1. Introduction

In this paper, we study the possibility of finding a positive solution on unbounded domain with unseparated conditions for the following fractional differential inclusion:

\[ R^\alpha \left[ \kappa(t)v(t) \right] \in A(t, v(t)), \quad t \in [0, \infty), \] (1)

\[ v^{(i)}(0) = 0, \quad i = 0, \ldots, n-2; \quad n \in \mathbb{N}, \] (2)

\[ R^{\alpha-1} [\kappa(0)v(0)] = \lim_{\tau \to \infty} R^{\alpha-1} [\kappa(\tau)v(\tau)], \] (3)

which is contingent with \( A(t, v(t)) = q(t)B(t, v(t)) \) for which \( B : [0, \infty) \times \mathbb{R} \to \mathbb{R} \) is multivalued map, \( n-1 < \alpha < n, n \geq 2, \kappa(t), q(t) \in BC([0, \infty), \kappa(t) \geq 1, \) and \( R^\alpha \) is the symbol of the Riemann–Liouville fractional derivative.

Riemann–Liouville fractional derivative and corresponding integral and many other types of fractional derivatives and integrals with singular and nonsingular kernels are used in fractional calculus as generalizations of the ordinary differentiations and integrations. Thus, many scientific teams are attracted to link their works with fractional calculus, which has been effectively applied in the other scientific fields. As a result, there are some books talking about fractional calculus and some of its applications with fractional equations and inclusions, see [1–3]. In the existence and uniqueness fields, there are many articles concerned with different types of fractional differential equations or inclusions. For fractional differential equations, there are a huge number of contributions (see [4–9] and the references given therein). For fractional differential inclusions, Salem and Al-Dosari [10] have studied the existence results of solution for fractional Sturm-Liouville inclusion associated with composition with multimaps. Chen and Tang [11] have investigated probability of the positive solution for the fractional equation below on unbounded domain at resonance:

\[ R^\alpha v(t) = g(t, v(t)), \quad t \in [0, \infty), \]

\[ v^{(i)}(0) = 0, \quad i = 0, 1, 2, 3 < \alpha < 4, \] (4)

\[ R^{\alpha-1} v(0) = \lim_{\tau \to \infty} R^{\alpha-1} v(\tau). \]

Jiang and Yang [12] have studied the positive solution for the second ordinary boundary value problems:

\[ v''(t) + g(t, v(t)) = 0, \quad t \in [0, \infty), \]

\[ v(0) = 0, \]

\[ v'(\xi_i) = \sum_{i=1}^{m-1} a_i v' (\xi_i), \] (5)

where \( a_i > 0, \sum_{i=1}^{m-1} a_i = 1, 0 = \xi_1 < \ldots < \xi_{m-1} < \infty \) and \( g(t, 0) \) is not always equal to zero.
On a bounded domain, Chen et al. [13] have explored sufficient conditions to obtain a positive solution for the problem:

\[ RD^\alpha v(\tau) \in g(\tau, v(\tau)), \quad \tau \in [0, 1], \]

\[ v(0) = 0, \quad i = 0, 1, 2, 3 < \alpha < 4, \]

\[ RD^{\alpha-1} v(0) = RD^{\alpha-1} v(1). \]  

Furthermore, Hu [14] has given some results of positive solution at resonance for the boundary value problem formulated as follows:

\[ C^{\alpha} v(\tau) = g(\tau, v(\tau)), \quad \tau \in [0, 1], \]

\[ v^{(i)}(0) = 0, \quad i = 1, 2, \ldots, n-1, \]

\[ v(0) = v(1), \quad n-1 < \alpha < n. \]  

By reducing nonperturbed boundary value problems at resonance, Wang and Liu [15] have presented their results about positive solution of the problem:

\[ RD^\alpha v(\tau) + g(\tau, v(\tau)) = 0, \quad \tau \in [0, 1], \]

\[ v(0) = 0, \quad 1 < \alpha < 2, \]

\[ v(1) = \beta v(\zeta), \quad \beta^{\alpha - 1} = 1. \]  

About an overall summary of resonance and its applications, Haller [16] has mentioned that “resonances are regions in the phase space of a dynamical system in which the frequencies of some angular variables become nearly commensurate. Such regions have a profound effect on the dynamics of the system, since they are rich sources of highly complex motions. In molecular dynamics, resonances are known to give rise to chaotic patterns, multiple time scales, and apparent irreversibility in the transfer of energy between different oscillatory states of molecules. In engineering structures, interactions among resonant modes are responsible for most complicated dynamical phenomena, which again include energy transfer, multitime-scale behavior, and chaotic motions. It is of great practical importance to understand the common mechanism behind these irregular features, both qualitatively and quantitatively. The circle of further applications ranges from nonlinear optics through celestial and fluid mechanics to electromagnetism.”

Chaotic patterns, oscillatory states of molecules, complicated dynamical phenomena, and multitime-scale behavior are all given a strong cause to study differential problems at resonance associated with multivalued maps, which are not presented until now. So, our aim is to show the possibility of having at least one positive solution at resonance. For the sake of that, in Section 2, we give some basic notations and results of fractional differentiations and integrations, some facts of multimeasures and their arguments, and some needed lemmas and fixed point theorems. Section 3 contains some required results to the existence of positive solution for the given problem. Before the conclusion, Section 4 shows a quintessence as an application of our outcomes.

## 2. Precursory Notations

This section is devoted to provide some notations and definitions for the fractional calculus, multivalued functions, and Fredholm operator.

### 2.1. Fractional Calculus

We introduce some definitions and fundamental rules on the fractional calculus that are needed for the new results [1, 17, 18].

**Definition 1.** For \( \zeta > 0 \), the Riemann–Liouville fractional integral of a continuous function \( h(\tau) \): \([0, \infty) \rightarrow \mathbb{R} \) is defined by

\[ \mathcal{I}_\zeta^h h(\tau) = \frac{1}{\Gamma(\zeta)} \int_0^\tau (\tau - t)^{\zeta - 1} h(t) dt. \]  

**Definition 2.** For \( n \in \mathbb{N} \) and \( n - 1 \leq \zeta < n \), the Riemann–Liouville fractional derivative of an \( n \)th absolutely continuous function \( h(\tau) \): \([0, \infty) \rightarrow \mathbb{R} \) is given by

\[ \mathcal{D}_\zeta^h h(\tau) = \frac{1}{\Gamma(n-\zeta)} \left( \frac{d}{d\tau} \right)^n \int_0^\tau (\tau - t)^{n-\zeta-1} h(t) dt. \]  

**Lemma 1.** Let \( h(\tau) \in L^1([0, \infty)) \) and \( \zeta_1, \zeta_2, \zeta > 0 \). Then,

\[ \mathcal{I}_\zeta^{\zeta_1} \mathcal{I}_\zeta^{\zeta_2} h(\tau) = \mathcal{I}_\zeta^{\zeta_1 + \zeta_2} h(\tau), \]

\[ \mathcal{D}_\zeta^h h(\tau) = h(\tau). \]  

**Lemma 2.** Let \( \mathcal{D}_\zeta^h h(\tau) \in L^1([0, \infty)) \), \( \zeta > 0 \). Then,

\[ \mathcal{I}_\zeta^{\mathcal{D}_\zeta^h} h(\tau) = h(\tau) - \sum_{m=1}^n b_m \tau^{\zeta-m}, \quad \tau \in [0, \infty), \]

for some \( b_m \in \mathbb{R}, m = 1, 2, \ldots, n, n \in \mathbb{N} \).

### 2.2. Multivalued Function

In this section, we state some necessary facts on multivalued maps [2, 19–21].

Let \( (E, \| \cdot \|) \) and \( (H, \| \cdot \|) \) be Banach spaces and \( A: E \rightarrow P_c(E) \) be a multivalued map. The mapping \( A \) is

(i) Convex (closed) if \( A(e) \) is convex (closed), for every \( e \in E \).

(ii) Completely continuous if \( A(B) \) is relatively compact, for every \( B \in P_c(E) \).

(iii) Upper semicontinuous if \( A^{-1}(W) \) is closed subset of \( E \), for each closed subset \( W \subset E \). That is, the set \( \{ e \in E : A(e) \subset O \} \) is open for all open sets \( O \subset E \).

(iv) Lower semicontinuous if \( A^{-1}(Z) \) is open subset of \( E \), for each open subset \( Z \subset E \). In the other words, the set \( \{ e \in E : A(e) \cap O \neq \emptyset \} \) is open for all open sets \( O \subset E \).

(v) Measurable multivalued if for every \( e \in E \), the function \( \tau \mapsto d(e, A(\tau)) = \inf \{ d(e, a) : a \in A(\tau) \} \) is \( \mathcal{F} \)-measurable function.
Definition 3. A multivalued map $A: [0, \infty) \times \mathbb{R} \to P(\mathbb{R})$ is known as a Carathéodory if

1. For all $r \in \mathbb{R}$, $r \mapsto A(r, r)$ is measurable.
2. For a.e. $r \in [0, \infty)$, $r \mapsto A(r, r)$ is upper semicontinuous.

In addition to assumptions (1) and (2), the map $A$ is $L^1$-Carathéodory if for each $k > 0$, $\exists \phi_k = C[0, \infty) \cap L^1[0, \infty)$ satisfying $\sup_{t \in [0, \infty)} |\phi_k(t)| < \infty$ and $\phi_k > 0$, that is,

$$\|A(r, (1 + t^{a-1})r)\| = \sup\{|a|: a \in A(r, (1 + t^{a-1})r)| \leq \phi_k(r),$$

for all $|r| \leq k$, $r \in [0, \infty)$.

2.3. Fredholm Operator. We recall some preliminaries about the operators specially Fredholm type where we can get them from [3, 22-24]. Let $L: E \to H$ be any considered operator. Then, we define the following.

1. The kernel of $L$ by

$$Ker(L) = \{e \in E: L(E) = 0\}. \tag{14}$$

2. The image (rang) of $L$ by

$$Im(L) = R(L) = \{L(e): e \in E\} \subseteq H. \tag{15}$$

3. The cokernel of $L$ by

$$Coker(L) = \{h: h \in H/Im(L)\}. \tag{16}$$

4. The index of $F$ by

$$Ind(L) = \dim Ker(L) - \dim Coker(L). \tag{17}$$

Note that

$$\dim Coker(L) = \co \dim Im(L). \tag{18}$$

The operator $L$ is called Fredholm operator if it is a bounded linear operator with finite dimensional kernel and cokernel and closed range. It is said to be Fredholm of index zero if and only if $Ind(L) = 0$.

Let $L: dom(L) \subseteq E \to H$ be Fredholm of index zero and $P: E \to E$, $Q: H \to H$ be continuous projections. In the case of

$$Im(P) = Ker(L) \cap Im(L) = Ker(Q),$$

$$E = Ker(L) \oplus Ker(P) \cap H = Im(L) \oplus Im(Q),$$

then $L|_{dom(L) \cap Ker(P)}$ is invertible, and so we can define

$$K_p = (L|_{dom(L) \cap Ker(P)})^{-1}. \tag{20}$$

In fact, there is an isomorphic map $J: Im(Q) \to Ker(L)$. Consider the inclusion

$$Lv \in Nv, \tag{21}$$

which is equivalent to

$$v \in (P + JQN)v + K_p(I - Q)Nv. \tag{22}$$

Let $C \subseteq E$ be a convex and a closed subset. Then, $C$ is called a cone if

(i) $\rho v \in C, \forall v \in C, \rho \geq 0$

(ii) $v - v \in C \Rightarrow v = 0$

Consequently, there is an induced partial order $\leq$ in $E$ subject to

$$o \leq v \Leftrightarrow v - o \in C. \tag{23}$$

Lemma 3. Let $E$ be a Banach space contains a cone $C$. Then, for every $\eta \in C/\{0\}$, there exists a positive number $\sigma(\eta)$ which satisfies

$$\|v + \eta\| \geq \sigma(\eta)\|v\|, \quad v \in C. \tag{24}$$

Define $\mu: E \to C$ to be a retraction (continuous mapping constrained with $\mu(\eta) = \eta, \forall \eta \in C$). Define the map $\Theta$ as

$$\Theta = P + JQN + K_p(I - Q)N. \tag{25}$$

Then,

(i) $Lv \in Nv \Leftrightarrow v \in (P + JQN)v + K_p(I - Q)Nv \Leftrightarrow v \in \Theta v$

(ii) $\Theta_\mu = \Theta \mu$

Theorem 1. (O'Regan and Zima). Let $C \subseteq E$ be a cone, and $\Omega_1$ and $\Omega_2$ be open bounded subsets of $E$, which satisfy $\Omega_1 \subseteq \Omega_2$, and $C \cap (\Omega_2/\Omega_1) \neq \emptyset$. Assume that

1. $L: E \to H$ is a Fredholm operator of index zero.
2. $N: E \to H$ is an upper-semicontinuous mapping with nonempty compact convex values.
3. $QN: E \to H$ is bounded on bounded subsets of $C$, and $K_p(I - Q)N: E \to H$ is compact on every bounded subset of $C$.
4. $Lv \notin \gamma Nv, \forall v \in C \cap \partial \Omega_2 \cap domL$ and $\gamma \in (0, 1)$.
5. $\mu$ subsets of $\Omega_2$ into bounded subsets of $C$.
6. $deg([I - (P + JQN)\mu_{KerL}KerL \cap \Omega_2, 0]) \neq 0.
7. There is $v_0 \in C/\{0\}$ such that

$$\|v\| \leq \sigma(v_0)\|\eta\|, \quad \forall v \in C(\gamma_0) \cap \partial \Omega_1, \eta \in \Theta v, \tag{26}$$

where

$$C(\gamma_0) = \{v \in C | \rho v \leq \nu, \text{ for some } \rho > 0\}, \tag{27}$$

and $\sigma(\gamma_0)$ is such that $\|v + \gamma_0\| \geq \sigma(\gamma_0)\|v\|, \quad v \in C.$
8. $(P + JQN)\mu_{KerL} \subseteq C$.
9. $\Theta_\mu(\Omega_2/\Omega_1)$ is such that $\|v + \gamma_0\| \geq \sigma(\gamma_0)\|v\|, \quad v \in KerL \cap \partial \Omega_2$.
10. $v \notin (P + JQN)\mu_{KerL}, \quad v \in KerL \cap \partial \Omega_2$.\]
Then, the inclusion \( L \nu \in N \nu \) can be solvable in the set \( C \cap (\Omega_1/\Omega_1) \).

Remark 1. Let
\[
E = \left\{ \nu | \nu \in C[0, \infty), \lim_{\tau \to \infty} \frac{\nu(\tau)}{1 + \tau^{a-1}} \right\},
\]
with the norm
\[
\|\nu\|_E = \sup_{\tau \geq 0} \frac{\nu(\tau)}{1 + \tau^{a-1}}.
\]
And let
\[
H = \left\{ h | h(\tau) \in C[0, \infty) \cap L^1[0, \infty) \cap A(\tau, \nu(\tau)), \sup_{\tau \geq 0} |h(\tau)| < +\infty \right\},
\]
with the norm
\[
\|h\|_H = \sup_{\tau \geq 0} |h(\tau)| + \int_0^\infty |h(\tau)| d\tau.
\]
Then, \((E, \|\cdot\|_E)\) and \((H, \|\cdot\|_H)\) are Banach spaces, see [11].

Expand the operator \( L \), for which
\[
dom L = \left\{ \nu \in E | R^D[a] [\kappa(\nu)(\tau)] \in C[0, \infty) \cap L^1[0, \infty), \nu^{(i)}(0) = 0, i = 0, \ldots, n - 2, R^D[a-1][\kappa(\nu)(\tau)]_{\tau \geq 0} = \lim_{\tau \to \infty} R^D[a-1][\kappa(\nu)(\tau)] \right\},
\]
where
\[
L: \dom L \subset E \longrightarrow H, \quad \nu \longmapsto R^D[a][\kappa(\nu)(\tau)],
\]
\[
N: E \longrightarrow H, \quad \nu \longmapsto a(\tau, \nu(\tau)).
\]
Then, the multivaluge problems (1)–(3) are equivalent to the inclusion:
\[
L \nu \in N \nu, \quad \nu \in \dom L.
\]

We can understand the proof of the following lemma if we see the compactness hypothesis in [11, 25, 26].

Lemma 4. Let \( \Omega \) be subset of \( E \); then, \( \Omega \) is a relatively compact subset if and only if the next conditions hold.

(i) The subset \( \Omega \) is uniformly bounded, i.e.,
\[
\forall \nu \in \Omega, \quad \exists R > 0 \ni \|\nu\|_E \leq R.
\]
(ii) Let \( I \) be compact subinterval of \([0, \infty)\) and let for all \( \epsilon > 0 \) there exists \( \delta = \delta(\epsilon) > 0 \) such that \( |\tau_1 - \tau_2| < \delta \) for \( \tau_1, \tau_2 \in I \). Then,
\[
\left| \frac{\nu(\tau_1)}{1 + \tau_1^{a-1}} - \frac{\nu(\tau_2)}{1 + \tau_2^{a-1}} \right| < \epsilon, \quad \forall \nu \in \Omega,
\]
(iii) For \( \epsilon > 0 \) be given, there exists \( \lambda = \lambda(\epsilon) \) in since
\[
\left| \frac{\nu(\omega_1)}{1 + \omega_1^{a-1}} - \frac{\nu(\omega_2)}{1 + \omega_2^{a-1}} \right| < \epsilon, \quad \forall \nu \in \Omega, \omega_1, \omega_2 > \lambda.
\]

3. Acquired Upshots

In this section, we discuss some results for the sake of seeing the attainability of solution by apply (O’Regan and Zima, Theorem 1) on the half line. Consequently, in view of the arguments of Fredholm operator, we first need to explore some lemmas and facts as follows.

3.1. Basic Requirements. Here, by using the general form of solution, we prove several facts in order to explore that \((\mathcal{H}_1)\) \( L \) is Fredholm operator of index zero.

Also, we explain that this operator is invertible in the set \( \dom L \cap Ker P \) to compute the formula of its inverse \( K_\rho \).

Finally, under the version of Lemma 3 (i) and by the known solution, we prove several facts in order to explore that
\[
(\mathcal{H}) \quad L \text{ is Fredholm operator of index zero.}
\]

Lemma 5. Consider \( h(\tau) \in H \). Then, \( \nu \in E \) is a solution of the boundary value problem:
\[
R^D[a][\kappa(\nu)(\tau)] = h(\tau), \quad \tau \in [0, \infty),
\]
\[
\nu^{(i)}(0) = 0, \quad i = 0, \ldots, n - 2,
\]
\[
R^D[a-1][\kappa(\nu)(0)] = \lim_{\tau \to \infty} R^D[a-1][\kappa(\nu)(\tau)],
\]
if and only if
\[
\nu(\tau) = b \frac{R^D[a-1][\kappa(\nu)(\tau)]}{\kappa(\tau)} + \frac{1}{\Gamma(a)\kappa(\tau)} \int_0^\tau (\tau - t)^{a-1} h(t) dt,
\]
where \( b \in \mathbb{R} \) and
\[
\int_0^\infty h(\tau) d\tau = 0.
\]

Proof. The proof can be completely seen if we are backing to both Lemmas 1 and 2 and applying accompanying conditions.

Now, using (33)–(35), we obtain
\[
L \nu = R^D[a][\kappa(\nu)(\tau)],
\]
\[
N \nu = \{ \alpha | \alpha(\tau, \nu(\tau)) = q(\tau) \beta(\tau, \nu(\tau)), \beta(\tau) \in B(\tau, \nu(\tau)) \},
\]
which implies that
\[
Ker L = \left\{ \nu | \nu = b \left( \frac{R^D[a-1][\kappa(\tau)]}{\kappa(\tau)} \right), \quad \tau \geq 0, b \in \mathbb{R} \right\},
\]
\[
Im L = \left\{ h(\tau) \in H | \int_0^\infty h(\tau) d\tau = 0 \right\} \subset H.
\]
By using the equation,
\[
\kappa(\tau) \nu(\tau) = b R^D[a-1],
\]
Lemma 6. Let \( P: E \rightarrow E \) be a map defined as
\[
P_v(t) = \left[ \frac{1}{\Gamma(a)} \int_0^\infty e^{-t} \kappa(t) v(t) \, dt \right] \frac{\tau^{a-1}}{\kappa(t)}.
\] (46)

Then, \( P \) is a continuous projection on \( E \).

Proof. Let \( v \in E \) and \( P \) be defined as in (46). Then,
\[
P^2 v(t) = P[P v(t)] = \frac{1}{\Gamma(a)} \int_0^\infty e^{-t} \kappa(t) v(t) \, dt \left[ \frac{\tau^{a-1}}{\kappa(t)} \right] = P v(t),
\]
which completes the proof. \( \square \)

Remark 2. We can recall that
\[
KerP = \{ v \mid \int_0^\infty e^{-t} \kappa(t) v(t) \, dt = 0 \},
\] (48)
\[
ImP = KerL.
\] (49)

Immediately, we have
\[
E = KerP \oplus ImP = KerP \oplus KerL.
\] (50)

According to both integrals \( \int_0^\infty e^{-t} \, dt = 1 \) and \( \int_0^\infty h(t) \, dt = 0 \) in (41), we can explain and prove that there exists a continuous projection \( P \) on the space \( H \). See the next lemma.

Lemma 7. Let \( Q: H \rightarrow H \) be a mapping formed by
\[
Q h(t) = e^{-t} \int_0^\infty h(t) \, dt,
\] (51)
where \( \tau \geq 0, h(t) \in H \). Then, \( Q \) is a continuous projection on \( H \).

Remark 3. We can make sure that
\[
ImQ = \{ b e^{-t}, \ b \in \mathbb{R}, \ \tau \geq 0 \},
\] (52)
\[
KerQ = ImL.
\] (53)

Claim that \( H = KerQ \oplus ImQ = ImL \oplus ImQ \). For that, take \( h(t) \in H \). Then, we have
\[
h(t) = h(t) - Q h(t) + Q h(t) = (I - Q) h(t) + Q h(t),
\] (54)
where \( Q h(t) \in ImQ \). Moreover,
\[
Q[(I - Q) h(t)] = Q h(t) - \hat{Q} h(t),
\] (55)
\[
\hat{Q} h(t) = Q h(t) - Q h(t).
\]

Thus, \( H = KerQ + ImQ \). Assume that \( h(t) \in KerQ \cap ImQ \). Then,
\[
h(t) = be^{-t},
\]
\[
Q h(t) = 0,
\]
\[
\Rightarrow be^{-t} \int_0^\infty e^{-t} \, dt = 0,
\] (56)
\[
\Rightarrow b = 0,
\]
\[
\Rightarrow h(t) = 0.
\]

Hence, \( H = ImL \oplus ImQ \). It remains to prove that \( L \) is of index zero. Due to the previous results of \( Q \), we find that
\[
1 = \dim \mathbb{R} = \dim ImQ = \dim KerQ = \dim ImL < +\infty.
\] (57)

Since \( ImL \) is closed in \( H \), it implies that \( L \) is the Fredholm operator of index zero.

Furthermore, we can see clearly that \( KerL \equiv ImQ \) if we define the isomorphism \( J: ImQ \rightarrow KerL \) by
\[
J(\hat{b}) = b \left( \frac{\tau^{a-1}}{\kappa(t)} \right), \ \tau \geq 0, b \in \mathbb{R},
\] (58)
as long as \( ImQ \) defined by (52).

Once we have \( L \) is the Fredholm operator of index zero, then it is invertible in the set \( domL \cap KerP \). Create \( (L|_{domL \cap KerP}) = L_p: domL \cap KerP \rightarrow ImL \) and \( L_p^{-1} = K_p \). Let \( v(t) \in L \cap KerP \), which follows that \( v(t) \) is defined by (40) and satisfying the condition in (48). By substituting (40) in the equation given in (48), the constant \( b \) will be subject to
\[
b = -\frac{1}{\Gamma(a)} \int_0^\infty e^{-t} \int_0^t \frac{(t-s)^{a-1}}{\Gamma(a)} h(s) \, ds \, dt.
\] (59)

Therefore,
\[
(K_p h)(t) = -\frac{1}{\Gamma(a)} \int_0^\infty e^{-t} \int_0^t \frac{(t-s)^{a-1}}{\Gamma(a)} h(s) \, ds \, dt \left( \frac{\tau^{a-1}}{\kappa(t)} \right)
\]
\[
+ \frac{1}{\Gamma(a)} \int_0^t \frac{(t-s)^{a-1}}{\Gamma(a)} h(s) \, ds \, dt, \ \ h(t) \in ImL.
\] (60)

Lemma 8. Let \( L \) be the Fredholm operator of index zero. That is,
\[
L v = \frac{\partial}{\partial t} [k(t) v(t)],
\] (61)
\[
(\dot{L}|_{domL \cap KerP}) = L_p,
\]
where \( do mL \) and \( KerP \) are defined by (32), (46), and (48), respectively. Let \( K_p \) be elected such as in (60). Then,
\[
K_p(L_p) = L_p(K_p) = I.
\] (62)
Proof. Opting \( v(t) \in dom L \cap Ker P \) drives

\[
(\mathcal{L}_p L_p) (v)(t) = \mathcal{L}_p (L_p v)(t)
\]

\[
= - \left( \frac{1}{\Gamma (\alpha)} \int_0^t (t-s)^{\alpha-1} L_v (s) ds \right) \left( \frac{e^{-z}}{\kappa (\tau)} \right)
\]

\[
+ \frac{1}{\kappa (\tau)} \int_0^t (t-s)^{\alpha-1} L_v (s) ds dt
\]

\[
= - \left( \frac{1}{\Gamma (\alpha)} \int_0^t (t-s)^{\alpha-1} G (s) \alpha (s) ds \right) \left( \frac{e^{-z}}{\kappa (\tau)} \right)
\]

\[
\times \left( \frac{e^{\alpha z}}{\kappa (\tau)} \right) \left( \frac{1}{\Gamma (\alpha)} \int_0^t e^{-\alpha z} dt \right) \left( \frac{e^{-z}}{\kappa (\tau)} \right)
\]

\[
+ v(t) - b \left( \frac{e^{-z}}{\kappa (\tau)} \right)
\]

\[
= v(t).
\]  

(63)

And use (43) to verify that

\[
\left[ JQ + \mathcal{L}_p (I-Q) \right] h(t) = \left\{ h^* \in H \mid h^*(t) = \frac{e^{\alpha z}}{\Gamma (\alpha) \kappa (\tau)} \int_0^t G_1 (r,t) h(t) dt - \int_0^t G_2 (r,t) h(t) dt + h(t) \in N (\gamma), \right\}
\]  

(66)

where

\[
G_1 (r,t) = \begin{cases} 
0, & \tau = 0, \\
\Gamma (\alpha) \left( t - \int_0^t (t-s)^{\alpha-1} e^{-s} ds + \int_0^t \int_0^t G_2 (r,m) e^{-m} dm dt \right) \frac{(t-s)^{\alpha-1}}{\tau^{\alpha-1}}, & \tau \neq 0, 0 \leq t \leq r < +\infty, \\
\Gamma (\alpha) \left( t - \int_0^t (t-s)^{\alpha-1} e^{-s} ds + \int_0^t \int_0^t G_2 (r,m) e^{-m} dm dt \right) \frac{(t-s)^{\alpha-1}}{\tau^{\alpha-1}}, & 0 \leq r \leq t < +\infty,
\end{cases}
\]

(67)

\[
G_2 (r,t) = \begin{cases} 
0, & 0 < r \leq t < +\infty, \\
\frac{(t-r)^{\alpha-1}}{\tau^{\alpha-1}} e^{-r}, & 0 \leq t \leq r < +\infty.
\end{cases}
\]  

Lemma 9. We have

\[
0 \leq G_2 (r,t) \leq \frac{e^{-z}}{\Gamma (\alpha)} e^{-r},
\]  

(68)

\[
0 \leq \Gamma (\alpha) - 1 + \frac{1}{2^{\alpha-1}} \leq G_1 (r,t) \leq 1 + \alpha + \Gamma (\alpha), \ \forall \alpha > 1.
\]  

(69)

Proof. Basically, we have the following inequalities:

\[
0 < \int_0^t \int_0^t G_2 (r,m) e^{-m} dm dt \leq \int_0^t e^{-m} dm = 1,
\]  

(70)

\[
0 \leq G_2 (r,t) \leq \frac{e^{-z}}{\Gamma (\alpha)} e^{-r}.
\]  

In order to prove the L.H.S of (69), we note that, for all positive reals \( m < t \Rightarrow e^{-m} > e^{-t} \), to imply that

\[
\int_0^t \int_0^t G_2 (r,m) e^{-m} dm dt \geq \int_0^t e^{-m} dm dt = \frac{1}{\Gamma (\alpha + 1)} \int_0^t e^{-m} dm dt \frac{1}{2^{\alpha-1}},
\]  

(71)

which leads to

\[
\Gamma (\alpha) - 1 + \frac{1}{2^{\alpha-1}} \leq G_1 (r,t).
\]  

(72)

By analytical methods, we can see that
0 < \Gamma (\alpha) - 1 + \frac{1}{2^{\alpha + 1}} \quad \forall \alpha > 1. \tag{73}

Now, to make sure about the R.H.S of (69), use
\[ - \int_0^1 \frac{(r-z)^{\alpha-1}}{r^{\alpha - 1}} e^{-z} \, dz < 0. \tag{74} \]

Then,
\[
G_1(\tau,t) \leq \Gamma (\alpha) + 1 + \int_0^\infty \int_0^t G_z(t, m) e^{-m} \, dm \, dt
\]
\[ \leq \Gamma (\alpha) + 1 + \int_0^\infty \frac{\Gamma (\alpha)}{\Gamma (\alpha)} e^{-t} \, dt \tag{75} \]
\[ = \Gamma (\alpha) + 1 + \alpha. \]

\[ \square \]

3.2. Essential Theorem. Apply all results in the first part to illustrate the main theorem with some needed hypothesis as follows.

**Theorem 2.** Reckoning in addition of \((\mathcal{H}_1)\) that the following.

\((\mathcal{H}_2)\) Let \(B: [0,\infty) \times \mathbb{R} \to BCC(\mathbb{R})\) be \(L^1\)-Caratheodory (Definition 3) with \(S_{\alpha, \nu}\) which has nonempty compact convex values conditional on which there exist nonnegative functions \(\gamma_i(t), i = 1, 2, 3\), \(\eta_j(t), j = 1, 2\) and \(\theta(t)\) satisfying

\[
\beta(t, \nu(t)) \leq - \gamma_1(t) |\beta(t, \nu(t))| + \gamma_2(t) \frac{\nu(t)}{1 + t^{\alpha - 1}} + \gamma_3(t), \tag{76} \]

\[
- \theta(t) \frac{\nu(t)}{1 + t^{\alpha - 1}} \leq \beta(t, \nu(t)) \leq - \eta_1(t) \frac{\nu(t)}{1 + t^{\alpha - 1}} + \eta_2(t), \tag{77} \]

for all \(\beta(t) \in B(t, \nu(t)),\) and \(0 < \nu(t) / 1 + t^{\alpha - 1} < R.\)

\((\mathcal{H}_3)\) For \(a(t, \nu(t)) = q(t) \beta(t, \nu(t))\), we have
\[
\int_0^\infty q(t) \theta(t) \, dt < \frac{\Gamma (\alpha) + 1}{2(\Gamma (\alpha) + 1/2)(\Gamma (\alpha) + \alpha + 1)} \Gamma (\alpha) + \frac{\Gamma (\alpha + \alpha + 1)}{\Gamma (\alpha) + 1} \tag{78} \]
\[
eq e^{\nu(t)} \theta(t) < \frac{1 + t^{\alpha - 1}}{(\Gamma (\alpha) + \alpha + 1)} \tag{79} \]

and there exists \(\delta > 0\) in which
\[
\delta = \frac{\Gamma (\alpha) + 1}{\Gamma (\alpha) + 1/2} \Gamma (\alpha) + \frac{\Gamma (\alpha + \alpha + 1)}{\Gamma (\alpha) + 1} \int_0^\infty q(t) \theta(t) \, dt < 1. \tag{80} \]

\((\mathcal{H}_4)\) There exist positive constants \(q_0, \gamma_0, \Gamma_0,\) and \(R_0\), where

\[ \Gamma_0 = \frac{2}{\gamma_0} \sup_{\tau \geq 0} \left[ \frac{y_2(\tau) + (e^{-\tau} \kappa(\tau) y_0(1 + t^{\alpha - 1})) / 2^q(\tau)}{\eta_1(\tau)} \right], \tag{81} \]

\[ R_0 = \max \left\{ \frac{q_0 \Gamma_0}{\gamma_0} \int_0^\infty \eta_2(\tau) \, d\tau, \frac{2q_0}{\gamma_0} \int_0^\infty \eta_1(\tau) \, d\tau, \right\} \tag{82} \]

where \(q_0 = \sup_{\tau \geq 0} |q(\tau)|, \gamma_0 = \inf_{\tau \geq 0} \gamma_1(\tau),\) and
\[ \eta_0 = \int_0^\infty q(t) \eta_1(t) \frac{1 + t^{\alpha - 1}}{(1 + t^{\alpha - 1}) \kappa(t)} \, dt. \tag{83} \]

Then, it is distinctly possible to find positive solution for problems (1)–(3) in \(C \cap (\Omega_2' / \Omega_1').\)

**Proof.** Let \(E\) and \(H\) be Banach spaces defined as in Remark. Define the linear operator \(L\) and its property by (32), (33), (43), and (44), and the nonlinear operator \(N\) by (34) as well as (35) holds. Then, to show that if it is possible for the given problem to has a solution, we will prove all points of (O’Regan and Zima, Theorem 1-).

Step 1: the operator \(L\) will be the Fredholm operator of index zero by using \((\mathcal{H}_1)\).

Step 2: by \((\mathcal{H}_2)\), the operator \((N)\) is upper semicontinuous mapping with nonempty compact convex values.

Step 3: according to \((\mathcal{H}_3)\), \(QN\) is bounded in the bounded set and

\[ K'P(I - Q)N \tag{84} \]

is compact, where \(P, Q, \) and \(K_P\) are all conformed by (46), (51), and (60), respectively.

Define the needed sets \(\Omega_1, \Omega_2,\) and \(C\) as follows:
\[ \Omega_1 = \left\{ v \in E \mid \|v\|_E < \frac{\nu(t)}{1 + t^{\alpha - 1}} < R_1, R_1 \in (0, R_2), e \in (\delta, 1) \right\}; \]
\[ \Omega_2 = \left\{ v \in E \mid \|v\|_E < R_2, R_2 \in (R_0, R) \right\}; \]
\[ C = \left\{ v \in E \mid \nu(t) \geq 0, t \geq 0 \right\} \subset E. \tag{85} \]

Clearly, \(\Omega_1 \subset \Omega_2\) and \(C\) forms a cone in \(E.\)

Step 4: claim that \(Lv \notin \gamma Nv, \forall v \in C \cap \partial \Omega_2 \cap domL, \gamma \in (0, 1).\)

Assume by contradiction that \(v \geq 0, \|v\|_E = R_2\) such that \(Lv \notin \gamma Nv.\) Since

\[ v = v - Pv + P = K_P(L - P)v + P = K_PLv + P, \]
\[ Lv = \gamma h(\tau), \]
\[ h(\tau) \in Nv, \tag{86} \]
we have, by using Hölder’s inequality with $p = 1$ and $q = \infty$, (66) and (68) that

$$
\frac{\nu(t)}{1 + t^{a-1}} = \frac{t^{a-1}}{\Gamma(\alpha)(1 + t^{a-1})} \left[ \int_0^\infty e^{-t\kappa(t)}\nu(t)dt - \int_0^\infty e^{-t\kappa(t)}\nu(t)dt \right] + \frac{1}{\kappa(t)(1 + t^{a-1})} \int_0^t \nu(t)\int_0^s \nu(s)dsdt + \int_0^\infty \nu(t)\int_0^t \nu(t)dt \right]
$$

In case

$$
\rho^a [\kappa(t)\nu(t)] = L\nu = \gamma a(t, \nu(t)) = \gamma q(t)\beta(t, \nu(t)),
$$

we can see by (92) and (77) that

$$
\rho^a [\kappa(t)\nu(t)] = \gamma q(t)\beta(t, \nu(t))
$$

Now, we have

$$
\rho^a [\kappa(t)\nu(t)] = \gamma q(t)\beta(t, \nu(t))
$$

Relations (89), (90), and (91) give the ensuing results:

$$
0 = \int_0^\infty \rho^a [\kappa(t)\nu(t)]dt \leq \gamma q(t)\beta(t, \nu(t)) + \gamma q(t)\beta(t, \nu(t)) + \gamma q(t)\beta(t, \nu(t))
$$
Complexity

that are equivalent, respectively, to

\[
\int_0^\infty |D^\alpha [\kappa(t)\nu(t)]|dt \leq \frac{1}{\gamma_0} \int_0^\infty \gamma_2(t)q(t) \frac{\nu(t)}{1 + t^\alpha} dt + \frac{1}{\gamma_0} \int_0^\infty \gamma_3(t)q(t)dt,
\]

\[
\int_0^\infty \eta_1(t)q(t) \frac{\nu(t)}{1 + t^\alpha} dt \leq \int_0^\infty \eta_2(t)q(t)dt.
\]

From (95), it can be seen that

\[
\int_0^\infty q(t)\eta_1(t) \frac{\nu(t)}{1 + t^\alpha} dt \leq q_0 \int_0^\infty \eta_2(t)dt.
\]  

(96)

The relations (81) and (94)–(96) together with \((\mathcal{H}_4)\) show that (87) will be equivalent to

\[
\frac{\nu(t)}{1 + t^\alpha} \leq \frac{2q_0}{\gamma_0\Gamma(\alpha)} \int_0^\infty \gamma_2(t) \frac{\nu(t)}{1 + t^\alpha} dt
\]

\[
+ \frac{2q_0}{\gamma_0\Gamma(\alpha)} \int_0^\infty \gamma_3(t)dt + \int_0^\infty e^{-\kappa(t)}(\nu(t)dt)
\]

\[
\leq \frac{\Gamma_0}{\Gamma(\alpha)} \int_0^\infty q(t)\eta_1(t) \frac{\nu(t)}{1 + t^\alpha} dt + \frac{2q_0}{\gamma_0\Gamma(\alpha)} \int_0^\infty \gamma_3(t)dt
\]

\[
\leq \frac{q_0\Gamma_0}{\Gamma(\alpha)} \int_0^\infty \eta_2(t)dt + \frac{2q_0}{\gamma_0\Gamma(\alpha)} \int_0^\infty \gamma_3(t)dt
\]

\[
< R_0 < R_2 < R,
\]

which is contradiction to \(v \in C \cap \Omega_2 \cap domL\).

Step 5: to recall that \(\mu\) maps subsets of \(\Omega_2\) into bounded sets of \(C\), let \(v \in \Omega_2\). Since \(\mu(v(\tau)) = |v(\tau)| = v(\tau), \forall v \in C\), then

\[
\|\mu(v)\|_C = \|\mu(v)\|_E = \|v\|_E \leq R_2, \quad \forall v \in \Omega_2.
\]

(98)

Step 6: this step will show that

\[
\text{deg}(\big[ I - (P + JQN)_\mu \big]_{KerL \cap \Omega_2}, 0) \neq 0.
\]

(99)

Define the map \(\tilde{H}(v, \rho)\) by

\[
\tilde{H}(v, \rho) = \big[ I - \rho(P + JQN)_\mu \big]v, \quad \rho \in [0, 1].
\]

(100)

Let \(v \in KerL \cap \Omega_2\), and consider by contradiction that \(0 \in \tilde{H}(v, \rho)\). Since \(v \in KerL\), then it is given by the form

\[
v(\tau) = b \frac{\tau^{n-1}}{\kappa(\tau)}, \quad \tau \geq 0, b \in \mathbb{R}.
\]

(101)

Consequently, we have

\[
\tilde{H}(v, \rho) = \big[ I - \rho(P + JQN)_\mu \big] \left( b \frac{\tau^{n-1}}{\kappa(\tau)} \right)
\]

\[
= \left[ b - \rho|b| - \rho \int_0^\infty q(t)f(t, |b| \frac{\tau^{n-1}}{\kappa(\tau)}) dt \right] \frac{\tau^{n-1}}{\kappa(\tau)}.
\]

(102)

where \(b \in [-R_2, R_2], \rho \in [0, 1]\). Now, expound a map

\[
J_1: \text{Ker}L \cap \Omega_2 \rightarrow \mathbb{R},
\]

such as

\[
J_1 \left( b \frac{\tau^{n-1}}{\kappa(\tau)} \right) = b.
\]

(104)

Then, \(J_1, \ J (\text{as in (58)})\) are used to see that

\[
d_B \big[ \tilde{H} \left( b \frac{\tau^{n-1}}{\kappa(\tau)} \right), \text{Ker}L \cap \Omega_2, 0 \big] = d_B \big[ J_1 \tilde{H} \left( J_1^{-1} b, \rho \right), J_1(\text{Ker}L \cap \Omega_2), 0 \big].
\]

(105)

so that

\[
0 \in J_1 \tilde{H} \left( J_1^{-1} b, \rho \right).
\]

(106)

Thus, for all \(a(\tau, \nu(\tau)) = q(\tau)\beta(\tau, \nu(\tau)) \in A(\tau, \nu(\tau))\), we have

\[
b - \rho|b| - \rho \int_0^\infty q(t)\beta(t, |b| \frac{\tau^{n-1}}{\kappa(\tau)}) dt = 0
\]

\[
\Leftrightarrow b = \rho \left( |b| + \int_0^\infty q(t)\beta(t, |b| \frac{\tau^{n-1}}{\kappa(\tau)}) dt \right).
\]

(107)

Using \((\mathcal{H}_2\frac{77}{77})\) and \((\mathcal{H}_3\frac{78}{78})\) to explain that \(b \geq 0\), take \(b_0 \in J_1(\text{Ker}L \cap \Omega_2)\), then \(|b_0| = R_2\). Suppose \(0 \in J_1 \tilde{H} \left( J_1^{-1} b, \rho \right)\), which leads to \(b_0 = R_2\). Together with \((\mathcal{H}_2\frac{77}{77})\) and \((\mathcal{H}_4\frac{82}{82})\), we work out that \(0 \in \text{A}(\tau, \nu(\tau)) = q(\tau)\beta(\tau, R_2 \left( \tau^{n-1}/\kappa(\tau) \right) \in A(\tau, R_2(\tau^{n-1}/\kappa(\tau)))\), satisfying

\[
R_2 = \rho \left( |R_2| + \int_0^\infty q(t)\beta(t, |R_2| \frac{\tau^{n-1}}{\kappa(\tau)}) dt \right)
\]

\[
\leq \rho R_2 \left( 1 - \int_0^\infty q(t)\eta_1(t) \frac{\tau^{n-1}}{(1 + \tau^{n-1})\kappa(\tau)} dt \right)
\]

\[
+ \int_0^\infty q(t)\eta_2(t) dt
\]

\[
\leq \rho R_2 \leq R_2.
\]

If \(\rho = 0\), then \(R_2 = 0\) is impossible. This is the cause of \(0 \notin J_1 \tilde{H} \left( J_1^{-1} b, \rho \right)\) for all \(b \in J_1(\text{Ker}L \cap \Omega_2), \rho \in [0, 1]\). Therefore,
where  
\[ C(\nu) = \{ \nu \in C \mid \rho_0 \nu \leq \nu, \text{ for some } \rho > 0 \}, \] 
and \( \sigma(\nu) \) that is \( \| \nu + \nu_0 \| \geq \sigma(\nu) \| \nu \|, \nu \in C. \)

\[ \frac{(\Theta \nu)(\tau_0)}{1 + \tau_0^{-1}} \geq \frac{1}{1 + \tau_0^{-1}} \left[ P\nu(\tau_0) + (JQN + K_F (I - Q)N)\nu(\tau_0) \right] \]

Then, we conclude that 
\[ \| \nu \|_E \leq \frac{(\Theta \nu)(\tau_0)}{1 + \tau_0^{-1}} \leq \| \Theta \nu \|_H \leq \sigma(\nu_0) \| \Theta \nu \|_H. \] 

In order to see that take \( \nu(\tau) = 1 + \tau^{a-1}, \sigma(\nu_0) = 1, \) and

\[ C(\nu) = \left\{ \nu \in C \mid \inf_{\tau > 0} \left[ \frac{\nu(\tau)}{1 + \tau^{a-1}} \right] > 0 \right\}. \]

Now, let

\[ \tau_0 > 0 \Rightarrow \frac{\tau_0^{-1}}{\kappa(\tau_0)(1 + \tau_0^{-1})} > \frac{\Gamma(\alpha) + (1/2)}{\Gamma(\alpha) + 1}. \]

Then, for \( \nu \in C(\nu_0) \cap \partial \Omega_1, \) we have

\[ \| \nu \|_E \leq R_1 < R_2, \]

\[ \frac{\nu(t)}{1 + \tau^{a-1}} \geq e\| \nu \|_E, \quad e \in (\delta, 1). \]

And use (66), (68), (69), \((\mathcal{H}_2 (77)), \) and \((\mathcal{H}_4 (78), (80))\) to show that

\[ P + JQN (|\nu(\tau)|) = \frac{\tau^{a-1}}{\kappa(\tau)} \left[ \int_0^\infty e^{-t} \kappa(t)|\nu(t)|dt + \int_0^\infty q(t)\beta(t, |\nu(t)|)dt \right] \]

\[ \geq \frac{\tau^{a-1}}{\kappa(\tau)} \left[ \int_0^\infty \left( e^{-t}(1 + t^{a-1}) - q(t)\theta(t) \right) \frac{|\nu(t)|}{(1 + t^{a-1})} dt \right] \]

\[ \geq 0. \]

That makes \( (P + JQN)_\rho (\partial \Omega_2) \subset C. \)

Step 9: by this step, \( \Theta_2 (\overline{\Omega_2} / \Omega_1) \subset C \) will be satisfied. For that take \( \nu \in \overline{\Omega_2} / \Omega_1. \) It follows that \( R_1 \leq |\nu(\tau)| \leq R_2. \)

Now, use \((\mathcal{H}_4 (79)), \) we obtain
\[ \Theta (|v(t)|) \geq \frac{r^{a-1}}{\Gamma (a) \kappa (r)} \left[ \int_0^\infty \left( e^{-\tau} (1 + t^{a-1}) - (\Gamma (t) + a + 1)q(t)\theta (t) \right) \frac{|v(t)|}{(1 + t^{a-1})} \, dt \right] \]

\[ \geq 0, \]

which means that \( \Theta_{\mu} (\overline{\Omega}_2 / \Omega_1) \subset C \) is hold.

Step 10: this step proves that \( v \notin (P + JQN)_{\mu} v, \forall v \in KerL \cap \partial \Omega_2 \) will be true. Consider \( v \in KerL \cap \partial \Omega_2 \), then \( |b| = R_2 \). Moreover,

\[ P + JQN \left( \frac{|b|^2}{\kappa (r)} \right) = \frac{r^{a-1}}{\kappa (r)} \left[ \frac{1}{\Gamma (t)} \int_0^\infty e^{-\tau} \kappa (t) |b|^2 \frac{t^{a-1}}{\kappa (t)} \, dt + \int_0^\infty q(t) \beta (t, |b|^2) \frac{t^{a-1}}{\kappa (t)} \, dt \right] \]

\[ \leq \frac{r^{a-1}}{\kappa (r)} \left[ R_2 - R_2 \int_0^\infty q(t) \eta_1 (t) \frac{t^{a-1}}{\kappa (t)} \, dt + \int_0^\infty q(t) \eta_2 (t) \, dt \right] \]

\[ \leq R_2. \]

So, \( v \notin (P + JQN)_{\mu} v, \forall v \in KerL \cap \partial \Omega_2 \) is true. Hence, problem (39), the steps (Step 1–Step 10), and (O’Regan and Zima, Theorem 1) together show that our problem (1)–(3) can attain a positive solution at resonance in the set \( C \cap (\overline{\Omega}_2 / \Omega_1) \).

### 4. An Example

**Example 1.** Taking problems (1)–(3) with respect to

\[ \alpha = \frac{5}{2}, \]

\[ \kappa (r) = 2, \]

\[ A(r, v(r)) = \left[ -\frac{1}{30} e^{-r} v(r) + \frac{1}{\lambda^2 (1 + r^{3/2}) (1 + r^2)} \right] \]

\[ \lambda \in \mathbb{N}. \]

\[ (120) \]

First, if \( a(r, v(r)) \in A(r, v(r)) \), we obtain

\[ a(r, v(r)) = \frac{1}{30} e^{-r} v(r) + \frac{1}{\lambda^2 (1 + r^{3/2}) (1 + r^2)} \]

\[ = \frac{1}{1 + r^{3/2}} \left[ -\frac{1}{30} e^{-r} (1 + r^{3/2})^2 \frac{v(r)}{(1 + r^{3/2})} + \frac{1}{\lambda^2 (1 + r^2)} \right]. \]

(121)

From that we will take

\[ q(r) = \frac{1}{1 + r^{3/2}}, \]

\[ q_0 = 1, \]

\[ B(r, v(r)) = \left[ -\frac{1}{30} e^{-r} (1 + r^{3/2})^2 \frac{v(r)}{(1 + r^{3/2})} + \frac{1}{\lambda^2 (1 + r^2)} \right] \]

\[ \lambda \in \mathbb{N}, \]

\[ \beta(r, v(r)) = \frac{1}{30} e^{-r} (1 + r^{3/2})^2 \frac{v(r)}{(1 + r^{3/2})} + \frac{1}{\lambda^2 (1 + r^2)} \]

\[ (122) \]

Also,

\[ \beta (r, v(r)) \leq |\beta (r, v(r))| \]

\[ \leq \eta_1 (r) \frac{v(r)}{(1 + r^{3/2})} + \eta_2 (r) \]

\[ \Rightarrow |\beta (r, v(r))| \geq -\eta_1 (r) \frac{v(r)}{(1 + r^{3/2})} - \eta_2 (r) \]

\[ \Rightarrow |\beta (r, v(r))| \leq 2|\beta (r, v(r))| + \eta_1 (r) \frac{v(r)}{(1 + r^{3/2})} + 3\eta_2 (r) \]

\[ \Rightarrow |\gamma_1 (r)| = \gamma_0 = 2, \gamma_2 (r) = \eta_1 (r), \gamma_3 (r) = 3\eta_2 (r). \]

(124)

So, \( \mathcal{H}_3 \) is held.

To explore \( \mathcal{H}_3 \), we need to compute the values hereinafter:

\[ \mathcal{H}_3 \]

\[ (123) \]
\[
\Gamma\left(\frac{5}{2}\right) = \frac{3}{4}\sqrt{\pi},
\]
\[
\Gamma\left(\frac{5}{2}\right) + \frac{7}{2} = 4.829 < 30, \quad (125)
\]
\[
2\left(\Gamma\left(\frac{5}{2}\right) + \frac{1}{2}\right) = 3.659 < 30,
\]
\[
2\left(\Gamma\left(\frac{5}{2}\right) + \frac{1}{2}\right) + \frac{7}{2} = 17.66901 < 30.
\]

Now, we can illustrate that (\mathcal{R}_3) is useful as follows:
\[
q(\tau)\theta(\tau) = \frac{1}{30}e^{-\tau}(1 + r^{3/2})
\]
\[
\Rightarrow e^{r}q(\tau)\theta(\tau) = \frac{1}{30}(1 + r^{3/2})
\]
\[
\leq \frac{1 + r^{3/2}}{\Gamma(5/2) + (7/2)}.
\]
\[
\int_{0}^{\infty} q(\tau)\theta(\tau)d\tau = \frac{1}{30}(\Gamma(5/2) + 1)
\]
\[
\leq \frac{\Gamma(5/2) + 1}{2(\Gamma(5/2) + (1/2))(\Gamma(5/2) + (7/2))},
\]
\[
\delta = 0.887655 < 1. \quad (126)
\]

At the last, by calculating the upcoming values, we see that (\mathcal{R}_4) is verified:
\[
\eta_0 = \frac{3\sqrt{\pi}}{4(60)} = \frac{3\sqrt{\pi}}{240},
\]
\[
q_0 = \frac{240}{3\sqrt{\pi}},
\]
\[
\theta_0 = 1,
\]
\[
\gamma_0 = 2,
\]
\[
\Gamma_0 = 61,
\]
\[
\frac{q_0\Gamma_0}{\Gamma(5/2)} = \frac{244}{3\sqrt{\pi}},
\]
\[
\frac{6q_0}{\gamma_0\Gamma(5/2)} = \frac{3}{3\sqrt{\pi}},
\]
\[
\int_{0}^{\infty} \eta_2(t)dt = \frac{\pi}{2},
\]
\[
R_0 = \frac{\pi}{2}\left(\frac{244}{3\sqrt{\pi}}\right) = \frac{122\sqrt{\pi}}{3}. \quad (127)
\]

By adopted upshots and Theorem 2, the presented problem seems to be solvable.

### 5. Conclusion

Academically, we analyzed the potentialities of having a positive solution in unbounded domain (on the half line) for the presumed inclusion problems (1)–(3). As we see, getting the positive solution at resonance was contingent with using O’Regan and Zima, Theorem 1. In the way to see the importance of the new upshots, we spelled out by example. We picked out these ramifications, and fortunately we can verify them for the sake of finding some extent applications in the other scientific fields.

### Data Availability

The data used to support the findings of this study are available from the corresponding author upon request.

### Conflicts of Interest

The authors declare that they have no conflicts of interest.

### Acknowledgments

This project was funded by the Deanship of Scientific Research (DSR), King Abdulaziz University, Jeddah, under Grant no. D-028-130-1438. The authors, therefore, gratefully acknowledge DSR for their technical and financial support.
