Keywords: Maxwell’s vacuum equations, Hamilton-Jacobi equation, Klein-Gordon-Fock equation, integrals of motion, algebra of symmetry operators, linear partial differential equations.

1 Introduction

A special place in mathematical physics is occupied by the problem of exact integration of the equations of motion of a classical or quantum test particle in external electromagnetic and gravitational fields. This problem is closely related to the study of the symmetry of gravitational and electromagnetic fields in which a given particle moves. A necessary condition for the existence of such symmetry is the admissibility of the algebra of symmetry operators, given by vector and tensor Killing fields, for spacetime and the external electromagnetic field. The algebras of these operators are isomorphic to the algebras of the symmetry operators of the equations of motion of a test particle - Hamilton-Jacobi, Klein-Gordon-Fock, or Dirac-Fock. At present, two methods are known for the exact integration of the equations of motion of a test particle. These are the methods of commutative and noncommutative integration. The first method is based on the use of a commutative algebra of symmetry operators (integrals of motion) that form a complete set. The complete set includes linear operators of first and second degree in momentum formed by vector and tensor Killing fields of complete sets of geometric objects of $V_4$. The method is known as the method of complete separation of variables (in the Hamilton-Jacobi, Klein-Gordon-Fock, or Dirac-Fock equations). The spaces in which the method of complete separation of variables is applicable are called Stackel spaces. The theory of Stackel spaces was developed in [11]-[12]. A description of the theory and a detailed bibliography can be found in [13], [14]-[16]. The most frequently used exact solutions of the gravitational field equations in the theory of gravity were constructed on the basis of Stackel spaces (see, e.g., [17]-[19]). These solutions are still widely used in the study of various effects in gravitational fields (see, e.g., [21]-[28].)
The second method (noncommutative integration) was developed in [29]. This method is based on the use of an algebra of symmetry operators, which are linear in momenta and constructed using Killing vector fields forming noncommutative groups of motion of spacetime \( G_3 \) and \( G_4 \). The algebras of the symmetry operators of the Klein-Gordon-Fock equation constructed using the algebras of the operators of the noncommutative motion group of space \( V_4 \) are complemented to a commutative algebra by the operators of differentiation of the first order in 4 essential parameters. Among these spacetime manifolds, the homogeneous spaces are of greatest interest for the theory of gravity (see, e.g., [30]-[37]).

Thus, these two methods complement each other to a considerable extent and have similar classification problems (by solving the classification problem, we mean enumerating all metrics and electromagnetic potentials that are not equivalent in terms of admissible transformations). Among these classification problems, the most important are the following.

Classification of all metrics of homogeneous and Stackel spaces in privileged coordinate systems. For Stackel spaces, this problem was solved in building the theory of complete separation of variables in the papers cited above. For homogeneous spaces, this problem was solved in the work of Petrov (see [38]).

Classification of all (admissible) electromagnetic fields applicable to these methods. For the Hamilton-Jacobi and Klein-Gordon-Fock equations, this problem is completely solved in homogeneous spaces (see [39]-[44]). In Stackel spaces, it is completely solved for the Hamilton-Jacobi equation and partially solved for the Klein-Gordon-Fock equation (see [14]-[16]).

Classification of all vacuum and electrovacuum solutions of the Einstein equations with metrics of Stackel and homogeneous spaces in admissible electromagnetic fields. This problem has been completely solved for the Stackel metric (see [17]-[21]). However, this classification problem has not yet been studied for homogeneous spaces.

The solutions to these problems can be viewed as stages of the solution of a single classification problem. In the first two stages, we find all relevant gravitational and electromagnetic fields that are not connected by field equations. In the third stage, using the results of the first two stages, we find metrics and electromagnetic potentials that satisfy the Einstein-Maxwell vacuum equations and have physical meaning.

Thus, for the complete solution to the problem of uniform classification, it remains to integrate the Einstein-Maxwell vacuum equations using the previously found potentials of admissible electromagnetic fields and the known metrics of homogeneous spaces in privileged (canonical) coordinate systems. This problem can also be divided into two stages. In the first stage, all solutions of Maxwell’s vacuum equations for the potentials of admissible electromagnetic fields should be found. The present work is devoted to this stage. In the next stage, it is planned to use the obtained results for the integration of the Einstein-Maxwell equations. This will be the subject of further research. The present work is organized as follows.

Section number two contains information from the theory of homogeneous spaces, which will be used later, and definitions and conditions for the potentials of admissible electromagnetic fields, written in canonical frames associated with motion groups of a homogeneous space.

In the third section, Maxwell’s vacuum equations are written in canonical frames.

The fourth section contains all solutions of Maxwell’s vacuum equations for homogeneous spaces admitting groups of motions \( G_3(I) - G_3(VI) \).
2 Homogeneous spaces

By the accepted definition, a spacetime manifold $V_4$ is a homogeneous space if a three-parameter group of motions acts on it, whose transitivity hypersurface $V_3$ is endowed with the Euclidean space signature. Let us introduce a semi-geodesic coordinate system $[u^i]$, in which the metric $V_4$ has the form:

$$ ds^2 = g_{ij}du^i du^j = -du^0^2 + g_{\alpha\beta}du^\alpha du^\beta, \quad \text{det}|g_{\alpha\beta}| > 0. $$ (2.1)

The coordinate indices of the variables of the semi-geodesic coordinate system are denoted by the lower case Latin letters: $i, j, k, l = 0, 1 \ldots 3$. The coordinate indices of the variables of the local coordinate system on the hypersurface $V_3$ are denoted by the lower case Greek letters: $\alpha, \beta, \gamma, \sigma = 1, \ldots 3$. A 0 index denotes the temporary variable. Group indices and indices of nonholonomic frames are denoted by $a, d, c = 1, \ldots 3$. Summation is performed over repeated upper and lower indices within the index range.

There is another (equivalent) definition of a homogeneous space, according to which the spacetime $V_4$ is homogeneous if its subspace $V_3$, endowed with the Euclidean space signature, admits a set of coordinate transformations (the group $G_3$ of motions spaces $V_4$) that allow to connect any two points in $V_3$. (see, e.g., [45]). This definition directly implies that the metric tensor of the $V_3$ space can be represented as follows:

$$ g_{\alpha\beta} = e^a_\alpha e^b_\beta \eta_{ab}, \quad ||\eta_{ab}|| = ||a_{ab}(u^0)||, \quad e^a_{\alpha,0} = 0, \quad \text{det}||a_{ab}|| = l_0^2, $$ (2.2)

while the form

$$ \omega^a = e^a_\alpha du^\alpha $$

is invariant under the transformation group $G_3$. The vectors of the frame $e^a_\alpha$ (we call them canonical) define a nonholonomic coordinate system in $V_3$, and their dual triplet of vectors

$$ e^a_\alpha, \quad e^a_\alpha e^b_\alpha = \delta^b_a, \quad e^a_\alpha e^a_\beta = \delta^\alpha_\beta $$

define the operators of the $G_3$ algebra group:

$$ \hat{Y}_a = e^a_\alpha \partial_\alpha, \quad [\hat{Y}_a, \hat{Y}_b] = C^c_{ab} \hat{Y}_c. $$

The Killing vector fields $\xi^a_\alpha$ and their dual vector fields $\xi^a_a$ form another frame in the space $V_3$ (we will call it the Killing frame) and another representation of the algebra of the group $G_3$. In the dual frame, the metric of the space $V_3$ has the form:

$$ g_{\alpha\beta} = \xi^a_\alpha \xi^b_\beta G_{ab}, \quad \xi^a_\alpha \xi^b_\alpha = \delta^b_a, \quad \xi^a_\alpha \xi^c_\beta = \delta^\alpha_\beta, $$ (2.3)

where $G_{ab}$ are the nonholonomic components of the $g_{\alpha\beta}$ tensor in this framework. The vector fields $\xi^a_\alpha$ satisfy the Killing equations:

$$ g^{\alpha\beta}_{\gamma} \xi_\gamma = g^{\alpha\gamma}_{\sigma} \xi^\sigma_\beta + g^{\beta\gamma}_{\alpha} \xi^\alpha_\gamma $$ (2.4)

and form the infinitesimal group operators of the algebra $G_3$:

$$ \hat{X}_a = \xi^a_\alpha \partial_\alpha, \quad [\hat{X}_a, \hat{X}_b] = C^c_{ab} \hat{X}_c. $$ (2.5)
The Killing equation in the $\xi^a$ frame has the following form:

$$G_{ab}^{c|d} = G^{ad}_c C^b_{dc} \quad (|a = \xi^a \partial_a). \quad (2.6)$$

Indeed, substituting the expression

$$g^{\alpha\beta} = \xi^a \xi^b G_{ab}$$

into the equation (2.4), we get

$$G_{ab}((\xi^a \xi^b - \xi^a \xi^b) + (\xi^a \xi^b - \xi^a \xi^b)) + \xi^a \xi^b G_{ab} = 0.$$ Substituting here the commutation relations (2.5), we get:

$$(G_{ab} - G^{ad}_c C^b_{dc} - G^{bd}_c C^a_{dc}) \xi^a \xi^b = 0.$$ The Hamilton-Jacobi equation for a charged test particle in an external electromagnetic field with potential $A_i$ is:

$$H = g_{ij} P_i P_j = m, \quad P_i = p_i + A_i, \quad p_i = \partial_i \varphi. \quad (2.7)$$

The integrals of motion of the free Hamilton-Jacobi equation are given using Killing vector fields as follows:

$$X_a = \xi^i_a P_i, \quad (2.8)$$

Thus, the symmetry of the space given by the Killing vector fields is directly related to the symmetry of the equations of the geodesics given by the integrals of motion. The Hamilton-Jacobi method makes it possible to find these integrals and use them to integrate the geodesic equations. Therefore, the study of the behavior of geodesics is necessary for the study of the geometry of space.

The linear momentum integral of the equation (2.7) has the following form:

$$X_a = \xi^i_a P_i + \gamma^a_i, \quad (2.9)$$

where $\gamma^a_i$ are some functions of $u^i$. The equation (2.7) admits a motion integral of the form (2.8) if $H$ and $\dot{X}_a$ commute under Poisson brackets:

$$[H, \dot{X}_a]_P = \frac{\partial H}{\partial p_i} \frac{\partial \dot{X}_a}{\partial x^i} - \frac{\partial H}{\partial x^i} \frac{\partial \dot{X}_a}{\partial p_i} = 0 \rightarrow g^{i\sigma} (\xi^j_a F_{ji} + \gamma^j_a) P_\sigma = 0. \quad (2.10)$$

Hence:

$$\gamma^j_a = \xi^j_a F_{ji}, \quad F_{ji} = A_{i,j} - A_{j,i}. \quad (2.11)$$

Thus, the admissible electromagnetic field is determined from the equations (2.11) (see [42]). In [40]-[41] it was proved that in the case of a homogeneous space, the conditions (2.11) can be represented as follows:

$$A_{a|b} = C^c_{ba} A_c, \quad (2.12)$$

at the same time

$$\gamma_a = -A_a \rightarrow \dot{X}_a = \xi^a \partial_a.$$
Here it is denoted:
\[ A_a = \xi^i A_i, \]

It can be shown that the equations (2.12) form a completely integrable system. This system specifies the necessary and sufficient conditions for the existence of an algebra of integrals of motion that are linear in momenta for equation (2.7). Note that in admissible electromagnetic fields given by the conditions (2.12), the Klein-Gordon-Fock equation
\[ \hat{H}\varphi = (g^{ij}\hat{P}_i\hat{P}_j)\varphi = m^2\varphi, \quad \hat{P}_k = \hat{p}_k + A_k, \quad \hat{p}_k = -i\hat{\nabla}_k \]
also admits an algebra of symmetry operators of the form:
\[ \hat{X}_a = \xi^i \hat{\nabla}_i \]
(see [30], [42]). \( \hat{\nabla}_i \) is the covariant derivative operator corresponding to the partial derivative operator - \( \hat{\partial}_i = ip_i \) in the coordinate field \( u^i \). \( \varphi \) is a scalar field, \( m = const. \)

All admissible electromagnetic fields for the homogeneous spacetime are found in [40]. We will use the results of A.Z. Petrov [38]. We follow the notation used in this book with minor exceptions. For example, the nonignorable variable \( x^4 \) will be denoted \( u^0 \) etc.

3 Maxwell’s equations for an admissible electromagnetic field in a homogeneous spacetime

Consider Maxwell’s equations with zero electromagnetic field sources in a homogeneous spacetime in the presence of an admissible electromagnetic field:
\[ \frac{1}{\sqrt{-g}}(\sqrt{-g}F^{ij})_{,j} = 0, \quad g = det|g_{\alpha\beta}|. \quad (3.1) \]
When \( i = 0 \) from the system (3.1), the equation follows:
\[ \frac{1}{\sqrt{-g}}(\sqrt{-g}g^{\alpha\beta}A_{\beta,0})_{,\alpha} = 0. \quad (3.2) \]
Using the Killing equations (2.4), (2.5), we can obtain:
\[ \frac{g_{ia}}{g} = 2\xi^a_{,\alpha}. \]
Indeed,
\[ -\frac{g_{ia}}{g} = g^{i\beta}_{\alpha\beta}g_{\alpha\beta} = G^{i\alpha}_{|\beta}G_{\beta\alpha} + 2\xi^\alpha_{,\alpha\alpha} + 2C_\alpha = 2\xi^\alpha_{,\alpha\alpha} \quad (C_\alpha = C^{\beta}_{\alpha\beta}). \]
Substituting this expression and the relation (2.12) into the equation (3.2), we get:
\[ G^{\alpha\beta}C_\beta A_{\alpha,0} = 0. \quad (3.3) \]
In the case of spaces with groups \( G_3(I) \), \( G_3(II) \), \( G_3(VIII) \), \( G_3(IX) \) \( C_a = 0 \). That is why the equation (3.3) is satisfied. In the case of the groups \( G_3(III), -G_3(VII) \) \( C_a = const\delta_{\alpha\beta} \), and from (3.3) it follows:
\[ \eta^{\beta a}A_{\beta,0} = 0, \quad \tilde{A}_a = A_{a\alpha} e^\alpha_a. \quad (3.4) \]
For $i = \alpha$ we have:
\[
\frac{1}{\sqrt{g}}(\sqrt{g}g^{\alpha\beta}F_{\beta\gamma})_0 + \frac{1}{\sqrt{g}}(\sqrt{g}g^{\alpha\beta}g^{\gamma\sigma}F_{\beta\sigma})_\gamma = 0.
\] (3.5)

We transform the equations (3.5) using the (2.2) frame. The first term then has the form:
\[
\frac{1}{\sqrt{-g}}(\sqrt{-g}g^{\alpha\beta}F_{\beta\gamma})_0 = -\frac{1}{l_0}(l_0\eta^{\alpha\beta}\tilde{A}_{ab})_0\epsilon_b, \quad (l_0)^2 = \text{det} |\eta_{ab}|.
\]

The second term using the (2.3) frame, the relations (2.12), and the commutation relations between the operators of the group can be reduced to the following form:
\[
\frac{1}{\sqrt{g}}(\sqrt{g}g^{\alpha\beta}g^{\gamma\sigma}F_{\beta\sigma})_\gamma = \frac{1}{2}G^{a_{2b_1}}C^{a}_{a_{2b_2}}(2C_{b_1}G^{b_{2b}} + C^{b}_{a_{1b_1}}G^{a_{1b_2}})\xi^{\alpha\beta\epsilon\delta}\tilde{A}_c.
\] (3.7)

So the (3.5) equations can be written as follows:
\[
\frac{1}{l_0}(l_0\eta^{\alpha\beta}\tilde{A}_{ab})_0 = \tilde{W}^{a\beta}_{\beta b},
\] (3.6)

where
\[
\tilde{W}^{a\beta}_{\beta b} = (\epsilon^{a}_{\beta\alpha}a_{1})(\epsilon^{a}_{\alpha\beta}a_{2})W^{a_{1}b_1}, \quad W^{a\beta}_{\beta b} = \frac{1}{2}G^{a_{2b_1}}C^{a}_{a_{2b_2}}(2C_{b_1}G^{b_{2b}} + C^{b}_{a_{1b_1}}G^{a_{1b_2}}).
\]

Then Maxwell’s equations can be represented as follows:
\[
\beta^{a}_{0} = l_0\tilde{W}^{a\beta}_{\beta b}\tilde{A}_{b},
\] (3.8)

\[
\tilde{A}_{a,0} = \frac{1}{l_0}\beta^{b}_{\beta a}. \quad (3.9)
\]

4 Maxwell’s equations for spaces type I-VI by Bianchi classification

The group operators in the canonical coordinate set of homogeneous spaces type I- VI by the Bianchi classification can be represented as follows (see [27]):
\[
X_1 = p_1, \quad X_2 = p_2, \quad X_3 = (ru^1 + \varepsilon u^2)p_1 + nu^2p_2 - p_3.
\] (4.1)

The values \( k \quad \varepsilon \quad n \) for each group take the following values.

1. \( G(I) \) \( k = 0, \quad \varepsilon = 0, \quad n = 0. \)
2. \( G(II) \) \( k = 0, \quad \varepsilon = 1, \quad n = 0. \)
3. \( G(III) \) \( k = 1, \quad \varepsilon = 0, \quad n = 0. \)
4. \( G(IV) \) \( k = 1, \quad \varepsilon = 1, \quad n = 1. \)
5. \( G(V) \) \( k = 1, \quad \varepsilon = 0, \quad n = 1. \)
Structural constants can be represented as follows:

\[ C_{ab}^c = k\delta^c_1(\delta^1_a\delta^3_b - \delta^3_a\delta^1_b) + (\varepsilon\delta^1_a + n\delta^a_2)(\delta^2_b\delta^3_3 - \delta^3_b\delta^2_3) \rightarrow C_a = -(k + n)\delta^a_3 \]  \hspace{0.5cm} (4.2)

Find the frame vectors \([\xi^a_0], [e^a_0]\) and their dual vectors \([\xi^a_n], [e^a_n]\). For this, we use the metrics of homogeneous spaces and the group operators given in \([38]\).

\[ \xi^a_0 = \delta^1_0\delta^a_1 + \delta^2_0\delta^a_2 + \delta^3_0(\delta^1_1(ku^1 + \varepsilon u^2) + \delta^3_0 nu^2 - \delta^3_0), \]  \hspace{0.5cm} (4.3)

\[ \xi^a_n = \delta^1_0\delta^a_1 + \delta^2_0\delta^a_2 + \delta^3_0(\delta^1_1(ku^1 + \varepsilon u^2) + \delta^3_0 nu^2 - \delta^3_0) \]

\[ e^a_0 = \delta^1_0\delta^a_1 \exp(-ku^3) + \delta^2_0(\delta^1_1\varepsilon u^3 \exp(-ku^3) + \delta^3_0 \exp(-nu^3)) + \delta^3_0\delta^a_3, \]  \hspace{0.5cm} (4.4)

\[ e^a_n = \delta^1_0\delta^a_1 \exp(\varepsilon ku^3) + \delta^2_0(\delta^1_1\varepsilon u^3 \exp ku^3 + \delta^3_0 \exp nu^3)) + \delta^3_0\delta^a_3. \]

With these expressions we find the matrix \(\tilde{W}^{ab}\) \((3.7)\).

\[ \tilde{W}^{ab} = \frac{1}{l_0^2}[\delta^a_0\delta^b_1(\varepsilon g_{11} + \varepsilon(n - k)g_{12} - kng_{22}) \exp(-2nu^3) + \]  \hspace{0.5cm} (4.5)

\[ - (\delta^a_0\varepsilon u^3 + \delta^a_3) (\delta^b_1\varepsilon u^3 + \delta^b_3) kngg_{11} \exp(-2ku^3) + \]  \hspace{0.5cm}

\[ [\delta^b_0(\delta^a_1\varepsilon u^3 + \delta^a_3) n(g_{12} + \varepsilon g_{11}) + \delta^b_1(\delta^a_0\varepsilon u^3 + \delta^a_3) k(g_{12} - \varepsilon g_{11})]. \]

Here (see \([38]\))

\[ g_{11} = a_{11} \exp 2ku^3, \quad g_{12} = (\varepsilon u^3 a_{11} + a_{12}) \exp(n + k)u^3, \quad g_{22} = (\varepsilon u^3 a_{11} + 2\varepsilon a_{12} + a_{22}) \exp 2nu^3, \]

Maxwell’s equation \((3.8)-(3.9)\) becomes:

\[ \dot{\beta}^b = \frac{1}{l_0}[\delta^a_0\delta^b_1(\varepsilon g_{11} + \varepsilon(n - k)g_{12} - kng_{22}) \exp(-2nu^3) + \]  \hspace{0.5cm} (4.6)

\[ - (\delta^a_0\varepsilon u^3 + \delta^a_3) (\delta^b_1\varepsilon u^3 + \delta^b_3) kngg_{11} \exp(-2ku^3) + \]  \hspace{0.5cm}

\[ [\delta^b_0(\delta^a_1\varepsilon u^3 + \delta^a_3) n(g_{12} + \varepsilon g_{11}) + \delta^b_1(\delta^a_0\varepsilon u^3 + \delta^a_3) k(g_{12} - \varepsilon g_{11})]\tilde{A}_a, \]

\[ \beta^a = l_0\eta^{ab}\tilde{A}_{b,0}. \]  \hspace{0.5cm} (4.7)

The dots denote the time derivatives. The components \(\tilde{A}_a\) are defined by the solutions of the \((2.12)\) \(A_b\) system of equations using the formulas:

\[ \tilde{A}_a = e^a_0 e^b_0 A_b \]  \hspace{0.5cm} (4.8)

Further solutions of the system of equations \((4.6)\) for homogeneous spaces with groups of motions \(G_3(I - V I)\) are given. Spatial metrics are given in the book \([38]\). Solutions for the system \((2.12)\) can be found in \([39]\), \(\alpha_a = \alpha_a(\varepsilon u^3)\).
4.1 Group $G_3(I)$

As the parameters $k, n, \varepsilon$ and $C_{bc}^a$ equal zero, $G_3(I)$ is an Abelian group. The components of the vector electromagnetic potential have the form:

$$A_a = \tilde{A}_a = A_a = \alpha_a,$$

Substituting these expressions into the system of equations (4.6)-(4.7), we obtain the following system of ordinary differential equations:

$$\dot{\beta}^a = 0 \rightarrow \beta^a = \epsilon^a = \text{const};$$

$$l_0 \dot{\alpha}_a = a_{ba} c^b \rightarrow \alpha_q = \int \frac{a_{abc}^b}{l_0} du^0, \quad l_0^2 = \text{det}|a_{ab}|.$$ 

All components of $a_{ab}$ are arbitrary functions of $u^0$.

4.2 Group $G_3(II)$

For the group $G_3(II)$ the parameters $k, n, \varepsilon$ have the following values: $k = n = 0, \varepsilon = 1$. The components of the vector electromagnetic potential in the frames $[\xi^a]$ and $[\epsilon^a]$ have the form:

$$A_1 = \alpha_1, \quad A_2 = \alpha_2 + \alpha_1 u^3, \quad A_3 = \alpha_1 u^3 - \alpha_3; \quad \tilde{A}_a = \alpha_a.$$

Substituting these expressions into the system of equations (4.6)-(4.7), we obtain the following system of ordinary differential equations:

$$l_0 \dot{\beta}_a = \alpha_1 a_{11} \delta_1 a \rightarrow l_0 \dot{\beta}_1 = \alpha_1 a_{11}, \quad \beta_2 = c_2, \quad \beta_3 = c_3 \quad (\beta_a = \delta^{ab} \beta^b);$$

$$l_0 \dot{\alpha}_a = a_{1a} \beta_1 + a_{2a} c_2 + a_{3a} c_3, \quad l_0^2 = \text{det}|a_{ab}| \quad (c_a = \text{const}).$$

The (4.9)-(4.10) system of equations contains 5 equations for 11 functions:

$$l_0, \quad a_{ab}, \quad \alpha_a, \quad \beta_1.$$

We should consider separately the variants $\alpha_1 = 0$ and $\alpha_1 \neq 0$.

1. $\alpha_1 = 0 \rightarrow \beta_1 = c_1 = \text{const}$. In this case, the system of equations (4.9) - (4.10) has a quadrature solution:

$$\alpha_q = \int \frac{a_{ab} c_b}{l_0} \delta^{bb_1} du^0 \quad (q = 2, 3).$$

For $a = 0$, (4.10) implies a linear dependence of the components $a_{1q}$:

$$c_1 a_{11} + c_2 a_{12} + c_3 a_{13} = 0.$$ 

All independent components of $a_{ab}$ are arbitrary functions of $u^0$.

2. $\alpha_1 \neq 0$. Consider the following equations from the system (4.9) - (4.10):

$$l_0 \dot{\alpha}_1 = (a_{11} \beta_1 + c_2 a_{12} + c_3 a_{13}), \quad l_0 \dot{\beta}_1 = a_{11} \alpha_1.$$ (4.11)
Let us take the function $a_{11}$ out of (4.11). As a result, we obtain:

$$(\alpha_1^2 - \beta_1^2)_0 = \frac{2\alpha_1}{l_0}(c_2a_{12} + c_3a_{13}).$$

Hence:

$$\beta_1 = \xi \sqrt{\alpha_1^2 - 2} \int \frac{\alpha_1}{l_0}(c_2a_{12} + c_3a_{13}) du^0 \quad (\xi^2 = 1).$$

From the remaining equations of the system, we get:

$$\alpha_q = \int \frac{(a_{1q}\beta_1 + a_{2q}c_2 + a_{3q}c_3)}{l_0} du^0 \quad (q = 2, 3); \quad a_{11} = \frac{l_0\beta_1}{\alpha_1}. \quad (4.13)$$

The functions $l_0$, $\alpha_1$, and all components of $a_{ab}$, except $a_{11}$, $a_{33}$, are arbitrary functions of $u_0$. The component $a_{33}$ results from the equation $l_0^2 = \det[a_{ab}]$:

$$a_{33} = \frac{l_0^2 + a_{11}a_{23}^2 + a_{22}a_{13}^2 - 2a_{12}a_{13}a_{23}}{a_{11}a_{22} - a_{12}^2} \quad (4.14)$$

### 4.3 Group $G_3(III)$

For the group $G_3(III)$ the parameters $k$, $n$, $\varepsilon$ have the following values: $k = 1$, $n = \varepsilon = 0$. The components of the vector electromagnetic potential in the frames $[c_\alpha]_a$ and $[e_\alpha]_a$ have the form:

$$A_1 = \alpha_1 \exp u^3, \quad A_2 = \alpha_2, \quad A_3 = \alpha_1 \exp u^3 - \alpha_3.$$

Substituting these expressions into the system of equations (4.6)-(4.7), we obtain the following system of ordinary differential equations:

$$l_0\dot{\beta}_a = \alpha_1 a_{12}\delta_{2a} \rightarrow l_0\dot{\beta}_2 = \alpha_1 a_{12}, \quad \beta_1 = c_1, \quad \beta_3 = 0; \quad (4.13)$$

$$l_0\dot{\alpha}_a = a_{2a}\beta_2 + a_{3a}c. \quad (4.14)$$

Here and further the equation (3.4) is used, according to which $\beta_3 = 0$. The system of equations (4.9)-(4.10) contains 5 equations for 11 functions:

$$l_0, \quad a_{ab}, \quad \alpha_a, \quad \beta_2.$$

We should consider separately the variants $\alpha_1 = 0$ and $\alpha_1 \neq 0$.

1. $\alpha_1 = 0 \rightarrow \beta_2 = c_2 = \text{const}$. In this case the system (4.9) - (4.10) has a solution in quadratures:

$$\alpha_q = \int \frac{a_{q}\delta_{bb}}{l_0} du^0 \quad (q = 2, 3).$$

From (4.10) it follows a linear dependence of the components $a_{1q}$:

$$c_1a_{13} + c_2a_{23} = 0 \rightarrow a_{12} = ba_{11}, \quad \beta_1 = b, \quad \beta_2 = 1.$$
and all independent components of \( a_{ab} \) are arbitrary functions of \( u^0 \). The component \( a_{33} \) is found from the equation (4.12)

2. Let \( \alpha_1 \neq 0 \). Consider the following equations from the system (4.9) - (4.10):

\[
\begin{align*}
l_0 \dot{\alpha}_1 &= a_{12} \beta_2 + c_1 a_{11}, \\
l_0 \dot{\beta}_2 &= a_{12} \alpha_1.
\end{align*}
\]

(4.15)

from the system (4.15) it follows:

\[
(\alpha_1^2 - \beta_2^2),_0 = \frac{2\alpha_1}{l_0} c_1 a_{11}.
\]

Hence:

\[
\beta_2 = \xi \sqrt{\alpha_1^2 - 2 \int \frac{\alpha_1}{l_0} (c_1 a_{11} + c_3 a_{13}) du^0} \quad (\xi^2 = 1).
\]

From the remaining equations of the system we get:

\[
\alpha_q = \int \frac{(a_{2q} \beta_2 + a_{1q} c_1 + a_{3q} c_3)}{l_0} du^0 \quad (q = 2, 3); \quad a_{11} = \frac{l_0 \dot{\beta}_2}{\alpha_1}.
\]

The functions \( l_0, \alpha_1 \) and all components of \( a_{ab} \), except \( a_{11}, a_{33} \), are arbitrary functions of \( u_0 \). The component \( a_{33} \) results from the equation (4.12)

### 4.4 Group \( G_3(IV) \)

For the group \( G_3(IV) \) the parameters \( k, n, \varepsilon \) have the values: \( k = n = \varepsilon = 1 \). The components of the vector electromagnetic potential in the frames \( [\xi_a^\alpha] \) and \( [\xi_a^\alpha] \) have the form:

\[
\begin{align*}
A_1 &= \alpha_1 \exp u^3, \\
A_2 &= (\alpha_2 + \alpha_1 u^3) \exp u^3, \\
A_3 &= (\alpha_1(u^1 + u^2 + u^2 u^3) + \alpha_2 u^2) \exp u^3 - \alpha_3;
\end{align*}
\]

\[
\tilde{A}_a = \alpha_a.
\]

Maxwell’s equations (3.8), (3.9) reduce to the following system:

\[
\begin{align*}
l_0 \dot{\beta}_a &= \delta_{1a}(a_{11}(\alpha_1 + \alpha_2) - \alpha_1 a_{22} + \alpha_2 a_{12}) + \delta_{2a}(\alpha_1 a_{12} - a_{11}(\alpha_1 + \alpha_2)). \\
l_0 \dot{\alpha}_a &= \beta_2 a_{a2} + \beta_1 a_{a1}, \quad \beta_3 = 0.
\end{align*}
\]

(4.16)

(4.17)

from the system (4.17) it follows:

\[
\dot{\alpha}_3 = \int \frac{\beta_2 a_{32} + \beta_1 a_{31}}{l_0} du^0.
\]

(4.18)

Let us now consider the remaining equations.

A) \( \beta_1 \neq 0 \).

From the system (4.16) it follows:

\[
\begin{align*}
a_{12} &= \frac{1}{\beta_1} (l_0 \dot{\alpha}_2 - \beta_2 a_{22}) \\
a_{11} &= \frac{1}{\beta_1} (l_0 (\dot{\alpha}_1 \beta_1 - \dot{\alpha}_2 \beta_2) + \beta_2^2 a_{22}).
\end{align*}
\]

(4.19)
Using these relations, we obtain a consequence from the remaining equations of the system (4.16)–(4.17):

$$\beta_1 \dot{\beta}_2 - \beta_2 (\dot{\beta}_1 + \dot{\beta}_2) = \alpha_1 \dot{\alpha}_2 - (\alpha_1 + \alpha_2) \dot{\alpha}_1. \quad (4.20)$$

With the equation (4.20) the dependent functions $\alpha_a$, $\beta_a$ can be expressed in terms of the independent functions. Let us write down the solutions.

1. $(\alpha_1 \beta_1 + \beta_2 (\alpha_1 + \alpha_2)) \beta_2 \neq 0$.

$$\alpha_1 = a \exp \varphi + b \exp \varphi, \quad \beta_2 = a \exp \varphi - b \exp \varphi, \quad \beta_1 = e \beta_2 \quad (e = \text{const}).$$

2. $\beta_1 = 0$.

$$\alpha_2 = \alpha_1 (a + \ln \alpha_1), \quad a_{12} = \frac{l_0 \dot{\alpha}_2}{\beta_1}, \quad a_{11} = \frac{l_0 \dot{\alpha}_1}{\beta_1}, \quad a_{22} = \frac{l_0 (\dot{\alpha}_2 (\alpha_1 + \alpha_2) - \dot{\beta}_1 \beta_2)}{\alpha_1 \beta_1}.$$
\( l_0, a_{13}, a_{23}, \alpha_1, \alpha_2 \) are arbitrary functions of time. The function \( a_{33} \) is expressed in terms of these functions using the relation (4.12).

b) \( \alpha_2 = -\alpha_1 \rightarrow \alpha_1 = a \exp \varphi - b \exp \varphi \)  
\( \beta_2 = a \exp \varphi + b \exp \varphi, \)  
\( a_{12} = \frac{\dot{\alpha}_1}{\beta_2}, \)  
\( a_{22} = \frac{\dot{\alpha}_2}{\beta_2}. \)

\( l_0, a_{11}, a_{13}, a_{23}, \varphi, \beta_1 \) are arbitrary functions of time. The function \( a_{33} \) is expressed in terms of these functions using the relation (4.12).

4.5 Group \( G_3(V) \)

For the group \( G_3(V) \) the parameters \( k, n, \), \( \varepsilon \) have the values: \( k = n = 1, \varepsilon = 0. \)

The components of the vector electromagnetic potential in the frames \( [\xi^\alpha_a] \) and \( [\epsilon^\alpha_a] \) have the form:

\[ \mathbf{A}_1 = \alpha_1 \exp u^3, \quad \mathbf{A}_2 = \alpha_2 \exp u^3, \quad \mathbf{A}_3 = (\alpha_1 u^1 + \alpha_2 u^2) \exp u^3 - \alpha_3; \]

\( \dot{\mathbf{A}}_a = \alpha_a. \)

Maxwell’s equations (3.6) reduce to the following system of equations:

\[ l_0 \dot{\alpha}_a = \beta_2 a_{a2} + \beta_1 a_{a1}, \quad \beta_3 = 0. \quad (4.21) \]

\[ l_0 \dot{\beta}_a = \delta_{1a}(a_{12} \alpha_2 - \alpha_1 a_{22}) + \delta_{2a}(a_{12} \alpha_1 - a_{11} \alpha_2), \quad (4.22) \]

Hence:

\[ \dot{\alpha}_3 = \int \frac{\beta_2 a_{32} + \beta_1 a_{31}}{l_0} du^0, \]

\[ l_0 \dot{\alpha}_1 = (a_{11} \beta_1 + a_{12} \beta_2), \quad l_0 \dot{\alpha}_2 = (a_{12} \beta_1 + a_{22} \beta_2). \quad (4.23) \]

1. \( \alpha_1 \neq 0. \) From the system (4.22) it follows:

\[ a_{12} = \frac{1}{\alpha_1}(l_0 \dot{\beta}_2 + \alpha_2 a_{11}), \quad a_{22} = \frac{1}{\alpha_1^2}(l_0(\dot{\beta}_2 \alpha_2 - \dot{\beta}_1 \alpha_1) + a_{11} \alpha_2^2). \quad (4.24) \]

Substituting (4.24) into (4.23), we get the corollary:

\[ \beta_1 \dot{\beta}_2 - \beta_2 \dot{\beta}_1 = \alpha_1 \dot{\alpha}_2 - \alpha_2 \dot{\alpha}_1. \quad (4.25) \]

\[ a_{11}(\alpha_1 \beta_1 + \alpha_2 \beta_2) = l_0(\dot{\alpha}_1 \alpha_1 - \dot{\beta}_2 \beta_2). \quad (4.26) \]

From (4.25) it follows:

\[ \alpha_2 = \alpha_1 \left(b + \int \frac{\beta_1 \dot{\beta}_2 - \beta_2 \dot{\beta}_1}{\alpha_1^2} du^0\right), \]

Let us consider (4.27).

a) \( \alpha_1 \beta_1 + \alpha_2 \beta_2 \neq 0. \) Then we have:

\[ a_{11} = \frac{l_0(\alpha_1 \dot{\alpha}_2 - \alpha_2 \dot{\alpha}_1)}{\alpha_1 \beta_1 + \alpha_2 \beta_2}; \]
$l_0, \ a_{13}, \ a_{23}, \ \alpha_1, \ \beta_a$ are arbitrary functions of time. The function $a_{33}$ is expressed in terms of these functions using the relation (4.12).

\[ b) \ \alpha_1 \beta_1 + \alpha_2 \beta_2 = 0 \rightarrow \alpha_1 \dot{\alpha}_1 - \beta_1 \dot{\beta}_1 = 0, \ \alpha_1 \dot{\alpha}_2 + \beta_2 \dot{\beta}_1 = 0. \]

From this, it follows:

\[
\alpha_1 = a \exp \varphi + b \exp \varphi, \ \beta_2 = a \exp \varphi - b \exp \varphi, \ \alpha_2 = -l \alpha_1, \ \beta_1 = l \beta_2,
\]

where $a, \ b, \ l = \text{const}$, $\varphi = \varphi(u^0)$. $l_0, \ a_{11}, \ a_{13}, \ a_{23}$ are arbitrary functions of time. The function $a_{33}$ is expressed in terms of these functions using the relation (4.12).

2. $\alpha_1 = 0$. From the system (4.22) it follows:

\[
\dot{\alpha}_{12} = \frac{l_0 \dot{\alpha}_1}{\alpha_2}, \ \dot{\alpha}_{11} = -\frac{l_0 \dot{\alpha}_2}{\alpha_2}, \ \dot{\alpha}_{22} = \frac{l_0 (\dot{\alpha}_2 \alpha_2 - \dot{\beta}_1 \beta_1)}{\alpha_2 \beta_2}, \ \beta_1 = a \beta_2,
\]

where $a = \text{const}$, $l_0, \ a_{13}, \ a_{23}, \ \alpha_2, \ \beta_2$ are arbitrary functions of time. The function $a_{33}$ is expressed in terms of these functions using the relation (4.12).

### 4.6 Group $G_3(VI)$

For the group $G_3(VI)$ the parameters $k, \ n, \ \varepsilon$ have the following values: $k = 1$, $n = 2$, $\varepsilon = 0$. The components of the vector electromagnetic potential in the frames $[\xi^a]$ and $[e^a]$ have the form:

\[
A_1 = \alpha_1 \exp u^3, \ \ A_2 = \alpha_2 \exp 2u^3, \ \ A_3 = \alpha_1 u^1 \exp u^3 + 2 \alpha_2 u^2 \exp 2u^3 - \alpha_3;
\]

\[ \tilde{A}_a = \alpha_a. \]

Maxwell’s equation (3.6) has the form:

\[ l_0 \dot{\alpha}_a = \beta_2 a_{a2} + \beta_1 a_{a1}. \]  

\[ l_0 \dot{\beta}_a = \delta_1 a_{a2}(a_{12} \alpha_2 - 2 \alpha_1 a_{22}) + \delta_2 a_{a1}(a_{12} \alpha_1 - 2 a_{11} \alpha_2), \ \beta_3 = 0, \]  

from the system (4.27) it follows:

\[
\dot{\alpha}_3 = \int \frac{\beta_2 a_{32} + \beta_1 a_{31}}{l_0} \, du^0.
\]

\[ l_0 \dot{\alpha}_1 = (a_{11} \beta_1 + a_{12} \beta_2), \ \ l_0 \dot{\alpha}_2 = (a_{12} \beta_1 + a_{22} \beta_2). \]  

4. \ \beta_1 \neq 0, \ \ \text{from the system (4.27) it follows:}

\[
a_{12} = \frac{1}{\beta_1} (l_0 \dot{\alpha}_2 - \beta_2 a_{22}), \ \ a_{11} = \frac{1}{\beta_1} (l_0 (\dot{\alpha}_1 \beta_1 - \dot{\alpha}_2 \beta_2) + a_{22} \beta_2^2). \]

Substituting (4.30) into (4.27), we get:

\[ a_{22}(\alpha_1 \beta_1 + 2 \alpha_2 \beta_2) = l_0 (\alpha_2 \dot{\alpha}_2 - \dot{\beta}_1 \beta_1), \]  

\[ 13 \]
Using this relation, we get the following solutions:

1) \( \alpha_1 \beta_1 + 2\alpha_2 \beta_2 \neq 0. \) From (4.31) it follows:

\[
a_{22} = \frac{l_0(\dot{\alpha}_2 \alpha_2 - \dot{\beta}_1 \beta_1)}{(\alpha_1 \beta_1 + 2\alpha_2 \beta_2)}.
\]

Denote:

\[
\alpha_q = a_q \exp \varphi, \quad \beta_q = b_q \exp \varphi \quad (q = 1, 2),
\]

where \( a_q, \ b_q, \ \varphi \) are functions of \( u^0. \) From the equation (4.32) we get:

\[
\dot{\varphi} = \frac{(\dot{b}_1 b_2 + 2\dot{a}_2 a_1)(\alpha_1 b_1 + 2\alpha_2 b_2) - (2a_1 b_1 + a_2 b_2)(2a_2 \dot{a}_1 + \dot{b}_2 b_1)}{(2a_1 a_2 + b_1 b_2)(a_1 b_1 - a_2 b_2)};
\]

\[
a_{12} = \frac{l_0(\dot{\varphi} a_2 + a_2) - b_2 a_{22}}{b_1}; \quad a_{11} = \frac{l_0((\alpha_1 b_1 - a_2 b_2)\dot{\varphi} + \dot{a}_1 b_1 - \dot{a}_2 b_2) + b_2^2 a_{22}}{b_1^2};
\]

\[
a_{22} = \frac{l_0((a_2^2 - b_2^2)\dot{\varphi} + \dot{a}_2 a_2 - \dot{b}_2 b_1)}{2a_1 b_1 + a_2 b_2}.
\]

\( l_0, \ a_{13}, \ a_{23}, \ a_q, \ b_q \) are arbitrary functions dependent on time. The function \( a_{33} \) is expressed by these functions using the relation (4.12)

2) \( \dot{\alpha}_2 \alpha_2 - \dot{\beta}_1 \beta_1 = 0 \rightarrow \alpha_1 \beta_1 + 2\alpha_2 \beta_2 = 0. \) \( a_{22} \) - is an arbitrary function from \( \alpha \); \( a_2 = a \exp \varphi - b \exp(-\varphi), \ \beta_1 = a \exp \varphi + b \exp(-\varphi). \)

From this, it follows:

a) \[
\alpha_1 = -\frac{\beta_2}{2}\left(\frac{a \exp \varphi - b \exp(-\varphi)}{a \exp \varphi + b \exp(-\varphi)}\right);
\]

\[
a_{12} = l_0 \dot{\varphi} - \frac{\beta_2 a_{22}}{\beta_1}, \quad a_{11} = \frac{l_0(\alpha_1 \beta_1 - \dot{a}_2 \beta_2) + \beta_2^2 a_{22}}{\beta_1^2};
\]

b) \( \dot{\varphi} = 0 \)

\[
\beta_1 = 1, \ \alpha_2 = -2b, \ \alpha_1 = -b \beta_2, \ \alpha_{12} = -\beta_2 a_{22}, \ \alpha_{11} = -b l_0 \dot{\beta}_2 + \beta_2^2 a_{22}.
\]

where \( l_0, \ a, \ b = \text{const} \ a_{22}, \ a_{13}, \ a_{23}, \ \beta_2, \ \varphi \) are arbitrary functions dependent on time.

II. \( \beta_1 = 0. \) From (4.27)-(4.28) it follows:

\[
a_{12} = \frac{2l_0 \dot{\alpha}_2 \alpha_2}{\beta_2}, \quad a_{22} = \frac{l_0 \dot{\alpha}_2}{\beta_2}, \quad a_{11} = \frac{l_0(2b^2 \dot{\alpha}_2 \alpha_2^2 - \beta_2 \dot{\beta}_2)}{2 \alpha_2 \beta_2}, \quad \alpha_1 = b \alpha_2^2.
\]

\( l_0, \ a_{22}, \ a_{13}, \ a_{23}, \ \alpha_2, \ \beta_2 \) depends arbitrarily on time functions. The function \( a_{33} \) is expressed in terms of these functions using the relation (4.12).
5 Conclusion

The performed classification of admissible electromagnetic fields will be used in the search for electrovacuum solutions of the Einstein-Maxwell equations. As known, the components of the Ricci tensor of a homogeneous space in the frame \[ (2.2) \] depend only on time. In order for Einstein’s equations with matter to prove to be an integrable system of ordinary differential equations, the equations of motion of matter must be subordinated to the conditions of space symmetry. These conditions are fulfilled first by the potentials of the electromagnetic fields determined in this work.
