COHEN-MACULAULAYNESS AND CANONICAL MODULE OF RESIDUAL INTERSECTIONS

MARC CHARDIN, JOSÉ NAELITON, AND QUANG HOA TRAN

Abstract. We show the Cohen-Macaulayness and describe the canonical module of residual intersections $J = a: R^I$ in a Cohen-Macaulay local ring $R$, under sliding depth type hypotheses. For this purpose, we construct and study, using a recent article of Hassanzadeh and the second named author [11], a family of complexes that contains important informations on a residual intersection and its canonical module. We also determine several invariants of residual intersections as the graded canonical module, the Hilbert series, the Castelnuovo-Mumford regularity and the type. Finally, whenever $I$ is strongly Cohen-Macaulay, we show duality results for residual intersections that are closely connected to results by Eisenbud and Ulrich [6]. It establishes some tight relations between the Hilbert series of some symmetric powers of $I/a$. We also provide closed formulas for the types and for the Bass numbers of some symmetric powers of $I/a$.

Keyword: Residual intersection, sliding depth, strongly Cohen-Macaulay, approximation complex, perfect pairing.

1. Introduction

The concept of residual intersection was introduced by Artin and Nagata in [1], as a generalization of linkage; it is more ubiquitous, but also harder to understand. Geometrically, let $X$ and $Y$ be two irreducible closed subschemes of a scheme $Z$ with $\text{codim}_Z(X) \leq \text{codim}_Z(Y) = s$ and $Y \not\subseteq X$, then $Y$ is called a residual intersection of $X$ if the number of equations needed to define $X \cup Y$ as a subscheme of $Z$ is the smallest possible, i.e. $s$. For a ring $R$ and a finitely generated $R$-module $M$, let $\mu_R(M)$ denotes the minimum number of generators of $M$.

The precise definition of a residual intersection is the following.

Definition 1.1. Let $R$ be a Noetherian ring, $I$ be an ideal of height $g$ and $s \geq g$ be an integer.
(1) An s-residual intersection of I is a proper ideal J of R such that \( \text{ht}(J) \geq s \) and \( J = (a: R I) \) for some ideal \( a \subseteq I \) which is generated by \( s \) elements.

(2) An arithmetic s-residual intersection of I is an s-residual intersection J of I such that \( \mu_p(I_a) \leq 1 \) for all prime ideal \( p \) with \( \text{ht}(p) \leq s \).

(3) A geometric s-residual intersection of I is an s-residual intersection J of I such that \( \text{ht}(I + J) \geq s + 1 \).

Notice that an s-residual intersection is a direct link if I is unmixed and \( s = \text{ht}(I) \). Also any geometric s-residual intersection is arithmetic.

The theory of residual intersections is a center of interest since the 80’s, after Huneke repaired in [16] an argument of Artin and Nagata in [1], introducing the notion of strongly Cohen-Macaulay ideal: an ideal such that all its Koszul homology is Cohen-Macaulay. The notion of strong Cohen-Macaulayness is stable under even linkage, in particular ideals linked to a complete intersection satisfy this property.

In [16] Huneke showed that if \( R \) is a Cohen-Macaulay local ring, \( J \) is a s-residual intersection of a strongly Cohen-Macaulay ideal \( I \) of \( R \) satisfying \( G_s \), then \( R/J \) is Cohen-Macaulay of codimension \( s \). Following [1], one says that \( I \) satisfies \( G_s \) if the number of generators \( \mu_p(I_p) \) is at most \( \dim(R_p) \) for all prime ideals \( p \) with \( I \subseteq p \) and \( \dim(R_p) \leq s - 1 \) and that \( I \) satisfies \( G_\infty \) if \( I \) satisfies \( G_s \) for all \( s \). Later, Herzog, Vasconcelos, and Villarreal in [17] replaced the assumption strong Cohen-Macaulayness by the weaker sliding depth condition, for geometric residuals, but they also showed that this assumption cannot be weakened any further. On the other hand, Huneke and Ulrich proved in [15] that the condition \( G_s \) is superfluous for ideals in the linkage class of a complete intersection, and more precisely:

**Theorem.** [15] Let \( R \) be a Gorenstein local ring and \( J \) be an ideal of height \( g \) that is evenly linked to a strongly Cohen-Macaulay ideal \( I \) of \( R \) satisfying \( G_\infty \). If \( J = a: R I \) is an s-residual intersection of \( I \), then \( R/J \) is Cohen-Macaulay of codimension \( s \) and the canonical module of \( R/J \) is the \( (s - g + 1) \)-th symmetric power of \( I/a \).

Let us notice that, in the proof of this statement, it is important to keep track of the canonical module of the residual along the deformation argument that they are using.

A natural question is then to know if the \( G_s \) assumption is at all needed to assert that residuals of ideals that are strongly Cohen-Macaulay, or satisfy the weaker sliding depth condition, are always Cohen-Macaulay, and to describe the canonical module of the residual. In this direction, Hassanzadeh and the second named author remarked in [11] that the following long-standing assertions were, explicitly or implicitly, conjectured:

**Conjectures.** [15, 22, 4] Let \( R \) be a Cohen-Macaulay local (or “local”) ring and \( I \) is strongly Cohen-Macaulay, or even just satisfy sliding depth. Then, for any s-residual intersection \( J = (a: R I) \) of \( I 

  (1) \( R/J \) is Cohen-Macaulay.

  (2) The canonical module of \( R/J \) is the \( (s - g + 1) \)-th symmetric power of \( I/a \), if \( R \) is Gorenstein, with \( g = \text{ht}(I) \leq s \).

  (3) \( a \) is minimally generated by \( s \) elements.

  (4) \( J \) is unmixed.

  (5) When \( R \) is positively graded over a field, the Hilbert series of \( R/J \) depends only upon \( I \) and the degrees of the generators of \( a \).

The first conjecture was shown by Hassanzadeh [8] for arithmetic residual intersections, thus in particular for geometric residual intersections, under the sliding depth condition. In the recent article [11], Hassanzadeh and the second named
conjectures are true if $\text{depth}(R/I) \geq \dim(R) - s$ and $I$ satisfies the sliding depth condition.

In this text we will complete the picture, by showing that the first and fifth conjectures hold whenever $I$ satisfies $\mathcal{SD}_1$ and that the second conjecture is true if $I$ satisfies $\mathcal{SD}_2$ – recall that an ideal $I = (f) = (f_1, \ldots, f_r)$ of height $g$ in a Noetherian local ring $R$ of dimension $d$ satisfies $\mathcal{SD}_k (k \geq 0)$ if $\text{depth}(H_i(f; R)) \geq \min\{d - g, d - r + i + k\}$ for all $i \geq 0$; note that $\mathcal{SD}_0$ is the sliding depth condition and $\mathcal{SD}_\infty$, that is $\mathcal{SD}_k$ for all $k \geq 0$, is strong Cohen-Macaulayness.

In particular all items in the conjecture holds for strongly Cohen-Macaulay ideals. The following puts together part of these results:

**Theorem** (Theorems 4.5, 4.8 and 6.2). Let $(R, m)$ be a Cohen-Macaulay local ring with canonical module $\omega$. Assume that $J = (a: R I)$ is an $s$-residual intersection of $I$ with $a \subset I$ and $\text{ht}(I) = g \leq s = \mu_R(a)$. Then

(i) $R/J$ is Cohen-Macaulay of codimension $s$ if $I$ satisfies $\mathcal{SD}_1$.

If furthermore $\text{Tor}_1^R(R/I, \omega) = 0$, then

(ii) $\omega_{R/J} \simeq \text{Sym}^{s-g+1}(I/a) \otimes_R \omega$, provided $I$ satisfies $\mathcal{SD}_2$.

(iii) $\omega_{\text{Sym}^b(I/a)} \simeq \text{Sym}_{g+1-k}(I/a) \otimes_R \omega$ for $1 \leq k \leq s - g$, provided $I$ is strongly Cohen-Macaulay.

Notice that $\text{Tor}_1^R(R/I, \omega) = 0$ if $R$ is Gorenstein or $I$ has finite projective dimension.

A key ingredient of our proofs is a duality result between some of the first symmetric powers of $I/a$ together with a description of the canonical module of the residual as in items (ii) and (iii) above. This could be compared to recent results of Eisenbud and Ulrich that obtained similar dualities under slightly different hypotheses in [6]. In their work, conditions on the local number of generators are needed and depth conditions are asked for some of the first powers of the ideal $I$, along the lines of [23], and the duality occurs between powers $I^t/aI^{t-1}$ in place of symmetric powers $\text{Sym}^t(I/a)$. Although their results and ours coincide in an important range of situations, like for geometric residuals of strongly Cohen-Macaulay ideals sating $G_s$, the domains of validity are quite distinct. We prove the following.

**Theorem** (Theorem 6.7). Let $(R, m)$ be a Gorenstein local ring and let $a \subset I$ be two ideals of $R$, with $\text{ht}(I) = g$. Suppose that $J = (a: R I)$ is an $s$-residual intersection of $I$. If $I$ is strongly Cohen-Macaulay, then $\omega_{R/J} \simeq \text{Sym}^{s-g+1}(I/a)$ and for all $0 \leq k \leq s - g + 1$

(i) the $R/J$-module $\text{Sym}^b_{R/J}(I/a)$ is faithful and Cohen-Macaulay,

(ii) the multiplication

$$\text{Sym}^b_{R/J}(I/a) \otimes_{R/J} \text{Sym}^{s-g+1-k}_{R/J}(I/a) \rightarrow \text{Sym}^{s-g+1}_{R/J}(I/a)$$

is a perfect pairing,

(iii) setting $A := \text{Sym}_{R/J}(I/a)$, the graded $R/J$-algebra

$$A := A_{>s-g+1} = \bigoplus_{i=0}^{s-g+1} \text{Sym}^i_{R/J}(I/a)$$

is Gorenstein.
The paper is organized as follows.

In Section 2 we collect the notations and general facts about Koszul complexes. We prove duality results for Koszul cycles in Propositions 2.2 and 2.4. We also describe the structure of the homology modules of the approximation complexes in Propositions 2.5 and 2.6.

In Section 3 we construct a family of residual approximation complex, all of same finite size, \{\hat{Z}^i\}_{i \in \mathbb{Z}}. This family is a generalization of the family \{\hat{k}Z^i\}_{i \in \mathbb{Z}} that is built in the recent article [11] by Hassanzadeh and the second named author. We study the properties of these complexes, of particular complexes \hat{\omega} \hat{k}Z^i, where \omega is the canonical module of \hat{R}. The main results of this section are Propositions 3.2, 3.3 and 3.5.

In Section 4 we prove one of the main results of this paper: the Cohen-Macaulayness and the description of the homology modules of approximation complexes with coefficients and \omega,\{\hat{Z}^i\},\{\hat{k}Z^i\} and [21, 12, 13, 14]. We give some results on the duality for Koszul cycles and approximation complexes. The reader can consult for instance [2, Chapter 1] and 5.3.

In Section 5 we study the stability of Hilbert functions and Castelnuovo-Mumford regularity of residual intersections. Using the acyclicity of \hat{\omega} \hat{k}Z^i, Proposition 5.1 says that the Hilbert function of \hat{R}/J only depends on the degrees of the generators of \hat{a} and the Koszul homologies of \hat{I}. The graded structure of the canonical module of \hat{R}/J in Proposition 5.3 is the key to derive the Castelnuovo-Mumford regularity of residual intersection in Corollary 5.4.

Finally, in Section 6 we consider the case where \hat{I} is strongly Cohen-Macaulay. The main results of this section are Theorems 6.2 and 6.7. In particular, for 1 \leq k \leq s - g,

\omega_{\text{Sym}^k(I/\hat{a})} \simeq \text{Sym}_R^{s-g+1-k}(I/\hat{a}) \otimes_R \omega,

whenever \text{Tor}^R_1(R/I, \omega) = 0. Consequently, we obtain some tight relations between the Hilbert series of the symmetric powers of \hat{I}/\hat{a} in Corollary 6.8. We also give the closed formulas for the types and for the Bass number of some symmetric powers of \hat{I}/\hat{a} in Corollaries 6.9 and 6.10 respectively.

2. Koszul cycles and approximation complexes

In this section we collect the notations and general facts about Koszul complexes and approximation complexes. The reader can consult for instance [2, Chapter 1] and 21 [12, 13, 14]. We give some results on the duality for Koszul cycles and describe the 0-th homology modules of approximation complexes with coefficients in a module.

Assume that \hat{R} is a Noetherian ring, \hat{I} = (f_1, \ldots, f_r) is an ideal of \hat{R}. Let \hat{M} be a finitely generated \hat{R}-module. The symmetric algebra of \hat{M} is denoted by \text{Sym}_\hat{R}(\hat{M}) and the k-th symmetric power of \hat{M} is denoted by \text{Sym}^k\hat{R}(\hat{M}). We consider \hat{S} = \hat{R}[T_1, \ldots, T_r] as a standard graded algebra over \hat{S}_0 = \hat{R}. For a graded \hat{S}-module \hat{N}, the k-th graded component of \hat{N} is denoted by \hat{N}[k]. We make \text{Sym}_\hat{R}(\hat{I}) an \hat{S}-algebra via the graded ring homomorphism \hat{S} \rightarrow \text{Sym}_\hat{R}(\hat{I}) sending \hat{T}_i to \hat{f}_i as an element of \text{Sym}_\hat{R}(\hat{I})[1] = \hat{I}, and write \text{Sym}_\hat{R}(\hat{I}) = \hat{S}/\hat{I}.
For a sequence of elements $x$ in $R$, we denote the Koszul complex by $K_*(x; M)$, its cycles by $Z_i(x; M)$, its boundaries by $B_i(x; M)$ and its homologies by $H_i(x; M)$. If $M = R$, then we denote, for simplicity, $K_i, Z_i, B_i, H_i$. To set more notation, when we draw the picture of a double complex obtained from a tensor product of two complexes (in the sense of [25, 2.7.1]) which at least one of them is finite, say $A \otimes B$ where $B$ is finite, we always put $A$ in the vertical and $B$ in the horizontal one. We also label the module which is in the up-right corner by $(0, 0)$ and consider the labels for the rest, as the points in the third-quadrant.

**Lemma 2.1.** Let $R$ be a ring and let $I = (f_1, \ldots, f_r)$ be an ideal of $R$. If $I = R$, then $Z_i \simeq \bigwedge R^{r-1}$.

**Proof.** Since $I = R$, $H_i = 0$, for all $i$ by [2] Proposition 1.6.5(c)]. The result follows from the fact that the Koszul complex is split exact in this case. \qed

Let us recall the conditions $S_k$ of Serre. Let $R$ be a Noetherian ring, and $k$ a non-integer. A finitely generated $R$-module $M$ satisfies Serre’s condition $S_k$ if

$$\text{depth}(M_p) \geq \min\{k, \dim M_p\}$$

for every prime ideal $p$ of $R$.

Let $(R, m)$ be a Noetherian local ring. The local cohomology modules of an $R$-module $M$ are denoted by

$$H^i_m(M) : H^i_m(M) = \lim_{\to} \text{Ext}^i_R(R/m^n, M).$$

The local cohomology functors $H^i_m$ are the right-derived functors of $H^0_m$. The local cohomology can also be computed with the Čech complex $C_m^*$ constructed on a parameter system of $R$ : $H^i_m(M) = H^i(M \otimes_R C_m^*)$.

Duality results for Koszul homology modules over Gorenstein rings have been obtained by several authors, for instance in [9] [5] [13]. For Koszul cycles, the following holds.

**Proposition 2.2.** Let $(R, m)$ be a Noetherian local ring and let $I = (f_1, \ldots, f_r)$ be an ideal of $R$. Suppose that $R$ satisfies $S_2$ and $\text{ht}(I) \geq 2$. Then, for all $0 \leq i \leq r-1$,

$$Z_i \simeq \text{Hom}_R(Z_{r-1-i}, R).$$

**Proof.** The inclusions $Z_i \hookrightarrow K_i = \bigwedge R^i$ and $Z_{r-1-i} \hookrightarrow K_{r-1-i} = \bigwedge R^{r-1-i}$ induce a map

$$\varphi_i : Z_i \times Z_{r-1-i} \longrightarrow K_i \times K_{r-1-i} \longrightarrow K_{r-1},$$

where the last map is the multiplication of the Koszul complex, which is a differential graded algebra, and $\text{Im}(\varphi_i) \subset Z_{r-1} \simeq K_r \simeq R$. It follows that $\varphi_i$ induces a map

$$\psi_i : Z_i \longrightarrow \text{Hom}_R(Z_{r-1-i}, R).$$

We induct on the height to show that for every $p \in \text{Spec}(R)$, $(\psi_i)_p$ is an isomorphism. If $\text{ht}(p) < 2$, then $I_p = R_p$, by Lemma 2.1

$$(Z_i)_p \simeq \bigwedge R^{i-1}_p \quad \text{and} \quad (Z_{r-1-i})_p \simeq \bigwedge R^{r-1-i}_p$$

and [2] Proposition 1.6.10(b)] shows that $(\psi_i)_p$ is an isomorphism.

Suppose that $\text{ht}(p) \geq 2$ and $(\psi_i)_p$ is an isomorphism for all prime contained properly in $p$. Replacing $R$ by $R_p$ and $m$ by $pR_p$, we can suppose that $\psi_i$ is an isomorphism on the punctured spectrum : the kernel and the cokernel of $\psi_i$ are
annihilated by a power of \( m \). It follows that \( H^0_m(\text{Ker}(\psi_i)) = H^0_m(\text{Coker}(\psi_i)) = 0 \) for \( j > 0 \). Since \( R \) satisfies \( S_2 \), \( \text{depth}(Z_i) \geq \min\{2, \text{depth}(R)\} = 2 \). The exact sequence
\[
0 \longrightarrow \text{Ker}(\psi_i) \longrightarrow Z_i \longrightarrow \text{Im}(\psi_i) \longrightarrow 0
\]
implies that \( \text{Ker}(\psi_i) = H^0_m(\text{Coker}(\psi_i)) = 0 \). Observing that
\[
\text{depth}(\text{Hom}_R(Z_{r-1-i}, R)) \geq \min\{2, \text{depth}(R)\} = 2,
\]
the exact sequence
\[
0 \longrightarrow Z_i \longrightarrow \text{Hom}_r(Z_{r-1-i}, R) \longrightarrow \text{Coker}(\psi_i) \longrightarrow 0
\]
implies that \( \text{Coker}(\psi_i) = H^0_m(\text{Coker}(\psi_i)) = 0 \). \[\square\]

To fix the terminology we will use, we recall some notations and definitions. Let \((R, m)\) be a Noetherian local ring. The injective envelope of the residue field \( R/m \) is denoted by \( E(R/m) \) (or by \( E \) when the ring is clearly identified by the context). The Matlis dual of an \( R \)-module \( M \) is the module \( M^\vee = \text{Hom}_R(M, E(R/m)) \). The Matlis duality functor is exact, sends Noetherian modules to Artinian modules and Artinian modules to Noetherian modules, and preserves annihilators.

When the module \( M \) is finitely generated, we have \( M^{\vee \vee} \cong \hat{M} \), the \( m \)-adic completion of \( M \), while \( X \cong X^{\vee \vee} \) when the module \( X \) is of finite length.

When \( R \) is the homomorphic image of a Gorenstein local ring \( A \), the canonical module of a finitely generated \( R \)-module \( M \), denoted by \( \omega_M \), is defined by
\[
\omega_M := \text{Ext}_A^{m-n}(M, A)
\]
where \( m = \dim(A) \) and \( n = \dim(M) = \dim(R/\text{ann}_R(M)) \). This module does not depend on \( A \). By the local duality theorem
\[
H^0_m(M) \cong \omega_M^\vee.
\]

We are particularly interested in the case that \( R \) admits the canonical module, hence in the sequel we assume that \( R \) is the quotient of a Gorenstein ring and write \( \omega \) for the canonical module of \( R \). Whenever \( R \) is Cohen-Macaulay, \( \omega \) is a canonical module of \( R \) in the sense of \cite[Definition 3.3.1]{2}.

If \( R \) is a Gorenstein local ring, \( \omega \cong R \), therefore, by Proposition \ref{2.2}
\[
\omega_{Z_p} \cong Z_{r-1-p}
\]
for all \( 0 \leq p \leq r-1 \). To generalize this result, we will use a result of Herzog and Kunz,

**Lemma 2.3.** \cite[Lemma 5.8]{10} Let \((R, m)\) be a Noetherian local ring and let \( M, N \) be two finitely generated \( R \)-modules. If \( \hat{M} \cong \hat{N} \), then \( M \cong N \).

We will denote by \( Z^\vee_i := Z_i(f; \omega) \) the module of \( i \)-th Koszul cycle, with \( f = f_1, \ldots, f_r \).

**Proposition 2.4.** Let \((R, m)\) be a Noetherian local ring of dimension \( d \) which is an epimorphic image of a Gorenstein ring. Suppose that \( I = (f_1, \ldots, f_r) \) is an ideal of \( R \), with \( \text{ht}(I) \geq 2 \). Then, for all \( 0 \leq p \leq r-1 \),
\[
\omega_{Z^\vee_p} \cong Z_{r-1-p}^{2n}.
\]
Moreover, if \( R \) satisfies \( S_2 \), then
\[
\omega_{Z^\vee_p} \cong Z_{r-1-p}.
\]
Proof. For simplicity, set $\omega := \omega_R$. First we consider the truncated complexes

$$K^{r,p}_m : 0 \rightarrow K_r \rightarrow \cdots \rightarrow K_{p+1} \rightarrow Z_p \rightarrow 0.$$ 

The double complex $C^*(K^{r,p}_m)$ gives rise to two spectral sequences. The second terms of the horizontal spectral are

$$H^0_m(K_r) \rightarrow \cdots \rightarrow H^0_m(K_{p+1}) \rightarrow H^0_m(Z_p) \rightarrow 0$$

and the first terms of the vertical spectral are

$$0 \rightarrow H^0_m(K_r) \rightarrow \cdots \rightarrow H^0_m(K_{p+1}) \rightarrow H^0_m(Z_p) \rightarrow 0.$$ 

Since $I$ annihilates $H_i$, $\dim(H_i) = \dim(R/I) \leq \dim(R) - \text{ht}(I) \leq d - 2$ if $H_i \neq 0$. Therefore, $H^d_m(H_i+p) = 0$, for all $j > d - 2$. The comparison of two spectral sequences gives a short exact sequence

$$(2.1) \quad H^d_m(K_{p+2}) \rightarrow \cdots \rightarrow H^d_m(K_{p+1}) \rightarrow H^d_m(Z_p) \rightarrow 0.$$ 

By local duality

$$H^d_m(K_i) \simeq \text{Hom}_R(K_i,\omega)^\vee \simeq (\text{Hom}_R(K_i,R) \otimes_R \omega)^\vee \simeq (K_{r-i} \otimes_R \omega)^\vee = K_{r-i}(f;\omega)^\vee.$$ 

Thus the exact sequence $(2.1)$ provides an exact sequence

$$K_{r-p-2}(f;\omega) \rightarrow \cdots \rightarrow K_{r-p-1}(f;\omega) \rightarrow H^d_m(Z_p) \rightarrow 0$$

that gives $H^d_m(Z_p) = Z^r_{r-1-p}$. Then the first isomorphism follows from this isomorphism, the local duality, and Lemma 2.33.

The second assertion is proved similarly, by considering the truncated complexes

$$K^{\omega,p}_m : 0 \rightarrow K_r(f;\omega) \rightarrow \cdots \rightarrow K_{p+1}(f;\omega) \rightarrow Z_p^\omega \rightarrow 0$$

and the double complex $C^*(K^{\omega,p}_m)$.

Since $I$ annihilates $H_i(f;\omega_i)$, $\dim(H_i(f;\omega)) \leq \dim(R) - \text{ht}(I) \leq d - 2$, for all $0 \leq i \leq r - 2$. Thus $H^d_m(H_i(f;\omega)) = 0$, for all $j > d - 2$ and $0 \leq i \leq r - 2$. By comparing two spectral sequences, we also obtain a short exact sequence

$$(2.2) \quad H^d_m(K_{p+2}(f;\omega)) \rightarrow \cdots \rightarrow H^d_m(K_{p+1}(f;\omega)) \rightarrow H^d_m(Z_p) \rightarrow 0.$$ 

By local duality

$$H^d_m(K_i(f;\omega)) \simeq H^d_m(K_i \otimes_R \omega) \simeq \text{Hom}_R(K_i \otimes_R \omega,\omega)^\vee \simeq \text{Hom}_R(K_i,\text{Hom}_R(\omega,\omega)^\vee) \simeq \text{Hom}_R(K_i,R)^\vee \simeq K_{r-i}^\vee$$

as $\text{Hom}_R(\omega,\omega) \simeq R$ since $R$ satisfies $S_2$.

The exact sequence $(2.2)$ provides an exact sequence

$$K_{r-p-2}^\vee \rightarrow K_{r-p-1}^\vee \rightarrow H^d_m(Z_p^\omega) \rightarrow 0$$

which shows that $H^d_m(Z_p^\omega) \simeq Z_p^\vee$. \qed
Now we describe the 0-th homology module of approximation complexes. These complexes was introduced in [21] and systematically developed in [12] and [13]. Recall that the approximation complex $Z_\bullet(f; M)$ is

$$0 \to Z_r^M \otimes_R S(-r) \to \cdots \to Z_1^M \otimes_R S(-1) \xrightarrow{\partial_T^M} Z_0^M \otimes_R S \to 0$$

that can be written

$$0 \to Z_r^M[T](-r) \to \cdots \to Z_1^M[T](-1) \xrightarrow{\partial_T^M} M[T] \to 0$$

where $T = T_1, \ldots, T_r$ and $Z_i^M = Z_i(f; M)$ is the $i$-th Koszul cycle of $K_\bullet(f; M)$. By the definition,

$$(2.3) \quad H_0(Z_\bullet(f; M)) \simeq M[T_1, \ldots, T_r]/\Sigma_M,$$

where $\Sigma_M$ is the submodule of $M[T_1, \ldots, T_r]$ generated by the linear forms $c_1T_1 + \cdots + c_rT_r$ with $(c_1, \ldots, c_r) \in Z_1^M$.

Let $F_\bullet$ be a free resolution of $R/I$ of the form

$$\cdots \to F_1 \xrightarrow{\delta} R^r \to R \to 0,$$

where $F_1$ is the free $R$-module indexed by a generating set of $Z_1$. By the definition,

$$\text{Tor}^R_1(R/I, M) = Z_1^M/\text{Im}(\delta \otimes 1_M) \hookrightarrow M^r/\text{Im}(\delta \otimes 1_M),$$

where $1_M$ denote the identity morphism on $M$. Note that $\delta$ is induced by the inclusion $Z_1 \hookrightarrow R^r$. Therefore, $\text{Im}(\delta \otimes 1_M) = (\delta \otimes 1_M)(Z_1 \otimes_R M)$ and we obtain an exact sequence

$$(2.4) \quad Z_1 \otimes_R M \xrightarrow{\delta \otimes 1_M} Z_1^M \to \text{Tor}^R_1(R/I, M) \to 0.$$

Let $\mathfrak{L}$ be the submodule of $S = R[T_1, \ldots, T_r]$ generated by the linear forms $c_1T_1 + \cdots + c_rT_r$ with $(c_1, \ldots, c_r) \in Z_1$. Then the exact sequence

$$0 \to \mathfrak{L} \xrightarrow{\theta} S \to \text{Sym}_R(I) \to 0$$

provides an exact sequence

$$\cdots \to \mathfrak{L} \otimes_R M \xrightarrow{\theta \otimes 1_M} M[T_1, \ldots, T_r] \to \text{Sym}_R(I) \otimes_R M \to 0.$$

The image of $\theta \otimes 1_M$ is denoted by $\Sigma M$. It follows that

$$(2.5) \quad \text{Sym}_R(I) \otimes_R M \simeq M[T_1, \ldots, T_r]/\Sigma M.$$ 

Notice that $\Sigma M$ is the submodule of $M[T_1, \ldots, T_r]$ generated by the linear forms $c_1T_1 + \cdots + c_rT_r$ with $(c_1, \ldots, c_r) \in \text{Im}(\delta \otimes 1_M) \subset Z_1^M$; thus $\Sigma M \subset \Sigma M$.

Let $\mathfrak{L}'$ be the submodule of $M[T_1, \ldots, T_r]/\Sigma M$ generated by the linear forms $c_1T_1 + \cdots + c_rT_r + \Sigma M$ with $(c_1, \ldots, c_r) + \text{Im}(\delta \otimes 1_M) \in \text{Tor}^R_1(R/I, M)$. Then

$$\mathfrak{L}' \simeq \Sigma M/\Sigma M.$$

It follows that

$$M[T_1, \ldots, T_r]/(\Sigma M + \mathfrak{L}') \simeq M[T_1, \ldots, T_r]/(\Sigma M)/\mathfrak{L}' \simeq (M[T_1, \ldots, T_r]/\Sigma M)/(\Sigma M/\mathfrak{L}) \simeq M[T_1, \ldots, T_r]/\Sigma M.$$

Thus we have already proved the following.
Proposition 2.5. Let $R$ be a Noetherian ring and let $I = (f_1, \ldots, f_r)$ be an ideal of $R$. Assume that $M$ is a finitely generated $R$-module. Then

$$H_0(\mathcal{Z}_*(f; M)) \simeq M[T_1, \ldots, T_r]/(\mathcal{L}M + \mathcal{L}')$$

where $\mathcal{L} \subset S$ is the defining ideal of $\text{Sym}_R(I)$ and $\mathcal{L}'$ is spanned by generators of $\text{Tor}^1(R/I, M)$.

Proposition 2.6. Let $R$ be a Noetherian ring and let $I = (f_1, \ldots, f_r)$ be an ideal of $R$. Assume that $M$ is a finitely generated $R$-module. Then there exists a natural epimorphism

$$\varphi : \text{Sym}_R(I) \otimes_R M \longrightarrow H_0(\mathcal{Z}_*(f; M))$$

that equals $H_0(\mathcal{Z}_*(f; R)) \simeq \text{Sym}_R(I)$ when $M = R$. Furthermore, $\varphi$ is an isomorphism if and only if $\text{Tor}^1(R/I, M) = 0$.

Proof. As $\mathcal{L} M \subset \mathcal{L}_M$, we can define an epimorphism

$$\varphi : \text{Sym}_R(I) \otimes_R M \longrightarrow H_0(\mathcal{Z}_*(f; M))$$

by (2.3) and (2.5). Moreover, the kernel of $\varphi$ is isomorphic to $\mathcal{L}_M/\mathcal{L} M$. Thus $\text{Tor}^1(R/I, M) = 0$ if and only if $\varphi$ is an isomorphism. \(\square\)

3. Residual approximation complexes

Assume that $R$ is a Noetherian ring of dimension $d$, $I = (f) = (f_1, \ldots, f_r)$ is an ideal of height $g$. Let $a = (a_1, \ldots, a_s)$ be an ideal contained in $I$ with $s \geq g$. Set $J = a: R I, S = R[T_1, \ldots, T_r]$ and $\mathcal{g} := (T_1, \ldots, T_r)$. We write $a_i = \sum_{j=1}^r c_{ij} f_j$, and

$$\gamma_i = \sum_{j=1}^r c_{ij} T_j.$$ Notice that the $\gamma_i$'s depend on how one expresses the $a_i$'s as a linear combination of the $f_j$'s. Set $\gamma = \gamma_1, \ldots, \gamma_s$. Finally, for a graded module $N$, we define $\text{end}(N) := \sup\{\mu \mid N_\mu \neq 0\}$ and $\text{indeg}(N) := \inf\{\mu \mid N_\mu \neq 0\}$.

Let $M$ be a finitely generated $R$-module. We denote by $\mathcal{Z}_*(f; M)$ the approximation complex associated to $f$ with coefficients in $M$ and by $K_0(\gamma; S)$ the Koszul complex associated to $\gamma$ with coefficients in $S$. Let $D_0^\bullet = \text{Tot}(\mathcal{Z}_*(f; M) \otimes_S K_0(\gamma; S))$. Then,

$$D_i^M = \bigoplus_{j=i-s}^i (\mathcal{Z}_j^M \otimes_R S)^{(-j)(-i)},$$

with $Z_i^M = 0$ for $j < 0$ or $j > r$, and for $j = r$ unless $\text{depth}_R(M) = 0$.

In what follows, we assume that $\text{depth}_R(M) > 0$, (hence $Z^M_r = 0$), in order that the complexes we construct have length $s$.

We recall that the $k$-th graded component of a graded $S$-module $N$ is denoted by $N[k]$. We have $(D_i^M)[k] = 0$ for all $k < i$. Consequently, the complex $(D_i^M)[k]$ is

$$0 \longrightarrow (D^M_0)[k] \longrightarrow (D^M_{k-1})[k] \longrightarrow \cdots \longrightarrow (D^M_i)[k] \longrightarrow 0.$$ The Čech complex of $S$ with respect to the ideal $\mathcal{g} = (T_1, \ldots, T_r)$ is denoted by $C^\bullet_0 = C^\bullet_0(S)$.

We now consider the double complex $C^\bullet_0 \otimes_S D^M_0$ that gives rise to two spectral sequences. The second terms of the horizontal spectral are

$$E^{-i,j}_{hor} = H^j_0(H_i(D^M_0))$$

and the first terms of the vertical spectral are

$$E^{-i,j}_{ver} = \begin{cases} 0 \longrightarrow H^j_0(D^M_{r+s-1}) \longrightarrow \cdots \longrightarrow H^j_0(D^M_s) \longrightarrow H^j_0(D^M_r) \longrightarrow 0 & \text{if } j = r \\ 0 & \text{otherwise} \end{cases}$$
and

\[ H^*_g(D_i^M) \simeq \bigoplus_{j=i+1-s}^i (Z^M_j \otimes_R H^*_g(S))(-i) \]

by [8, Lemma 2.1]. Since end\((H^*_g(S)) = -r\), it follows that end\((H^*_g(D_i^M)) = i - r\) if \(D_i^M \neq 0\), hence \(H^*_g(D_i^M)[i-r+j] = 0\), for all \(j \geq 1\). Hence, the \(k\)-th graded component of \(\text{I}^*\text{ver}^r\) is the complex:

\[
\begin{array}{c}
0 \rightarrow H^*_g(D_{M+k})[k] \rightarrow H^*_g(D_{M+k+1})[k] \rightarrow \cdots \rightarrow H^*_g(D_{M+k+s})[k] \rightarrow 0.
\end{array}
\]

Comparison of the spectral sequences for the two filtrations leads to the definition of the complex of length \(s\):

\[
\begin{array}{c}
MZ^+_k : 0 \rightarrow MZ^+_1 \rightarrow \cdots \rightarrow MZ^+_s \rightarrow MZ^+_0 \rightarrow 0
\end{array}
\]

wherein

\[
MZ^+_k = \begin{cases} (D_i^M)[k] & i \leq \min\{k, s\} \\ H^*_g(D_{M-i+1})[k] & i > k. \end{cases}
\]

and the morphism \(\tau_k\) is defined through the transgression. Notice that \(MZ^+_k\) is a direct generalization of the complex \(Z^*_k\) in [11, Section 2.1].

Since \(H^*_g(M \otimes_R S) \simeq M \otimes_R H^*_g(S)\) for any \(R\)-module \(M\), \(M\) \(\text{Z}^*_k\) have, like graded strands of \(D_i^M\), elements that are direct sums of Koszul cycles of \(K_*(f; M)\).

The structure of \(M\) \(\text{Z}^*_k\) is depending on the generating sets of \(I\), on the expression of the generators of \(a\) in terms of the generators of \(I\) and on \(M\). The complex \(M\) \(\text{Z}^*_k\) considered by Hassanzadeh and the second named author in [11], will be denoted by \(Z^*_k\) instead of \(M\) \(\text{Z}^*_k\).

**Definition 3.1.** The complex \(M\) \(\text{Z}^*_k\) is called the \(k\)-th residual approximation complex of \(J = a: R\) with coefficients in \(M\).

We consider the morphism

\[
M[T_1, \ldots, T_r](-1) = M \otimes_R S^*(1) \xrightarrow{1_M \otimes \partial_1^*} M \otimes_R S = M[T_1, \ldots, T_r],
\]

where \(\partial_1^*\) is the first differential of \(K_*(\gamma; S)\), and denote by \(\gamma M\) the image of \(1_M \otimes \partial_1^*\). It is the submodule of \(M[T_1, \ldots, T_r]\) generated by the linear forms \(\gamma_1, \ldots, \gamma_r\). Recall from Section 2 that we set \(\Sigma\) for the defining ideal of \(\text{Sym}_R(I)\) in \(S\) and \(\Sigma'\) for the module spanned by the linear forms correspond to generators of \(\text{Tor}_1^R(R/I, M)\).

**Proposition 3.2.** Let \(R\) be a Noetherian ring and let \(a \subset I\) be two ideals of \(R\). Suppose that \(M\) is a finitely generated \(R\)-module. Then

\[
H_0(D_i^M) \simeq M[T_1, \ldots, T_r]/(\Sigma M + \Sigma' + \gamma M)
\]

and for all \(k \geq 1\),

\[
H_0(MZ^+_k) \simeq M[T_1, \ldots, T_r][k]/(\Sigma M + \Sigma' + \gamma M)[k].
\]

**Proof.** The first isomorphism follows from the definition of \(D_i^M\) and Proposition 2.5. The last isomorphism is a consequence of the fact that, for all \(k \geq 1\), \(H_0(MZ^+_k) \simeq H_0(D_i^M)[k]\) is the \(k\)-th graded component of \(H_0(D_i^M)\). \(\square\)

**Proposition 3.3.** Let \(R\) be a Noetherian ring and let \(a \subset I\) be two ideals of \(R\). Assume that \(M\) is a finitely generated \(R\)-module. Then, for all \(k \geq 1\), there exists a natural epimorphism

\[
\psi : \text{Sym}^k_R(I/a) \otimes_R M \longrightarrow H_0(MZ^+_k).
\]

Furthermore, \(\psi\) is an isomorphism if \(\text{Tor}_1^R(R/I, M) = 0\).
Proof. As Sym$_R(I/a) \simeq$ Sym$_R(I)/a$Sym$_R(I) \simeq S/(\gamma + (\gamma))$, we have an exact sequence

\[
\varepsilon \oplus (\gamma) \longrightarrow S \longrightarrow \text{Sym}_R(I/a) \longrightarrow 0
\]

which provides a commutative diagram, with exact rows

\[
(\varepsilon \oplus (\gamma)) \otimes_R M \longrightarrow M[T] \longrightarrow \text{Sym}_R(I/a) \otimes_R M \longrightarrow 0
\]

\[
\varepsilon \otimes_R \varepsilon \longrightarrow (\gamma) \otimes_R M \longrightarrow M[T] \longrightarrow \text{Sym}_R(I/a) \otimes_R M \longrightarrow 0
\]

where $\beta$ is the inclusion $(\gamma) \hookrightarrow S$ and hence $\text{Im}(\beta \otimes 1_M) = \gamma M$. It follows that

\[
\text{Sym}_R(I/a) \otimes_R M \simeq M[T]/\text{Im}(\alpha \otimes 1_M) \simeq M[T_1, \ldots, T_r]/(\varepsilon M + \gamma M).
\]

The natural onto map

\[
M[T_1, \ldots, T_r]/(\varepsilon M + \gamma M) \longrightarrow M[T_1, \ldots, T_r]/(\varepsilon M + \varepsilon' + \gamma M)
\]

provides an epimorphism, for all $k \geq 1$,

\[
\psi : \text{Sym}_R^k(I/a) \otimes_R M \longrightarrow H_0^k(MZ^+_

by Proposition 3.2. Moreover, $\text{Tor}^R_1(R/I, M) = 0$ is equivalent to $\varepsilon_M = \varepsilon M$. Thus $\psi$ is an isomorphism if $\text{Tor}^R_1(R/I, M) = 0$.

Lemma 3.4. Let $M$ be a module over a ring $R$. Suppose that $N$ is a quotient of $M[T_1, \ldots, T_r]$, with $T_i$’s indeterminates of degree 1, by a graded submodule. Then, for all $k \geq 1$,

\[
\text{ann}_R(N_k) \subset \text{ann}_R(N_{k+1}).
\]

Proof. We consider a graded $S$-homomorphism of degree zero

\[
\vartheta : M[T_1, \ldots, T_r]^-(-1) \longrightarrow M[T_1, \ldots, T_r].
\]

\[
(g_1, \ldots, g_r) \longrightarrow \sum_{i=1}^r g_i T_i
\]

Then $\vartheta$ provides the epimorphisms of $R$-modules, for all $k \geq 1$,

\[
\vartheta_k : N_k^+ \longrightarrow N_{k+1}.
\]

We will show that $\text{ann}_R(N_k) \subset \text{ann}_R(N_{k+1})$, for all $k \geq 1$. Let $a \in \text{ann}_R(N_k)$ and $u \in N_{k+1}$. We have to show that $au = 0$. Since $\vartheta_k$ is surjective, there exist $g_1, \ldots, g_r \in N_k$ such that $u = \vartheta_k(g_1, \ldots, g_r)$. Therefore,

\[
a u = a \vartheta_k(g_1, \ldots, g_r) = \vartheta_k(a g_1, \ldots, a g_r) = \vartheta_k(0, \ldots, 0) = 0.
\]

Proposition 3.5. Let $R$ be a Noetherian ring and let $a \in I$ be two ideals of $R$. Assume that $M$ is a finitely generated $R$-module. Then $J = a :_R I$ annihilates $H_0^k(MZ^+)$, for all $k \geq 1$.

Proof. Fix $k \geq 1$. As in the proof of Lemma 3.4, the epimorphism $\psi$ in Proposition 3.2 implies that

\[
(3.1) \quad \text{ann}_R(\text{Sym}_R^k(I/a) \otimes_R M) \subset \text{ann}_R(H_0^k(MZ^+)).
\]

On the other hand, one always has

\[
(3.2) \quad \text{ann}_R(\text{Sym}_R^k(I/a)) \subset \text{ann}_R(\text{Sym}_R^k(I/a) \otimes_R M).
\]
Notice that $\text{Sym}_R(I/\mathfrak{a}) \simeq \text{Sym}_R(I)/(\gamma)\text{Sym}_R(I) \simeq S/(\mathfrak{c} + (\gamma))$. By Lemma 3.4
\[(3.3) \quad J = \text{ann}_R(I/\mathfrak{a}) \subset \text{ann}_R(\text{Sym}_R(I/\mathfrak{a})).\]

By (3.1), (3.2) and (3.3), $J \subset \text{ann}_R(\text{Sym}_R(I/\mathfrak{a}))$.

However, the structure of $H_0(M\mathbb{Z}_+)\mathbb{Z}$ is difficult to determine. We recall a definition of Hassanzadeh and the second named author in [11] Definition 2.1.

**Definition 3.6.** Let $R$ be a Noetherian ring and let $\mathfrak{a} \subset I$ be two ideals of $R$. The disguised s-residual intersection of $I$ w.r.t. $\mathfrak{a}$ is the unique ideal $K$ such that $H_0(\mathfrak{a}\mathbb{Z}_+) = R/K$.

To make use of the acyclicity of the $\mathfrak{k}\mathbb{Z}_+$ complexes, we recall the definition of classes of ideals that meet these requirements.

**Definition 3.7.** Let $(R, \mathfrak{m})$ be a Noetherian local ring of dimension $d$ and let $I = (f_1, \ldots, f_r)$ be an ideal of height $g$. Let $k \geq 0$ be an integer. Then
\begin{enumerate}
  \item $I$ satisfies the sliding depth condition, $\text{SD}_k$, if
    \[\text{depth}(H_i(\mathfrak{f}; R)) \geq \min\{d - g, d - r + i + k\}, \forall i;\]
    also $\text{SD}$ stands for $\text{SD}_0$;
  \item $I$ satisfies the sliding depth condition on cycles, $\text{SDC}_k$, if
    \[\text{depth}(Z_i(\mathfrak{f}; R)) \geq \min\{d - r + i + k, d - g + 2, d\}, \forall i \leq r - g;\]
  \item $I$ is strongly Cohen-Macaulay if $H_i(\mathfrak{f}; R)$ is Cohen-Macaulay, for all $i$.
\end{enumerate}

Clearly $I$ is strongly Cohen-Macaulay if and only if $I$ satisfies $\text{SD}_t$, for all $t \geq r - g$. Some of the basic properties and relations between such conditions $\text{SD}_k$ and $\text{SDC}_k$ are given in [8, Remark 2.4, Proposition 2.5], [11] Proposition 2.4, also see [14] [17] [24]. It will be of importance to us that $\text{SD}_k$ implies $\text{SDC}_{k + 1}$ whenever $R$ is a Cohen-Macaulay local ring by [8] Proposition 2.5.

**Remark 3.8.** Notice that adding an indeterminate $x$ to the ring and to ideals $I$ and $\mathfrak{a}$. One has $(\mathfrak{a} + (x)): (I + (x)) = (\mathfrak{a}: I) + (x)$ in $R[x]$ and in its localization at $\mathfrak{m} + (x)$. Hence, for most statements, one may reduce to the case where the height of $I$ is big enough, if needed.

In the recent article [11] Theorem 2.6, Hassanzadeh and the second named author proved the following results. The Cohen-Macaulay hypothesis in this theorem is needed to show that if for an $R$-module $M$, $\text{depth}(M) \geq d - t$ then for any prime $\mathfrak{p}$, $\text{depth}(M_{\mathfrak{p}}) \geq \text{ht}(\mathfrak{p}) - t$, see [24] Section 3.3.

**Theorem 3.9.** Let $(R, \mathfrak{m})$ be a Cohen-Macaulay local ring of dimension $d$ and let $I = (f_1, \ldots, f_r)$ be an ideal of height $g$. Let $s \geq g$ and fix $0 \leq k \leq \min\{s, s - g + 2\}$. Suppose that one of the following hypotheses holds:
\begin{enumerate}
  \item $r + k \leq s$ and $I$ satisfies $\text{SD}$, or
  \item $r + k \geq s + 1$, $I$ satisfies $\text{SD}$ and $\text{depth}(Z_i) \geq d - s + k$, for $0 \leq i \leq k$, or
  \item $I$ is strongly Cohen-Macaulay.
\end{enumerate}

Then for any $s$-residual intersection $J = (\mathfrak{a}: RI)$, the complex $\mathfrak{k}\mathbb{Z}_+$ is acyclic. Furthermore, $\text{Sym}_R^s(I/\mathfrak{a})$, for $1 \leq k \leq s - g + 2$, and the disguised residual intersection $R/K$ are Cohen-Macaulay of codimension $s$.

Notice that the condition (iii) is stronger than (i) and (ii). In [8] Theorem 2.11, Hassanzadeh showed that, under the sliding depth condition $\text{SD}$, $K \subset J$ and $\sqrt{K} = \sqrt{J}$, and further $K = J$, whenever the residual is arithmetic.
4. Cohen-Macaulayness and canonical module of residual intersections

In this section we will prove two important conjectures in the theory of residual intersections: the Cohen-Macaulayness of the residual intersections and the description of their canonical module.

In order to make reduction to lower height case and prove the Cohen-Macaulayness when \( s = g \), we first state the following proposition, which is a trivial generalization of [17] Lemma 3.5] that only treated the sliding depth condition SD. The proof goes along the same lines.

**Proposition 4.1.** Let \( (R, \mathfrak{m}) \) be a Cohen-Macaulay local ring, let \( I \) be an ideal of height \( g \) and \( k \geq 0 \) be an integer. Let \( x_1, \ldots, x_d \) be a regular sequence in \( I \). Let \( t \) denote the canonical epimorphism \( R \longrightarrow R' = R/(x_1, \ldots, x_d) \). Then \( I \) satisfies SD if and only if \( I' \) satisfies SD\(_k\) (in \( R' \)). In particular, \( I \) is strongly Cohen-Macaulay if and only if \( I' \) is strongly Cohen-Macaulay.

**Proposition 4.2.** Let \( (R, \mathfrak{m}) \) be a Cohen-Macaulay local ring of dimension \( d \) and let \( I \) be an ideal of height \( g \). Let \( x = x_1, \ldots, x_g \) be a regular sequence contained in \( I \) and \( J = ((x):_RI) \). Suppose that \( R/I \) is Cohen-Macaulay and \( I \) satisfies SD. Then \( R/J \) is Cohen-Macaulay of codimension \( g \).

**Proof.** The proof goes along the same lines as in [17]. By Proposition 4.1, we may reduce modulo \( x = x_1, \ldots, x_g \) and consider \( R' = R/(x) \). Thus we can assume that \( \text{ht}(I) = g = 0 \) and \( J = (0:RI) \).

Suppose that \( I \) is an ideal generated by the sequence \( x_1, \ldots, x_r \). Then \( Z_r = (0:RI) = J \) and \( K_r \simeq R \). The exact sequence

\[
0 \longrightarrow Z_r \longrightarrow K_r \longrightarrow B_{r-1} \longrightarrow 0
\]

shows that \( B_{r-1} \simeq K_r/Z_r \simeq R/J \).

Since \( I \) satisfies SD, \( I \) satisfies SD\(_C_1\) by [8] Proposition 2.5. It follows that \( Z_{r-1} \) is Cohen-Macaulay of dimension \( d \). Moreover, \( I \) satisfies SD, \( \text{depth}(H_{r-1}^{\mu}) \geq d - 1 \). Therefore, the exact sequence

\[
0 \longrightarrow B_{r-1} \longrightarrow Z_{r-1} \longrightarrow H_{r-1}^{\mu} \longrightarrow 0
\]

implies that \( H_{r-1}^{\mu}(B_{r-1}) = 0 \), for all \( i \neq d \), hence \( B_{r-1} \) is Cohen-Macaulay of dimension \( d \).

To study the Cohen-Macaulayness of residual intersections in the general case, we will use the following lemma.

**Lemma 4.3.** Let \( (R, \mathfrak{m}) \) be a Cohen-Macaulay local ring of dimension \( d \), with canonical module \( \omega \). Suppose that \( S = R[T_1, \ldots, T_r] \) is the standard graded polynomial ring over \( R \) and \( g := S_+ \). Let \( \mathfrak{a} \subset I = (f_1, \ldots, f_r) \) be two ideals of \( R \), with \( \text{ht}(I) = g \). If \( J = (\mathfrak{a};_RI) \) is an \( s \)-residual intersection of \( I \), then

(i) There is a natural graded isomorphism

\[
H^g_\mathfrak{a}(S) \simeq \homgr(S(-r), R).
\]

In particular, for all \( \mu \in \mathbb{Z} \),

\[
H^g_\mathfrak{a}(S)_\mu \simeq S^*_{-\mu-r} = \homgr(S_{-\mu-r}, R).
\]

(ii) If \( g \geq 2 \), then \( \text{depth}(\kappa Z^*_0) = \text{depth}(\kappa Z^*_1) = d \), for all \( 0 \leq k \leq s - 1 \).

(iii) If \( g = 2 \) and \( I \) satisfies SD\(_C_1\), then

\[
\text{depth}(\ell_0 Z^*_i) \geq \min\{d, d - s + i + \ell\},
\]

for all \( 1 \leq i \leq s - 1 \).
(iv) If \( g \geq 2 \), then the following diagram, where the vertical isomorphisms are induced by the identifications \( H^d_m(Z_s) \cong Z^\omega_{r-1-s} \) in Proposition 2.4, is commutative, for all \( 0 \leq k \leq s-2 \),

\[
\begin{array}{ccc}
H^d_m(k Z^+_s) & \cong & H^d_m(k Z^+_s) \\
\downarrow & & \downarrow \\
\omega_{s-k+1} Z^+_s & \cong & \omega_{s-k+1} Z^+_s
\end{array}
\]

Proof. (i) is the graded local duality theorem.

(ii) Since \( Z_{r-1} \cong Z_0 = R \), \( \text{depth}(k Z^+_0) = \text{depth}(k Z^+_1) = d \).

(iii) By [3, Proposition 2.5], \( I \) satisfies \( \text{SDC}_{r+1} \), that is

\[
\text{depth}(Z_j) \geq \min\{d - r + j + \ell + 1, d\},
\]

for all \( 0 \leq j \leq r - 2 \).

For any \( 1 \leq i \leq s-1 \),

\[
o Z^+_i = H^r_\theta(D_{r-1+i})[0] = \bigoplus_{j=r-1+i-s}^{r-1} (Z_j \otimes R H^r_\theta(S))_{[r-i]}.\]

Thus \( n Z^+_i \) is a direct sum of copies of modules \( Z_\delta, \ldots, Z_{r-1} \), where \( \delta = \max\{0, r - 1 + i - s\} \). Notice that \( 0 \leq \delta \leq r - 2 \). It follows that

\[
\text{depth}(n Z^+_i) = \min_{s \leq j \leq r-1} \{\text{depth}(Z_j)\} = \min_{s \leq j \leq r-1} \{\text{depth}(Z_j)\}, d) \geq \min\{d, d - r + \delta + \ell + 1\} \geq \min\{d, d - s + i + \ell\}.
\]

(iv) We have the following commutative diagrams, for all \( 0 \leq k \leq s-2 \),

\[
\begin{array}{ccc}
H^d_m(k Z^+_1) = H^d_m(H^r_\theta(D_{r+i-1}))_{[k]} & \cong & H^d_m(H^r_\theta(D_{r+i-2}))_{[k]} = H^d_m(k Z^+_1) \\
\downarrow & & \downarrow \\
H^d_m(Z_{r-1} \otimes R H^r_\theta(S)_{[k-r+s+1]} & \cong & H^d_m(Z_{r-1} \otimes R H^r_\theta(S)_{[k-r+s+2]} \oplus H^d_m(Z_{r-2} \otimes R H^r_\theta(S)_{[k-r+s+2]}) \\
\downarrow & & \downarrow \\
Z^\omega_{s-k+1} \otimes R S^*_i & \cong & Z^\omega_{s-k+1} \otimes R (S^*_i \oplus Z^\omega_{s-k-2}) \\
\downarrow & & \downarrow \\
(Z^\omega_{s-k+1} \otimes R S^*_i)^\vee & \cong & (Z^\omega_{s-k+1} \otimes R S^*_i)^\vee \oplus Z^\omega_{s-k-2} \\
\downarrow & & \downarrow \\
((D^\omega_{s-k+1})_{[k-s-k-2]} \otimes R S^*_i)^\vee & \cong & ((D^\omega_{s-k+1})_{[k-s-k-2]} \otimes R S^*_i)^\vee
\end{array}
\]

where the first diagram and the last diagram are commutative by the definitions, the second diagram is commutative by the natural isomorphisms in item (i) and Proposition 2.4, and the third diagram is commutative by the natural isomorphism

\[
Z^\omega_{s-k+1} \otimes R S^*_i \cong (Z^\omega_{s-k+1} \otimes R S^*_i)^\vee,
\]

for all \( i, \ell \), see [3, II, §4, no 4, Proposition 4]. □

**Proposition 4.4.** Let \((R, m)\) be a Cohen-Macaulay local ring of dimension \( d \), with canonical module \( \omega \), and \( I = (f_1, \ldots, f_r) \) be an ideal of height 2. Suppose that \( J = (a: R I) \) is an \( s \)-residual intersection of \( I \) and \( K \) is the disguised \( s \)-residual
intersection of $I$ w.r.t. $a$. If $I$ satisfies $\mathcal{SD}_1$, then there exists an epimorphism of $R$-modules

$$\phi : H_0(\omega_{s-1}^\Sigma Z_+^s) \to \omega_{R/K}$$

and $\phi$ is an isomorphism if $I$ satisfies $\mathcal{SD}_2$.

Proof. Since $I$ satisfies $\mathcal{SD}_1$, $aZ_+^s$ is acyclic and $R/K$ is Cohen-Macaulay of dimension $d-s$ by Theorem [9.9]. By local duality

\begin{equation}
H^d_{m-s}(R/K) \simeq \omega_{R/K}^{\Sigma}
\end{equation}

Now the double complex $C_{m}(0Z_+^s)$ gives rise to two spectral sequences. The second terms of the horizontal spectral are

\begin{equation}
E_{\text{hor}}^{i,-j} = \begin{cases} H^d_{m-s}(R/K) & \text{if } j = d-s \text{ and } i = 0 \\ 0 & \text{otherwise} \end{cases}
\end{equation}

and the first terms of the vertical spectral are

\begin{equation}
E_{\text{ver}}^{i,-j} = \begin{cases} 0 & \text{otherwise} \end{cases}
\end{equation}

By Lemma [4.3](iv), we have the following commutative diagram

$$H^d_{m}(0Z_+^s) \to H^d_{m}(0Z_+^{s-1}) \to H^d_{m}(0Z_+^{s-2}) \to \cdots \to H^d_{m}(0Z_+^{1}) \to H^d_{m}(R)$$

since depth$(0Z_+^s) \geq d-s+i+1$, for all $1 \leq i \leq s-1$, by Lemma [4.3](iii).

By the convergence of the spectral sequences, we obtain

\begin{equation}
2E_{\text{ver}}^{-s,-d} \simeq H^d_{m-s}(R/K) \simeq \omega_{R/K}^{\Sigma}
\end{equation}

By Lemma [4.3](iv), we have the following commutative diagram

$$H^d_{m}(0Z_+^{s-1}) \to H^d_{m}(0Z_+^{s}) \to \cdots \to H^d_{m}(0Z_+^{1}) \to H^d_{m}(R)$$

Therefore

\begin{equation}
2E_{\text{ver}}^{-s,-d} \simeq H_0(\omega_{s-1}^\Sigma Z_+^s)\Sigma
\end{equation}

By \[4.1\], \[4.2\] and \[4.3\], we can define a monomorphism of $R$-modules by the compositions

$$\omega_{R/K}^{\Sigma} \to H^d_{m-s}(R/K) \to 2E_{\text{ver}}^{-s,-d} \to H_0(\omega_{s-1}^\Sigma Z_+^s)$$

which provides an epimorphism
\[ \phi : H_0(s^{-1}\mathbb{Z}^+_1) \rightarrow \omega_{R/K}. \]

If \( I \) satisfies \( SD_2 \), then \( \text{depth}(a\mathbb{Z}_1^+) \geq \min\{d, d-s+1\} \), for all \( 1 \leq i \leq s-1 \), by Lemma [3.3 iii]. It follows that
\[ H_m^{d-1}(R/K) \simeq \infty E_{\text{ver}}^{-s,-d} = 2E_{\text{ver}}^{-s,-d} \]
and thus \( \phi \) is an isomorphism. \( \square \)

Now we state our main result that answers the question of Huneke and Ulrich in [15, Question 5.7] and also answers the conjecture of Hassanzadeh and the second named author in [11, Conjecture 5.9].

**Theorem 4.5.** Let \((R, \mathfrak{m})\) be a Cohen-Macaulay local ring of dimension \( d \), with canonical module \( \omega \), and \( a \subset I \) be two ideals of \( R \), with \( \text{ht}(I) = g \leq s \). Suppose that \( I \) satisfies \( SD_1 \) and \( J = (a : R)I \) is an \( s \)-residual intersection of \( I \). Then \( R/J \) is Cohen-Macaulay of dimension \( d-s \).

**Proof.** Let \( K \) be the disguised \( s \)-residual intersection of \( I \) w.r.t. \( a \). Since \( I \) satisfies \( SD_1 \), hence \( SD_2 \), \( R/K \) is Cohen-Macaulay of dimension \( d-s \) by Theorem 4.4 and \( K \subset J \) by [8, Theorem 2.11]. The proof will be completed by showing that \( J \subset K \).

We first consider the case where \( g = 2 \). By Proposition 4.4 there is the epimorphism
\[ \phi : H_0(s^{-1}\mathbb{Z}^+_1) \rightarrow \omega_{R/K}. \]
As \( R/K \) is Cohen-Macaulay, \( \text{ann}_R(\omega_{R/K}) = \text{ann}_R(R/K) = K \). The epimorphism \( \phi \) implies that
\[ \text{ann}_R(H_0(s^{-1}\mathbb{Z}^+_1)) \subset \text{ann}_R(\omega_{R/K}) = K. \]
By Proposition [5.5], \( J \subset \text{ann}_R(H_0(s^{-1}\mathbb{Z}^+_1)) \subset K. \)

We may always reduce to the case \( g \geq 2 \) by Remark 5.8. If \( g > 2 \), then we can choose a regular sequence \( a \) of length \( g-2 \) inside \( a \) which is a part of a minimal generating set of \( a \). Since \( R \) is Cohen-Macaulay, by [2, Theorem 2.1.3], \( R/a \) is a Cohen-Macaulay local ring of dimension \( d-g+2 \). Moreover, \( J/a = a : I/a \) and \( \mu(a/a) = \mu(a) - g + 2 \), therefore \( J/a \) is an \( (s-g+2) \)-residual intersection of \( I/a \) which is of height 2. Furthermore, \( I/a \) satisfies \( SD_1 \) by Proposition 4.4. Hence, it follows from the height two case that \( R/J \simeq (R/a)/(J/a) \) is Cohen-Macaulay of dimension \( d-s \).

It follows from the proof of Proposition 5.5 that \( J \subset \text{ann}_R(Sym^k_R(I/a)) \), for all \( k \geq 1 \). Then a natural question is: under what conditions one has
\[ \text{ann}_R(Sym^k_R(I/a)) = J? \]
It is known that \( \text{ann}_R(Sym^k_R(I/a)) = J \), for all \( k \geq 1 \) whenever \( J \) is arithmetic in [11, Corollary 2.8(iv)]. The next result answers this question.

**Corollary 4.6.** Let \((R, \mathfrak{m})\) be a Cohen-Macaulay local ring of dimension \( d \), with canonical module \( \omega \), and let \( a \subset I \) be two ideals of \( R \), with \( \text{ht}(I) = g \). Suppose that \( J \) is an \( s \)-residual intersection of \( I \) and let \( 1 \leq k \leq s-g+1 \).

(i) If \( I \) satisfies \( SD_1 \), then \( Sym^k_R(I/a) \) is a faithful \( R/J \)-module.

(ii) If \( I \) satisfies strongly Cohen-Macaulay, then \( Sym^k_R(I/a) \) is a maximal Cohen-Macaulay faithful \( R/J \)-module.

**Proof.** (i) The proof will be completed by showing that \( \text{ann}_R(Sym^{s-g+1}_R(I/a)) \subset J \).

As in the proof of Theorem 4.5 it suffices to prove that \( \text{ann}_R(Sym^{s-g+1}_R(I/a)) \subset J \) in the case \( g = 2 \). The inclusions \( \text{ann}_R(Sym^{s-1}_R(I/a)) \subset \text{ann}_R(H_0(s^{-1}\mathbb{Z}^+_1)) \subset K = J \) are demonstrated in the proofs of Proposition 3.3 and of Theorem 4.5.
The following example shows that the above corollary does not hold for the 
\((s - g + 2)\)-th symmetric power of \(I/\mathfrak{a}\).

**Example 4.7.** [11 Example 2.10] Let \(R = \mathbb{Q}[x, y], I = (x, y)\) and \(\mathfrak{a} = (x^2, y^2)\). We set \(J = \mathfrak{a}:_R I\). Using Macaulay2 [7], we see that \(J = (x^2, xy, y^2)\) is a 2-residual intersection (a link in this case) of \(I\) and

\[
\text{Sym}_R(I/\mathfrak{a}) \simeq R[T_1, T_2]/(xT_1, yT_2, -yT_1 + xT_2).
\]

Thus a free resolution of \(\text{Sym}_R^2(I/\mathfrak{a})\) is

\[
0 \longrightarrow R^3 \overset{N}{\longrightarrow} R^6 \overset{M}{\longrightarrow} R^3 \longrightarrow \text{Sym}_R^2(I/\mathfrak{a}) \longrightarrow 0,
\]

where

\[
M = \begin{pmatrix}
x & 0 & 0 & y & 0 & 0 \\
0 & x & 0 & 0 & y & 0 \\
0 & 0 & x & 0 & 0 & y
\end{pmatrix}
\]

and

\[
N = \begin{pmatrix}
-y & 0 & 0 \\
0 & -y & 0 \\
x & 0 & 0 \\
0 & x & 0 \\
0 & 0 & x
\end{pmatrix}.
\]

It follows that

\[
\text{Ann}_R(\text{Sym}_R^2(I/\mathfrak{a})) = (x, y) \supseteq J.
\]

We now give a description the canonical module of residual intersections.

**Theorem 4.8.** Let \((R, \mathfrak{m})\) be a Cohen-Macaulay local ring of dimension \(d\), with canonical module \(\omega\), and let \(\mathfrak{a} \subset I\) be two ideals of \(R\), with \(\text{ht}(I) = g\). Suppose that \(I\) satisfies SD\(_2\), \(\text{Tor}^R_1(R/I, \omega) = 0\) and \(J = (\mathfrak{a}:_R I)\) is an \(s\)-residual intersection of \(I\). Then the canonical module of \(R/J\) is \(\text{Sym}^r \omega \simeq \text{Sym}^s(I/\mathfrak{a}) \otimes_R \omega\).

**Proof.** We first consider the case where \(g = 2\). By Proposition 4.3 and Theorem 4.5

\[
\omega_{R/J} \simeq H_0(\omega(-1) \mathcal{Z}^+) \simeq \text{Sym}^s(I/\mathfrak{a}) \otimes_R \omega.
\]

The last isomorphism by Proposition 4.3.

We may always reduce to the case \(g \geq 2\) by Remark 4.3. If \(g > 2\), then we can choose a regular sequence \(\mathfrak{a}\) of length \(g - 2\) inside \(\mathfrak{a}\) which is a part of a minimal generating set of \(\mathfrak{a}\) as in the proof of Theorem 4.5. As \(\mathfrak{a} \subset I\) is regular on \(\omega\),

\[
\text{Tor}^R_1(R/I, \omega) \simeq \text{Tor}^R_1(R/\mathfrak{a}, \omega/\mathfrak{a} \omega) = 0.
\]

Furthermore, observing that the canonical module of \(R/\mathfrak{a}\) is \(\omega/\mathfrak{a} \omega\), it follows from the height two case that

\[
\omega_{R/J} \simeq \text{Sym}^{(s-g+2)-1}(R/\mathfrak{a}/\mathfrak{a}) \otimes_R \omega_{R/\mathfrak{a}} \simeq \text{Sym}^{(s-g+1)}(I/\mathfrak{a}) \otimes_R \omega.
\]

Notice that the hypothesis \(\text{Tor}^R_1(R/I, \omega) = 0\) is always satisfied for ideals of finite projective dimension. In particular, if \(R\) is Gorenstein, then \(\omega \simeq R\), hence \(\text{Tor}^R_1(R/I, \omega) \simeq \text{Tor}^R_1(R/I, R) = 0\), therefore the canonical module of \(R/J\) is \((s - g + 1)\)-th symmetric power of \(I/\mathfrak{a}\). As a consequence, the second conjecture in the introduction is proved under the SD\(_2\) condition.

**Remark 4.9.**
(i) Under assumptions of Theorem 4.8 but I only satisfies SD1 instead of SD2. Then there exists an epimorphism of R-modules
\[ \text{Sym}^{s-g+1} R(I/a) \otimes_R \omega \rightarrow \omega_{R/J}. \]

(ii) In the height two case, by using Proposition 4.4 we could omit the assumption Tor1R(R/I, ω) = 0 in Theorem 4.8. In this case, the canonical module of R/J is the (s − 1)-th graded component of
\[ \omega[T_1, \ldots, T_r]/(\omega + \omega' + \gamma \omega) \]
by Proposition 3.2 and Theorem 4.3.

The following example shows that Theorem 4.8 does not hold if I only satisfies SD condition.

**Example 4.10.** [6] Example 2.9] Let \( R = k[[x_1, \ldots, x_5]] \) and let I be the ideal of 2 × 2 minors of the matrix
\[
\begin{pmatrix}
x_1 & x_2 & x_3 & x_4 \\
x_2 & x_3 & x_4 & x_5
\end{pmatrix}.
\]
Then I is of height 3. If we take \( a \) to be the ideal generated by 4 sufficiently general cubic forms in I, then J = a: I is a 4-residual intersection. Using Macaulay2 [7], it is easy to see that I satisfies SD. Moreover, we see that \( I^2/ai \) requires only 16. Thus there is no surjection \( \omega_{R/J} \rightarrow I^2/ai \), therefore \( \omega_{R/J} \) is not isomorphic to \( \text{Sym}^2_{R/I}(I/a) \).

Computation of the initial degree of \( \text{Sym}^2_{R/I}(I/a) \) and \( \omega_{R/J} \) shows that there can be no surjection \( \text{Sym}^2_{R/I}(I/a) \rightarrow \omega_{R/J} \). This shows that SD1 condition in Remark 4.9(i) is necessary.

Recall that in a Noetherian local ring \( (R, m) \), the type of a finitely generated R-module M is the dimension of the R/m-vector space \( \text{Ext}^{\text{depth}(M)}_R(R/m, M) \) and it is denoted by \( r_R(M) \) or just \( r(M) \). The minimal number of generators of the R-module M is the dimension of the R/m-vector space \( R/m \otimes_R M \) and it is denoted by \( \mu(M) \). Notice that if M, N are two finitely generated R-modules, then
\[
\mu(M \otimes_R N) = \dim_{R/m}(M \otimes_R N \otimes_R R/m) = \dim_{R/m}(M \otimes_R R/m \otimes_R N \otimes_R R/m) = \mu(M) \mu(N).
\]

**Corollary 4.11.** Under the assumptions of Theorem 4.8
\[
r(R/J) = \left( \frac{\mu(I/a) + s - g}{\mu(I/a) - 1} \right) r(R).
\]
Thus \( R/J \) is Gorenstein if and only if R is Gorenstein and \( \mu(I/a) = 1 \).

**Proof.** Since the canonical module of \( R/J \) is \( \text{Sym}^{s-g+1} R(I/a) \otimes_R \omega \) by Theorem 4.8 it follows from [2] Proposition 3.3.11] that
\[
r(R/J) = \mu(\omega_{R/J}) = \mu(\text{Sym}^{s-g+1} R(I/a) \otimes_R \omega) = \mu(\text{Sym}^{s-g+1} R(I/a)) \mu(\omega) = \dim_{R/m}(\text{Sym}^{s-g+1} R(I/a) \otimes_R R/m)r(R) = \dim_{R/m}(\text{Sym}^{s-g+1} R(I/a \otimes_R R/m)r(R).
\]
Since \( I/a \otimes_R R/m \) is a R/m-vector space of dimension \( \mu(I/a) \),
\[
\text{Sym}_{R/m}(I/a \otimes_R R/m) \cong (R/m)[Y_1, \ldots, Y_{\mu(I/a)}].
\]
It follows that
\[ r(R/J) = \left( \frac{\mu(I/a) + s - g}{\mu(I/a) - 1} \right) r(R). \]

5. Stability of Hilbert functions and Castelnuovo-Mumford regularity of residual intersections

One is based on the resolution of residual intersections \( \alpha \mathbb{Z}_+^* \), from which we could provide many informations concerning \( R/J \), like the stability of Hilbert functions and the Castelnuovo-Mumford regularity of residual intersections.

First we study the stability of Hilbert functions of residual intersections. We recall the definitions of the Hilbert function, Hilbert polynomial and Hilbert series, the reader can consult for instance [2, Chapter 4]. Let \( M \) be a graded \( R \)-module whose graded components \( M_n \) have finite length, for all \( n \). The numerical function \( H(M, -) : \mathbb{Z} \to \mathbb{Z} \) with \( H(M, n) = \text{length}(M_n) \), for all \( n \in \mathbb{Z} \), is the Hilbert function, and \( H_M(t) := \sum_{n \in \mathbb{Z}} H(M, n)t^n \) is the Hilbert series of \( M \).

If \( R \) is assumed to be generated over \( R_0 \) by elements of degree one, that is, \( R = R_0[R_1] \) and \( M \) is a finitely generated graded \( R \)-module of dimension \( m \geq 1 \), then there exists a polynomial \( P_M(X) \in \mathbb{Q}[X] \) of degree \( m-1 \) such that \( H(M, n) = P_M(n) \) for all \( n \gg 0 \). This polynomial is called the Hilbert polynomial of \( M \). We can write
\[ P_M(X) = \sum_{i=0}^{m-1} (-1)^{m-1-i} e_{m-1-i} \binom{X+i}{i}. \]

Then the multiplicity of \( M \) is defined to be
\[ e(M) = \begin{cases} e_0 & \text{if } m > 0 \\ \text{length}(M) & \text{if } m = 0. \end{cases} \]

In [4], Eisenbud, Ulrich and the first named author restated an old question of Stanley in [20] asking for which open sets of ideals \( \alpha \) the Hilbert function of \( R/\alpha \) depends only on the degrees of the generators \( \alpha \). More precisely, they consider the following two conditions.

(A1) Is the Hilbert function of \( R/\alpha \) constant on the open set of ideals \( \alpha \) generated by \( s \) forms of the given degrees such that \( \text{ht}(\alpha: R I) \geq s \);

(A2) Is the Hilbert function of \( R/(\alpha: R I) \) constant on this set.

It is shown in [4] Theorem 2.1] that ideals with some sliding depth conditions in conjunction with \( G_{s-1} \) or \( G_s \) satisfy these two conditions. In [11] Proposition 3.1], Hassanzadeh and the second named author proved that if \( (R, \mathfrak{m}) \) is a Cohen-Macaulay graded local ring of dimension \( d \) over an Artinian local ring \( R_0 \) and if \( \alpha \subset I \) are two homogeneous ideals, \( I \) satisfies \( SD \), and \( \text{depth}(R/I) \geq d - s \), then the above condition (A1) is satisfied for any \( s \)-residual intersection \( J = (\alpha: R I) \). It follows directly from [8 Theorem 2.11] and [11] Proposition 3.1] that if \( I \) satisfies \( SD \), then, for any arithmetic \( s \)-residual intersection \( J = (\alpha: R I) \), the above condition (A2) is satisfied.

The next proposition, we will show that the above condition (A2) is satisfied for any residual intersection under \( SD_1 \) condition.

**Proposition 5.1.** Let \( (R, \mathfrak{m}) \) be a graded Cohen-Macaulay local ring over an Artinian local ring \( R_0 \) and \( \alpha \subset I \) be two homogeneous ideals, with \( \text{ht}(I) = g \). Suppose that \( I \) satisfies \( SD_1 \) and \( J = (\alpha: R I) \) is an \( s \)-residual intersection of \( I \). Then the Hilbert function of \( R/J \) satisfies the above condition (A2).
Proof. By Theorem 5.5 and Theorem 4.5, the complex $0 Z^+_\ast$ is a resolution of $R/J$. Hence, the Hilbert function of $R/J$ can be written in terms of the Hilbert functions of the components of the complex $0 Z^+_\ast$ which, according to the definition of $0 Z^+_\ast$, are just some direct sums of Koszul cycles of $I$ shifted by the twists appearing in the Koszul complex $K_s(γ; S)$. Since the Hilbert functions of Koszul cycles are inductively calculated in terms of those of the Koszul homology modules, the Hilbert function of $R/J$ only depends on the Koszul homology modules of $I$ and on the degrees of the generators of $\mathfrak{a}$. □

Next, the important numerical invariant associated an algebraic or geometric object is the Castelnuovo-Mumford regularity. Assume that degrees of the generators of a positively graded Noetherian $R$ ring ($R$ of function of $R/J$ inductively calculated in terms of those of the Koszul homology modules, the Hilbert function of Koszul cycles of $I$ are just some direct sums of Koszul cycles of $I$ in the Koszul complex $K_R$. Hence, the Hilbert function of a homogeneous ideal of the components of the complex $(\text{Corollary 5.4})$. This equality is showed by Hassanzadeh for perfect ideals of height 2 [8, Theorem 3.16(iii)].

Proof. The proof proceeds along the same lines as in the local case. □

Indeed, Theorem 4.5 implies that $\text{reg}((\mathfrak{a}: R/I)) = \text{reg}((\mathfrak{a}: J)) + \sigma(\mathfrak{a}) - (s - g + 1)\text{indeg}(I/\mathfrak{a}) - s$.

The next proposition improves the result of Hassanzadeh and the second named author in [11 Proposition 3.3].

Proposition 5.2. Let $(R, \mathfrak{m})$ be a positively graded Cohen-Macaulay local ring over a Noetherian local ring $(R_0, \mathfrak{m}_0)$ and $\mathfrak{a} \subseteq I$ be two homogeneous ideals, with $\text{ht}(I) = g$. Suppose that $I$ satisfies $SD_1$. Then, for any $s$-residual intersection $J = (\mathfrak{a}: R/I)$,

$$\text{reg}(R/J) \leq \text{reg}(R) + \text{dim}(R_0) + \sigma(\mathfrak{a}) - (s - g + 1)\text{indeg}(I/\mathfrak{a}) - s.$$ 

Proof. The proof of this result goes along the same lines as in [8, Theorem 3.6]. Indeed, Theorem 4.5 implies that $R/J$ is Cohen-Macaulay and is resolved by $0 Z^+_\ast$. □

The next proposition improves the result of Hassanzadeh and the second named author in [11 Proposition 3.3].

Proposition 5.3. Let $(R, \mathfrak{m})$ be a positively graded Cohen-Macaulay local ring over a Noetherian local ring $(R_0, \mathfrak{m}_0)$, with canonical module $\omega$. Let $\mathfrak{a} \subseteq I$ be two homogeneous ideals, with $\text{ht}(I) = g$, and let $J = (\mathfrak{a}: R/I)$ be an $s$-residual intersection of $I$. Suppose that $I$ satisfies $SD_2$ and $\text{Tor}_1^R(R/I, \omega) = 0$. Then

$$\omega_{R/J} = \text{Sym}^{s-g+1}(I/\mathfrak{a}) \otimes_R \omega(\sigma(\mathfrak{a})).$$

Proof. The proof proceeds along the same lines as in the local case. □

The following result is already an improvement of [8 Proposition 3.15] and also of [11 Proposition 3.3]. We show the equality of the proposed upper bound for Castelnuovo-Mumford regularity of residual intersections in Proposition 5.2. This equality is showed by Hassanzadeh for perfect ideals of height 2 [8 Theorem 3.16(iii)].

Corollary 5.4. Under the assumptions of Proposition 5.3

$$\text{reg}_{\mathfrak{m}}(R/J) = \text{reg}_{\mathfrak{m}}(R) + \sigma(\mathfrak{a}) - (s - g + 1)\text{indeg}(I/\mathfrak{a}) - s.$$
In particular, if \( \dim(R_0) = 0 \) then

\[
\operatorname{reg}(R/J) = \operatorname{reg}(R) + \sigma(a) - (s - g + 1)\operatorname{indeg}(I/a) - s.
\]

**Proof.** By Theorem 4.5, \( R/J \) is Cohen-Macaulay of dimension \( d - s \). By using the local duality theorem and Proposition 5.3,

\[
\operatorname{reg}_m(R/J) = \operatorname{end}(H^m_{\mathfrak{m}}(R/J)) + d - s = -\operatorname{indeg}(\omega_{R/J}) + d - s
\]

\[
= \sigma(a) - \operatorname{indeg}(\Sym^g_R(I/a) \otimes_R \omega) + d - s
\]

\[
= \sigma(a) - \operatorname{indeg}(\Sym^{g+1}_R(I/a)) - \operatorname{indeg}(\omega) + d - s
\]

\[
= \operatorname{reg}_m(R) + \sigma(a) - \operatorname{indeg}(\Sym^{g+1}_R(I/a)) - s,
\]

since \( \operatorname{reg}_m(R) = \operatorname{end}(H^m_{\mathfrak{m}}(R)) + d = -\operatorname{indeg}(\omega) + d \).

It remains to prove that \( \operatorname{indeg}(\Sym^{g+1}_R(I/a)) = (s - g + 1)\operatorname{indeg}(I/a) \).

Let \( g_1, \ldots, g_{\ell} \) be a minimal set of generators of \( I/a \). We have

\[
\Sym_R(I/a) \otimes_R R/m \simeq (R/m)[Y_1, \ldots, Y_{\ell}],
\]

where \( Y_i \) is the class of \( g_i \) in \( \Sym_R(I/a) \otimes_R R/m \).

Suppose that \( \deg(g_1) = \operatorname{indeg}(I/a) \). Since

\[
\Sym_R(I/a) \otimes_R R/m \simeq (R/m)[Y_1, \ldots, Y_{\ell}]
\]

is a polynomial ring, we see that \( Y_i^{s-g+1} \neq 0 \), hence \( g_1^{s-g+1} \neq 0 \) (this product in \( \Sym_R(I/a) \)) and \( g_1^{s-g+1} \in \Sym^{s+1}_R(I/a) \). Thus

\[
\operatorname{indeg}(\Sym^{s-g+1}_R(I/a)) \leq \deg(g_1^{s-g+1}) = (s - g + 1)\deg(g_1) = (s - g + 1)\operatorname{indeg}(I/a).
\]

On the other hand, \( \operatorname{indeg}(\Sym^{s-g+1}_R(I/a)) \geq (s - g + 1)\operatorname{indeg}(I/a) \). Thus

\[
\operatorname{indeg}(\Sym^{s-g+1}_R(I/a)) = (s - g + 1)\operatorname{indeg}(I/a).
\]

The remaining part follows from \( \operatorname{reg}(M) \leq \operatorname{reg}_m(M) \leq \operatorname{reg}(M) + \dim(R_0) \) for any finitely generated graded \( R \)-module \( M \). \( \Box \)

Finally, we close this section by giving some tight relations between the Hilbert series of a residual intersection and the \( (s - g + 1) \)-th symmetric power of \( I/a \).

**Corollary 5.5.** Let \( (R, \mathfrak{m}) \) be a positively graded Cohen-Macaulay \( \mathfrak{m} \)-local algebra of dimension \( d \) over an Artinian local ring \( R_0 \), with canonical module \( \omega \). Suppose that \( \mathfrak{a} \subset I \) are two homogeneous ideals of \( R \), with \( \operatorname{ht}(I) = g \), and \( J = (\mathfrak{a}:_RI) \) is an \( s \)-residual intersection of \( I \). Write

\[
H_{R/J}(t) = \frac{P(t)}{(1 - t^a)^{d-s}}, \quad H_{\Sym^g_R(I/a) \otimes_R \omega}(t) = \frac{Q(t)}{(1 - t^a)^{d-s}},
\]

with \( a \) the least common multiple of the degrees of the generators of the algebra \( R \) over \( R_0 \) and \( P(t), Q(t) \in \mathbb{Z}[t, t^{-1}] \), with \( P(1), Q(1) > 0 \). If \( I \) satisfies \( SD_2 \) and \( \operatorname{Tor}^R_1(R/I, \omega) = 0 \), then

\[
P(t) = t^{\sigma(a) + (d-s)}Q(t^{-1}).
\]

In particular, if \( R \) is generated over \( R_0 \) by elements of degree one, that is, \( R = R_0[RI] \), then

\[
e(\mathfrak{R}/J) = e(\Sym^{s-g+1}_R(I/a) \otimes_R \omega).\]

**Proof.** By Proposition 5.3,

\[
\omega_{R/J} \simeq \Sym^{s-g+1}_R(I/a) \otimes_R \omega(\sigma(a)).
\]

It follows from \cite{2} Corollary 4.4.6 that

\[
H_{\Sym^{s-g+1}_R(I/a) \otimes_R \omega(\sigma(a))}(t) = (-1)^{d-s}H_{R/J}(t^{-1})
\]
is equivalent to

\[ H_{\text{Sym}^{r+s+1}(I/a) \otimes_R \omega}^t(t) = (-1)^{d-s} t^{\sigma(a)} H_{R/J}(t^{-1}). \]

Thus

\[ Q(t) = t^{\sigma(a)+a(d-s)} P(t^{-1}) \]

gives

\[ P(t) = t^{\sigma(a)+a(d-s)} Q(t^{-1}). \]

In particular,

\[ e(R/J) = P(1) = Q(1) = e(\text{Sym}^{r+s+1}(I/a) \otimes_R \omega), \]

by [2, Proposition 4.1.9]. □

6. Duality for residual intersections of strongly Cohen-Macaulay ideals

The duality for residual intersections is a center of interest in during the development
of the theory of residual. The first results of duality were proven by Peskine
and Szpiro for the theory of liaison in [19]. Afterwards, around the works of Huneke
and Ulrich in [15], generalizing the corresponding statement in the theory of linkage
of Peskine and Szpiro. In particular, the recent works of Eisenbud and Ulrich in [6]
give some results on the duality for residual intersections.

In this section, we provide the duality for residual intersections in the case where
I is a strongly Cohen-Macaulay ideal. In this case, the structure of the canonical
module of some symmetric powers of \( I/\alpha \) is given. Therefore, we may establish
some tight relations between the Hilbert series of the symmetric powers of \( I/\alpha \)
and we give the closed formulas for the type and for the Bass number of \( \text{Sym}_R^k(I/\alpha) \).

First we prove on the duality of residual approximation complexes in the height
two case.

**Proposition 6.1.** Let \((R, \mathfrak{m})\) be a Cohen-Macaulay local ring of dimension \( d \),
with canonical module \( \omega \), and let \( \alpha \subseteq I \) be two ideals of \( R \). Suppose that \( I \) is a strongly
Cohen-Macaulay ideal of height 2 and \( J = (\alpha: RI) \) is an s-residual intersection of \( I \). Then, for all \( 0 \leq k \leq s-2 \),

\[ \omega_{\text{Hor}(kZ^+_s)} \cong H_{(s-k-1)Z^+_s}. \]

**Proof.** By Theorem 3.9 the complex \( _kZ^+_s \) is acyclic and \( H_{0(kZ^+_s)} \) is Cohen-Macaulay
of dimension \( d-s \). Therefore, by local duality,

\[ \omega_{\text{Hor}(kZ^+_s)} \cong H_{m}^{d-s}(H_{0(kZ^+_s)}). \]

As \( I \) is strongly Cohen-Macaulay of height 2, we have that depth\((Z_i) = d, \)
for all \( 0 \leq i \leq r-1 \). By the definition of \( _kZ^+_s \), for all \( 0 \leq i \leq s, _kZ^+_i \) is a direct sum
of copies of modules \( Z_0, Z_1, \ldots, Z_r \), therefore depth\((_kZ^+_i) = d \). We now consider
the double complex \( C_{hor}^m(kZ^+_s) \) that gives rise to two sequences. The second terms
of the horizontal spectral are

\[ 2E_{hor}^{i,j} = \begin{cases} H_{m}^{d-s}(H_{0(kZ^+_s)}) & \text{if } j = d-s \text{ and } i = 0 \\ 0 & \text{otherwise} \end{cases} \]

and the first terms of the vertical spectral are

\[ 2E_{ver}^{i,j} = \begin{cases} 0 & \text{if } j = d-1 \\ H_{m}^d(kZ^+_s) & \text{otherwise}. \end{cases} \]
Proposition 4.1, it follows from the height two case that a set of a regular sequence

\[ \text{Tor}_J^d \mathcal{J} \]

The last isomorphism follows from Proposition 3.3.

Proof. canonical module \( \omega \), Theorem 6.2. Let \( \text{Hom}_R \psi \) (6.2) \( H \leq \) By Lemma 4.3(iv), we have a commutative diagram, for all \( 0 \leq k \leq s - 2 \)

\[
\begin{array}{ccc}
H^d_m(k, Z_s^-) & \xrightarrow{\sim} & H^d_m(k, Z_{s-1}^-) \\
\downarrow & & \downarrow \\
(s-k-1)Z_s^+ & \xrightarrow{\sim} & (s-k-1)Z_{s-1}^+.
\end{array}
\]

Therefore

\[ 2\mathcal{E}^{s,-d}_{\text{ver}} \simeq H_0(s-k-1Z_s^+). \]

By (6.1), (6.2), (6.3) and Lemma 2.3

\[ \omega H_n(k, Z_s^+) \simeq H_0(s-k-1Z_s^+). \]

We now state the main result of this section. Let recall us that if \( M, N, L \) are three \( R \)-modules, then a morphism \( \varphi : M \otimes_R N \rightarrow L \) is a perfect pairing if \( \psi_1 : M \rightarrow \text{Hom}_R(N, L) \), sending \( m \) to \( \psi_1(m) : n \mapsto \varphi(m \otimes n) \) and \( \psi_2 : N \rightarrow \text{Hom}_R(M, L) \), sending \( n \) to \( \psi_2(n) : m \mapsto \varphi(m \otimes n) \) are two isomorphisms.

**Theorem 6.2.** Let \( (R, m) \) be a Cohen-Macaulay local ring of dimension \( d \), with canonical module \( \omega \), and let \( a \subset I \) be two ideals of \( R \), with \( \text{ht}(I) = g \). Suppose that \( J = (a : RI) \) is an \( s \)-residual intersection of \( I \). If \( I \) is strongly Cohen-Macaulay and \( \text{Tor}_R^d(R/I, \omega) = 0 \), then, for all \( 1 \leq k \leq s - g \),

(i) the canonical module of \( \text{Sym}_R^k(I/a) \) is \( \text{Sym}_R^{s-g+1-k}(I/a) \otimes_R \omega \);

(ii) there is a perfect pairing

\[ (\text{Sym}_R^k(I/a) \otimes_R \omega) \otimes_R \text{Sym}_R^{s-g+1-k}(I/a) \rightarrow \text{Sym}_R^{s-g+1}(I/a) \otimes_R \omega. \]

**Proof.** (i) First we treat the case \( g = 2 \). By Proposition 6.1 for all \( 1 \leq k \leq s - 2 \),

\[
\omega_{\text{Sym}_R^k(I/a)} \simeq H_0(s-k-1Z_s^+) \\
\simeq \text{Sym}_R^{s-k-1}(I/a) \otimes_R \omega.
\]

The last isomorphism follows from Proposition 3.3

Now, we may suppose that \( g \geq 2 \) by Remark 4.8. If \( g > 2 \), then we choose a regular sequence \( a \) of length \( g - 2 \) inside \( a \) which is a part of a minimal generating set of \( a \) as in the proof of Theorem 4.8. As \( I/a \) is strongly Cohen-Macaulay by Proposition 6.1 it follows from the height two case that

\[
\omega_{\text{Sym}_R^k(I/a)} \simeq \omega_{\text{Sym}_R^k(I/a)} \omega \simeq \text{Sym}_R^{(s-g+2)-k-1}(I/a) \otimes_R (\omega/\omega a) \\
\simeq \text{Sym}_R^{s-g+1-k}(I/a) \otimes_R \omega.
\]

(ii) It suffices to prove that, for all \( 1 \leq k \leq s - g \),

\[
\text{Sym}_R^k(I/a) \otimes_R \omega \simeq \text{Hom}_R\left(\text{Sym}_R^{s-g+1-k}(I/a), \text{Sym}_R^{s-g+1}(I/a) \otimes_R \omega \right).
\]

As \( \text{Sym}_R^{s-g+1-k}(I/a) \) is a maximal Cohen-Macaulay \( R/J \)-module by Corollary 1.8(ii) and \( \text{Sym}_R^{s-g+1}(I/a) \otimes_R \omega \) is the canonical module of \( R/J \) by Theorem 1.8

\[
\omega_{\text{Sym}_R^{s-g+1-k}(I/a)} \simeq \text{Hom}_R(\text{Sym}_R^{s-g+1-k}(I/a), \text{Sym}_R^{s-g+1}(I/a) \otimes_R \omega).
\]

The conclusion follows from (i).
In particular, if the residual intersections are geometric, we obtain the following results that could be compared to one of [1] Theorem 2.2.

**Corollary 6.3.** Let \((R, m)\) be a Gorenstein local ring of dimension \(d\) and let \(a \subseteq I\) be two ideals of \(R\). Assume that \(I\) is a strongly Cohen-Macaulay ideal of height \(g\) and \(J = (a; I)\) is a geometric \(s\)-residual intersection of \(I\). Then, for all \(1 \leq k \leq s - g\),

(i) the canonical module of \(I^k/aI^{k-1}\) is \(I^{s-g+1-k}/aI^{s-k}\);

(ii) there is a perfect pairing

\[
I^k/aI^{k-1} \otimes_R I^{s-g+1-k}/aI^{s-k} \to I^{s-g+1}/aI^{s-g}.
\]

**Proof.** It is an immediate translation from Theorem 6.2, in view of the facts that \(\text{Sym}_R^k(I/a) \simeq I^k/aI^{k-1}\) by [11] Corollary 2.11 and \(\omega_R \simeq R\). \(\square\)

Notice that the pairing in this Corollary, and in the main Theorem above, need not be given by multiplication. However, Eisenbud and Ulrich proved that, in many situations where our results apply, the multiplication indeed produces a perfect pairing. In this regards, an example they provide is interesting.

**Example 6.4.** [1] Example 2.8] Let \(R = k[[x, y, z]]\), where \(k\) is an infinite field and \(I = (x, y)^2\). If \(I\) is generated by 3 sufficiently general elements of degree 3 in \(I\), then \(J = a; R I\) is a 3-residual intersection. Using Macaulay2 [7], they verified that \(I\) is strongly Cohen-Macaulay, hence \(\omega_{R/j} \simeq \text{Sym}_R^2(I/a)\). Moreover \(\omega_{I/j} \simeq I/a\).

Computation shows that there is a unique (up to scalars) nonzero homogeneous map \(I/a \otimes_R I/a \to \omega_{R/j}\) of lowest degree, and this is a perfect pairing. But they notice that there can be no perfect pairing \(I/a \otimes_R I/a \to I^2/aI\) because the target is annihilated by \((x, y, z)^2\) while \(I/a\) is not. This implies that \(\omega_{R/j} \neq I^2/aI\) and \(J\) is not geometric.

However, the multiplication with value in the symmetric square \(I/a \otimes_R I/a \to \text{Sym}_R^2(I/a)\) is a perfect pairing.

Next, we will show that the perfect paring in Theorem 6.2 and also in Corollary 6.3 could be chosen by multiplication. First, we need the following lemmas.

**Lemma 6.5.** Let \((R, m, k)\) be a local Noetherian ring and \(S\) be a Noetherian standard graded \(R\)-algebra. For any \(s \geq t\), we consider
\[
\psi : S_t \to \text{Hom}_R(S_{s-t}, S_s)
\]
the natural map given by the algebra structure of \(S\). If \(H^0_{S_s}(S \otimes_R k)_t = 0\), then \(\psi \otimes k\) is into.

**Proof.** Let \(L \in S_t\) be such that \(0 \neq \mathcal{L} \in S_t \otimes_R k = (S \otimes_R k)_t\). The element \(L\) is sent to the class of the homomorphism \(\times L\). We have to prove that this class is not zero. As
\[
\text{mHom}_R(S_{s-t}, S_s) \subseteq \text{Hom}_R(S_{s-t}, \text{m}S_s),
\]
it suffices to show that the image of \(\times L\) is not contained in \(\text{m}S_s\). The assertion is obvious if \(s = t\). If \(s > t\), as \(\mathcal{L} \notin H^0_{S_s}(S \otimes_R k)_t\) and \(S_{s-t} = (S_s)^{s-t}\), there exist \(u \in S_{s-t}\) such that \(\mathcal{T} \cdot \pi \neq 0\). Hence the image of \(\times L\) contains \(L, u \notin \text{m}S_s\). \(\square\)

**Lemma 6.6.** Let \((R, m, k)\) be a local Noetherian ring and \(M\) be a finitely generated \(R\)-module. For any \(s \geq t\), if there exists a \(R\)-module isomorphism
\[
\varphi : \text{Hom}_R(\text{Sym}_R^{s-t}(M), \text{Sym}_R^s(M)) \to \text{Sym}_R^t(M),
\]
then the natural map given by the algebra structure of \(\text{Sym}_R(M)\)
\[
\psi : \text{Sym}_R^t(M) \to \text{Hom}_R(\text{Sym}_R^{s-t}(M), \text{Sym}_R^s(M))
\]
is an isomorphism.
Proof. The assertion of the lemma is equivalent to show that $\varphi \circ \psi$ is onto, which in turn is equivalent to $\psi \otimes_R k$ being into (or equivalently onto).

Choose $\tau_1 : R^n \to M$ onto with $n$ minimal (equivalently such that $R^n \otimes_R k \simeq M \otimes_R k$ via $\tau_1$). Then $\tau := \Sym_R(\tau_1) : \Sym_R(R^n) \to \Sym_R(M)$ is onto and $\tau \otimes_R k$ is an isomorphism identifying $\Sym_R(M) \otimes_R k$ with a polynomial ring in $n$ variables. It follows that $S = \Sym_R(M)$ satisfies the condition of Lemma [5.5] hence $\psi \otimes k$ is into.

Note that $\Sym^0_{R/J}(I/a) = R/J$ and $\Sym^k_{R/J}(I/a) = \Sym^k_R(I/a)$ for $k > 0$. We have the following results.

Theorem 6.7. Let $(R, m)$ be a Gorenstein local ring and let $a \subset I$ be two ideals of $R$, with $\ht(I) = g$. Suppose that $J = (a : R I)$ is an $s$-residual intersection of $I$. If $I$ is strongly Cohen-Macaulay, then $\omega_{R/J} \simeq \Sym^{s-g+1}(I/a)$ and for all $0 \leq k \leq s - g + 1$

(i) the $R/J$-module $\Sym^k_{R/J}(I/a)$ is faithful and Cohen-Macaulay,

(ii) the multiplication

$$\Sym^k_{R/J}(I/a) \otimes_{R/J} \Sym^{s-g+1-k}(I/a) \to \Sym^{s-g+1}(I/a)$$

is a perfect pairing,

(iii) setting $A := \Sym_{R/J}(I/a)$, the graded $R/J$-algebra

$$\overline{A} := A/A_{s-g+1} = \bigoplus_{i=0}^{s-g+1} \Sym^i_{R/J}(I/a)$$

is Gorenstein.

Proof. The first item is Corollary [4.6] (ii). The second and last items directly follow from Lemma [6.6] together with Theorem [6.2] (ii) and (i), respectively.

Corollary 6.8. Let $(R, m)$ be a positively graded Cohen-Macaulay local algebra of dimension $d$ over an Artinian local ring $R_0$, with canonical module $\omega$. Suppose that $a \subset I$ are two homogeneous ideals of $R$, with $\ht(I) = g$, and $J = (a : R I)$ is an $s$-residual intersection of $I$. Write

$$H_{\Sym^k(I/a)}(t) = \frac{P_k(t)}{(1 - t^d)^{d-s}}, \quad H_{\Sym^k(I/a) \otimes_R \omega}(t) = \frac{Q_k(t)}{(1 - t^d)^{d-s}},$$

with $a$ the least common multiple of the degrees of the generators of the algebra $R$ over $R_0$ and $P_k(t), Q_k(t) \in \mathbb{Z}[t, t^{-1}]$, with $P_k(1), Q_k(1) > 0$, for each $1 \leq k \leq s - g$. If $I$ is strongly Cohen-Macaulay and $\Tor^R_1(R/I, \omega) = 0$, then

$$P_k(t) = t^{\sigma(a) + a(d-s)} Q_{s-g+1-k}(t^{-1}).$$

In particular, if $R$ is generated over $R_0$ by elements of degree one, that is, $R = R_0[R_1]$, then

$$e(\Sym^k_R(I/a)) = e(\Sym^{s-g+1-k}(I/a) \otimes_R \omega).$$

Proof. The proof is analogous to one of Corollary [5.5] It follows from the fact that

$$H_{\Sym^k_R(I/a) \otimes_R \omega}(t) = (-1)^{d-s} \sigma(a) H_{\Sym^{s-g+1-k}(I/a)}(t^{-1}).$$

The next corollary enables us to calculate the type of some symmetric powers of $I/a$. This is comparable with the results of Hassanzadeh and the second named author in [14, Theorem 2.12].
Corollary 6.9. Let \((R, \mathfrak{m})\) be a Cohen-Macaulay local ring of dimension \(d\), with canonical module \(\omega\), and let \(a \subset I\) be two ideals of \(R\), with \(\text{ht}(I) = g\). Suppose that \(J = (a :_R I)\) is an \(s\)-residual intersection of \(I\). If \(I\) is strongly Cohen-Macaulay and \(\text{Tor}_1^R(R/I, \omega) = 0\), then, for each \(1 \leq k \leq s - g\),
\[
r(Sym_k^R(I/a)) = \left( \frac{\mu(I/a) + s - g - k}{\mu(I/a) - 1} \right)r(R).
\]

Proof. The proof is totally similar to one of Corollary 4.11. For all \(1 \leq k \leq s - g\),
\[
r(Sym_k^R(I/a)) = \mu(Sym_{R/a}^{s-g+1-k}(I/a) \otimes_R \omega),
\]
by Theorem 6.2(i) and [2, Proposition 3.3.11].

Let \(R\) be a Noetherian ring, \(M\) be a finitely generated \(R\)-module and \(p \in \text{Spec}(R)\). The finite number
\[
\mu_i(p, M) = \dim_{k(p)}(\text{Ext}^i_{R/p}(k(p), M_p)) = \dim_{k(p)}(\text{Ext}^i_R(R/p, M)_p)
\]
is called the \(i\)-th Bass number of \(M\) with respect to \(p\), where \(k(p) = R_p/pR_p\). If \(R\) is local, then \(r(M) = \mu_{\text{depth}(M)}(\mathfrak{m}, M)\). These numbers have an interpretation in terms of the minimal injective resolution of \(M\), (see [2 Proposition 3.2.9]). The next corollary enables us to calculate the Bass numbers of some symmetric powers of \(I/a\).

Corollary 6.10. Under the assumptions of Corollary 6.9. Let \(p\) be a prime ideal containing \(J\) of \(R\), with \(\text{ht}(p) = i\), then, for every \(1 \leq k \leq s - g\),
\[
\mu_{i-k}(p, Sym_k^R(I/a) \otimes_R \omega) = \left( \frac{\mu((I/a)_p) + s - g - k}{\mu((I/a)_p) - 1} \right).
\]

Proof. By Theorem 4.5, \(R/J\) is Cohen-Macaulay of dimension \(d - s\) and by Corollary 4.6(ii), \(Sym_k^R(I/a)\) is a maximal Cohen-Macaulay faithful \(R/J\)-module, for all \(1 \leq k \leq s - g + 1\). Furthermore, by Theorem 6.2(i), \(Sym_k^R(I/a) \otimes_R \omega\) is a maximal Cohen-Macaulay faithful \(R/J\)-module, for all \(1 \leq k \leq s - g\).

Suppose that \(J \subset p_1 \subseteq p_{s+1} \subseteq \cdots \subseteq p_i = p\) is a maximal chain of primes of \(\text{Spec}(R/J)\) contained in \(p\). Let \(b_j \in p_j - p_{j-1}\), for all \(s + 1 \leq j \leq i\). Then \(b = (b_{s+1}, \ldots, b_i)\) is a regular sequence over \(R/J\) and therefore also over \(Sym_k^R(I/a)\) and \(Sym_k^R(I/a) \otimes_R \omega\), for all \(1 \leq k \leq s - g\).

For \(1 \leq k \leq s - g\), \((b_{s+1}, \ldots, b_i)\) is a regular sequence over \((Sym_k^R(I/a) \otimes_R \omega)_p\) and annihilates \(k(p)\), hence [2, Lemma 1.2.4] gives
\[
\text{Ext}^i_{R/p}((k(p), (Sym_k^R(I/a) \otimes_R \omega)_p) \simeq \text{Hom}_{R/p}(k(p), (Sym_k^R(I/a) \otimes_R \omega)_p \otimes_{R_p} R_p/bR_p)
\]
\[
\simeq \text{Hom}_{R_p}(k(p), \text{Hom}_{R}(Sym_k^{s-g+1-k}(I/a), \omega_{R/J}) \otimes_R R_p/bR_p).
\]

The last isomorphism follows from Theorem 4.3 and Theorem 6.2(ii). By [2, Proposition 3.3.3]
\[
\text{Hom}_{R}(Sym_k^{s-g+1-k}(I/a), \omega_{R/J}) \otimes_R R_p/bR_p
\]
\[
\simeq \text{Hom}_{R_p}(Sym_k^{s-g+1-k}(I/a) \otimes_R R_p/bR_p, \omega_{R/J} \otimes_R R_p/bR_p).
\]
Thus, we obtain
\[
\text{Ext}_{R_p}^{i-s}(k(p), \text{Sym}_k^b(I/a) \otimes_R \omega_p) \\
\simeq \text{Hom}_{R_p}(k(p), \text{Hom}_{R_p}(\text{Sym}_{R_p}^{-g+1-k}(I/a) \otimes_R R_p/bR_p, \omega_{R/J} \otimes_R R_p/bR_p)) \\
\simeq \text{Hom}_{R_p}(k(p) \otimes_{R_p} \text{Sym}_{R_p}^{-g+1-k}(I/a) \otimes_R R_p/bR_p, \omega_{R/J} \otimes_R R_p/bR_p) \\
\simeq \text{Hom}_{R_p}(k(p) \otimes_{R_p} \text{Sym}_{R_p}^{-g+1-k}(I/a), \omega_{R/J} \otimes_R R_p/bR_p) \\
\simeq \text{Hom}_{R_p}(\text{Sym}_{k(p)}^{-g+1-k}(k(p) \otimes_R I/a), \omega_{R/J} \otimes_R R_p/bR_p).
\]

Since \(k(p) \otimes_R I/a \simeq k(p) \otimes_{R_p} (I/a)_p\) is a \(k(p)\)-vector space of dimension \(\mu_p := \mu((I/a)_p)\),
\[
\text{Sym}_{k(p)}(k(p) \otimes_R I/a) \simeq k(p)[Y_1, \ldots, Y_{\mu_p}].
\]

It follows that
\[
\text{Ext}_{R_p}^{i-s}(k(p), \text{Sym}_k^b(I/a) \otimes_R \omega) \simeq \text{Hom}_{R_p}(k(p)^{(\mu_p + s - g - k)}, \omega_{R/J} \otimes_R R_p/bR_p) \\
\simeq \text{Hom}_{R_p}(k(p), \omega_{R/J} \otimes_R R_p/bR_p)^{(\mu_p + s - g - k)} \\
\simeq \text{Ext}_{R_p}^{i-s}(k(p), \omega_{R/J})^{(\mu_p + s - g - k)}.
\]

The last isomorphism follows from the fact that \(bR_p\) is regular over \((\omega_{R/J})_p\) and annihilates \(k(p)\). Therefore
\[
\mu_{i-s}(p, \text{Sym}_k^b(I/a) \otimes_R \omega) = \left(\frac{\mu_p + s - g - k}{\mu_p - 1}\right)^{\mu_{i-s}(p, \omega_{R/J})} = \left(\frac{\mu_p + s - g - k}{\mu_p - 1}\right),
\]

since \(\text{ht}(p) = i - s\) in \(R/J\), \(\mu_{i-s}(p, \omega_{R/J}) = 1\), by [2] Theorem 3.3.10].

Acknowledgments

The authors would like to thank Seyed Hamid Hassanzadeh for useful comments on a first version that led to important improvements. A part of this work was done while the second named author was visiting the Université Pierre et Marie Curie and he expresses his gratitude for this hospitality. All authors are partially supported by the Math-AmSud program SYRAM that gave them the opportunity to work together on this question.
