, b];$$  \hfill (199)

5 ) for any three homogeneous elements $a, b$ and $c$ of $\mathcal{L}_s$, we have the generalized Jacobi identity:

$$[a, [b, c]](-1)^{\deg a \deg c} + [b, [c, a]](-1)^{\deg b \deg a} + [a, [b, c]](-1)^{\deg c \deg b} = 0.$$  \hfill (200)

We notice that the even subspace $\mathcal{L}_0$, is an ordinary complex Lie algebra whereas the odd subspace, $\mathcal{L}_1$, is a carrier space for a representation of a Lie algebra $\mathcal{L}_0$.

Just as an ordinary Lie algebra can, in general, be represented by a set of complex matrices a Lie superalgebra can also be represented, in general, by a set of complex matrices. Nevertheless, the graded character of a superalgebra implies certain special conditions for the structure of these matrices.

**Definition A.2** Suppose that for every $a \in \mathcal{L}_s$, there exists a matrix $\Gamma(a)$ from the set of complex matrices partitioned in the form $(d_0/d_1) \times (d_0/d_1)$, that we denotes by $M(d_0/d_1; \mathbb{C})$, such that

1 ) for all $a, b \in \mathcal{L}_s$ and $\alpha, \beta$ of the field of $\mathcal{L}_s$,

$$\Gamma(\alpha a + \beta b) = \alpha \Gamma(a) + \beta \Gamma(b);$$  \hfill (201)
2) for all \( a, b \in L_s \),
\[
\Gamma([a,b]) = [\Gamma(a), \Gamma(b)];
\]  
(202)

3) if \( a \in L_0 \), the even subspace of \( L_s \), then \( \Gamma(a) \) a la forme
\[
\Gamma(a) = \begin{pmatrix}
\Gamma_{00}(a) & 0 \\
0 & \Gamma_{11}(a)
\end{pmatrix},
\]  
(203)

where \( \Gamma_{00}(a) \) and \( \Gamma_{11}(a) \) are \( d_0 \times d_0 \) and \( d_1 \times d_1 \) dimensional submatrices respectively; and if \( a \in L_1 \), the odd subspace of \( L_s \), then \( \Gamma(a) \) has the form
\[
\Gamma(a) = \begin{pmatrix}
0 & \Gamma_{01}(a) \\
\Gamma_{10}(a) & 0
\end{pmatrix},
\]  
(204)

where \( \Gamma_{01}(a) \) and \( \Gamma_{10}(a) \) are \( d_0 \times d_1 \) and \( d_1 \times d_0 \) dimensional submatrices respectively.

Then these matrices \( \Gamma(a) \) are said to form a \((d_0/d_1)\)-dimensional graded representation of \( L_s \).

Let \( L_s \) be a \((m/n)\) dimensional complex Lie superalgebra with even basis elements \( a_1, a_2, \ldots, a_m \) and odd basis elements \( a_{m+1}, a_{m+2}, \ldots, a_{m+n} \), represented by the set of matrices \( \Gamma(a_k), k = 1, 2, \ldots, m+n \). To each matrix \( \Phi(a_k) \), we can associate a linear operator \( \Phi(a_k) \) acting on the carrier space \( W \) of the representation. This space is a \((d_0 + d_1)\) inner product vector space expanded by a basis formed by the set of even vectors \( \{|w_j\}_{j=0}^{d_0} \) and the set of odd vectors \( \{|w_j\}_{j=d_0+1}^{d_0+d_1} \) and this action is defined by the relation
\[
\Phi(a_k)|w_j\rangle = \sum_{i=1}^{d_0+d_1} \langle \Gamma(a_k)_{ij} |w_i\rangle.
\]  
(205)

Then \( L_s \) can also be represented by set of even operators \( \Phi(a_k) \) \((k = 1, 2, \ldots, m)\) and the set of odd operators \( \Phi(a_k) \) \((k = m+1, m+2, \ldots, m+n)\), verifying the same super-commutation relations as the basis elements \( a_k \) \((k = 1, 2, \ldots, m+n)\).

Let \( \mathcal{X} \) to be a polynomial function of the \( L_s \) superalgebra generators, with complex Grassmannian coefficients. We say that \( \mathcal{X} \) is a superHermitian (anti–superHermitian) operator if \( \mathcal{X} = \mathcal{X}^\dagger \) ( \( \mathcal{X} = -\mathcal{X}^\dagger \) ). In particular, if \( \mathcal{X} \) is a complex Grassmannian linear combination of the \( L_s \) superalgebra generators, i.e.,
\[
\mathcal{X} = \sum_{j=1}^{m} C^j \Phi(a_j) + \sum_{k=1}^{n} D^k \Phi(a_{m+k}),
\]  
(206)
where $C^j \in \mathbb{C}BL \ (j = 1, 2 \ldots, m)$ and $D^k \in \mathbb{C}BL \ (k = 1, 2, \ldots, n)$ then
\[
\mathcal{X}^\dagger = \sum_{j=1}^{m} (\Phi(a_j))^\dagger (C^j)^\dagger + \sum_{k=1}^{n} (\Phi(a_{m+k}))^\dagger (D^k)^\dagger,
\]  
(207)
where the $\dagger$ symbol is reserved for the usual adjoint operation. We say that a general $\mathcal{U}$ operator is superunitary if $\mathcal{U}\mathcal{U}^\dagger = \mathcal{U}^\dagger \mathcal{U} = I$, where $I$ is the identity operator. In particular, if $\mathcal{X}$ is an anti–superHermitian operator, then $\mathcal{U} = e^{\mathcal{X}}$ is a superunitary operator.

If for $j = 1, 2, \ldots, m$ and every element $E_\mu$ of $\mathbb{C}BL$, we define the even operators
\[
M^j_\mu = \mathcal{E}_\mu \Phi(a_j),
\]  
(208)
and for $k = 1, 2, \ldots, n$ and every odd element $E_\nu$ of $\mathbb{C}BL$, we define the even operators
\[
N^k_\nu = \mathcal{E}_\nu \Phi(a_{m+k}),
\]  
(209)
then the set of $(m+n)^{2^{L-1}}$ operators defined by the equation (208) and (209) form a basis of a $(m+n)^{2^{L-1}}$ dimensional real Lie algebra, whose Lie product is given by the usual commutator induced by the generalized Lie product of $\mathcal{L}_s$. This real Lie algebra is denoted by $\mathcal{L}_s(\mathbb{C}BL)$ and is called a super Lie algebra. A general element $M$ of this super Lie algebra writes
\[
M = \sum_{j=1}^{m} \sum_{\text{even } \mu} X^j_\mu M^j_\mu + \sum_{k=1}^{n} \sum_{\text{odd } \nu} \Theta^k_\nu N^k_\nu,
\]  
(210)
where $X^j_\mu$ and $\Theta^k_\nu$ are real parameters. Also we can write this element in the form
\[
M = \sum_{j=1}^{m} X^j M^j + \sum_{k=1}^{n} \Theta^k N^k,
\]  
(211)
where $X^j = \sum_{\text{even } \mu} X^j_\mu \mathcal{E}_\mu \in \mathbb{R}BL_0$, $\Theta^k = \sum_{\text{odd } \nu} \Theta^k_\nu \mathcal{E}_\nu \in \mathbb{R}BL_1$ and
\[
M^j = \mathcal{E}_\Phi \Phi(a_j), \quad N^k = \mathcal{E}_\Phi \Phi(a_{m+k}).
\]  
(212)

Let us end this Appendix by giving a method of construction of a linear Lie supergroup[22]. If $\mathcal{L}_s(\mathbb{C}BL)$ is a real super Lie algebra whose basis elements are defined by (208) and (209), then every linear Lie group whose associated real Lie super algebra is given by $\mathcal{L}_s(\mathbb{C}BL)$ is a $(m/n)$ linear Lie supergroup, which we denote by $\mathcal{G}_s(\mathbb{C}BL)$. The elements near the identity can be parametrized by
\[
\mathcal{G}(X; \Theta)(M) = \exp\{M\} = \exp \left\{ \sum_{j=1}^{m} X^j M^j + \sum_{k=1}^{n} \Theta^k N^k \right\}.
\]  
(213)
B  Solving \([a + \beta a^\dagger + \gamma b + \delta b^\dagger] |\psi\rangle = z |\psi\rangle\)

In this appendix we will solve the eigenvalue equation (95). We will do it in two steps. Firstly, we will solve the eigenvalue equation (118) and express its solutions in terms of a generalized supersqueeze operator acting on the supercoherent states \(e^z|0; \pm\rangle\). This supersqueeze operator is used to reduce the eigenvalue equation (95) to a simpler one, see section 4.3, that is to the eigenvalue equation (143). Finally, we will solve the eigenvalue equation (143).

B.1 The SAES of \(a + \gamma b + \delta b^\dagger\)

Let us solve the eigenvalue equation (118). The solution is assumed on the type (97) and by inserting it into (118), then using the usual properties of the operators and the states \(\{|n; \pm\}\), we get the system \((n = 0, 1, 2 \ldots)\)

\[
\begin{align*}
\sqrt{n} + iC_{n+1} + \gamma D^*_n &= zC_n, \\
\sqrt{n} + iD_{n+1} + \delta C^*_n &= zD_n.
\end{align*}
\]

Let us notice the symmetric form of this system. Proceeding by iteration we can express the \(C_n\) and \(D_n\) coefficients in terms of the arbitrary Grassmann constants \(C_0\) and \(D_0\), that is \((n = 1, 2, \ldots)\)

\[
\begin{align*}
C_n &= \frac{1}{\sqrt{n!}} \left\{ z^n C_0 - \sum_{k_1=0}^{(n-1)} z^{(n-1-k_1)} \gamma (z^*)^{k_1} D^*_0 + \sum_{k_1=0}^{(n-2)} \sum_{k_2=0}^{(n-2-k_1)} z^{(n-2-k_1-k_2)} \gamma (z^*)^{k_2} \delta^* z^{k_1} C_0 \\
&- \sum_{k_1=0}^{(n-3)} \sum_{k_2=0}^{(n-3-k_1)} \sum_{k_3=0}^{(n-3-k_1-k_2)} z^{(n-3-k_1-k_2-k_3)} \gamma (z^*)^{k_1} \delta^* z^{k_2} (z^*)^{k_1} D^*_0 + \ldots \\
&+ (-1)^n (\gamma \delta^*)^{\left[\frac{n}{2}\right]} \gamma^{(n-2\left[\frac{n}{2}\right])} F_{n-2\left[\frac{n}{2}\right]} \right\},
\end{align*}
\]

and

\[
\begin{align*}
D_n &= \frac{1}{\sqrt{n!}} \left\{ z^n D_0 - \sum_{k_1=0}^{(n-1)} z^{(n-1-k_1)} \delta (z^*)^{k_1} C^*_0 + \sum_{k_1=0}^{(n-2)} \sum_{k_2=0}^{(n-2-k_1)} z^{(n-2-k_1-k_2)} \delta (z^*)^{k_2} \gamma^* z^{k_1} D_0 \\
&- \sum_{k_1=0}^{(n-3)} \sum_{k_2=0}^{(n-3-k_1)} \sum_{k_3=0}^{(n-3-k_1-k_2)} z^{(n-3-k_1-k_2-k_3)} \delta (z^*)^{k_1} \gamma^* z^{k_2} \delta (z^*)^{k_1} C^*_0 + \ldots \\
&+ (-1)^n (\gamma \delta^*)^{\left[\frac{n}{2}\right]} \delta^{(n-2\left[\frac{n}{2}\right])} G_{n-2\left[\frac{n}{2}\right]} \right\},
\end{align*}
\]

where \(\left[\frac{n}{2}\right]\) represents the entire part of \(\frac{n}{2}\) and \(F_0 = C_0, F_1 = D_0^*, G_0 = D_0, G_1 = C_0^*\). Here we need to calculate the multiple summation. By expressing \(z\) as a sum of their even and odd
parts, \( z = z_0 + z_1 \), we get for example, \((\ell = 1, 2, \ldots, n)\)
\[
\sum_{k_1=0}^{(n-\ell)(n-\ell-1)} \sum_{k_2=0}^{(n-\ell-2)(n-\ell-1-1)} \cdots \sum_{k_{\ell}=0}^{(n-\ell-\ell-1)} \gamma(z^*)^{k_1} \delta^* z_{k_{\ell-1}} \gamma(z^*)^{k_{\ell-2}} \delta^* \cdots
\]
\[
= \frac{n!}{(n-\ell)!} \left\{ (\gamma \delta^* \gamma^* \delta^* \cdots) z_0 \right. \\
+ \frac{(n-\ell)}{\ell + 1} \sum_{j=0}^{\ell} (-1)^{j+\ell} (\gamma \delta^* \gamma^* \delta^* \cdots) z_1 \left( \cdots \gamma \delta^* \gamma \right) z_0^{(n-\ell-1)}
\]
\[
= \mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) z^n,
\] (218)

where \( \mathcal{O}_{z_0} \) is the differential operator
\[
\mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) = \frac{1}{\ell!} \left\{ (\gamma \delta^* \gamma \cdots) \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) \right. \\
+ \frac{1}{\ell + 1} \sum_{j=0}^{\ell} (-1)^{j+\ell} (\gamma \delta^* \gamma \cdots) z_1 \left( \cdots \gamma \delta^* \gamma \right) \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right\},
\] (219)

which is also defined for \( \ell = 0 \), in fact \( \mathcal{O}_{z_0}(0, \gamma, \delta^*, z_1) = 1 \). By inserting (218) into (216) and (217), we get the compact form of \( C_n \) and \( D_n \) coefficients, that is
\[
C_n = \sum_{\ell=0}^{n} (-1)^\ell \mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) \frac{z^n}{\sqrt{n!}} F_{\ell-2\left[\frac{n}{2}\right]} \] (220)

and
\[
D_n = \sum_{\ell=0}^{n} (-1)^\ell \mathcal{O}_{z_0}(\ell, \delta, \gamma^*, z_1) \frac{z^n}{\sqrt{n!}} G_{\ell-2\left[\frac{n}{2}\right]}.
\] (221)

By inserting (220) and (221) into (97) and then separating the terms to multiply arbitrary constants \( C_0 \) and \( D_0 \), we obtain two independent solutions for the eigenvalue equation (118):
\[
|\psi; -\rangle = \left[ \sum_{n=0}^{\infty} \sum_{\ell \text{ even}}^{2[n/2]} \mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) \frac{z^n}{\sqrt{n!}} |n; -\rangle - \sum_{n=1}^{\infty} \sum_{\ell \text{ odd}}^{2\left[(n+1)/2\right]-1} \mathcal{O}_{z_0}(\ell, \delta, \gamma^*, z_1) \frac{z^n}{\sqrt{n!}} |n; +\rangle \right] C_0
\] (222)

and
\[
|\psi; +\rangle = \left[ \sum_{n=0}^{\infty} \sum_{\ell \text{ even}}^{2[n/2]} \mathcal{O}_{z_0}(\ell, \delta, \gamma^*, z_1) \frac{z^n}{\sqrt{n!}} |n; +\rangle - \sum_{n=1}^{\infty} \sum_{\ell \text{ odd}}^{2\left[(n+1)/2\right]-1} \mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) \frac{z^n}{\sqrt{n!}} |n; -\rangle \right] D_0^*.
\] (223)

As \( \mathcal{O}_{z_0}(\ell, \gamma, \delta^*, z_1) z^n = 0 \), when \( \ell > n \), we can spread out the sum on \( \ell \) index up to infinity and then place it out of the sum corresponding to the \( n \) index. In this way, we can add up on the \( n \)
into (143), and proceeding as in the above sections, we get the algebraic system (222) and (223) on the form

\[
|\psi; -\rangle = \left[ \sum_{\ell \text{ even}}^\infty O_{20}(\ell, \gamma, \delta^*, z_1)e^{za_1}|0; -\rangle - \sum_{\ell \text{ odd}}^\infty O_{20}(\ell, \delta, \gamma^*, z_1)e^{za_1}|0; +\rangle \right] C_0
\]

and

\[
|\psi; +\rangle = \left[ \sum_{\ell \text{ even}}^\infty O_{20}(\ell, \delta, \gamma^*, z_1)e^{za_1}|0; +\rangle - \sum_{\ell \text{ odd}}^\infty O_{20}(\ell, \gamma, \delta^*, z_1)e^{za_1}|0; -\rangle \right] D_0^*,
\]

respectively. Finally, using the fact that \( \frac{\partial e^{za_1}}{\partial z_0} = (a^\dagger)^\ell e^{za_1} \), we get the generalized super-squeezed states (119) and (120).

**B.2 The SAES of \( a + \hat{\beta}_1 a^\dagger + \gamma_0 b + \delta_0 b^\dagger \)**

Let us solve the eigenvalue equation (143) by taking \( |\varphi\rangle \) again on the form (97). By inserting it into (143), and proceeding as in the above sections, we get the algebraic system \((n = 1, 2, \ldots)\)

\[
\sqrt{n+1}C_{n+1} + \gamma_0 D_n^* + \sqrt{n}\hat{\beta}_1 C_{n-1} = zC_n,
\]

\[
\sqrt{n+1}D_{n+1} + \delta_0 C_n^* + \sqrt{n}\hat{\beta}_1 D_{n-1} = zD_n,
\]

together with

\[
C_1 = zC_0 - \gamma_0 D_0^*, \quad (228)
\]
\[
D_1 = zD_0 - \delta_0 C_0^*. \quad (229)
\]

Again, we notice the symmetric form of this algebraic system. Proceeding by iteration, we can express the \( C_n \) and \( D_n \) coefficients in terms of the arbitrary Grassmann constants \( C_0 \) and \( D_0 \), we get \((n = 2, 3, \ldots)\)

\[
C_n = \tilde{C}_n - \frac{1}{\sqrt{n!}} \left[ \sum_{\ell \text{ even}}^{2[\ell/2]} \sum_{k_1=0}^{(n-\ell-r_1)} \sum_{k_2=0}^{(n-\ell-r_2)} \cdots \sum_{k_{\ell-1}=0}^{(n-\ell-r_{\ell-2})} \sum_{j=1}^{k_j} (z^{n-\ell-r_{j-1}})(z^*)^{k_j} \right] C_0
\]
\[
+ \frac{1}{\sqrt{n!}} \left[ \sum_{\ell \text{ odd}}^{2[\ell/2]+1} \sum_{k_1=0}^{(n-\ell-r_1)} \sum_{k_2=0}^{(n-\ell-r_2)} \cdots \sum_{k_{\ell-1}=0}^{(n-\ell-r_{\ell-2})} \sum_{j=1}^{k_j} (z^{n-\ell-r_{j-1}})(z^*)^{k_j} \right] D_0^*, \quad (230)
\]
\[ D_n = \tilde{D}_n - \frac{1}{\sqrt{n!}} \left[ \sum_{\text{even } \ell = 2}^{2\left[ \frac{n}{\ell} \right]} \sum_{k_1 = 0}^{(n-\ell)} \sum_{k_2 = 0}^{(n-\ell-r_1)} \cdots \sum_{k_{\ell-1} = 0}^{(n-\ell-r_{\ell-2})} \frac{\ell}{2} \right] D_0 + \frac{1}{\sqrt{n!}} \left[ \sum_{\text{odd } \ell = 3}^{2\left[ \frac{n+1}{\ell} \right]-1} \sum_{k_1 = 0}^{(n-\ell)} \sum_{k_2 = 0}^{(n-\ell-r_1)} \cdots \sum_{k_{\ell-1} = 0}^{(n-\ell-r_{\ell-2})} \frac{\ell}{2} \right] C_0^*, \]  

where

\[ r_\ell = \sum_{j=1}^{\ell} k_j \]  

and, in accordance with Eqs. (220) and (221),

\[ \tilde{C}_n = \sum_{\ell=0}^{n} (-1)^\ell O_{20}(\ell, \gamma_0, \delta_0, z_1) \frac{z^n}{\sqrt{n!}} F_{\ell-2}[\frac{\ell}{2}] \]  

and

\[ \tilde{D}_n = \sum_{\ell=0}^{n} (-1)^\ell O_{20}(\ell, \delta_0, \gamma_0, z_1) \frac{z^n}{\sqrt{n!}} G_{\ell-2}[\frac{\ell}{2}]. \]  

Using the fact that for \( \ell \) even, we have

\[ z^{(n-\ell-r_{\ell-1})}(z^*)^{k_{\ell-1}}z^{k_{\ell-2}} \cdots (z^*)^{k_1} = z_0^{(n-\ell)} + [(n-\ell) - 2(k_1 + k_3 + \cdots + k_{l-1})]z_0^{(n-\ell-1)}z_1, \]  

for \( \ell \) odd, we have

\[ z^{(n-\ell-r_{\ell-1})}(z^*)^{k_{\ell-1}}z^{k_{\ell-2}} \cdots z^{k_1} = z_0^{(n-\ell)} + [(n-\ell) - 2(k_2 + k_4 + \cdots + k_{l-1})]z_0^{(n-\ell-1)}z_1, \]  

and that

\[ \sum_{k_1 = 0}^{(n-\ell)} \sum_{k_2 = 0}^{(n-\ell-r_1)} \sum_{k_3 = 0}^{(n-\ell-r_2)} \cdots \sum_{k_{\ell-1} = 0}^{(n-\ell-r_{\ell-2})} \Lambda_\ell(k) \]  

is equal to

\[
\begin{cases}
\frac{(n-1)!}{(n-\ell)!((\ell-1)!)}, & \text{if } \Lambda_\ell(k) = 1 \text{ and } \ell \geq 2, \\
\frac{2(n-\ell)!((\ell-1)!)!}{(n-\ell)!((\ell-1)!)!}, & \text{if } \Lambda_\ell(k) = (k_1 + k_3 + \cdots + k_{\ell-1}) \\
\frac{\ell(n-1)!}{2(n-\ell)!((\ell+1)!)!} \left[(n-\ell) + \frac{\ell}{2}(n-\ell + 1)\right], & \text{if } \Lambda_\ell(k) = (k_1 + k_3 + \cdots + k_{\ell-1})^2 \\
\frac{(\ell-1)(n-1)!}{2(n-\ell)!\ell!}, & \text{if } \Lambda_\ell(k) = (k_2 + k_4 + \cdots + k_{\ell-1}) \\
\frac{(\ell-1)(n-\ell+1)(n-1)!}{4(n-\ell)!\ell!}, & \text{if } \Lambda_\ell(k) = (k_2 + k_4 + \cdots + k_{\ell-1})^2 \\
& \text{and } \ell = 3, 5, \ldots,
\end{cases}
\]
and after some manipulations, we can reduce (230) and (231) to

\[
C_n = \tilde{C}_n - \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{even } \ell=2}^{2\lfloor n/2 \rfloor} \frac{n!}{(n-\ell)!(\ell-1)!} \left( z_0^{(n-\ell)} + \frac{(n-\ell)}{(\ell+1)} z_0^{(n-\ell-1)} z_1 \right) (\sqrt{\gamma_0 \delta_0})^{\ell-2} \right] C_0 + \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{odd } \ell=3}^{2\lfloor n/2 \rfloor} \frac{(\ell-1)n!}{(n-\ell)!\ell!} \gamma_0 \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-3} D_0^* \right],
\]

(239)

and

\[
D_n = \tilde{D}_n - \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{even } \ell=2}^{2\lfloor n/2 \rfloor} \frac{n!}{(n-\ell)!(\ell-1)!} \left( z_0^{(n-\ell)} + \frac{(n-\ell)}{(\ell+1)} z_0^{(n-\ell-1)} z_1 \right) (\sqrt{\gamma_0 \delta_0})^{\ell-2} \right] D_0 + \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{odd } \ell=3}^{2\lfloor n/2 \rfloor} \frac{(\ell-1)n!}{(n-\ell)!\ell!} \gamma_0 \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-3} C_0^* \right],
\]

(240)

respectively. Then, using the fact that

\[
\frac{n!}{(n-\ell)!} z_0^{n-\ell} = \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) z_0^n, \quad \frac{n!}{(n-\ell-1)!} z_0^{n-\ell-1} z_1 = z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} z_0^n,
\]

(241)

we can write (239) and (240) in the form

\[
C_n = \tilde{C}_n - \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{even } \ell=2}^{2\lfloor n/2 \rfloor} \frac{1}{(\ell-1)!} \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) + \frac{z_1}{(\ell+1)} \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right] z_0^n \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-2} C_0 + \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{odd } \ell=3}^{2\lfloor n/2 \rfloor} \frac{(\ell-1)}{\ell!} \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-3} \gamma_0 \right] D_0^* \]

(242)

\[
D_n = \tilde{D}_n - \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{even } \ell=2}^{2\lfloor n/2 \rfloor} \frac{1}{(\ell-1)!} \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) + \frac{z_1}{(\ell+1)} \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right] z_0^n \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-2} D_0 + \frac{\hat{\beta}_1}{2\sqrt{n!}} \left[ \sum_{\text{odd } \ell=3}^{2\lfloor n/2 \rfloor} \frac{(\ell-1)}{\ell!} \left( \frac{\partial^\ell}{\partial z_0^\ell} - z_1 \frac{\partial^{\ell+1}}{\partial z_0^{\ell+1}} \right) \left( \sqrt{\gamma_0 \delta_0} \right)^{\ell-3} \delta_0 \right] C_0^* \]

(243)

respectively. We notice that, when the inverse of the product \( \gamma_0 \delta_0 \) exist, or even if it does not exist, we can write formally these last equations in the compact form

\[
C_n = \tilde{C}_n - \frac{\hat{\beta}_1}{2} \left( \gamma_0 \delta_0 \right)^{-1} \left[ \sum_{\text{even } \ell=2}^{2\lfloor n/2 \rfloor} \ell O_{z_0}(\ell, \gamma_0, \delta_0, z_1) \frac{z_0^n}{\sqrt{n!}} \right] C_0 + \frac{\hat{\beta}_1}{2} \left( \gamma_0 \delta_0 \right)^{-1} \left[ \sum_{\text{odd } \ell=3}^{2\lfloor n/2 \rfloor} (\ell-1) O_{z_0}(\ell, \gamma_0, \delta_0, z_1) \frac{z_0^n}{\sqrt{n!}} \right] D_0^* \]

(244)
and
\[
D_n = \tilde{D}_n - \frac{\hat{\beta}_1(\gamma_0\delta_0)}{2} \left[ \sum_{\text{even } \ell=2}^{2[\frac{n+1}{2}]-1} \ell \mathcal{O}_{\ell_0}(\ell, \delta_0, \gamma_0, z_1) \frac{z^n}{\sqrt{n!}} \right] D_0 \\
+ \frac{\hat{\beta}_1(\gamma_0\delta_0)}{2} \left[ \sum_{\text{odd } \ell=3}^{2[\frac{n+1}{2}]-1} (\ell - 1) \mathcal{O}_{\ell_0}(\ell, \delta_0, \gamma_0, z_1) \frac{z^n}{\sqrt{n!}} \right] C_0^*.
\]

(245)

Now, by inserting (244) and (245) into (97) and proceeding exactly as in section B.1, we get the two independent solutions (145) and (146).
