TERWILLIGER ALGEBRAS OF WREATH PRODUCTS BY QUASI-THIN SCHEMES

KIJUNG KIM

Abstract. The structure of Terwilliger algebras of wreath products by thin schemes or one-class schemes was studied in [A. Hanaki, K. Kim, Y. Maekawa, Terwilliger algebras of direct and wreath products of association schemes, J. Algebra 343 (2011) 195–200]. In this paper, we will consider the structure of Terwilliger algebras of wreath products by quasi-thin schemes. This gives a generalization of their result.

Key words: Terwilliger algebra; Wreath product, Quasi-thin scheme.

1. Introduction

The Terwilliger algebra is a new algebraic tool for the study of association schemes introduced by P. Terwilliger in [10, 11, 12]. In general, this algebra is a non-commutative, finite dimensional, and semisimple \( \mathbb{C} \)-algebra. In the theory of association schemes, the wreath product is a method to construct new association schemes. Recently G. Bhattacharyya, S.Y. Song and R. Tanaka began to study Terwilliger algebras of wreath products of one-class association schemes in [4]. In particular, S.Y. Song and B. Xu gave a complete structural description of Terwilliger algebras for wreath products of one-class association schemes in [9]. Terwilliger algebras of wreath products by thin schemes or one-class schemes were studied in [4]. In this paper, we give a generalization of their result by replacing thin schemes with quasi-thin schemes.

The remainder of this paper is organized as follows. In Section 2, we review notations and basic results on coherent configurations and Terwilliger algebras as well as important results on quasi-thin schemes. In Section 3, based on the fact that one point extensions of quasi-thin schemes coincide with their Terwilliger algebras, we determine all central primitive idempotents of Terwilliger algebras of wreath products by quasi-thin schemes. In Section 4, we state our main theorem.

2. Preliminaries

In this section, to unify notations and terminologies given in [2, 4, 7, 8], we combine them. We assume that the reader is familiar with the basic notions of association schemes in [13].

2.1. Coherent configurations and coherent algebras. Let \( X \) be a finite set and \( S \) a partition of \( X \times X \). Put by \( S^\uparrow \) the set of all unions of the elements of \( S \). A pair \( \mathcal{C} = (X, S) \) is called a coherent configuration on \( X \). If the following conditions hold:

1. \( 1_X := \{(x, x) \mid x \in X\} \in S^\uparrow \).
2. For \( s \in S \), \( s^* := \{(y, x) \mid (x, y) \in s\} \in S \).

This work was supported by the National Research Foundation of Korea Grant funded by the Korean Government (Ministry of Education, Science and Technology) [NRF-2010-355-C00002].
For all \( s, t, u \in S \) and all \( x, y \in X \),
\[
p^*_u := |\{z \in X \mid (x, z) \in s, \ (z, y) \in t\}|
\]
is constant whenever \((x, y) \in u\).

The elements of \( X, S \) and \( S^{(2)} \) are called the points, the basis relations and the relations, respectively. The numbers \(|X|\) and \(|S|\) are called the degree and rank. Any set \( \Delta \subseteq X \) for which \( 1_\Delta \in S \) is called the fiber. The set of all fibers is denoted by \( \text{Fib}(C) \). The coherent configuration \( C \) is called homogeneous or a scheme if \( 1_X \in S \). If \( Y \) is a union of fibers, then the restriction of \( C \) to \( Y \) is defined to be a coherent configuration
\[
C_Y = (Y, S_Y),
\]
where \( S_Y \) is the set of all non-empty relations \( s \cap (Y \times Y) \) with \( s \in S \). For \( s \in S \), let \( \sigma_s \) denote the matrix in \( \text{Mat}_X(C) \) that has entries
\[
(\sigma_s)_{xy} = \begin{cases} 1 & \text{if } (x, y) \in s; \\ 0 & \text{otherwise}. \end{cases}
\]

We call \( \sigma_s \) the adjacency matrix of \( s \in S \). Then \( \bigoplus_{s \in S} C \sigma_s \) becomes a subalgebra of \( \text{Mat}_X(C) \). We call \( \bigoplus_{s \in S} C \sigma_s \) the adjacency algebra of \( S \), and denote it by \( A(S) \). A linear subspace \( A \) of \( \text{Mat}_X(C) \) is called a coherent algebra if the following conditions hold:

1. \( A \) contains the identity matrix \( I_X \) and the all-one matrix \( J_X \).
2. \( A \) is closed with respect to the ordinary and Hadamard multiplications.
3. \( A \) is closed with respect to transposition.

Let \( B \) be the set of primitive idempotents of \( A \) with respect to the Hadamard multiplication. Then \( B \) is a linear basis of \( A \) consisting of \( \{0, 1\} \)-matrices such that
\[
\sum_{s \in B} \sigma_s = J_X \quad \text{and} \quad \sigma_s \in B \iff \sigma'_s \in B.
\]

**Remark 2.1.** There are bijections between the sets of coherent configurations and coherent algebras as follows:
\[
S \mapsto A(S) \quad \text{and} \quad A \mapsto C(A),
\]
where \( C(A) = (X, S') \) with \( S' = \{s \in X \times X \mid \sigma_s \in B\} \).

Let \( C = (X, S) \) be a coherent configuration. For each \( x \in X \), we define \( xs := \{y \in X \mid (x, y) \in s\} \). A point \( x \in X \) is called regular if
\[
|xs| \leq 1, \ s \in S.
\]
In particular, if the set of all regular points is non-empty, then \( C \) is called 1-regular.

Let \( C = (X, S) \) be a scheme and \( T \) a closed subset containing the thin residue of \( S \). Put by \( S_{(T)} \) the set of all basic relations \( s_{\Delta, \Gamma} := s \cap (\Delta \times \Gamma) \), where \( s \in S \) and \( \Delta, \Gamma \subseteq X/T := \{xT \mid x \in X\} \). Then by [3] or [7], the pair \( C_{(T)} = (X, S_{(T)}) \) is a coherent configuration called the thin residue extension of \( C \).

### 2.2. Terwilliger algebras and one point extensions

Let \( (X, S) \) be a scheme. For \( U \subseteq X \), we denote by \( \varepsilon_U \) the diagonal matrix in \( \text{Mat}_X(C) \) with entries \((\varepsilon_U)_{xx} = 1 \) if \( x \in U \) and \((\varepsilon_U)_{xx} = 0 \) otherwise. Note that \( J_{U, V} := \varepsilon_U J_X \varepsilon_V \) and \( J_U := J_{U, U} \) for \( U, V \subseteq X \).

The **Terwilliger algebra** of \( (X, S) \) with respect to \( x_0 \in X \) is defined as a subalgebra of \( \text{Mat}_X(C) \) generated by \( \{\sigma_s \mid s \in S\} \cup \{\varepsilon_{x_0 s} \mid s \in S\} \) (see [10]). The Terwilliger algebra will be denoted by \( T(X, S, x_0) \) or \( T(S) \). Since \( A(S) \) and \( T(S) \) are closed under transposed conjugate, they are semisimple \( C \)-algebras. The set of irreducible characters of \( T(S) \) and \( A(S) \) will be denoted by \( \text{Irr}(T(S)) \) and \( \text{Irr}(A(S)) \), respectively. The trivial character \( 1_{A(S)} \) of \( A(S) \) is a map \( \sigma_s \mapsto n_s \), where \( n_s := p^*_s \).
is called the *valency of* $s$, and the corresponding central primitive idempotent is $|X|^{-1}J_X$. The *trivial character* $1_{T(S)}$ of $T(S)$ corresponds to the central primitive idempotent $\sum_{s \in S} n_s^{-1} \varepsilon_{x_0} J_X \varepsilon_{x_0}$ of $T(S)$. For $\chi \in \text{Irr}(A(S))$ or $\text{Irr}(T(S))$, $\varepsilon_\chi$ will be the corresponding central primitive idempotent of $A(S)$ or $T(S)$. For convenience, we denote $\text{Irr}(A(S)) \setminus \{1_{A(S)}\}$ and $\text{Irr}(T(S)) \setminus \{1_{T(S)}\}$ by $\text{Irr}(A(S))^*$ and $\text{Irr}(T(S))^*$, respectively.

Let $C = (X, S)$ be a coherent configuration and $x \in X$. Denote by $S_x$ the set of basic relations of the smallest coherent configuration on $X$ such that $1_x \in S_x$ and $S \subseteq S^J_x$.

Then the coherent configuration $C_x = (X, S_x)$ is called a *one point extension* of $C$. It is easy to see that given $s, t, u \in S$ the set $xs$ and the relation $u_{xs, st}$ are unions of some fibers and some basic relations of $C_x$, respectively.

**Remark 2.2.** A one point extension $C_x$ of a scheme $C$ is related to $T(X, S, x)$. In fact, $C_x \supseteq T(X, S, x)$.

**2.3. Direct sums, direct products and wreath products.** Let $C = (X, S)$ and $C' = (X', S')$ be coherent configurations. Put by $X \cup X'$ the disjoint union of $X$ and $X'$, and by $S \sqcup S'$ the union of the set $S \cup S'$ and the set of all relations $\Delta \times \Delta'$, $\Delta \times \Delta'$, where $\Delta, \Delta'$ are fibers of $C$ and $C'$, respectively. Then the pair $C \sqcup C' = (X \cup X', S \sqcup S')$ is a coherent configuration called the *direct sum* of $C$ and $C'$. Set $S \times S' = \{ss' | s \in S, s' \in S'\}$, where $ss'$ is the relation on $X \times X'$ consisting of all pairs $((a, a'), (b, b'))$ with $(a, b) \in s$ and $(a', b') \in s'$. Then the pair $C \times C' = (X \times X', S \times S')$ is a coherent configuration called the *direct product* of $C$ and $C'$. The adjacency matrix of $s \times s' \in S \times S'$ is given by the Kronecker product $\sigma_s \otimes \sigma_{s'}$.

Let $(X, S)$ and $(Y, T)$ be schemes. For $s \in S$, set $\overline{s} = \{(x, y), (x', y') \mid (x, x') \in s, y \in Y\}$. For $t \in T$, set $\overline{t} = \{(x, y), (x', y') \mid x, x' \in X, (y, y') \in t\}$.

Also set $S \sqcup T = \{\overline{s} \mid s \in S\} \cup \{\overline{t} \mid t \in T\} \setminus \{1_Y\}$. Then $(X \times Y, S \sqcup T)$ is a scheme called the *wreath product* of $(X, S)$ by $(Y, T)$. For the adjacency matrices, we have $\sigma_s = \sigma_0 \otimes I_Y, \sigma_t = J_X \otimes \sigma_t$. Note that $(x_0, y_0)s = (x_0s, y_0) = \{(x, y_0) \mid x \in x_0s\}$, $(x_0, y_0)t = (X, y_0t) = \{(x, y) \mid x \in X, y \in y_0t\}$ and $\varepsilon_{(x_0, y_0)s} = \varepsilon_{x_0s} \otimes \varepsilon_{y_0t}$, $\varepsilon_{(x_0, y_0)t} = \sum_{s \in S} \varepsilon_{xs} \otimes \varepsilon_{y_0t} = J_X \otimes \varepsilon_{y_0t}$.

**2.4. Quasi-thin schemes.** A scheme $C = (Y, T)$ is called *quasi-thin* if $T = T_1 \cup T_2$, where $T_i$ is the set of basic relations with valency $i$ ($i \in \{1, 2\}$).

**Lemma 2.1.** ([S], Lemma 4.1) For $t \in T_2$, there exists a unique $t^\perp$ such that $tt^\perp = \{1_Y, t^\perp\}$.

In $[S]$, any element from the set $T^\perp = \{t^\perp \mid t \in T_2\}$ is called an *orthogonal* of $C$.

If $|T^\perp| = 1$ and $T^\perp \subseteq T_1$, then $H := \{1_Y\} \cup T^\perp$ is the thin residue. Considering $C(H) = (Y, T(H))$, it follows that given $\Delta, \Gamma \in \text{Fib}(C(H))$ either the set $\Delta \times \Gamma \in T(H)$ or the set $\Delta \times \Gamma \notin T(H)$. Denote the latter case by $\Delta \sim \Gamma$. Then $\sim$ is an equivalence relation on the set $\text{Fib}(C(H))$.

Next, we state two results on quasi-thin schemes.

**Theorem 2.2.** ([S], Theorem 6.1) Let $C = (Y, T)$ be a quasi-thin scheme and $y_0 \in Y$. Then $A(T(y_0)) = T(Y, T, y_0)$.

**Theorem 2.3.** ([S], Theorem 5.2 and Corollary 6.4) Let $C = (Y, T)$ be a quasi-thin scheme with $T^\perp \neq \emptyset$. 3
(1) If \( |T^+| = 1 \) and \( T^+ \subseteq T_2 \), then
\[
T = T_1 \{1_Y, u\},
\]
where \( y_0 \in Y \) and \( T^+ = \{u\} \).
(2) If \( |T^+| = 1 \) and \( T^+ \subseteq T_1 \), then
\[
C_{(H)} = \bigoplus_{i \in I} C_i,
\]
where \( I \) is the set of classes given in the above \( \sim \), \( Y_i \) is the union of fibers belonging a class \( i \in I \), and \( C_i = (C_{(H)})_{Y_i} \).
(3) If \( |T^+| \geq 2 \), then \( C_{y_0} = (Y, T_{y_0}) \) is \( 1 \)-regular. In particular, any point of \( y_0 \in T_2 \) is regular.

**Example 2.3.** Some examples for each case of Theorem 2.3 can be found in [5].

(2) as12 No.48
(3) as28 No.175, No 176

3. Wreath products by quasi-thin schemes

Let \( (X, S) \) and \( (Y, T) \) be schemes. Fix \( x_0 \in X \) and \( y_0 \in Y \) and consider \((X \times Y, S \div T)\) and \( T(X \times Y, S \div T, (x_0, y_0))\). In the rest of this section, we assume that \((Y, T)\) is a quasi-thin scheme with \( T^+ \neq \emptyset \).

3.1. **The restriction of \( T(S \div T) \) to \( X \times (Y \setminus \{y_0\}) \).** \( T(S \div T) \) is generated by \( \{J_X \otimes \sigma_I, I_X \otimes I_{y_0t} \mid t \in T \setminus \{1\}\} \cup \{\sigma_s \otimes I_Y, \varepsilon_{y_0t} \mid s \in S\} \).

Since \( \sum_{s \in S} \varepsilon_{xos} \otimes \varepsilon_{y_0t} = I_X \otimes I_{y_0t} \) and \( \sum_{s \in S} \sigma_s \otimes I_Y = J_X \otimes J_Y \), we consider a subalgebra \( U \) generated by \( \{J_X \otimes \sigma_I, I_X \otimes I_{y_0t} \mid t \in T \} \). It is easy to see that \( U \) is generated by \( \{\varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid s \in S\} \) and isomorphic to \( T(T) \). So by Theorem 2.2 a basis \( B(U) \) of \( U \) can be determined by \( C(T(T)) \), i.e., \( B(U) = \{\varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid c \in R\} \), where \( R \) is the set of basic relations of \( C(T(T)) \).

We consider \( \varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid T(S \div T) \otimes X \otimes Y \setminus \{y_0\} \). Since \( T(S \div T) \) is generated by \( \{J_X \otimes \sigma_I, I_X \otimes I_{y_0t} \mid s \in S\} \), \( \varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid T(S \div T) \otimes Y \setminus \{y_0\} \) is generated by \( \{\varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid s \in S\} \). Thus, we can determine a basis of \( \varepsilon_{xos} \otimes \varepsilon_{y_0t} \mid T(S \div T) \otimes X \otimes Y \setminus \{y_0\} \) with respect to the set of basic relations of \( C(T(T)) \).

3.2. **A basis of \( A(T_{y_0}) = T(Y, T, y_0) \).** By Theorem 2.2, \( A(C_{y_0}) = T(Y, T, y_0) \). In order to find a basis of \( T(Y, T, y_0) \), it is enough to know all basic relations of \( C_{y_0} \).

In particular, we focus on \( \Delta \times \Gamma \in T_{y_0} \) or \( \nexists T_{y_0} \) for \( \Delta, \Gamma \in \text{Fib}(C_{y_0}) \) of size 2.

**Lemma 3.1.** If \( C = (Y, T) \) belongs to case (1) or (3) in Theorem 2.3 then \( \Delta \times \Gamma \notin T_{y_0} \) for \( \Delta, \Gamma \in \text{Fib}(C_{y_0}) \) of size 2.

**Proof.** In the case of Theorem 2.3(1), each \( t \in T_2 \) is represented by \( t \) in \( T_1 \). For \( t', t'' \in T_2, \sigma_{t't''} = \sigma_{t''} \), \( \Delta \times \Gamma \notin T_{y_0} \) implies that \( \Delta \times \Gamma \notin T_{y_0} \) for \( \Delta, \Gamma \in \text{Fib}(C_{y_0}) \) of size 2.

In the case of Theorem 2.3(3), clearly \( \Delta \times \Gamma \notin T_{y_0} \) for \( \Delta, \Gamma \in \text{Fib}(C_{y_0}) \) of size 2.

**Lemma 3.2.** Suppose that \( C = (Y, T) \) belongs to case (2) in Theorem 2.3. For distinct \( i_1, i_2 \in I \), if fibers \( \Delta \subseteq Y_{i_1} \) and \( \Gamma \subseteq Y_{i_2} \), then \( \Delta \times \Gamma \in T_{y_0} \).

**Proof.** First, we show that \( (C_{(H)})_{Y'} = (C_{y_0})_{Y'} \), where \( Y' = \cup_{t \in T_2 \setminus T_{y_0}} Y_t \). Since \( A(C_{y_0}) = T(T) = \{\varepsilon_{y_0t} \mid t \in T \} \), \( \varepsilon_{Y'} A(C_{y_0}) \varepsilon_{Y'} = \{\varepsilon_{y_0t} \mid t \in T \} \). By thin residue extension, \( A(C_{(H)}) = \{\varepsilon_{\Delta} \sigma_{\varepsilon_{\Delta t}} \mid \Delta \in Y/H, t \in T_1 \} \).
Lemma 3.1, we have \( u \subseteq \text{fibers} \Delta \). By mimicking the proof of Lemma 3.4, we get the following lemma.

For \( \chi \in \text{Irr}(\mathcal{T}(U(1^1))) \), define

\[
\tilde{e}_\chi = e_\chi \otimes \varepsilon_{\{y_0\}} \in \mathcal{T}(S \otimes T).
\]

For \( t \in T_1 \setminus \{1_Y\} \) and \( \varphi \in \text{Irr}(\mathcal{A}(U(t))) \), define

\[
\tilde{e}_\varphi = e_\varphi \otimes \varepsilon_{0} \in \mathcal{T}(S \otimes T).
\]

Then they are idempotents of \( \mathcal{T}(S \otimes T) \).

Lemma 3.3. \([1], \text{Lemma 4.2 and 4.4}\) For \( \chi \in \text{Irr}(\mathcal{T}(U(1^1))) \), \( \tilde{e}_\chi \) is a central primitive idempotent of \( \mathcal{T}(S \otimes T) \).

Lemma 3.4. \([1], \text{Lemma 4.3 and 4.4}\) For \( t \in T_1 \setminus \{1_Y\} \) and \( \varphi \in \text{Irr}(\mathcal{A}(U(t))) \), \( \tilde{e}_\varphi \) is a central primitive idempotent of \( \mathcal{T}(S \otimes T) \).

By mimicking the proof of Lemma 3.4 we get the following lemma.

Lemma 3.5. For \( t \in T_2 \) and \( \psi \in \text{Irr}(\mathcal{A}(S)) \), \( \tilde{e}_\psi \) is a central primitive idempotent of \( \mathcal{T}(S \otimes T) \).

Proof. First, we show that \( \tilde{e}_\psi \) commutes with \( \sigma_s \otimes I_Y, J_X \otimes I_u \) \((u \in T \setminus \{1_Y\})\), \( \varepsilon_{x_0} \otimes \varepsilon_{\{y_0\}} \), and \( J_X \otimes \varepsilon_{y_0} \). Since \( \varepsilon_{x_0} \otimes \varepsilon_{\{y_0\}} = (\varepsilon_{x_0} \otimes \varepsilon_{y_0}) \varepsilon_{\{y_0\}} = 0 \), we have \( \tilde{e}_\psi = (J_X \otimes I_u) \varepsilon_{y_0} = 0 \).

Since \( \varepsilon_{1_A(\psi)} = |A|^{-1}J_X \) and \( e_{1_A(\psi)} \) is the central primitive idempotent of \( \mathcal{A}(S) \), \( \tilde{e}_\psi \) is a central primitive idempotent of \( \mathcal{T}(S \otimes T) \).

From now on, we define the other central primitive idempotents of \( \mathcal{T}(S \otimes T) \). Suppose that \( (Y, T) \) belongs to case (1) or (3) in Theorem 3.3. We define the following matrices \( G_{y_0, y_0} \) for \( t, t' \in T_2 \). Let

\[
G_{y_0, y_0} = \frac{1}{|Y|} J_X \otimes (J_{\{y_1(1)\}, \{y_2(1)\}} + J_{\{y_1(2)\}, \{y_2(2)\}}) - J_{\{y_1(1)\}, \{y_2(1)\}} - J_{\{y_1(2)\}, \{y_2(2)\}} - J_{\{y_1(1)\}, \{y_2(1)\}}) \), where \( y_0t = \{y_1(1), y_2(2)\} \) and \( y_0t' = \{y_1(2), y_2(1)\} \). It is easy to see that \( G_{y_0, y_0} \) is a linearly independent subset of \( \mathcal{T}(S \otimes T) \).

Lemma 3.6. \( \{G_{y_0, y_0} \mid t, t' \in T_2\} \) is an ideal. Moreover, \( \{G_{y_0, y_0} \mid t, t' \in T_2\} \cong \text{Mat}_{T_2}(\mathbb{C}) \).

Proof. First, we prove that \( \sigma_u G_{y_0, y_0} \), \( G_{y_0, y_0} \), \( \sigma_u \in \{G_{y_0, y_0} \mid t, t' \in T_2\} \) for \( u \in S \). Since \( (\sigma_u)_{y_0, y_0} \) is defined by \( \sigma_u G_{y_0, y_0} \), \( G_{y_0, y_0} \), \( \sigma_u \in \{G_{y_0, y_0} \mid t, t' \in T_2\} \) for \( u \in S \). Since \( (\sigma_u)_{y_0, y_0} \) is an isomorphism, \( G_{y_0, y_0} \) is also an isomorphism. Similarly, \( (\sigma_u)_{y_0, y_0} \) is an isomorphism for \( u \in T \). Thus, \( \{G_{y_0, y_0} \mid t, t' \in T_2\} \) is proved. For \( u \in S \times T \) and \( t, t' \in T_2 \), clearly \( \varepsilon_{(x_0, y_0)u} G_{y_0, y_0} = \frac{1}{|Y|} \) is an isomorphism.
where \( \phi \) is that \( t \) following matrices \( G \) is an isomorphism. It is enough to show that \( G_{yt, yt'}^\circ G_{yt', yu}^\circ = \delta_{tu}^{}G_{yt, yu}^\circ \). By calculation, we have \( G_{yt, yt'}^\circ G_{yt', yu}^\circ = \frac{1}{2|X|} J_X \otimes (J_{y_{(1)}} \cdot y_{(2)}) + J_{y_{(2)}} \cdot (y_{(2)}' - J_{y_{(1)}} \cdot (y_{(2)}' - J_{y_{(1)}} \cdot (y_{(2)}')) + J_{y_{(1)}} \cdot (y_{(2)}' - J_{y_{(1)}} \cdot (y_{(2)}') - J_{y_{(1)}} \cdot (y_{(2)}')) = G_{yt, yu}^\circ \).

Finally, we prove that \( \{G_{yt, yt'}^\circ \mid t, t' \in T_2\} \cong \text{Mat}_{T_2}(\mathbb{C}) \). For \( t, t' \in T_2 \), let \( e_{tt'} \) be the \([T_2] \times [T_2]\) matrix whose \((t, t')\)-entry is 1 and whose other entries are all zero. Then the linear map \( \phi : \{G_{yt, yt'}^\circ \mid t, t' \in T_2\} \to \text{Mat}_{T_2}(\mathbb{C}) \) defined by \( \phi(G_{yt, yt'}) = e_{tt'} \) is an isomorphism.

Define

\[
\tilde{e}_{\eta} = \sum_{t \in T_2} \frac{1}{2|X|} J_X \otimes (\tilde{\varepsilon}_{yt} - \tilde{\varepsilon}_{yt'}),
\]

where \( \bar{\varepsilon}_{yt} := J_{y_{(1)}} \cdot (y_{(2)}') + J_{y_{(1)}} \cdot (y_{(2)}') \). Then by Lemma 3.6, \( e_{\eta} \) is a central primitive idempotent of \( T(S; T) \).

Suppose that \((Y, T)\) belongs to case (2) in Theorem 2.3. Put \( y_0 \in Y_0 \). For each \( i \in I \setminus \{i_0\} \), we consider the set \( U_i := \{ t \in T_2 \mid y_0 t \subseteq Y_i \} \). Define the following matrices \( G_{yt, yt'}^\circ \) for \( t, t' \in U_i \). Let \( G_{yt, yt'}^\circ = \frac{1}{2|X|} J_X \otimes (J_{y_{(1)}} \cdot (y_{(2)}') + J_{y_{(2)}} \cdot (y_{(1)}') - J_{y_{(2)}} \cdot (y_{(1)}') - J_{y_{(1)}} \cdot (y_{(2)}')). \) According to process in the proof of Lemma 3.6, we can prove that \( \{G_{yt, yt'}^\circ \mid t, t' \in U_i\} \) is an ideal. For each \( i \in I \setminus \{i_0\} \), define

\[
\tilde{e}_{\bar{\varepsilon}} = \sum_{t \in U_i} \frac{1}{2|X|} J_X \otimes (\tilde{\varepsilon}_{yt} - \tilde{\varepsilon}_{yt'}),
\]

where \( \bar{\varepsilon}_{yt} := J_{y_{(1)}} \cdot (y_{(2)}') + J_{y_{(1)}} \cdot (y_{(2)}') \). Then \( \tilde{e}_{\bar{\varepsilon}} \) is a central primitive idempotent of \( T(S; T) \). We denote \( \sum_{i \in I \setminus \{i_0\}} \tilde{e}_{\bar{\varepsilon}_i} \) by \( \tilde{e}_{\bar{\varepsilon}} \).

**Lemma 3.7.** The sum of \( e_{1_{T(S; T)}}, \bar{\varepsilon}_X \)'s, \( \tilde{e}_{\bar{\varepsilon}} \)'s, \( \bar{\varepsilon}_X \)'s and \( \tilde{e}_{\bar{\varepsilon}} \) is the identity element.

**Proof.** It is easy to see that

\[
e_{1_{T(S; T)}} = e_{1_{(U(1y))}} \otimes \varepsilon_{y_0} + \sum_{t \in T_1 \setminus \{1y\}} \frac{1}{|X|} \varepsilon_{F(t)} I_X \otimes \varepsilon_{F(t)},
\]

\[
\sum_{\chi \in \text{Irr}(T(U(1y)))} \bar{\varepsilon}_X = \varepsilon_{F(t)} I_X \otimes \varepsilon_{F(t)} - e_{1_{(U(1y))}} \otimes \varepsilon_{y_0},
\]

\[
\sum_{\varphi \in \text{Irr}(A(U(1y)))} \bar{\varepsilon}_\varphi = \varepsilon_{F(t)} I_X \otimes \varepsilon_{F(t)} - \frac{1}{|X|} \varepsilon_{F(t)} I_X \otimes \varepsilon_{F(t)}
\]

for each \( t \in T_1 \setminus \{1y\} \),

\[
\sum_{\psi \in \text{Irr}(A(S))} \tilde{e}_\psi = \varepsilon_{F(t)} I_X \otimes \varepsilon_{F(t)} - \frac{1}{|X|} (J_X \otimes \varepsilon_{F(t)} + J_X \otimes \varepsilon_{F(t)})
\]

for each \( t \in T_2 \),

\[
e_\eta = \sum_{t \in T_2} \frac{1}{2|X|} J_X \otimes (\varepsilon_{yt} - \varepsilon_{yt'}). \]
Thus, we have
\[ e_{1_{T(S\wr T)}} + \sum_{\chi \in \text{Irr}\left(T(U^{(1Y)})\right)^{\times}} \hat{e}_x + \sum_{t \in T_1 \setminus \{1_Y\}} \sum_{\varphi \in \text{Irr}(A(U^{(t)}))^{\times}} \hat{e}_\varphi + \sum_{t \in T_2} \sum_{\psi \in \text{Irr}(A(S))^{\times}} \hat{e}_\psi + e_\eta = I_{X \times Y} \]

\[ \square \]

4. Main result

In conclusion, we have determined the set of all central primitive idempotents of Terwilliger algebras of wreath products by quasi-thin schemes. Combining Section 3 and Theorem 4.1 of [4] gives the following theorem.

**Theorem 4.1.** Let \((X, S)\) and \((Y, T)\) be association schemes. Suppose that \((Y, T)\) is a quasi-thin scheme or a one-class scheme. Fix \(x_0 \in X\) and \(y_0 \in Y\), and consider the wreath product \(X \times Y, S \wr T\). Then

1. If \((Y, T)\) is a thin scheme or a one-class scheme, then
   \[ \{e_{1_{T(S\wr T)}}\} \cup \{\hat{e}_x \mid \chi \in \text{Irr}\left(T(U^{(1Y)})\right)^{\times}\} \cup \bigcup_{t \in T_1 \setminus \{1_Y\}} \{\hat{e}_\varphi \mid \varphi \in \text{Irr}(A(U^{(t)}))^{\times}\} \]
   is the set of all central primitive idempotents of \(T(X \times Y, S \wr T, (x_0, y_0))\).

2. If \((Y, T)\) has \(T^\perp \subseteq T_2\) or \(|T^\perp| \geq 2\), then
   \[ \{e_{1_{T(S\wr T)}}\} \cup \{\hat{e}_x \mid \chi \in \text{Irr}\left(T(U^{(1Y)})\right)^{\times}\} \cup \bigcup_{\varphi \in \text{Irr}(A(U^{(1)}))^{\times}} \{\hat{e}_\varphi \mid \varphi \in \text{Irr}(A(U^{(t)}))^{\times}\} \cup \{\hat{e}_\psi \mid \psi \in \text{Irr}(A(S))^{\times}\} \cup \{e_\eta\} \]
   is the set of all central primitive idempotents of \(T(X \times Y, S \wr T, (x_0, y_0))\).

3. If \((Y, T)\) has \(|T^\perp| = 1\) and \(T^\perp \subseteq T_1\), then
   \[ \{e_{1_{T(S\wr T)}}\} \cup \{\hat{e}_x \mid \chi \in \text{Irr}\left(T(U^{(1Y)})\right)^{\times}\} \cup \bigcup_{t \in T_1 \setminus \{1_Y\}} \{\hat{e}_\varphi \mid \varphi \in \text{Irr}(A(U^{(t)}))^{\times}\} \cup \bigcup_{t \in T_2} \{\hat{e}_\psi \mid \psi \in \text{Irr}(A(S))^{\times}\} \cup \{e_{\eta_i} \mid i \in I \setminus \{i_0\}\} \]
   is the set of all central primitive idempotents of \(T(X \times Y, S \wr T, (x_0, y_0))\).
