Abstract

It is proposed a model of Kaluza Klein that does make the quantification of the electric charges without magnetic monopoles. This model of Kaluza Klein allows to calculate the radius of compactation proposed for Klein. The model is of Kaluza Klein, but it has consequences in the theory of quantum strings, and it is possible to indicate a manner of to test the existence of quantum strings. The model indicates that: if the quantum strings exist really, the cosmological variation of the fine structure constant would do quantum jumps. If this variation is continuous, the quantum strings does not exist. It is possible to the astronomers to decide this.

PACS: 04.50.+h, 11.25.Mj

KEY WORDS: Kaluza Klein Theory, Compactification.

Preface

This paper is a presentation to the astronomers of the consequences, in experimental astronomy, of a special model of Kaluza Klein [3].

In essence, all indicates that: if the quantum strings exist really, the cosmological variation of the fine structure constant would do quantum jumps. If this variation is continuous the quantum strings does not exist.
This is caused because the fine structure constant is a function of the radius of compactification, in this model, and – if the quantum strings exist really – the “circle of compactification” must to be formed for a natural number of lengths of quantum strings, causing the quantification.

1 Alternative Kaluza Klein theory unifying the electromagnetic and gravitational fields.

Consider a space time with the variables $x^0, x^1, x^2, x^3, x^4$, where $x^0$ is the time, $(x^1, x^2, x^3)$ forms the normal space, and $x^4$ is a compact almost circular variable where $0 \leq x^4 \leq 2\pi r_k$, approximately, and $r_k$ is the radius of compactification of Klein.

We can do:

$$u^i = dx^i/ds, \quad i = 0, 1, 2, 3, 4.$$  \hspace{1cm} (1)

where

$$ds^2 = g'_{kl}dx^kdx^l, \quad k, l = 0, 1, 2, 3, 4.$$  \hspace{1cm} (2)

and $g'_{kl}$ is the metric tensor of the space-time of five dimensions. Our convention will be $g_{\alpha\beta}$ to normal space-time $\alpha, \beta = 0, 1, 2, 3$. The use of $R'_{ik}, R_{\alpha\beta}$, et coetera will do the same convention.

We know, naturally the relativistic inertial displacement on the geodesic:

$$du^i/ds = -\{k^i_{\ l}\}'u^k u^l, \quad i, k, l = 0, 1, 2, 3, 4.$$  \hspace{1cm} (3)

where $\{k^i_{\ l}\}'$ is the Christoffel symbols. But using the $\{\ldots\}'$ to express the Christoffel symbols of the penta-space-time, and using $\{\ldots\}$ to the case of the normal space-time.

Naturally, using $\alpha, \beta, \gamma = 0, 1, 2, 3$, we can do from (3):

$$du^\alpha/ds = -[\{\alpha^\beta_{\ \gamma}\}'u^\beta u^\gamma + \{\beta^\alpha_{\ 4}\}'u^\beta u^4 + \{\gamma^\alpha_{\ 4}\}'u^\gamma u^4 + \{\ 4^\alpha_{\ 4}\}']u^4 u^4$$  \hspace{1cm} (4)

E lecting:

$x_4 \equiv$ the length of the arch of the right section of the cylinder of the Universe,

or:
the coordinate $x_4$ is defined as how: if

$$dx^0 = dx^1 = dx^2 = dx^3 = 0,$$

$$ds = dx_4$$

therefore

$$g'_4 \equiv 1$$

This choice of the coordinate $x_4$ is very important, because it eliminates the problem that impeached the Kaluza Klein theory of to do a complete unification between the gravitational field and the electromagnetic field. This is the first time what it is obtained a complete unification of the electromagnetic and the gravitational fields in the Kaluza Klein theory of five dimensions. The tensorial liberty of to choice anyone coordinate is broke in the case of fifth coordinate. But the experimental requirements of the relativity demands the liberty of choice of the four coordinates of the normal space-time so only. The liberty of choice of $x^4$ is not necessary to establish the relativity of the coordinates $x_0, x_1, x_2, x_3$. This relativity is verified in the experiments of the physic, but demands not the liberty of choice of $x_4$. By other side, if we elect the fifth coordinate as we did, we obtain the quantification of the electrical charges which is a experimental fact of the Nature.

Now, we consider a $\mathcal{R}^4$ space where there is a

$$g^{\alpha\beta} = g'^{\alpha\beta}; \quad \alpha, \beta = 0, 1, 2, 3.$$ 

Naturally we can define $g_{\alpha\beta}$ the inverse matrix of $g^{\alpha\beta}$ as:

$$g_{\alpha\mu}g^{\mu\beta} = \delta^\beta_\alpha.$$ 

And without to think in the electromagnetical field (or as it is defined in the classical Kaluza Klein Theory) we will consider the definition of a mathematical function:

$$A_\beta = g'_4 \beta = g'_\beta$$

Naturally we can define:

$$A^\mu = g'^{\mu\beta} A_\beta$$
The unique case that preserves the necessary relation:

\[ g'^{\alpha \beta} g'_{\beta \mu} = \delta^\alpha_\mu \]

is the case:

\[ g'_{4\alpha} = g'_{\beta 4} = A_\alpha; \quad g'_{44} = 1; \quad g'_{\alpha \beta} = g_{\alpha \beta} + A_\alpha A_\beta; \quad g'^{\alpha \beta} = g^{\alpha \beta}; \quad g'^{4 \beta} = g'^{\beta 4} = -A_\beta \] (5)

and

\[ g^{44} = 1 + A_\beta A_\beta \]
to \( \alpha, \beta = 0, 1, 2, 3. \)

Considering that there is a symmetry (cylindrical) that needs be explained for the cosmologists in the future:

\[ \partial g'_{kl}/\partial x^4 \equiv 0, \quad k, l = 0, 1, 2, 3, 4 \] (6)

and choosing the “Gauge” (with “...”, because \( A_\beta \) is only a mathematical object here):

\[ A_\beta u^\beta(t) = 0 \]

All these hypothesis and the equation (4) will result in:

\[ du^\alpha/ds = -\{ \beta \alpha \gamma \} u^\beta u^\gamma + F^\alpha_{\beta} u^\beta u^4; \quad \alpha, \beta, \gamma = 0, 1, 2, 3. \] (7)

where we define:

\[ F_{\beta \gamma} = \partial A_\gamma/\partial x^\beta - \partial A_\beta/\partial x^\gamma. \] (8)

**Demonstration of (7):**

Repeating (4) for better clarity:

\[ du^\alpha/ds = -[\{ \beta \alpha \gamma \}' u^\beta u^\gamma + \{ \beta \alpha 4 \}' u^\beta u^4 + \{ 4 \alpha \gamma \}' u^4 u^\gamma + \{ 4 \alpha 4 \}' ] u^4 u^4. \]

But from (6):

\[ \partial g'_{kl}/\partial x^4 \equiv 0, \quad k, l = 0, 1, 2, 3, 4 \text{ and } g_{44} = 1. \]

We can conclude that \( \{ 4 \alpha 4 \}' = 0. \)

By other side, remembering from (5) the relations about the metric tensors

\[ \{ \beta \alpha 4 \}' u^\beta u^4 = \{ 4 \alpha \gamma \}' u^4 u^\gamma = (1/2)[g^{\alpha \mu} \{ \mu, \beta 4 \}' - A^{\alpha \beta} \{ 4 \beta 4 \}'] = (1/2)g^{\alpha \mu} \{ \mu, \beta 4 \}'. \]
Naturally \( \{4, \beta 4\} = 0 \) because: \( \partial g_{kl}/\partial x^4 \equiv 0. \)

Therefore:

\[
\{ \beta \alpha \}^4 u^\beta u^4 + \{ 4 \alpha \gamma \}^4 u^4 u^\gamma = 2g^{\alpha \mu} \{ \mu, \beta 4\} u^\beta u^4 = g^{\alpha \mu} \{ \partial_\beta g_{\mu 4} + \partial_4 g_{\mu \beta} - \partial_\mu g_{\beta 4} \} u^\beta u^4.
\]

Considering from (5) \( g_{\beta 4} = A_\beta \) and from (6): \( \partial g_{kl}/\partial x^4 \equiv 0 \)

Naturally:

\[
\{ \beta \alpha \}^4 u^\beta u^4 + \{ 4 \alpha \gamma \}^4 u^4 u^\gamma = 2g^{\alpha \mu} \{ \mu, \beta 4\} u^\beta u^4 = g^{\alpha \mu} [\partial_\beta g_{\mu 4} - \partial_\mu g_{\beta 4}] u^\beta u^4
\]
	herefore

\[
\{ \beta \alpha \}^4 u^\beta u^4 + \{ 4 \alpha \gamma \}^4 u^4 u^\gamma = -F^\alpha_\beta u^\beta u^4.
\]

We can reduce now (4) to the form:

\[
du^\alpha/\partial s = -\{ \beta \alpha \gamma \}^4 u^\beta u^\gamma + F^\alpha_\beta u^\beta u^4.
\]

But

\[
\{ \beta \alpha \gamma \}^4 = (1/2)[g^{\alpha \mu} \{ \mu, \beta \gamma \}^4 - A^\alpha \{ 4, \beta 4\}^4] = (1/2)[g^{\alpha \mu} \{ \mu, \beta \gamma \}^4 - (1/2)A^\alpha \{ 4, \beta 4\}^4].
\]

Considering the relations of (5) and (6): \( 4, \beta 4\) = \( \partial_\beta A_\gamma + \partial_\gamma A_\beta \). Therefore

\[
\{ \beta \alpha \gamma \}^4 = (1/2)[2g^{\alpha \mu} \{ \mu, \beta \gamma \}^4 - A^\alpha (\partial_\beta A_\gamma + \partial_\gamma A_\beta)].
\]

By other side as \( g_{\alpha \beta} = g_{\alpha \beta} + A_\alpha A_\beta, \)

\[
\{ \beta \alpha \gamma \}^4 = (1/2)[2g^{\alpha \mu} \{ \mu, \beta \gamma \} + A^\alpha \partial_\gamma A_\beta + A_\beta g^{\alpha \mu} \partial_\gamma A_\mu + A^\alpha \partial_\beta A_\gamma
\]
\[
\quad + A_\gamma g^{\alpha \mu} \partial_\beta A_\mu - g^{\alpha \mu} A_\beta \partial_\mu A_\gamma - g^{\alpha \mu} A_\gamma \partial_\mu A_\beta - A^\alpha \partial_\beta A_\gamma - \partial_\gamma A_\beta].
\]

Doing the cancellations:

\[
\{ \beta \alpha \gamma \}^4 = (1/2)[2g^{\alpha \mu} \{ \mu, \beta \gamma \} + A_\beta g^{\alpha \mu} \partial_\gamma A_\mu + A_\gamma g^{\alpha \mu} \partial_\beta A_\mu - g^{\alpha \mu} A_\beta \partial_\mu A_\gamma - g^{\alpha \mu} A_\gamma \partial_\mu A_\beta]
\]

therefore:

\[
\{ \beta \alpha \gamma \}^4 u^\beta u^\gamma = \{ \beta \alpha \gamma \} u^\beta u^\gamma + (1/2)[A_\beta g^{\alpha \mu} \partial_\gamma A_\mu + A_\gamma g^{\alpha \mu} \partial_\beta A_\mu - g^{\alpha \mu} A_\beta \partial_\mu A_\gamma - g^{\alpha \mu} A_\gamma \partial_\mu A_\beta] u^\beta u^\gamma.
\]
But if \( A_\beta u^\beta(t) = 0 \) (the “gauge”) we obtain:

\[
\{ \beta_\alpha \gamma \}' u^\beta u^\gamma = \{ \beta_\alpha \gamma \} u^\beta u^\gamma
\]

and returning to:

\[
du^\alpha/ds = -\{ \beta_\alpha \gamma \}' u^\beta u^\gamma + F^\alpha_\beta u^\beta u^4
\]

we can conclude the demonstration of (7):

\[
du^\alpha/ds = -\{ \beta_\alpha \gamma \} u^\beta u^\gamma + F^\alpha_\beta u^\beta u^4.
\]

Q.E.D.

Now, we can stop and to think. This kind of mathematical object is similar to a complete unification of the gravitational field and the electrical field (without the \( g_{44} = -\phi \) to disturb all). The unification pretended for Kaluza and Klein and never completed, it is here, now. The magic was the definition of the variable:

\( x^4 \equiv \) the length of the arch of the right section of the cylinder of the Universe.

That produces:

\( g_{44} \equiv 1. \)

## 2 Quantification of electric charge.

In the electromagnetism without gravitational field

\[
(mcdu^\alpha/ds)_{\text{electromagnetic}} = (q/c) F^\alpha_\beta u^\beta.
\]

It is obvious that:

\[
q = cp^4 = mc^2 u^4
\]

does the function of the charge of the particle. But the coordinate \( x^4 \) is compacted and it is a (almost) “circle” of \( 2\pi r_k \) of extension. Obvious the wave-particle will have a wave length:

\[
\lambda = 2\pi r_k/n, \quad n \in \mathbb{N}
\]

and

\[
p^4 = h/\lambda = nh/2\pi r_k.
\]
Considering that the charge of the particle is:

\[ q = cp^4 = n \cdot (hc/r_k). \]  

(12)

We conclude that the electric charge is quantified, with a unitary quantum \( e' \), where

\[ e' = hc/r_k. \]  

(13)

We know that the quantum of electric charge \( e' \) is 1/3 of the charge of the electron \( e \). Therefore:

\[ e = 3e' = 3hc/r_k. \]  

(14)

It is obvious that it defines the dimensionality of \( q, A_\mu, F^\alpha_\beta \):

\[ [q] = ML^2/T^2, [A_\mu] = 1, [qA_\mu] = ML^2/T^2, [F^\alpha_\beta] = L^{-1}, [qF^\alpha_\beta] = ML/T^2. \]  

(15)

3 Calculating the permisssivity.

Using the definition of the Tensor of Riemann \( R_{k\ell} \) and remembering (5) and (8) it is possible to prove:

\[ R'_{\beta\ell} = -D_\alpha F^\alpha_\beta/2; \quad \alpha, \beta = 0, 1, 2, 3. \]  

(16)

Where \( D_\alpha \) is the covariant derivative.

Demonstration: Using the definition of the Tensor of Riemann of second order:

\[ R'_{\beta\ell} = \partial_m \{ \beta^m_\ell \} - \partial_4 \{ \beta^m_4 \} + \{ \ell^l_4 \} \{ \beta^m_m \} - \{ \beta^l_4 \} \{ \ell^m_4 \}. \]

Where \( \beta = 0, 1, 2, 3; m, l = 0, 1, 2, 3, 4 \) and \{ \ldots \} denotes the symbol of Christoffel in the \( R^5 \).

But

\[ \partial_4 \{ \beta^m_m \} = 0; \quad \{ \beta^m_4 \} = -F^m_\beta/2; \quad \{ \beta^l_4 \} = -F^l_\beta/2; \quad \text{and} \quad \{ \ell^m_4 \} = -F^m_\ell/2. \]

Doing these substitutions:

\[ R'_{\beta\ell} = -[\partial_m F^m_\beta + F^l_\beta \{ \ell^m_m \} - \{ \beta^l_4 \} F^m_\ell]/2 = -D_\alpha F^\alpha_\beta/2. \]
It demonstrates the equation (16).
Q.E.D.

But

\[ D_\alpha F^{\beta \alpha} = j^\beta / \varepsilon_0 c \rightarrow D^\alpha F^\beta_\alpha = j^\beta / \varepsilon_0 c \rightarrow D^\alpha F_{\beta \alpha} = j_\beta / \varepsilon_0 c \rightarrow D^\alpha F_{\alpha \beta} = -j_\beta / \varepsilon_0 c \]

\[ D_\alpha F^\alpha_\beta = -j_\beta / \varepsilon_0 c; \quad \alpha, \beta = 0, 1, 2, 3. \]  \hspace{1cm} (17)

Where \( j_\beta \) is the electric current and \( \varepsilon_0 \) is the permittivity.

By other side, another form of the equation of Einstein of gravitation is:

\[ R^\beta_\alpha = (8\pi G/c^4)[T^\beta_\alpha - \delta^\beta_\alpha T/(N - 2)]; \quad \alpha, \beta = 0, 1, 2, 3, \text{ or } \alpha, \beta = 0, 1, 2, 3, 4; \]  \hspace{1cm} (18)

where \( N \) is the number of dimensions of the Kaluza Klein.

Where \( T^\beta_\alpha \) is the tensor of momentum-energy and \( T \) is its scalar contraction, and \( N \) is the number of dimensions of the considered theory (Kaluza Klein or traditional).

Naturally:

\[ R'_\alpha = (8\pi G/c^4)T'_\alpha, \quad \alpha = 0, 1, 2, 3. \]  \hspace{1cm} (19)

Consider a special case where the space is almost cylindrical and the charge and the mass of the body of probe is little:

We will use \( g'_\alpha \beta, R'_\alpha \beta, \) et coetera, to impeach the confusion with the traditional case of four dimensions.

\[ g'_00 = 1, \quad g'_{ii} = -1, \quad i = 1, 2, 3, \text{ and in our theory } g'_44 = 1; \]  \hspace{1cm} (20)

by other side:

\[ g'_{ij} = 0 \text{ to } i, j = 1, 2, 3 \text{ and } i \neq j; \]
\[ g'_44 = g'_{4i} = A'_i; \]
\[ g'_0i = g'_i0 = 0 \text{ and } g'_04 = g'_40 = A'_0. \]

Therefore:

\[ T'_\alpha4 = g'44T'_\alpha4 + g'_{4\beta}T'_\alpha\beta; \quad \alpha, \beta = 0, 1, 2, 3, \]  \hspace{1cm} (21)
considering (5)

\[ T_{ij} = T'_{ij} + A_{\beta} T'_{\alpha \beta}; \quad \alpha, \beta = 0, 1, 2, 3. \]  

(22)

In our special case the body of prove is small (as a baseball ball, for example) and its gravitational field is negligible. If his charge is the minimum (a third part of the charge of the electron) the electromagnetic field - in almost all inner volume of the ball - will be negligible and therefore:

\[ T'_{ij} \approx T'_{ij}. \]  

(23)

Considering (19), it conduces to:

\[ R'_{ij} = 8\pi GT'_{ij}/c^4 \approx 8\pi GT_{ij}^4/c^4. \]  

(24)

By other side:

\[ T'_{\alpha \beta} = (p + \varepsilon) u_\alpha u_\beta + p \delta_\alpha \beta. \]  

(25)

Where \( p \) the pressure and \( \varepsilon \) is the density of the energy.

Naturally:

\[ T_{ij}^4 = (p + \varepsilon) u_i u_j^4. \]  

(26)

Consider now that the body source of the gravitational field is naturally little and it is solid too, and the pressure is negligible.

\[ T_{ij}^4 = mc^2 u_i u_j^4/V. \]  

(27)

Where \( V \) is the volume of the body which is the source of the gravitational field and \( m \) is the mass.

Remembering (9), (23) and (27), we obtain:

\[ j_i = qcu_i/V = mc^3 u_i u_j^4/V = cT_{ij}^4 \approx cT_{ij}'^4, \quad i = 1, 2, 3. \]  

(28)

Considering (16), (17), and (28)

\[ R'_{ij} = j_i/2\varepsilon_0 c \approx T_{ij}'/2\varepsilon_0. \]  

(29)

But, remembering (24), we conclude:

\[ \varepsilon_0 = c^4/16\pi G. \]  

(30)

This is the value of the permissivity in this theory.
4 Calculating the radius of Klein (of the compactification).

The constant of fine-structure $a$ is:

$$ a = e^2/4\pi\varepsilon_0hc. \quad (31) $$

If we put (12) and (30) in (31):

$$ \alpha = 36G\hbar/c^3r_k^2. \quad (32) $$

$$ \alpha = 36l_{\text{Planck}}^2/r_k^2. \quad (33) $$

Where $l_{\text{Planck}}$ is the length of Planck.

It conduces to the calculation of the radius of compactification of the Universe (radius de Klein):

$$ r_k = 70,238 \ l_{\text{Planck}}. \quad (34) $$

5 The signal of $g_{44}$

The signal of $g_{44}$ is important. Our preference was the positive signal. It causes that in a case without gravity:

$$ E^2/c^2 + (p^4)^2 - (p_x)^2 - (p_y)^2 - (p_z)^2 = m^2c^2. \quad (35) $$

But there is a “effective mass”, considering the usual formula:

$$ E^2/c^2 - (p_x)^2 - (p_y)^2 - (p_z)^2 = m_{\text{eff}}^2c^2. \quad (36) $$

Where $m_{\text{eff}}$ is the mass normally attributed to the particles and, naturally:

$$ m = (m_{\text{eff}}^2 + (p^4/c^2)^{1/2} = (m_{\text{eff}}^2 + q^2/c^4)^{1/2} = (m_{\text{eff}}^2 + n^2\hbar^2/c^2r_k^2)^{1/2}. \quad (37) $$

The effective mass is the mass that we observe in the particle.

If the signal of $g_{44}$ would be negative and $g_{44} = -1$

$$ E^2/c^2 - (p^4)^2 - (p_x)^2 - (p_y)^2 - (p_z) = m^2c^2 \quad (38) $$
and
\[ m = (m_{eff}^2 - (p_4)^2/c^2)^{1/2} = (m_{eff}^2 - q^2/c^4)^{1/2} = (m_{eff}^2 - n^2 \hbar^2/c^2 r_k^2)^{1/2}. \] (39)

It would cause that the real masses of the charged particles (that we know) would be imaginary (without physical sense). Therefore, the fifth coordinate is a “kind-time” and no a “kind-space” coordinate. Another interpretation is to consider that the effective mass would be excessively big (as in the hierarchy problem) if the fifth coordinate would be “kind-space”. Therefore, the fifth coordinate must be “kind-time”.

6 The variation of the fine constant structure in the cosmological times.

If the radius of compactification suffers a little change during the cosmological times it can explain the variation of the fine-structure constant [1] of:
\[ \Delta \alpha/\alpha \Delta t = (-0, 2 \pm 0, 8) \times 10^{-17} \text{ year}^{-1} \] (40)
mentioned for Srianand [2] et al.

There is a lot of cosmological models and it is necessary to investigate the variation of the fine structure constant in all cases. I invite the cosmologists to do this job.

7 The question of the Experimental Test of the Theory of Quantum Strings

We knows that the strings models and Kaluza Klein models converges almost. If this theory of quantum strings is true, the “circle of Klein” (of the fifth coordinate) needs to be a natural number of the quantum strings.

Consider that:
\[ l_{string} = \eta l_{Plank} \] (41)

where \( l_{string} \) is the length of the quantum string and \( \eta \) is a no dimensional constant.

Naturally:
\[ 2\pi r_k = N \eta l_{Plank} \] (42)
If we use (33):

$$\alpha = 36 \frac{l_{\text{Planck}}^2}{r_k^2} = 144\pi^2/N^2\eta^2$$  \hspace{1cm} (44)

The fine structure constant would suffer quantum jumps during its cosmological variation. In a jump of $N + 1$ to $N$ would occur:

$$\Delta \alpha/\alpha = -(2N + 1)/N^2(N + 1)^2$$  \hspace{1cm} (45)

This result is compatible with a variation of $\sim 10^{-7}$ (in $10^{10}$ years) to $\eta \sim 1$, and consequently (see (34) and (42)) a value of $N \sim 200$. The model created here and the theory of quantum strings are compatible. But it is necessary better measurements to confirm the variation of the fine structure constant and to verify if the variation is continuous or for quantum jumps. If it is continuous the theory of quantum strings is false. If it is by quantum jumps this theory is true. Finally we have a manner of to test it.

8 Conclusions

The Kaluza Klein of five dimensions conduces to the quantification of the charges (without string of Dirac) and creates a probable way of explanation to the variation of the fine structure constant. It is possible to do a complete unification between the electromagnetic and gravitational fields, sacrificing the liberty of choice the fifth compact coordinate, without to change the relativity in the four space-time and naturally doing maintenance of the liberty of to choice of the four coordinates of the normal space-time. It is possible to test, for astronomy, if the quantum strings are true or not.
