1. Introduction

Disseminated hypopigmented keratosis (DHK) was first described by Morison et al. in 1991 [1]. No case was reported till the study with the 13 cases of hypopigmented keratosis (HK) was reported by Kim et al. in 2013 [2]. Here we report a case presented with diffuse hypopigmented keratotic lesions considered with the diagnosis of DHK which was improved by oral acitretin and we compared the characteristics of our case with the cases reported before.

2. Case Report

A 21-year-old man referred to our outpatient clinic because of the numerous asymptomatic hypopigmented lesions which appeared 10 years ago. The lesions persisted since the beginning and they had a course of gradual and slow increase in number. The lesions were disseminated during this period. He had no history of any systemic disease or phototherapy/UV exposure and he was healthy in all other respects. The family history was unremarkable.

Dermatological examination revealed hypopigmented, 2–5 mm in size, nonfollicular, numerous keratotic lichenoid papules occurring on the extensor surfaces of the extremities, back and lumber region. Histopathological examination showed orthohyperkeratosis, irregular acanthosis, and sporadic papillomatosis with a normal amount of melanin and number of melanocytes. In addition, no marked inflammation or melanophages were seen. In order to exclude other possible causes, we performed laboratory tests and radiological examination which were all found to be normal. As the clinical and histopathological features of our patient were taken into account, it was considered to be compatible with the diagnosis of disseminated hypopigmented keratoses. So far, only topical therapies have been used with failure in the previously reported cases except one patient. Considering the extensive lesions, we treated the present patient with 3% salicylic acid in addition to oral acitretin and significant regression in all lesions was achieved, particularly on the keratosis.
Table 1: The general characteristics of the cases of DHK reported in the literature.

| Year  | Author (ref.) | Age | Gender | Site                                   | Age of onset | Histopathology                                                                 |
|-------|---------------|-----|--------|----------------------------------------|--------------|--------------------------------------------------------------------------------|
| 1991  | Morison et al. [1] | 19  | Female | Trunk, extremities, and dorsa of the hands and feet | 19           | Mild orthohyperkeratosis and papillomatosis                                    |
| 1991  | Morison et al. [1] | 5   | Female | Extremities and trunk                   | 5            | Biopsy was not performed Hyperkeratosis, acanthosis, decreased melanin content, and number of melanocytes |
| 2013  | Kim et al. [2]  | 4   | Female | Arm, leg, and trunk                     | 2            | Biopsy was not performed Hyperkeratosis, acanthosis, and 50 of melanocytes     |
| 2013  | Kim et al. [2]  | 5   | Female | Arm                                     | 0            | Same with above Melanocytes                                                    |
| 2013  | Kim et al. [2]  | 40  | Male   | Trunk                                  | 33           | Biopsy was not performed Hyperkeratosis, acanthosis, and 50 of melanocytes     |
| 2013  | Kim et al. [2]  | 70  | Female | Trunk                                  | 50           | Biopsy was not performed Hyperkeratosis, acanthosis, and 50 of melanocytes     |
| 2017  | Present case   | 21  | Male   | Trunk, extremities, and face            | 11           | Orthohyperkeratosis, irregular acanthosis, and sporadic papillomatosis         |

Figure 3: The appearance of the left upper back and the left upper arm after 2 months of the treatment.

The reported cases of DHK are listed and summarized in Table 1. In 2002, Kokturk et al. reported a localized variant of this entity presented in a 16-year-old girl [3].

In the study reported by Kim et al., 13 cases of HK were reported and 4 of them had a disseminated distribution [2]. The authors suggested that HK may be a “hyperkeratotic” variant of idiopathic guttate hypomelanosis [2]. The lesions are distributed more intensively and extensively in our patient keratosis (Figure 3). No major side effect was seen related to the use of acitretin.

3. Discussion

Here we presented a case of DHK improved with oral acitretin that represents a distinct entity with a unique presentation [1].
compared to previous reported cases. Additionally, the papules coalesced in some areas and were more scaly in our patient. Therefore it could be speculated that the present case might represent a distinct variant of HK. Although the first reports suggested that the UV exposure might be involved in the pathogenesis [1], the eruption of our case was unrelated to UV.

Many dermatoses could be considered in the differential diagnosis of DHK including stucco keratosis, verruca plana, lichen nitidus, Darier’s disease, and guttate psoriasis. The diagnosis of DHK was established based on the exclusion of the differential diagnosis regarding the clinical and histological features.

A few treatment modalities were tried for the HK in the previous reports including tretinoin, propylene glycol, salicylic acid gel, and cryosurgery without significant improvement [1, 2]. One exception is that tretinoin gel and salicylic acid ointment provided marked improvement in the case of the localized HK reported by Kokturk et al. [3]. We tried to use oral acitretin for the treatment of the present case considering the extensive scaly lesions and the failure of the topical therapies reported before. The significant response to the retinoid therapy leads us to speculate that this disorder may arise from an undetermined pathology of keratinization. However, there is no further evidence to support or disprove this idea.

4. Conclusion

DHK is a rarely reported entity with widespread hypopigmented keratotic papules with unknown etiology. Acitretin may be a considerable option for the treatment of HK.

Conflicts of Interest

There are no conflicts of interest.
