Abstract. We invert the second-order, single-field, general slow-roll formula for the power spectrum to obtain a second-order formula for inflationary parameters in terms of the primordial power spectrum.

Keywords: inflation, physics of the early universe, power spectrum

ArXiv ePrint: astro-ph/0511476
1. Introduction

The primordial curvature perturbations [1] are manifested today by anisotropies in the cosmic microwave background (CMB) and inhomogeneities in the large scale structure of the observable universe, and are characterized in terms of the power spectrum. Observations [2] of the CMB and large scale structure allow the reconstruction of inflationary parameters [3]–[5]. For a proper analysis of the upcoming high precision observations, such as Planck [6], we need accurate analytical studies. Usually, one chooses a particular theory, assesses the spectrum it predicts and attempts a comparison between its predictions and the observed universe. However, to interpret observations, it is more useful to have an inverse formula that determines inflationary parameters in terms of the primordial spectrum, which is in turn determined by observational quantities.

The standard slow-roll approximation used for inflationary scenarios makes some strong assumptions about the properties of inflation, which have not yet been confirmed observationally. Hence, a more general slow-roll approximation has been put forward [7] which lifts the extra, unjustified, assumptions of the standard slow-roll approximation. The advantages of the general slow-roll approximation, compared with the standard approximation, are clearly discussed in [8].

Recently we proposed a general inverse formula [9] for extracting inflationary parameters from the power spectrum of cosmological perturbations. There, we inverted the leading order, single-field, general slow-roll formula for the power spectrum to obtain a formula for inflationary parameters in terms of the primordial spectrum. Here we extend our inverse formalism to the second order.

2. Second-order general slow-roll power spectrum

We follow the formalism of our first inverse paper [9]. For single-field inflationary models, it is convenient to express inflationary quantities in terms of [7, 10]

$$ f = \frac{2\pi a \xi \dot{\phi}}{H} $$

(1)
where \( \xi = - \int \frac{dt}{a} = \frac{1}{aH} (1 - \frac{H}{H'} + \cdots) \) is minus the conformal time. We think of \( f \) as a function of \( \ln \xi \) so that \( f' \equiv df/d\ln \xi \).

Under the general slow-roll approximation, the spectrum for a single-field inflation model can be expressed up to second-order terms as [11]

\[
\ln \mathcal{P}(\ln k) = \int_0^\infty \frac{d\xi}{\xi} \left[ \ln \frac{1}{\xi f'(\ln \xi)^2} + \frac{2}{3} \frac{f'(\ln \xi)}{f(\ln \xi)} \right] + \frac{\pi^2}{2} \left[ \int_0^\infty \frac{d\xi}{\xi} m(k\xi) \right]^2
\]

where

\[
W(x) = \frac{3 \sin(2x)}{2x^3} - \frac{3 \cos(2x)}{x^2} - \frac{3 \sin(2x)}{2x} - 1
\]

and

\[
m(x) = \frac{2}{\pi} \left[ \frac{1}{x} - \frac{\cos(2x)}{x} - \sin(2x) \right].
\]

\( W(x) \) and \( m(x) \) have the asymptotic behaviours

\[
\lim_{x \to 0} W(x) = \frac{2}{5} x^2 + \mathcal{O}(x^4)
\]

and

\[
\lim_{x \to 0} m(x) = \frac{4}{3\pi} x^3 + \mathcal{O}(x^5)
\]

and window properties

\[
\int_0^\infty \frac{dx}{x} [-xW'(x)] = 1
\]

\[
\int_0^\infty \frac{dx}{x} m(x) = 1
\]

and

\[
\int_0^\infty \frac{dx}{x} \frac{1}{x} m(x) = \frac{2}{\pi}
\]

2.1. Inverse formula

Our fundamental inverse identity is

\[
\int_0^\infty \frac{dk}{k} m(k\zeta) W(k\xi)
\]

\[
= \frac{1}{2\xi^3} [\text{sgn}(\xi + \zeta) + \text{sgn}(\xi - \zeta)] + \frac{1}{2} [\text{sgn}(\xi + \zeta) - \text{sgn}(\xi - \zeta)] - \text{sgn}(\zeta)
\]

where \( \text{sgn}(x) = -1 \) for \( x < 0 \) and \( \text{sgn}(x) = 1 \) for \( x > 0 \). Taking the derivative with respect to \( \xi \) we get

\[
\int_0^\infty \frac{dk}{k} m(k\zeta) [-k\xi W'(k\xi)] = \frac{3}{2\xi^3} [\text{sgn}(\xi + \zeta) + \text{sgn}(\xi - \zeta)]
\]
which we can use to invert the first-order general slow-roll formula [7],
\[
\ln \mathcal{P} = \int_0^\infty \frac{d\xi}{\xi} \left[ -k\xi W'(k\xi) \right] \left( \ln \frac{1}{f^2} + \frac{2 f'}{3 f} \right),
\]
(12)
to get [9]
\[
\ln \frac{1}{f^2} = \int_0^\infty \frac{dk}{k} m(k\xi) \ln \mathcal{P}
\]
(13)
and hence
\[
2 \frac{f'}{f} = \int_0^\infty \frac{dk}{k} m(k\xi) \frac{\mathcal{P}'}{\mathcal{P}}.
\]
(14)
Substituting into equation (2) gives
\[
\int_0^\infty \frac{d\xi}{\xi} \left[ -k\xi W'(k\xi) \right] \left[ \ln \frac{1}{f^2} \ln(\xi) \right] + \frac{2 f'(\ln(\xi))}{f(\ln(\xi))} = \ln \mathcal{P}(\ln k) - \pi^2 \left[ \int_0^\infty \frac{d\xi}{\xi} m(k\xi) \int_0^\infty \frac{dl}{l} m(l\xi) \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)} \right]^2
\]
\[
+ \frac{\pi}{2} \int_0^\infty \frac{d\xi}{\xi} m(k\xi) \int_0^\infty \frac{dl}{l} m(l\xi) \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)} \int_0^\infty \frac{d\zeta}{\zeta} \frac{1}{k\xi} \int_0^\infty \frac{d\eta}{\eta} m(\eta \zeta) \frac{\mathcal{P}'(\ln \eta)}{\mathcal{P}(\ln \eta)}
\]
(15)
and applying equation (11) gives
\[
\ln \frac{1}{f(\ln(\xi))^2} = \int_0^\infty \frac{dk}{k} m(k\xi) \ln \mathcal{P}(\ln k) - \frac{\pi^2}{8} \int_0^\infty \frac{dk}{k} m(k\xi)
\]
\[
\times \left[ \int_0^\infty \frac{d\zeta}{\zeta} m(k\xi) \int_0^\infty \frac{dl}{l} m(l\zeta) \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)} \right]^2
\]
\[
+ \frac{\pi}{2} \int_0^\infty \frac{dk}{k} m(k\xi) \int_0^\infty \frac{d\zeta}{\zeta} m(k\zeta) \int_0^\infty \frac{dl}{l} m(l\zeta) \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)}
\]
\[
\times \int_\zeta^{\infty} \frac{d\chi}{\chi} \frac{1}{k\chi} \int_0^\infty \frac{d\eta}{\eta} m(\eta \chi) \frac{\mathcal{P}'(\ln \eta)}{\mathcal{P}(\ln \eta)}.
\]
(16)
Reordering we get
\[
\ln \frac{1}{f(\ln(\xi))^2} = \int_0^\infty \frac{dk}{k} m(k\xi) \ln \mathcal{P}(\ln k) - \frac{\pi^2}{8} \int_0^\infty \frac{dk}{k} m(k\xi)
\]
\[
\times \left[ \int_0^\infty \frac{dl}{l} \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)} \int_0^\infty \frac{d\zeta}{\zeta} m(k\zeta) m(l\zeta) \right]^2
\]
\[
+ \frac{\pi}{2} \int_0^\infty \frac{dl}{l} \frac{\mathcal{P}'(\ln l)}{\mathcal{P}(\ln l)} \int_0^\infty \frac{d\eta}{\eta} \frac{\mathcal{P}'(\ln \eta)}{\mathcal{P}(\ln \eta)} \int_0^\infty \frac{d\zeta}{\zeta} m(l\zeta)
\]
\[
\times \int_\zeta^{\infty} \frac{dk}{k^2} m(k\xi) m(k\zeta) \int_\zeta^{\infty} \frac{d\chi}{\chi^2} m(\chi \zeta).
\]
(17)
Now, we have the identity
\[ \int_0^\infty \frac{d\zeta}{\zeta} m(k \zeta) m(l \zeta) = \frac{2}{\pi^2} \ln \left| \frac{k + l}{k - l} \right| \]  
\hspace{1cm} (18)

and using the identities
\[ \int_0^\infty \frac{d\chi}{\chi^2} m(q \chi) = \frac{2}{\pi} \sin^2 \left( \frac{q \zeta}{\chi} \right) \]  
\hspace{1cm} (19)

and
\[ \int_0^\infty \frac{dk}{k^2} m(k \xi) m(k \zeta) \]
\[ = \frac{2}{3\pi \xi \zeta} \left[ 2\xi^3 \text{sgn}(\xi) + 2\zeta^3 \text{sgn}(\zeta) \right. \]
\[ \left. - (\xi^3 - \zeta^3) \text{sgn}(\xi - \zeta) - (\xi^3 + \zeta^3) \text{sgn}(\xi + \zeta) \right] \]  
\hspace{1cm} (20)

we get
\[ \int_0^\infty \frac{d\zeta}{\zeta} m(l \zeta) \int_0^\infty \frac{dk}{k^2} m(k \xi) m(k \zeta) \int_0^\infty \frac{d\chi}{\chi^2} m(q \chi) = \frac{2}{\pi} M(l \xi, q \xi) \]  
\hspace{1cm} (21)

where
\[ M(x, y) = \frac{2}{\pi^2 xy} \left[ g(x) + g(y) - \frac{1}{2} g(x - y) - \frac{1}{2} g(x + y) \right] \]  
\hspace{1cm} (22)

with
\[ g(x) = x \text{Si}(2x) + \frac{\cos(2x)}{2} - \frac{1}{2} \]  
\hspace{1cm} (23)

where
\[ \text{Si}(x) \equiv \int_0^x \frac{\sin t}{t} \, dt. \]  
\hspace{1cm} (24)

\[ M(x, y) \] has the window property
\[ \int_0^\infty \frac{dx}{x} \int_0^\infty \frac{dy}{y} M(x, y) = 1 \]  
\hspace{1cm} (25)

and the asymptotic behaviour
\[ \lim_{x,y \to 0} M(x, y) = \frac{4xy}{3\pi^2} \left[ 1 + \mathcal{O} \left( x^2 + y^2 \right) \right]. \]  
\hspace{1cm} (26)

Substituting equations (18) and (21) into (17), we get the simplified form for the second-order inverse formula
\[ \ln \frac{1}{f(\ln k)^2} = \int_0^\infty \frac{dk}{k} m(k \xi) \ln \mathcal{P}(\ln k) \]
\[ - \frac{1}{2\pi^2} \int_0^\infty \frac{dk}{k} m(k \xi) \left[ \int_0^\infty \frac{dl}{l} \ln \left| \frac{k + l}{k - l} \right| \frac{\mathcal{P}(\ln l)}{\mathcal{P}(\ln l)} \right]^2 \]
\[ + \int_0^\infty \frac{dl}{l} \int_0^\infty \frac{dq}{q} M(l \xi, q \xi) \frac{\mathcal{P}(\ln l)}{\mathcal{P}(\ln l)} \frac{\mathcal{P}'(\ln q)}{\mathcal{P}(\ln q)}. \]  
\hspace{1cm} (27)
3. Examples

3.1. Standard slow-roll approximation

In the context of standard slow-roll, the power spectrum has the form

\[ \ln P = \ln P_\circ + (n_\circ - 1) \ln \left( \frac{k}{k_\circ} \right) + \frac{1}{2} \eta' \ln^2 \left( \frac{k}{k_\circ} \right) + \cdots \]  

(28)

where \( n \) is the spectral index and \( k_\circ \) is some reference wavenumber. Applying our inverse formula equation (27), using the window properties equations (8) and (25), and the results

\[ \int_0^\infty \frac{dx}{x} m(x) \ln(x) = \alpha \]  

(29)

\[ \int_0^\infty \frac{dx}{x} m(x) \ln^2(x) = \alpha^2 + \frac{\pi^2}{12} \]  

(30)

\[ \frac{1}{2\pi^2} \int_0^\infty \frac{dx}{x} m(x) \left[ \int_0^\infty \frac{dy}{y} \ln \left| \frac{x+y}{x-y} \right| \right]^2 = \frac{\pi^2}{8} \]  

(31)

where \( \alpha = 2 - \ln 2 - \gamma \approx 0.7296 \), gives

\[ \ln \frac{1}{f_*^2} = \ln P_\circ + \alpha_\circ (n_\circ - 1) + \frac{1}{2} \left( \alpha_\circ^2 + \frac{\pi^2}{12} \right) n'_\circ + \left( 1 - \frac{\pi^2}{8} \right) (n_\circ - 1)^2 + \cdots \]  

(32)

where \( \alpha_\circ = \alpha - \ln(k_\circ \xi) \). Equation (32) reproduces the standard slow-roll inverse, which is trivially obtained from the standard slow-roll formula [10]

\[ \ln P = \ln \frac{1}{f_*^2} - 2\alpha_\circ \frac{f'^*}{f_*^*} - \left( \alpha_\circ^2 - \frac{\pi^2}{12} \right) \frac{f''^*}{f_*^*} + \left( \alpha_\circ^2 - 4 + \frac{5\pi^2}{12} \right) \left( \frac{f'^*}{f_*^*} \right)^2 + \cdots \]  

(33)

where \( \alpha_\circ = \alpha - \ln(k_\circ \xi) \) and \( \xi_* \) is an arbitrary evaluation point usually taken to be around horizon crossing.

3.2. Power law

Consider the simple case where the spectrum has the power law form

\[ \ln P = \ln P_0 - A_1 k^\nu - A_2 k^{2\nu} \]  

(34)

with \( \nu > 0 \). Substituting this power spectrum into our inverse formula equation (27), and using the results

\[ \int_0^\infty \frac{dx}{x} m(x) x^{\nu'} = \frac{2^{1-\nu} \Gamma(2 + \nu)}{\pi} \sin \left( \frac{\pi \nu}{2} \right) \equiv C(\nu) \]  

(35)

\[ \frac{\nu^2}{2\pi^2} \int_0^\infty \frac{dx}{x} m(x) \left[ \int_0^\infty \frac{dy}{y} \ln \left| \frac{x+y}{x-y} \right| y' \right]^2 = \frac{1}{2} \tan^2 \left( \frac{\pi \nu}{2} \right) C(2\nu) \]  

(36)

and

\[ \int_0^\infty \frac{dx}{x} \int_0^\infty \frac{dy}{y} M(x, y) x^{\nu'} y^{\nu'} = \frac{C^2(\nu)}{(1 - 2\nu)(1 + \nu)^2} \]  

(37)
we obtain
\[
\ln \frac{1}{f^2} = \ln \mathcal{P}_0 - A_1 C(\nu) \xi^{-\nu} - \left[ A_2 C(2\nu) + \frac{1}{2} A_1^2 \tan^2 \left( \frac{\pi\nu}{2} \right) C(2\nu) - \frac{A_1^2 \nu^2}{(1-2\nu)(1+\nu)^2} C^2(\nu) \right] \xi^{-2\nu}. \tag{38}
\]

To understand this result better, let us see the forward calculation. Consider an inflationary scenario with
\[
\ln \frac{1}{f^2} = \ln \frac{1}{f^\infty} - B_1 \xi^{-\nu} - B_2 \xi^{-2\nu}. \tag{39}
\]
Calculating the power spectrum up to second-order terms using equation (2) we obtain
\[
\ln \mathcal{P} = \ln \frac{1}{f^\infty} - \frac{B_1}{C(\nu)} k^\nu - \left[ \frac{B_2}{C(2\nu)} - \frac{1}{2} \tan^2 \left( \frac{\pi\nu}{2} \right) \frac{B_1^2}{C^2(\nu)} + \frac{\nu^2}{(1-2\nu)(1+\nu)^2} \frac{B_1^2}{C(2\nu)} \right] k^{2\nu}. \tag{40}
\]
The term proportional to $A_1$ in equation (38), i.e. the first-order result, diverges at $\nu = 1$. This is to be expected as the term proportional to $B_1$ in equation (40), i.e. the first-order general slow-roll result, is degenerate at $\nu = 1$ and so one cannot expect an inverse to exist beyond that point. The second-order terms in equation (38) diverge at $\nu = 1/2$. This is to be expected as the term proportional to $B_2$ in equation (40) is degenerate at $\nu = 1/2$ and so one cannot expect a second-order inverse to exist beyond that point.

### 3.3. Linear potential with a sharp slope change

Consider a linear potential with slope changing from $-A$ to $-A - \Delta A$ at $\phi = \phi_0$ \[11\]–\[13\]
\[
V(\phi) = V_0 \{1 - [A + \Delta A \theta(\phi - \phi_0)] (\phi - \phi_0)\}
\]
with $A \ll 1$ so that de Sitter space is a good approximation, and $\Delta A/A \ll 1$ to ensure approximate scale invariance. For this case
\[
\ln \frac{1}{f^2} = \ln \left( \frac{V_0}{12\pi^2 A^2} \right) - 2 \left( \frac{\Delta A}{A} \right) \left( 1 - \frac{\xi^3}{\xi_0^3} \right) \theta(\xi_0 - \xi) + \left( \frac{\Delta A}{A} \right)^2 \left( 1 - \frac{\xi^3}{\xi_0^3} \right)^2 \theta(\xi_0 - \xi) \tag{42}
\]
and
\[
\ln \mathcal{P} = \ln \left( \frac{V_0}{12\pi^2 A^2} \right) + 2 \left( \frac{\Delta A}{A} \right) W(k\xi_0) + \left( \frac{\Delta A}{A} \right)^2 \left\{ 1 + X(k\xi_0) \left[ 2 X(k\xi_0) - \frac{3}{k^3 \xi_0^3} - \frac{3}{k \xi_0} \right] \right\} \tag{43}
\]
where $W(x)$ is defined in equation (3) and
\[
X(x) = \frac{3}{2x^5} + \frac{3}{2x} - \frac{3 \cos(2x)}{2x^3} - \frac{3 \sin(2x)}{x^2} + \frac{3 \cos(2x)}{2x}. \tag{44}
\]
From the spectrum to inflation

Now, using our inverse formula equation (27), equation (10), and the identities
\[
\int_0^\infty \frac{dk}{k} m(k\xi) \left[ \frac{3}{k^3 \xi_0^3} \left( 1 + k^2 \xi_0^2 \right) X(k\xi_0) \right] = 1 - \left( 1 - \frac{\xi_0^3}{\xi_3^3} \right)^2 \theta(\xi_0 - \xi) + \frac{24 \xi_0}{35\xi} \theta(\xi - \xi_0) + 3 \left( \frac{\xi_2^2}{\xi_0^2} - \frac{6\xi_4^4}{5\xi_0^4} + \frac{3\xi_6^6}{7\xi_0^6} \right) \theta(\xi_0 - \xi) \tag{45}
\]
\[
\frac{1}{2\pi} \int_0^\infty \frac{dl}{l} \ln \left| \frac{k+l}{k-l} \right| [-l\xi_0 W'(l\xi_0)] = -X(k\xi_0) \tag{46}
\]
and
\[
4 \int_0^\infty \frac{dl}{l} \int_0^\infty \frac{dq}{q} M(l\xi, q\xi) \left[ -l\xi_0 W'(l\xi_0) \right] \left[ -q\xi_0 W'(q\xi_0) \right] = \frac{24 \xi_0}{35\xi} \theta(\xi - \xi_0) + 3 \left( \frac{\xi_2^2}{\xi_0^2} - \frac{6\xi_4^4}{5\xi_0^4} + \frac{3\xi_6^6}{7\xi_0^6} \right) \theta(\xi_0 - \xi) \tag{47}
\]
we can invert the power spectrum of equation (43) to recover equation (42).
