Investigations of anticholinesterase and antioxidant potentials of methanolic extract, subsequent fractions, crude saponins and flavonoids isolated from *Isodon rugosus*

Anwar Zeb, Abdul Sadiq, Farhat Ullah, Sajjad Ahmad and Muhammad Ayaz

**Abstract**

**Background:** Based on the ethnomedicinal uses and the effective outcomes of natural products in various diseases, this study was designed to evaluate *Isodon rugosus* as possible remedy in oxidative stress, alzheimer’s and other neurodegenerative diseases. Acetycholinesterase (AChE) and butyrylcholinesterase (BChE) inhibitory activities of crude methanolic extract (Ir.Cr), resultant fractions (n-hexane (Ir.Hex), chloroform (Ir.Cf), ethyl acetate (Ir.EtAc), aqueous (Ir.Aq)), flavonoids (Ir.Flv) and crude saponins (Ir.Sp) of *I. rugosus* were investigated using Ellman’s spectrophotometric method. Antioxidant potential of *I. rugosus* was determined using DPPH, H₂O₂ and ABTS free radicals scavenging assays. Total phenolic and flavonoids contents of plant extracts were determined and expressed in mg GAE/g dry weight and mg RTE/g of dry sample respectively.

**Results:** Among different fractions Ir.Flv and Ir.Cf exhibited highest inhibitory activity against AChE (87.44 ± 0.51, 83.73 ± 0.64%) and BChE (82.53 ± 0.71, 88.55 ± 0.77%) enzymes at 1 mg/ml with IC₅₀ values of 45, 50 for AChE and 40, 70 μg/ml for BChE respectively. Activity of these fractions were comparable to galanthamine causing 96.00 ± 0.30 and 88.61 ± 0.43% inhibition of AChE and BChE at 1 mg/ml concentration with IC₅₀ values of 20 and 47 μg/ml respectively. In antioxidant assays, Ir.Flv, Ir.Cf, and Ir.EtAc demonstrated highest radicals scavenging activities in DPPH and H₂O₂ assays which were comparable to ascorbic acid. Ir.Flv was found most potent with IC₅₀ of 19 and 24 μg/ml against DPPH and H₂O₂ radicals respectively. Whereas antioxidant activates of plant samples against ABTS free radicals was moderate. Ir.Cf, Ir.EtAc and Ir.Cr showed high phenolic and flavonoid contents and concentrations of these compounds in different fractions correlated well to their antioxidant and anticholinesterase activities.

**Conclusion:** It may be inferred from the current investigations that the Ir.Sp, Ir.Flv and various fractions of *I. rugosus* are good sources of anticholinesterase and antioxidant compounds. Different fractions can be subjected to activity guided isolation of bioactive compounds effective in neurological disorders.

**Keywords:** Anticholinesterase, Antioxidant, Flavonoids, Phenolics, Saponins, *Isodon rugosus*
Background

Alzheimer’s disease (AD) is a chronic neurodegenerative disorder affecting more than twenty millions people globally and is the most common cause of dementia in elder population [1,2]. AD is characterized by degeneration of neurological function, presence of extra-neuronal amyloid deposits, neuritic plaques, gradual deficits in various neurotransmitters leading to decline in the levels of acetylcholine (ACh) and loss of cognitive abilities [1]. Inhibitors of acetylcholinesterase (AChE) and butyrylcholinesterase (BChE), key enzymes involved in the degradation of neurotransmitter ACh, have been shown to function by restoring the level of ACh in the synaptic region and thus reinstating deficient cholinergic neurotransmission [3,4]. Since the discovery of cholinergic deficits in patients suffering from neurological disorders, inhibition of these enzymes is the main target in the treatment of AD, senile dementia, Parkinsonism, ataxia and myasthenia gravis [5,6]. Synthetic drugs used in the treatment of cognitive dysfunction associated with AD and other diseases include tacrine, donepezil and rivastigmine [7]. But these drugs are associated with adverse effects including gastrointestinal disturbances, hepatotoxicity and bioavailability problems [8,9], which necessitates the development of better AChE and BChE inhibitors from natural resources i.e. galantamine.

Reactive oxygen species (ROS) are produced during aerobic respiration and other redox processes in the body. These ROS can attack some important biomolecules like enzymes, lipids, proteins, DNA and RNA leading to cellular damage and plays a major role in aging process [10]. To counteract oxidative stress, human body has several defense mechanisms including antioxidant enzymes and non-enzymatic compounds. But excess of free radicals make the organism unable to scavenge all ROS. These ROS are implicated in the development of some chronic diseases including cardiovascular diseases, cancer, diabetes, nephritis, rheumatism and aging. Oxidative stress has been reported to play a key role in the progression of neurodegenerative diseases like AD and Parkinson’s disease [11,12]. Generally consumption of herbs, fruits and vegetables are beneficial for health due to the presence of protective antioxidant phyto-nutrients present in them [13,14]. Synthetic antioxidant compounds including gallic acid esters, butylated hydroxy toluene (BHT), tertiary butylated hydroquinone and butylated hydroxy anisole (BHA) are associated with severe adverse effects and hence their use is limited. Consequently, there is need to discover new antioxidants from natural sources [15]. In this regard antioxidant potential of numerous plants has been reported [16-19]. In antioxidant compounds, flavonoids and phenolic compounds are very important. These compounds have the ability to scavenge free radicals effectively due to the presence of hydroxyl groups and conjugated system [20].

I. rugosus belongs to Labiatae, a family rich in species containing huge number of pharmacologically active compounds. The Isodon species are traditionally used as anticancer, antimicrobial, insecticidal, antioxidants and as anthelmintic [21-24]. I. rugosus is used traditionally in the management of hypertension, rheumatism, tooth-ache, and pyrexia [25]. Ethno-medicinally, this is used in the treatment of skin diseases, ear, nose and throat infections and the treatment of intestinal disorders are also reported [26]. In an effort to discover new sources which can potentially be used in the treatment of oxidative stress, AD and other neurological disorders, I. rugosus was investigated for anticholinesterase and antioxidant potentials.

Results

Total phenolic and flavonoid contents

Results of total phenolic and flavonoids contents in different fractions of I. rugosus are summarized in Table 1. Results indicate that Ir.Cf, Ir.EtAc and Ir.Cr exhibited high phenolic contents, i.e. 82.60 ± 0.68, 67.45 ± 0.83 and 65.51 ± 1.67 mg GAE/g of dry sample respectively. Whereas, Ir.Cf, Ir.Cr and Ir.EtAc showed highest flavonoids content i.e. 91.45 ± 1.12, 71.73 ± 0.69 and 68.46 ± 1.83 mg RTE/g of sample respectively. Phenolic compounds show greater antioxidant activity due to the presence of hydroxyl groups and conjugated system in their chemical structure [27,28]. Phenolic and flavonoid contents in different fractions of plant correlated well to the antioxidant activity.

Anticholinesterase assays

Results of AChE and BChE inhibitory potentials of I. rugosus at various tested concentrations are summarized in Table 2. In AChE inhibition assay, Ir.Fl, Ir.Cf and Ir.Sp showed highest activity against AChE causing 87.44 ± 0.51, 83.73 ± 0.64 and 77.85 ± 0.56% inhibitions at 1 mg/ml respectively. For these fractions IC50 values were 45, 50 and 75 μg/ml respectively. Standard drug galanthamine inhibited AChE enzyme by 96.00 ± 0.30% at 1 mg/ml concentration with IC50 value of 20 μg/ml.

Table 1 Total phenolics and total flavonoids of Ir.Cr and subfractions of I. rugosus

| Samples   | Total phenolics (mg GAE/g of sample) | Total flavonoids (mg RTE/g of sample) |
|-----------|-------------------------------------|---------------------------------------|
| Ir.Cr     | 65.51 ± 1.67                        | 71.73 ± 0.69                          |
| Ir.Hex    | 41.38 ± 1.15                        | 44.40 ± 2.76                          |
| Ir.Cf     | 82.60 ± 0.68                        | 91.45 ± 1.12                          |
| Ir.EtAc   | 67.45 ± 0.83                        | 68.46 ± 1.83                          |
| Ir.Aq     | 18.11 ± 2.25                        | 27.12 ± 1.33                          |

Each value in the table is represented as mean ± SEM (N = 3).

Abbreviations: Ir.Cr Crude methanolic extract, Ir.Hex n-hexane fraction, Ir.Cf Chloroform fraction, Ir.EtAc Ethyl acetate fraction, Ir.Aq Aqueous fraction.
Percent inhibitions of these fractions were comparable to the standard drug. AChE inhibition activity of all other fractions was less than 60%. On the other hand, Ir.Cr, Ir.Flv and Ir.EtAc were most effective fractions against BChE enzyme, causing 88.55 ± 0.77%, 82.53 ± 0.71 and 76.37 ± 0.68% inhibitions at 1 mg/ml concentration respectively. Ir.Cr, Ir.Flv and Ir.EtAc were most potent, presenting IC_{50} of 70, 40 and 52 μg/ml respectively. BChE inhibitory activities of these fractions were comparable to galanthamine result with percent inhibition of 88.61 ± 0.43% at 1 mg/ml with IC_{50} value of 47 μg/ml.

Antioxidant assays

**DPPH free radicals scavenging effect**

Analysis of plant samples against DPPH free radicals revealed that Ir.Flv, Ir.Sp, Ir.EtAc and Ir.Cr were most effective causing 81.1 ± 0.90, 76.36 ± 0.48, 74.53 ± 1.34 and 71.63 ± 0.67% scavenging respectively at 1 mg/ml concentration. Median inhibitory concentrations (IC_{50}) were 19, < 0.1, 22 and 28 μg/ml for Ir.Flv, Ir.Sp, Ir.EtAc and Ir.Cr respectively as shown in Figure 1. Ascorbic acid (Positive control) cause 85.71 ± 0.49% inhibition of DPPH radicals at 1 mg/ml concentration and IC_{50} was 52 μg/ml. Potency wise activity of Ir.Flv, Ir.Sp, Ir.EtAc and Ir.Cr was better than ascorbic acid. Other fractions were effective in concentration dependent manner. DPPH scavenging activity for all the tested samples were in ascending order of Ir.Flv > Ir.EtAc > Ir.Cr > Ir.Sp > Ir.Aq > Ir.Hex, shown in Figure 2.

**Hydrogen peroxide free radicals scavenging effect**

In H_{2}O_{2} free radicals scavenging activity, Ir.Flv, Ir.EtAc, Ir.Sp, Ir.Cr and Ir.Cf showed highest activities causing 78.9 ± 0.41, 74.1 ± 0.67, 69.5 ± 0.67, 69.50 ± 0.67 and 64.4 ± 0.64% inhibition at 1 mg/ml concentration (Figure 3).

### Table 2 Percent AChE and BChE inhibition potentials of I. rugosus at various tested concentrations

| Samples | Concentrations (μg/ml) | Percent AChE (mean ± SEM) | AChE IC_{50} (μg/ml) | Percent BChE (mean ± SEM) | BChE IC_{50} (μg/ml) |

The data is represented as mean ± SEM, (N = 3). Values significantly different as compare to positive control, *P < 0.05, **P < 0.01, ***P < 0.001.

Abbreviations: Ir.Cr Crude methanolic extract, Ir.Hex n-hexane fraction, Ir.Cf Chloroform fraction, Ir.EtAc Ethyl acetate fraction, Ir.Aq Aqueous fraction, Ir.Flv Crude flavonoids, Ir.Sp Crude Saponins.
For these fractions IC\textsubscript{50} were 24, 30, 250, 34 and 196 μg/ml respectively, as shown in Figure 1. Ascorbic acid inhibition was 83.08 ± 0.47% at the same tested concentration with IC\textsubscript{50} 24 μg/ml.

**ABTS free radicals scavenging effect**
In ABTS free radicals scavenging assay, Ir.Cr, Ir.Sp, Ir.Hex, Ir.EtAc and Ir.Flv showed highest activity causing 79.35 ± 0.61, 74.89 ± 0.22, 74.1 ± 1.04, 64.99 ± 0.92 and 57.04 ± 1.12% scavenging respectively at 1 mg/ml concentration (Figure 4). For these fractions, the IC\textsubscript{50} were 37, 70, 240 and 380 μg/ml respectively, as shown in Figure 1. The ascorbic acid inhibition was 84.78 ± 0.40% at 1 mg/ml with IC\textsubscript{50} of 50 μg/ml.

**Correlation of total phenolic contents and various activities**
Regression and correlation of total phenolic contents and various assays have been summarized in Figure 5 (A, B, C, D and E). The correlation coefficient (R\textsuperscript{2} = 0.742) obtained by plotting H\textsubscript{2}O\textsubscript{2} scavenging assay versus total phenolic
contents was the most prominent one. The regression line for H$_2$O$_2$ ($y = 0.312x + 45.60$) went parallel with the total phenolic contents. Similarly, the correlation co-efficients of ABTS and DPPH were calculated as 0.415 and 0.641 respectively. Furthermore, the regression line obtained for AChE ($y = 0.236x + 58.75$) and BChE ($y = 0.240x + 60.35$) goes moderately parallel with the total phenolic contents having correlation coefficient 0.663 and 0.390 respectively.

**Discussion**

Antioxidant compounds are useful neuroprotective agents in the therapy of early stages of Alzheimer’s disease (AD) [29]. Though exact origin of AD is unknown, the diminution of neurotransmitters like ACh caused by the enzymes AChE and BChE are clearly involved in the etiology of this disease [30]. One treatment strategy is to enhance cholinergic functions by the use of AChE and BChE inhibitors to augment the amount of ACh present.
in the synapses between cholinergic neurons. In this regard, use of selective inhibitors for AChE and BChE has attracted particular attention in the treatment of the Alzheimer-type dementia [31]. In recent times, BChE received particular attention since it is a co-regulator of cholinergic neurotransmission and its pharmacological activity is increased in AD and associated with all neuropathological lesions in this disorder [32]. Even though selective inhibitors of BChE from synthetic origin, based on quinazolinimines and lipoic acid have been reported [33]. The search for more efficient and less expensive natural substances is a mandatory research branch [29]. Use of AChE inhibitors like physostigmine or tacrine is restricted due to limitations such as short half life and serious side effects like hepatotoxicity. Alkylpyridium polymers, dehydroevodiamine (DHED) and carbamate type AChE inhibitors have been recently reported, but due to bioavailability problems and side effects, there is still great interest in searching better AChE inhibitors from natural sources [34].

Results of the current study revealed that Ir.Flv, Ir.Cf and Ir.Sp possesses highest inhibitory potential against AChE causing 87.44 ± 0.51, 83.73 ± 0.64 and 77.85 ± 0.56% enzyme inhibitions respectively at 1 mg/ml concentration. These fractions were most potent among others with IC\(_{50}\) values of 45, 50 and 75 \(\mu\)g/ml. AChE inhibitory activities of these fractions were comparable to standard drug galanthamine, whose percent inhibition was 96.00 ± 0.30 at the same tested concentration with IC\(_{50}\) of 20 \(\mu\)g/ml. In BChE inhibition assay, Ir.Cf, Ir.Flv and Ir.EtAc were found
most active causing 88.55 ± 0.77, 82.53 ± 0.71 and 72.66 ± 0.78% enzyme inhibition at 1 mg/ml respectively. Median inhibitory concentrations (IC$_{50}$) for these fractions were 70, 40 and 52 μg/ml respectively. Activities of these fractions were comparable to standard drug galanthamine at the same tested concentration. Among different fractions, Ir.Cf exhibited high phenolic (82.60 ± 0.68) and flavonoid (91.45 ± 1.12) contents, which can be linked to its highest enzyme inhibitory activities.

The use of antioxidants may slow the development of Alzheimer’s disease (AD) and diminish neuronal degeneration [35,36]. Due to deteriorating effects of oxidative stress on human health the interest in naturally occurring antioxidant has been increased [37]. The flavonoids are reported to possess strong BChE inhibitory potential [38]. The age related brain performance can be improved by the use of vegetables and fruits rich in flavonoids which have the capability to neutralize the free radicals [39]. The total phenolic and flavonoid contents can be correlated with the antioxidant potential against free radicals which can lead to cognitive aging and CNS disorders [40]. Phenolic acids have been reported as natural radical scavengers in vegetables, fruits and herbs by several researchers [41]. The antioxidant potential of phenolics is attributed to their redox properties which enables them to give hydrogen or quench the singlet oxygen [42].

The concentrations of the crude plant extracts that inhibited the DPPH, H$_2$O$_2$ and ABTS radicals by 50% (IC$_{50}$) are presented in the Figure 1. In DPPH free radicals scavenging assay, Ir.Sp, Ir.Flv, Ir.EtAc and Ir.Cf were found most potent with IC$_{50}$ of 0.1, 19, 22 and 28 μg/ml respectively. In H$_2$O$_2$ scavenging assay, Ir.Flv, Ir.EtAc and Ir.Cf proved IC$_{50}$ of 24, 30 and 34 μg/ml respectively. Likewise, in ABTS free radicals scavenging activity, Ir.Cr, Ir.Aq and Ir.Sp exhibited IC$_{50}$ of 37, 55 and 70 μg/ml respectively. In Linear correlation of total phenolic contents vs DPPH, H$_2$O$_2$ and ABTS radicals scavenging activities, these exhibited correlation coefficient of $R^2$ = 0.641, 0.742 and 0.415 respectively (Figure 5C, D and E). Concentrations of phenolics in different fractions correlated well to antioxidant and anticholinesterase activities. The current investigations suggest that $I$. rugosus is a good source of anticholinesterase and antioxidant compounds. The fractions showing highest activities should be further subjected to isolation of novel, cost effective and safer active compounds useful in the treatment of neurological disorders.

**Conclusion**

Based on the current investigations it may be concluded that the Ir.Flv, Ir.Sp and Ir.Cf isolated from $I$. rugosus exhibited anticholinesterase and antioxidant activities comparable to that of standard drugs which can be attributed to their high phenolic contents. The current study suggests further investigations of $I$. rugosus for isolation, purification and characterization of valuable bioactive compounds for the treatment of various neurodegenerative diseases.

**Methods**

**Plant collection and extraction**

The aerial parts of $I$. rugosus were collected from Dir (U) Khyber Pakhtunkhwa, Pakistan in May 2013. The plant was identified by plant taxonomist at the department of Botany, Shaheed Benazir Bhutto University, Sheringal Dir (U) KP, Pakistan. The plant specimen was deposited at the herbarium of the same University with voucher number (1016AZ). The plant material was cleaned from dust with tap water and then with distilled water till the complete removal of all the extra particles. It was spread on a clean paper and shade dried for 23 days. The plant material was converted into coarse powder with the help of a grinder. The powdered material (11 kg) was soaked in 80% methanol for 15 days and was filtered. The filtrated solution was concentrated under reduced pressure using rotary evaporator (Heidolph Laborota 4000, Schwabach, Germany) at 40°C. Finally, the crude methanolic extract (900 g) was obtained.

**Fractionation**

The crude methanolic extract having weight of 900 g was added to separating funnel and mixed with 500 mL of n-hexane, chloroform and ethyl acetate and fractionated by successive solvent-solvent extraction method starting from the low polar solvent towards the high polar solvent using method described previously [43]. Finally, Ir.Hex, Ir.Cr, Ir.EtAc and Ir.Aq obtained were 30 g, 45 g, 50 g and 180 g respectively.

**Extraction of crude saponins**

Crude saponins from *Isodon rugosus* were extracted by adding 20 g of the plant sample in a conical flask having 100 mL of 20% ethanol. This mixture was heated on water bath at 55°C for 4 h followed by filtration. The residue obtained was extracted again with 200 mL of 20% ethanol and was added to the first collection. Volume of solvent extract was reduced to 40 ml using water bath to obtained greenish color residue. The residue was transferred into a separating funnel and diethyl ether (20 mL) was added to it. After vigorous shaking, the separating funnel was put in a stand to get two layers. The upper organic layer was discarded while the lower aqueous layer obtained was diluted with 60 mL of n-butanol. This combined n-butanol extract was washed twice with 10 ml of 5% NaCl solution. The solution was evaporated by keeping in water bath to obtain the dried saponins [44].
Extraction of crude flavonoids
Harborne's procedure was followed for the isolation of crude flavonoids [45]. Plant sample having weight of 20 g was taken in powdered form and heated in 200 ml of 2 M HCl at 50°C under reflux for 30 minutes. It was allowed to cool and then filtered using whatman No.42 filter paper. The filtrate was treated with equal volume of ethyl acetate. The flavonoids present in the extract were precipitated, which was recovered with the help of weighed filter paper. The weight of flavonoids obtained was 1.5 grams (7.5%).

Determination of total phenolic contents
The total phenolic contents was determined following the procedure reported previously [46]. Briefly, 1 ml of diluted extract was mixed with 9 ml of distilled water followed by addition of 1 ml of Folin-Ciocalteu's reagent (FCR) with vigorous shaking. After 5 min, 10 ml of 7% Na₂CO₃ solution was added to it and properly mixed. The mixture was diluted to 25 ml with distilled water and shaken properly. After 90 min, the absorbance was measured by using UV spectrophotometer at 750 nm. Gallic acid standard curve was used for the measurement of total phenolic contents. The total phenolics were expressed as milligrams of gallic acid equivalent (mg GAE/g) per gram of dry sample.

Determination of total flavonoids contents
Total flavonoid contents of Isodon rugosus were determined using procedure previously described [47]. Briefly, 0.3 ml of plant sample solution, 0.15 ml NaNO₂ (0.5 M), 3.4 ml methanol (30%) and 0.15 ml AlCl₃·6H₂O (0.3 M) were mixed and added to a 10 ml test tube. After 5 min, 1 ml of NaOH (1.0 M) was added to it. The absorbance of the mixture was measured by using UV spectrophotometer at 506 nm. For the determination of total flavonoids, standard Rutin solution curve (0 to 100 mg/ml) was used. The total flavonoid contents were expressed as milligram of rutin equivalent per gram of dry sample (mg RTE/g).

Chemicals and drugs
Potassium phosphate buffer (pH 8.0), Galantamine from Lycoris Sp. (Sigma-Aldrich France), Butyrylthiocholin iodide (Sigma-Aldrich Switzerland), Acetylthiocholine Iodide (Sigma-Aldrich UK), 5,5-dithio-bis-nitrobenzoic acid (DTNB) (Sigma-Aldrich Germany), Electric eel acetylcholinesterase (type-VI-S, Sigma-Aldrich USA) and Aquine butyrylcholinesterase (Sigma-Aldrich USA) were used in enzyme inhibition assays. For antioxidant assays, DPPH (Sigma Aldrich CHEMIE GmbH USA), H₂O₂ (Riedel-de Haen Germany) and ABTS (Sigma-Aldrich Germany) were used. All solvents used in the assays were of analytical grades purchased from Sigma-Aldrich.

Anticholinesterase assays
In this method, plant samples were evaluated spectrophotometrically for AChE and BChE inhibition potentials using acetylthiocholine iodide and Butyrylthiocholine iodide as substrates, respectively following Ellman assay [48]. In this method, 205 μl of plant samples (125–1000 μg/ml) were added to the cuvette contained BChE (0.01 U/ml) and 5 μl of AChE (0.03 U/ml). DTNB (5 μl) was added to the mixture and incubated for 15 min in a water bath having temperature of 30°C. To start the reaction added 5 μl substrates to the mixture. Absorbance was measured using double beam Spectrophotometer at wavelength of 412 nm for 4 min.

The reaction between thiocochulines and DTNB was indicated by the formation of 5-thio-2-nitrobenzoate anion, which showed by yellow color appearance. White assay was carried out to check the hydrolysis of substrate contained no enzymes and plant samples. The reaction mixture containing without plant sample was taken as control. Percent enzyme activity and percent inhibition were calculated as follows;

\[
\text{% enzyme activity} = \frac{V}{V_{\text{max}}} \times 100
\]

\[
\text{% enzyme inhibition} = 100 - \text{% enzyme activity}
\]

(Where V indicates the rate of reaction in the presence of inhibitor and Vmax is the rate of reaction without inhibitor).

Antioxidant assays
DPPH free radicals scavenging activity
For DPPH free radicals scavenging activity the method of Brand-Williams et al. was followed with some modifications [49]. DPPH (24 mg) was dissolved in 100 ml of methanol to prepare DPPH solution. The stock solutions of plant samples were prepared in methanol having concentrations of 1 mg/ml and then diluted to the concentrations 1000, 500, 250 μg/ml. DPPH and sample solutions were mixed in a ratio of 1:1 and were incubated at 23°C for 30 min. Finally, absorbance was measured at 517 nm using UV spectrophotometer (Thermo electron corporation USA). Ascorbic acid was used as positive control. Percent radical scavenging activity was measured using the following equation;

\[
\text{Scavenging effect %} = \frac{\text{control absorbance–sample absorbance}}{\text{control absorbance}} \times 100
\]

Hydrogen peroxide free radicals scavenging activity
The plant samples were investigated for hydrogen peroxide free radical scavenging potential following the procedure of
Ruch et al., [50]. Briefly, 2 mmol solution of hydrogen peroxide was prepared in 50 mmol phosphate buffer having pH of 7.4. Various plant samples (0.1 ml) were taken in test tubes followed by addition of 50 mmol phosphate buffer to make the final volume 0.4 ml. Hydrogen peroxide (0.6 ml) was added to the test tube and kept for 10 min. Absorbance was measured spectrophotometrically at 230 nm against the blank. The hydrogen peroxide scavenging activity was calculated using the following equation:

\[
\text{Hydrogen peroxide scavenging activity} = \left( \frac{1 - \text{sample absorbance}}{\text{control absorbance}} \right) \times 100
\]

**ABTS free radicals scavenging activity**

Antioxidant potentials of Ir.Cr, Ir.Hex, Ir.EtAc, Ir.Cf, Ir.Aq, Ir.Fl and Ir.Sp were investigated using the free radicals of 2, 2-azinobis [3-ethylbenzthiazoline]-6-sulphonic acid (ABTS) [51]. ABTS (7 mmol) and potassium persulfate (2.45 mmol) solutions were prepared and thoroughly mixed. For production of free radicals, the solution was kept in the dark for 8 h at room temperature. Prior to use, ABTS solution was diluted with phosphate buffer (0.01 M), pH 7.4. The absorbance of ABTS solution was adjusted to 0.7 at 745 nm by the addition of 50% methanol. Radical scavenging ability of the fractions was analyzed by mixing 300 μl of each test sample with 3.0 ml of ABTS solution in a cuvette. The absorbance of the solution was measured using a double beam spectrophotometer for 6 min. Ascorbic acid was used as positive control. The experiment was repeated three times and percent ABTS scavenging activity was calculated as follows:

\[
\text{Scavenging activity (％)} = \left( \frac{\text{control absorbance} - \text{sample absorbance}}{\text{control absorbance}} \right) \times 100
\]

**Statistical analysis**

Each experiment was performed in three replicates and values were expressed as mean ± SEM. One way ANOVA followed by multiple comparison Dunnett’s test was used for the comparison of positive control with the test groups. The P values less than 0.05 were considered as statistically significant. IC₅₀ values were calculated by a linear regression analysis among the percent inhibition against the extract concentrations via Excel program.

**Regression and linear correlation**

Regression (y) and linear correlation (R²) for phenolic contents and various activities (anticholinesterase and antioxidants) were determined using Microsoft Excel 2007.

**Competing interests**

The authors declare that they have no competing interests.

**Authors’ contributions**

AZ and SA carried out experimental work, data collection and literature search under the supervision of AG. FU helped as co-supervision of the research work. MA drafted the manuscript for publication. AS make the final version of publication. All the authors have read and approved the final manuscript for publication.

**Acknowledgements**

The authors are grateful to the Department of Pharmacy for the kind provision of research laboratories for conduction of these activities. We are also thankful to Dr. Ali Hazrat, Department of Botany, SBBU, Sheringal, Dir Upper, Pakistan for identification of plant.

**Funding**

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.
