A MULTIPLICITY THEOREM
FOR PARAMETRIC SUPERLINEAR \((p, q)\)-EQUATIONS

Florin-Iulian Onete, Nikolaos S. Papageorgiou, and Calogero Vetro

Abstract. We consider a parametric nonlinear Robin problem driven by the sum of a \(p\)-Laplacian and of a \(q\)-Laplacian \((p, q)\)-equation). The reaction term is \((p-1)\)-superlinear but need not satisfy the Ambrosetti–Rabinowitz condition. Using variational tools, together with truncation and comparison techniques and critical groups, we show that for all small values of the parameter, the problem has at least five nontrivial smooth solutions, all with sign information.

Keywords: superlinear reaction, constant sign and nodal solutions, extremal solutions, nonlinear regularity, nonlinear maximum principle, critical groups.

Mathematics Subject Classification: 35J20, 35J60.

1. INTRODUCTION

Let \(\Omega \subseteq \mathbb{R}^N\) be a bounded domain with a \(C^2\)-boundary \(\partial \Omega\). In this paper we study the following parametric \((p, q)\)-equation

\[
\begin{aligned}
-\Delta_p u(z) - \Delta_q u(z) + \xi(z)|u(z)|^{p-2}u(z) &= \lambda f(z, u(z)) \quad \text{in} \ \Omega, \\
\frac{\partial u}{\partial n_{pq}} + \beta(z)|u|^{p-2}u &= 0 \quad \text{on} \ \partial \Omega, 1 < q < p < +\infty, \ \lambda > 0.
\end{aligned}
\]

For every \(r \in (1, +\infty)\) by \(\Delta_r\) we denote the \(r\)-Laplace differential operator defined by

\[
\Delta_r u = \text{div} \left( |\nabla u|^{r-2} \nabla u \right) \quad \text{for all} \ u \in W^{1,r}(\Omega).
\]

So, the differential operator in \((P_\lambda)\) is the \((p, q)\)-Laplacian plus a potential function \(\xi \in L^\infty(\Omega)\), \(\xi \geq 0\). The reaction term (right hand side of \((P_\lambda)\)) is parametric with \(\lambda > 0\) being the parameter. The function \(f(z, x)\) is a Carathéodory function (that is,
for all \( x \in \mathbb{R}, \ z \rightarrow f(z,x) \) is measurable and for a.a. \( z \in \Omega, \ x \rightarrow f(z,x) \) is continuous) and we assume that \( f(z,\cdot) \) is \((p-1)\)-superlinear near \( \pm \infty \), while it is \((q-1)\)-superlinear near zero. These assumptions incorporate in our framework the case of competing concave and convex nonlinearities in the reaction (concave-convex problem). In the boundary condition, \( \frac{\partial u}{\partial n_{pq}} \) denotes the conormal derivative of \( u \) corresponding to the \((p,q)\)-Laplacian. This conormal derivative is interpreted using the nonlinear Green’s identity (see Papageorgiou–Radulescu–Repovš [21], Corollary 1.5.16). If \( u \in C^1(\Omega) \), then
\[
\frac{\partial u}{\partial n_{pq}} = \left[ |\nabla u|^{p-2} + |\nabla u|^{q-2} \right] \frac{\partial u}{\partial n}
\]
with \( u(\cdot) \) being the outward unit normal on \( \partial \Omega \). The boundary coefficient \( \beta(\cdot) \) is nonnegative.

Using variational tools from the critical point theory together with suitable truncation and comparison techniques and critical groups, we show that for all \( \lambda > 0 \) small problem \((P_{\lambda})\) has at least five nontrivial smooth solutions, all with sign information (two positive, two negative and the fifth nodal (sign changing)).

Parametric \((p,q)\)-equations were studied primarily in the context of Dirichlet problems, using different conditions of the reaction. We mention the works of Benouhiba–Belyacine [4], Bhattacharya–Emamizadeh–Farjudian [5], Bobkov–Tanaka [6], Papageorgiou–Radulescu [15], Papageorgiou–Radulescu–Repovš [19,20], Papageorgiou–Vetro–Vetro [22], Papageorgiou–Zhang [25,26], Radulescu [28], Tanaka [29].

Equations driven by the sum of a \( p \)-Laplacian and of a \( q \)-Laplacian \((p,q)\)-equations), arise naturally in many mathematical models of physical processes. In elasticity theory such equations describe composites consisting of two different materials with distinct hardening exponents. In their general form such anisotropic materials have energy functionals with unbalanced growth and were introduced and studied by Marcellini [13] and Zhikov [30, 31]. Recently important regularity results for minimizers of such functionals were obtained by Mingione and coworkers (see [1,8,9]). We encounter \((p,q)\)-equations in other physical applications too. We mention the works of Bouchta–Radulescu–Repovš [2] (on transonic flows), Benci–D’Avenia–Fortunato–Pisani [3] (quantum physics), Cherfils–Il’yasov [7] (reaction-diffusion systems).

2. MATHEMATICAL BACKGROUND – HYPOTHESES

Let \( X \) be a Banach space. By \( X^* \) we denote the topological dual of \( X \) and by \( \langle \cdot, \cdot \rangle \) the duality brackets for the pair \((X^*,X)\). Given \( \varphi \in C^1(X,\mathbb{R}) \), we say that \( \varphi \) satisfies the “\( C \)-condition”, if the following property holds:

“Every sequence \( \{u_n\}_{n \geq 1} \subseteq X \) such that \( \{\varphi(u_n)\}_{n \geq 1} \subseteq \mathbb{R} \) is bounded and \((1 + \|u_n\|_X)\varphi'(u_n) \rightarrow 0 \) in \( X^* \) as \( n \rightarrow +\infty \), admits a strongly convergent subsequence.”

The main spaces in the study of \((P_{\lambda})\) are the Sobolev space \( W^{1,p}(\Omega) \), the Banach space \( C^1(\Omega) \) and the boundary Lebesgue spaces \( L^s(\partial \Omega), 1 \leq s \leq +\infty \).
By $\| \cdot \|$ we denote the norm of $W^{1,p}(\Omega)$ defined by

$$\|u\| = \left(\|u\|_p^p + \|\nabla u\|_p^{p-1}\right)^{1/p} \text{ for all } u \in W^{1,p}(\Omega).$$

The Banach space $C^{1}(\overline{\Omega})$ is ordered by the positive (order) cone

$$C_+ = \{ u \in C^{1}(\overline{\Omega}) : u(z) \geq 0 \text{ for all } z \in \overline{\Omega}\}.$$

This cone has a nonempty interior given by

$$D_+ = \{ u \in C_+ : u(z) > 0 \text{ for all } z \in \overline{\Omega}\}.$$

On $\partial \Omega$ we consider the $(N - 1)$-dimensional Hausdorff (surface) measure $\sigma(\cdot)$. Using this measure, we can define in the usual way the boundary Lebesgue spaces $L^s(\partial \Omega)$, $1 \leq s \leq +\infty$. From the theory of Sobolev spaces, we know that there exists a unique continuous linear map $\gamma_0 : W^{1,p}(\Omega) \to L^p(\partial \Omega)$, known as the “trace map”, such that

$$\gamma_0(u) = u|_{\partial \Omega} \text{ for all } u \in W^{1,p}(\Omega) \cap C^{1}(\overline{\Omega}).$$

So, the trace map extends the notion of boundary values to all Sobolev functions. We know that the trace map $\gamma_0(\cdot)$ is compact into $L^s(\partial \Omega)$ for all $1 \leq s < \frac{(N-1)p}{N-p}$ if $1 < p < N$ and into $L^s(\partial \Omega)$ for all $1 \leq s < +\infty$ if $N \leq p$. Moreover, we have

$$\text{im } \gamma_0 = W^{1,p}_{\text{loc}}(\partial \Omega) \left(\frac{1}{p} + \frac{1}{p'} = 1\right) \quad \text{and} \quad \ker \gamma_0 = W^{1,p}_{0}(\Omega).$$

In what follows, for the sake of notational simplicity, we drop the use of the trace map $\gamma_0(\cdot)$. All restrictions of Sobolev functions on $\partial \Omega$ are understood in the sense of traces.

As we already mentioned in the Introduction, we will also use critical groups in order to distinguish between solutions of $(P_\lambda)$. So, let us recall the definition of critical groups. As before, $X$ is a Banach space and $\varphi \in C^{1}(X, \mathbb{R})$. For $c \in \mathbb{R}$, we introduce the following sets:

$$K_\varphi = \{ u \in X : \varphi'(u) = 0 \} \quad \text{(the critical set of } \varphi),$$

$$\varphi^c = \{ u \in X : \varphi(u) \leq c \}.$$

For a topological pair $(Y_1, Y_2)$ such that $Y_2 \subseteq Y_1 \subseteq X$, for every $k \in \mathbb{N}_0$ by $H_k(Y_1, Y_2)$ we denote the $k^{th}$-relative singular homology group for the pair $(Y_1, Y_2)$ with integer coefficients. If $u \in K_\varphi$ is isolated, then the critical groups of $\varphi$ at $u$ are defined by

$$C_k(\varphi, u) = H_k(\varphi^c \cap U, \varphi^c \cap U \setminus \{ u \}) \text{ for all } k \in \mathbb{N}_0,$$

with $c = \varphi(u)$ and $U$ a neighborhood of $u$ such that $\varphi^c \cap U \cap K_\varphi = \{ u \}$. By convention $C_k(\varphi, u) = 0$ for all $k \in -\mathbb{N}$. The excision property of singular homology implies that this definition is independent of the choice of the isolating neighborhood $U$. 
Next let us introduce the basic notation that we will use throughout this work. For every \( x \in \mathbb{R} \), we set \( x^{\pm} = \max\{\pm x, 0\} \). Then given \( u \in W^{1,p}(\Omega) \), we define
\[
 u^{\pm}(z) = u(z)^{\pm} \quad \text{for all } z \in \Omega.
\]
We know that \( u^{\pm} \in W^{1,p}(\Omega) \) and \( u = u^{+} - u^{-} \). If \( v, u \in W^{1,p}(\Omega) \) and \( v \leq u \), then we define
\[
 [v, u] = \{ h \in W^{1,p}(\Omega) : v(z) \leq h(z) \leq u(z) \text{ for a.a. } z \in \Omega \}.
\]

**Remark 2.1.** Hypothesis \( H(f) \) (ii) implies that
\[
 \lim_{x \to \pm \infty} f(z, x) |x|^{p-2}x = +\infty \quad \text{uniformly for a.a. } z \in \Omega. \quad (2.1)
\]
A multiplicity theorem for parametric superlinear \((p, q)\)-equations

Therefore the reaction in problem \((P_\lambda)\) is \((p-1)\)-superlinear. However, we do not express this superlinearity of \(f(z, \cdot)\) using the Ambrosetti–Rabinowitz condition (the AR-condition for short), which is very common in the literature. Recall that the AR-condition says that there exist \(\vartheta > p\) and \(M > 0\) such that

\[
0 < \vartheta F(z, x) \leq f(z, x)x \quad \text{for a.a. } z \in \Omega, \text{ all } |x| \geq M, \tag{2.2a}
\]

\[
0 < \text{ess inf}_\Omega F(\cdot, \pm M). \tag{2.2b}
\]

Integrating (2.2a) and using (2.2b), we obtain the following weaker condition

\[
c_0 |x|^{\vartheta} \leq F(z, x) \quad \text{for a.a. } z \in \Omega, \text{ all } |x| \geq M, \text{ some } c_0 > 0. \tag{2.3}
\]

Then (2.2a) and (2.3) show that under the AR-condition \(f(z, \cdot)\) has at least \((\vartheta - 1)\)-polynomial growth. So, condition (2.1) holds. In the present work, instead of the AR-condition, we use a more general hypothesis (see \(H(f)\) (ii)), which incorporates in our framework superlinear nonlinearities with slower growth near \(\pm \infty\) (see the examples below). Note also that no sign condition is imposed on \(f(z, \cdot)\).

**Example 2.2.** The following functions satisfy hypotheses \(H(f)\). For the sake of simplicity we drop the \(z\)-dependence:

\[
f_1(x) = \begin{cases} 
|x|^r - 2x & \text{if } |x| \leq 1, \\
|x|^p - 2x \ln |x| + x & \text{if } 1 < |x|,
\end{cases}
\]

with \(1 < \tau < q < p,\)

\[
f_2(x) = \begin{cases} 
|x|^{\vartheta - 2}x + k_- & \text{if } x < -1, \\
|x|^\vartheta - 2x \ln (1 + |x|) & \text{if } |x| \leq 1,
\end{cases}
\]

\[
x^{r-1} + k_+ & \text{if } 1 < x,
\]

with \(1 < \vartheta < q + 1, p < r < p^*, k_\pm = -1 \pm \frac{1}{\ln 2}.
\]

From the above functions \(f_1\) does not satisfy the AR-condition.

3. SOLUTIONS OF CONSTANT SIGN

Let \(\gamma_p : W^{1,p}(\Omega) \to \mathbb{R}\) be the \(C^1\)-functional defined by

\[
\gamma_p(u) = \|\nabla u\|_p^p + \int_\Omega \xi(z)|u|^p dz + \int_{\partial \Omega} \beta(z)|u|^p d\sigma \quad \text{for all } u \in W^{1,p}(\Omega).
\]

Hypotheses \(H(\xi), H(\beta), H_0\), together with Lemma 4.11 of Mugnai–Papageorgiou [14] and Proposition 2.4 of Gasinski–Papageorgiou [10] imply that

\[
\gamma_p(u) \geq c_1 \|u\|^p \quad \text{for some } c_1 > 0, \text{ all } u \in W^{1,p}(\Omega). \tag{3.1}
\]

For every \(\lambda > 0\), we consider the \(C^1\)-functionals \(\varphi^\pm_\lambda : W^{1,p}(\Omega) \to \mathbb{R}\) defined by

\[
\varphi^\pm_\lambda(u) = \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \lambda \int_\Omega F(z, \pm u^\pm) dz \quad \text{for all } u \in W^{1,p}(\Omega).
\]
Proposition 3.1. If hypotheses $H(\xi)$, $H(\beta)$, $H_0$, $H(f)$ hold and $\lambda > 0$, then the functionals $\varphi^\pm_\lambda$ satisfy the C-condition.

Proof. We do the proof for the functional $\varphi^+_\lambda$, the proof for $\varphi^-_\lambda$ being similar.

We consider a sequence $\{u_n\}_{n \geq 1} \subseteq W^{1,p}(\Omega)$ such that

$|\varphi^+_\lambda(u_n)| \leq M_1$ for some $M_1 > 0$, all $n \in \mathbb{N}$,

$(1 + \|u_n\|)(\varphi^+_\lambda)'(u_n) \to 0$ in $W^{1,p}(\Omega)^{*}$ as $n \to +\infty$. \hspace{1cm} (3.3)

From (3.3) we have

$$\left| \langle (\varphi^+_\lambda)'(u_n), h \rangle \right| \leq \frac{\varepsilon_n \|h\|}{1 + \|u_n\|} \quad \text{for all } h \in W^{1,p}(\Omega), \text{ with } \varepsilon_n \to 0^{+},$$

$$\Rightarrow \left| \langle A_p(u_n), h \rangle + \langle A_q(u_n), h \rangle + \int_\Omega \xi(z)|u_n|^{p-2}u_n h \, dz + \int_{\partial\Omega} \beta(z)|u_n|^{p-2}u_n h \, d\sigma \right. $$

$$ - \lambda \int_\Omega f(z, u^+_n) h \, dz \left| \leq \frac{\varepsilon_n \|h\|}{1 + \|u_n\|}, \quad \text{for all } n \in \mathbb{N}. \hspace{1cm} (3.4)$$

In (3.4) we choose $h = -u^-_n \in W^{1,p}(\Omega)$. We obtain

$$\gamma_p(u^-_n) + \|\nabla u^-_n\|_q^q \leq \varepsilon_n \quad \text{for all } n \in \mathbb{N},$$

$$\Rightarrow c_1\|u^-_n\|^p \leq \varepsilon_n \quad \text{for all } n \in \mathbb{N} \text{ (see (3.1))},$$

$$\Rightarrow u^-_n \to 0 \quad \text{in } W^{1,p}(\Omega) \text{ as } n \to +\infty. \hspace{1cm} (3.5)$$

From (3.2) and (3.5) it follows that

$$\gamma_p(u^+_n) + \frac{p}{q}\|\nabla u^+_n\|_q^q - \lambda \int_\Omega F(z, u^+_n) \, dz \leq M_2 \quad \text{for some } M_2 > 0, \text{ all } n \in \mathbb{N}. \hspace{1cm} (3.6)$$

In (3.4) we choose $h = u^+_n \in W^{1,p}(\Omega)$ and obtain

$$-\gamma_p(u^+_n) - \|\nabla u^+_n\|_q^q + \lambda \int_\Omega f(z, u^+_n) u^+_n \, dz \leq \varepsilon_n \quad \text{for all } n \in \mathbb{N}. \hspace{1cm} (3.7)$$

We add (3.6) and (3.7) and recall that $q < p$. We obtain

$$\lambda \int_\Omega [f(z, u^+_n)u^+_n - pF(z, u^+_n)] \, dz \leq M_3 \quad \text{for some } M_3 > 0, \text{ all } n \in \mathbb{N}. \hspace{1cm} (3.8)$$

On account of hypotheses $H(f)$ (i),(ii) we have

$$\beta_1|x|^p - c_2 \leq f(z, x)x - pF(z, x) \quad \text{for a.a. } z \in \Omega, \text{ all } x \in \mathbb{R}, \text{ with } \beta_1 \in (0, \beta_0), \ c_2 > 0. \hspace{1cm} (3.9)$$
Using (3.9) in (3.8) we obtain
\[ \|u_n^+\|_{\mu}^\mu \leq M_4 \quad \text{for some } M_4 > 0, \text{ all } n \in \mathbb{N}. \] (3.10)

First suppose that \( N \neq p \). It is clear from hypothesis \( H(f) \) (ii) that we may assume that \( \mu \leq r < p^* \). We choose \( t \in [0, 1) \) such that
\[ \frac{1}{r} = \frac{1 - t}{\mu} + \frac{t}{p^*}. \] (3.11)
(recall that \( p^* = +\infty \) if \( N > p \)). Using the interpolation inequality (see Papageorgiou–Winkert [24, p. 116]), we have
\[ \|u_n^+\|_{r} \leq \|u_n^+\|_{r}^{1-t}\|u_n^+\|_{p^*}^t, \]
which implies
\[ \|u_n^+\|_{r} \leq c_3\|u_n^+\|_{p^*}^t \quad \text{for some } c_3 > 0, \text{ all } n \in \mathbb{N}, \]
(here we have used (3.10) and the Sobolev embedding theorem).

From hypothesis \( H(f) \) (i) we have
\[ f(z,x) \leq c_4[1 + |x|^r] \quad \text{for a.a. } z \in \Omega, \text{ all } x \in \mathbb{R}, \text{ some } c_4 > 0. \] (3.12)

In (3.4) we choose \( h = u_n^+ \in W^{1,p}(\Omega) \). Then for all \( n \in \mathbb{N} \) we have
\[ \gamma_{\mu}(u_n^+) + \|\nabla u_n^+\|_{\mu}^\mu - \lambda \int_\Omega f(z,u_n^+)u_n^+dz \leq \varepsilon_n, \]
which implies
\[ c_1\|u_n^+\|^p + \|\nabla u_n^+\|^q_{q} \leq c_5[\lambda(1 + \|u_n^+\|_{p^*}^t)] + 1 \]
for some \( c_5 > 0 \) (see (3.1) and (3.12))
\[ \leq c_6[\lambda(1 + \|u_n^+\|_{p^*}^t)] + 1 \quad \text{for some } c_6 > 0. \] (3.13)

From (3.11) and our hypothesis on \( \mu \) (see hypothesis \( H(f) \) (ii)) we infer that \( tr < p \). So, from (3.13) it follows that
\[ \{u_n^+\}_{n \geq 1} \subseteq W^{1,p}(\Omega) \text{ is bounded}. \] (3.14)

Now suppose that \( N = p \). In this case we know that \( p^* = +\infty \). On the other hand by the Sobolev embedding theorem (see, for example, [21, Theorem 1.9.15]) we have that \( W^{1,p}(\Omega) \hookrightarrow L^s(\Omega) \) for all \( 1 \leq s < +\infty \). So, for the previous argument to work, we need to replace \( p^* \) by \( s > r \) big so that
\[ tr = \frac{s(r - \mu)}{s - \mu} < p \quad \text{(recall } r - p < \mu, \text{ see } H(f) \text{ (ii))}. \]

Then with such a choice of \( s > r \), the previous argument goes through and again we reach (3.12).

From (3.5) and (3.14) it follows that \( \{u_n^+\}_{n \geq 1} \subseteq W^{1,p}(\Omega) \text{ is bounded}. \) So, by passing to a subsequence if necessary, we may assume that
\[ u_n \rightharpoonup u \text{ in } W^{1,p}(\Omega) \text{ and } u_n \rightarrow u \text{ in } L^r(\Omega) \text{ and in } L^p(\partial \Omega). \] (3.15)
In (3.4) we choose \( h = u_n - u \in W^{1,p}(\Omega) \), pass to the limit as \( n \to +\infty \) and use (3.15). Then
\[
\lim_{n \to +\infty} [\langle A_p(u_n), u_n - u \rangle + \langle A_q(u_n), u_n - u \rangle] = 0,
\]
\[
\Rightarrow \limsup_{n \to +\infty} [\langle A_p(u_n), u_n - u \rangle + \langle A_q(u_n), u_n - u \rangle] \leq 0 \quad \text{(recall that } A_q(\cdot) \text{ is monotone)},
\]
\[
\Rightarrow \limsup_{n \to +\infty} [\lambda_c u_n] = 0 \quad \text{(see (3.15))},
\]
\[
\Rightarrow u_n \to u \text{ in } W^{1,p}(\Omega) \quad \text{(since } A_p(\cdot) \text{ is of type } (S)_+). \]

This proves that \( \varphi^+ \) satisfies the C-condition. In a similar fashion we show that \( \varphi^- \) satisfies the C-condition.

Let \( \varphi_\lambda : W^{1,p}(\Omega) \to \mathbb{R} \) be the energy (Euler) functional for problem \((P_\lambda)\) defined by
\[
\varphi_\lambda(u) = \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \lambda \int_\Omega F(z,u) dx \quad \text{for all } u \in W^{1,p}(\Omega).
\]

Evidently \( \varphi_\lambda \in C^1(\mathcal{W}^{1,p}(\Omega)) \). With small changes in the previous proof we can have the following result.

**Proposition 3.2.** If hypotheses \( H(\xi), H(\beta), H_0, H(f) \) hold and \( \lambda > 0 \), then \( \varphi_\lambda \) satisfies the C-condition.

Now we are ready to produce constant sign solutions when \( \lambda > 0 \) is small.

**Proposition 3.3.** If hypotheses \( H(\xi), H(\beta), H_0, H(f) \) hold and \( \lambda > 0 \), then there exists \( \lambda^* > 0 \) such that for all \( \lambda \in (0, \lambda^*) \) problem \((P_\lambda)\) has at least four nontrivial solutions of constant sign \( u_0, \hat{u} \in D_+ \) and \( v_0, \hat{v} \in -D_+ \).

**Proof.** First we produce the positive solutions.

On account of hypotheses \( H(f)(i),(ii),(iii) \) we have
\[
F(z,x) \leq c_7 (|x| + |x|^r) \quad \text{for a.a. } z \in \Omega, \text{ all } x \in \mathbb{R}, \text{ with } c_7 > 0. \quad (3.16)
\]

Then for all \( u \in W^{1,p}(\Omega) \) we have
\[
\varphi_\lambda(u) \geq \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \lambda c_8 (\|u\|_r + \|u\|_{r'}) \quad \text{for some } c_8 > 0 \quad \text{(see (3.16))},
\]
\[
\geq \frac{c_1}{p} \|u\|^p - \lambda c_8 (\|u\|_r + \|u\|_{r'})
\]
\[
= \left[ \frac{c_1}{p} - \lambda c_8 \right] (\|u\|^{r-p} + \|u\|^{r'-p}) \|u\|^p. \quad (3.17)
\]

Consider the function
\[
\vartheta(t) = t^{r-p} + t^{r'-p} \quad \text{for all } t > 0.
\]
A multiplicity theorem for parametric superlinear \((p, q)\)-equations

We have \(\vartheta \in C^1(0, +\infty)\) and since \(\tau < p < r\), we see that
\[
\vartheta(t) \to +\infty \text{ as } t \to 0^+ \text{ and as } t \to +\infty.
\]
Therefore we can find \(t_0 \in (0, +\infty)\) such that
\[
\vartheta'(t_0) = 0
\]
\[
(p - \tau)t_0^{r - p - 1} = (r - p)t_0^{r - p - 1},
\]
\[
t_0 = \frac{p - \tau}{r - p}.
\]

We set \(\lambda^* = \frac{c_1}{\lambda_{pc8} \vartheta(t_0)} > 0\). Then for every \(\lambda \in (0, \lambda^*)\), from (3.17) we have
\[
\varphi_\lambda^+(u) \geq d_\lambda > 0 \text{ for all } \|u\| = t_0. \quad (3.18)
\]

On the other hand using again hypotheses \(H(f) (i),(ii)\), we see that given \(\eta > 0\), we can find \(c_{\eta} > 0\) such that
\[
F(z, x) \geq \eta |x|^q - c_{\eta} |x|^r \quad \text{for a.a. } z \in \Omega, \text{ all } x \in \mathbb{R}. \quad (3.19)
\]

Let \(\hat{u} \in D_+\) and \(t > 0\). We have
\[
\varphi_\lambda^+(t\hat{u}) \leq \frac{t^p}{p} \gamma_p(\hat{u}) + \frac{t^q}{q} \|\nabla \hat{u}\|_q^q - \lambda t^q \eta \|\hat{u}\|_q^q + \lambda c_{\eta} \|\hat{u}\|_r^r \quad \text{ (see (3.19))}
\]
\[
\leq c_9 [t^p + \lambda t^r] + \frac{t^q}{q} \left[\|\nabla \hat{u}\|_q^q - \lambda \eta \|\hat{u}\|_q^q\right] \quad \text{for some } c_9 = c_9(\eta) > 0.
\]

Choosing \(\eta > 0\) big, we see that
\[
\varphi_\lambda^+(t\hat{u}) \leq c_9 [t^p + \lambda t^r] - c_{10} t^q \quad \text{for some } c_{10} > 0. \quad (3.20)
\]

Since \(q < p < r\), from (3.20) it follows that for \(t \in (0, 1)\) small we have
\[
\varphi_\lambda^+(t\hat{u}) < 0. \quad (3.21)
\]

We consider the following minimization problem
\[
\inf \{\varphi_\lambda^+(u) : u \in \overline{B}_{t_0}\} = m_\lambda^+. \quad (3.22)
\]

The set \(\overline{B}_{t_0} = \{u \in W^{1,p}(\Omega) : \|u\| \leq t_0\} \subseteq W^{1,p}(\Omega)\) is sequentially weakly compact (by the Eberlein–Šmulian theorem). Also the Sobolev embedding theorem and the compactness of the trace map imply that \(\varphi_\lambda^+(\cdot)\) is sequentially weakly lower semicontinuous. So, by the Weierstrass–Tonelli theorem, we can find \(u_0 \in W^{1,p}(\Omega)\) such that
\[
m_\lambda^+ = \varphi_\lambda^+(u_0) \quad \text{(see (3.22))}, \quad (3.23)
\]
\[ \Rightarrow \varphi^+_\lambda(u_0) < 0 = \varphi^+_\lambda(0) \quad (\text{see (3.21)}), \]
\[ \Rightarrow u_0 \neq 0. \]

Moreover, from (3.18) we have that
\[ 0 < \|u_0\| < t_0, \]
\[ \Rightarrow (\varphi^+_\lambda)'(u_0) = 0 \quad (\text{see (3.22), (3.23)}), \]
\[ \Rightarrow (A_p(u_0), h) + (A_q(u_0), h) + \int_\Omega \xi(z)|u_0|^{p-2}u_0 h \, dz + \int_{\partial \Omega} \beta(z)|u_0|^{p-2}u_0 h \, d\sigma \]
\[ = \lambda \int_\Omega f(z, u_0) h \, dz \quad \text{for all } h \in W^{1,p}(\Omega). \quad (3.24) \]

In (3.24) we choose \( h = -u_0^- \in W^{1,p}(\Omega) \). We obtain
\[ \gamma_p(u_0^-) + \|\nabla u_0^-\|_q^p = 0, \]
\[ \Rightarrow c_1\|u_0^-\|_p^p \leq 0 \quad (\text{see (3.1)}), \]
\[ \Rightarrow u_0 \geq 0, u_0 \neq 0. \]

Then from (3.24) we have
\[
\begin{cases}
-\Delta_p u_0(z) - \Delta_q u_0(z) + \xi(z)u_0(z)^{p-1} = \lambda f(z, u_0(z)) & \text{for a.a. } z \in \Omega, \\
\frac{\partial u}{\partial n_{pq}} + \beta(z)|u_0|^{p-1} = 0 & \text{on } \partial \Omega. 
\end{cases} \quad (3.25)
\]

From (3.25) and Proposition 2.10 of Papageorgiou–Rădulescu [17], we have that \( u_0 \in L^\infty(\Omega) \). Then from the nonlinear regularity theory of Lieberman [12] we have that \( u_0 \in C_+ \setminus \{0\} \).

Let \( \rho = \|u_0\|_\infty \). Hypotheses \( H(f) \) (i),(iii) imply that we can find \( \widehat{\xi}_\rho > 0 \) such that
\[ \lambda f(z, x) + \widehat{\xi}_\rho|x|^p \geq 0 \quad \text{for a.a. } z \in \Omega, \text{ all } |x| \leq \rho. \quad (3.26) \]

Then from (3.25) and (3.26) we have
\[ \Delta_p u_0(z) + \Delta_q u_0(z) \leq \left[ \|\xi\|_\infty + \widehat{\xi}_\rho \right] u_0(z)^{p-1} \quad \text{for a.a. } z \in \Omega, \]
\[ \Rightarrow u_0 \in D_+ \quad (\text{see Pucci–Serrin [27, pp. 111, 120]}). \]

Also, if \( \tilde{u} \in D_+ \), then on account of hypothesis \( H(f) \) (ii) we have
\[ \varphi^+_\lambda(\tilde{u}) \rightarrow -\infty \quad \text{as } t \rightarrow +\infty. \quad (3.27) \]

From Proposition 3.1 we know that
\[ \varphi^+_\lambda(\cdot) \text{ satisfies the } C\text{-condition.} \quad (3.28) \]
Then (3.18), (3.27), (3.28) permit the use of the mountain pass theorem. So, we can find \( \tilde{u} \in W^{1,p}(\Omega) \) such that
\[
\tilde{u} \in K_{\phi^+} \text{ and } \phi^+_{\lambda}(u_0) < d_{\lambda} \leq \phi^+_{\lambda}(\tilde{u}) \text{ (see (3.18)).}
\] (3.29)

From (3.29) we see that \( \tilde{u} \neq u_0 \) and
\[
(A_p(\tilde{u}), h) + (A_q(\tilde{u}), h) + \int_{\Omega} \xi(z)|\tilde{u}|^{p-2}\tilde{u} h \, dz + \int_{\partial\Omega} \beta(z)|\tilde{u}|^{p-2}\tilde{u} h \, d\sigma
= \lambda \int_{\Omega} f(z, \tilde{u}^+) h \, dz \quad \text{for all } h \in W^{1,p}(\Omega).
\] (3.30)

As before, choosing \( h = -\tilde{u}^+ \in W^{1,p}(\Omega) \) in (3.30), we infer that \( \tilde{u} \geq 0 \). Moreover, as before, the nonlinear regularity theory implies that \( \tilde{u} \in C^+ \). We will show that \( \tilde{u} \neq 0 \).

Since \( \tilde{u} \) is a critical point of \( \phi_{\lambda}^+ \) of mountain pass type, we have
\[
C_1(\phi^+_{\lambda}, \tilde{u}) \neq 0.
\] (3.31)

(see Papageorgiou–Radulescu–Repovš [21, Theorem 6.5.8]).

For \( u \in W^{1,p}(\Omega) \) with \( \|u\| \leq 1 \), we have
\[
|\phi(u) - \phi^+_{\lambda}(u)| \leq \int_{\Omega} |\lambda[F(z, u) - F(z, u^+)]| \, dz
\leq \lambda c_{11} [\|u\|^r + \|u\|^{r-1}] \quad \text{for some } c_{11} > 0 \text{ (see (3.16))}
\leq 2\lambda c_{11} \|u\|^r \quad \text{(since } \|u\| \leq 1, \tau < r). \quad (3.32)
\]

Moreover, for all \( h \in W^{1,p}(\Omega) \) we have
\[
|\phi'(u) - (\phi^+_{\lambda})'(u), h)|
\leq \lambda \int_{\Omega} |f(z, u) - f(z, u^+)| |h| \, dz
= \lambda \int_{\Omega} |f(z, -u^-)| |h| \, dz
\leq \lambda c_{12} [\|u\|^{r-1} + \|u\|^{r-1} \|h\|] \quad \text{for some } c_{12} > 0
\leq 2\lambda c_{12} \|u\|^{r-1} \|h\| \quad \text{(since } \|u\| \leq 1, \tau < r). \quad (3.33)
\]

Then from (3.32), (3.33) and the \( C^1 \)-continuity of critical groups (see Papageorgiou–Radulescu–Repovš [21, Theorem 6.3.4]), we have
\[
C_k(\phi_{\lambda}, 0) = C_k(\phi^+_{\lambda}, 0) \quad \text{for all } k \in \mathbb{N}_0. \quad (3.34)
\]
Hypothesis $H(f)$ (iii) and Proposition 4.2 of Papageorgiou–Vetro–Vetro [23] imply that
\[
C_k(\varphi, 0) = 0 \quad \text{for all} \ k \in \mathbb{N}_0,
\]
\[
\Rightarrow \ C_k(\varphi^+_\lambda, 0) = 0 \quad \text{for all} \ k \in \mathbb{N}_0 \ (\text{see (3.34)}).
\]
(3.35)

Comparing (3.31) and (3.35), we conclude that $\hat{u} \neq 0$, that is, $\hat{u} \in C_+ \setminus \{0\}$.

As we did for $u_0$, via the nonlinear regularity theory (see [12]) and the nonlinear maximum principle (see [27]), we have $\hat{u} \in D_+$.

An inspection of the above proof reveals that it remains valid if we replace $\varphi^+_{\lambda}$ with $\varphi^-_{\lambda}$. So, for all $\lambda \in (0, \lambda^*)$ we can produce two nontrivial negative solutions $v_0, \hat{v} \in \mathcal{N}^{-}$.

Next we show that problem $(P_\lambda)$ admits extremal constant sign solutions, that is, it has a smallest positive solution and a biggest negative solution ($\lambda \in (0, \lambda^*)$). These extremal solutions will be useful in producing nodal solutions (see Section 4).

Let $\lambda \in (0, \lambda^*)$ and $\hat{\lambda}_1(q) \geq 0$ be the principal eigenvalue of the negative $q$-Laplacian with Robin boundary condition. On account of hypotheses $H(f)$ (i),(iii), given $\eta > \hat{\lambda}_1(q)$, we can find $c_{13} = c_{13}(\eta) > 0$ such that
\[
\lambda f(z, x) \geq \eta |x|^q - c_{13}|x|^r \quad \text{for a.a.} \ z \in \Omega, \text{all} \ x \in \mathbb{R}.
\]
(3.36)

This unilateral growth estimate for the reaction of $(P_\lambda)$ leads to the following auxiliary Robin problem
\[
\begin{cases}
-\Delta_q u(z) - \Delta_q u(z) + \xi(z)|u(z)|^{p-2}u(z) = \eta|u(z)|^{q-2}u(z) - c_{13}|u(z)|^{r-2}u(z) \quad \text{in} \ \Omega, \\
\frac{\partial u}{\partial n_{pq}} + \beta(z)|u|^{p-2}u = 0 \quad \text{on} \ \partial \Omega.
\end{cases}
\]
(3.37)

From Proposition 3.5 of Papageorgiou–Rădulescu [16], we have:

**Proposition 3.4.** Problem (3.37) admits a unique positive solution $\hat{u} \in D_+$ and since the equation is odd, $\hat{v} = -\hat{u} \in -D_+$ is the unique negative solution of (3.37).

We introduce the following sets:
\[
S^+_\lambda = \text{set of positive solutions of} \ (P_\lambda),
\]
\[
S^-\lambda = \text{set of negative solutions of} \ (P_\lambda).
\]

From Proposition 3.3 and its proof, we know that
\[
\emptyset \neq S^+_\lambda \subseteq D_+ \quad \text{and} \quad \emptyset \neq S^-\lambda \subseteq -D_+ \quad \text{for all} \ \lambda \in (0, \lambda^*).
\]

Moreover, from Papageorgiou–Rădulescu–Repovš [18] (proof of Proposition 7), we know that $S^+_\lambda$ is downward directed, while $S^-\lambda$ is upward directed.

**Proposition 3.5.** If hypotheses $H(\xi)$, $H(\beta)$, $H_0$, $H(f)$ hold and $\lambda \in (0, \lambda^*)$, then $\hat{u} \leq u$ for all $u \in S^+_\lambda$ and $v \leq \hat{v}$ for all $v \in S^-\lambda$. 

Proof. Let $u \in S_{\Lambda}^+ \subseteq D_+$ and consider the Carathéodory function

$$g_+(z, x) = \begin{cases} \eta(x^+)^{q-1} - c_{13}(x^+)^{r-1} & \text{if } x \leq u(z), \\ \eta u(z)^{q-1} - c_{13}u(z)^{r-1} & \text{if } u(z) < x. \end{cases}$$  \hspace{1cm} (3.38)

We set $G_+(z, x) = \int_0^x g_+(z, s) \, ds$ and consider the $C^1$-functional $\psi_+ : W^{1,p}(\Omega) \to \mathbb{R}$ defined by

$$\psi_+(u) = \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \int_\Omega G_+(z, u) \, dz \quad \text{for all } u \in W^{1,p}(\Omega).$$

From (3.11) and (3.38) it is clear that $\psi_+(\cdot)$ is coercive. Also, from the Sobolev embedding theorem and the compactness of the trace map, we have that $\psi_+(\cdot)$ is sequentially weakly lower semicontinuous. So, by the Weierstrass–Tonelli theorem we can find $\tilde{u}_0 \in W^{1,p}(\Omega)$ such that

$$\psi_+(\tilde{u}_0) = \inf \{ \psi_+(u) : u \in W^{1,p}(\Omega) \}. \hspace{1cm} (3.39)$$

As in the proof of Proposition 3.3 (see (3.20)), we have

$$\psi_+(\tilde{u}_0) < 0 = \psi_+(0),$$

$$\Rightarrow \quad \tilde{u}_0 \neq 0.$$

Using (3.38) we can easily check that

$$K_{\psi_+} \subseteq [0, u] \cap C^1(\Omega),$$

$$\Rightarrow \quad \tilde{u}_0 \in [0, u], \quad \tilde{u}_0 \neq 0,$$

$$\Rightarrow \quad \tilde{u}_0 = \tilde{u} \in D_+ \quad \text{see (3.38) and Proposition 3.4),}$$

$$\Rightarrow \quad \tilde{u} \leq u \quad \text{for all } u \in S_{\Lambda}^+ \subseteq D_+.$$

Similarly we show that $v \leq \tilde{v}$ for all $v \in S_{\Lambda}^- \subseteq -D_+$. \hfill \Box

Now we are ready to produce extremal constant sign solutions.

**Proposition 3.6.** If hypotheses $H(\xi)$, $H(\beta)$, $H_0$, $H(f)$ hold and $\lambda \in (0, \lambda^*)$, then problem $(P_{\lambda})$ has a smallest positive solution $u_{\lambda}^+ \in D_+$ and a biggest negative solution $v_{\lambda}^- \in -D_+$.

**Proof.** Recall that $S_{\Lambda}^+$ is downward directed. So, invoking Hu–Papageorgiou [11, Lemma 3.10, p. 178], we can find a decreasing sequence $\{u_n\}_{n \geq 1} \subseteq S_{\Lambda}^+ \subseteq D_+$ such that

$$\inf_{n \geq 1} u_n = \inf S_{\Lambda}^+.$$

We have

$$\langle A_p(u_n), h \rangle + \langle A_q(u_n), h \rangle + \int_\Omega \xi(z)|u_n|^{p-2}u_n \, h \, dz + \int_{\partial\Omega} \beta(z)|u_n|^{p-2}u_n \, h \, d\sigma$$
\[ = \lambda \int_{\Omega} f(z, u_n) \, h \, dz \quad \text{for all } h \in W^{1,p}(\Omega), \text{ all } n \in \mathbb{N}, \quad (3.40) \]

\[ \tilde{u} \leq u_n \leq u_1 \quad \text{for all } n \in \mathbb{N} \text{ (see Proposition 3.5)} \quad (3.41) \]

In (3.40) we choose \( h = u_n \in W^{1,p}(\Omega) \) and use (3.1), (3.41) and hypothesis \( H(f) \) \( (i) \) to infer that \( \{u_n\}_{n \geq 1} \subseteq W^{1,p}(\Omega) \) is bounded. So, we may assume that \( u_n \xrightarrow{n \to +\infty} u^*_\lambda \) in \( W^{1,p}(\Omega) \) and \( u_n \to u^*_\lambda \) in \( L^p(\Omega) \) and \( L^p(\partial \Omega) \). \( (3.42) \)

In (3.40) we choose \( h = u_n - u^*_\lambda \in W^{1,p}(\Omega) \), pass to the limit as \( n \to +\infty \) and use (3.42). We obtain

\[ \lim_{n \to +\infty} [\langle A_p(u_n), u_n - u^*_\lambda \rangle + \langle A_q(u_n), u_n - u^*_\lambda \rangle] = 0, \quad \Rightarrow \quad u_n \to u^*_\lambda \text{ in } W^{1,p}(\Omega) \text{ (as in the proof of Proposition 3.1)}. \quad (3.43) \]

Passing to the limit as \( n \to +\infty \) in (3.40) and using (3.43), we obtain

\[ \langle A_p(u^*_\lambda), h \rangle + \langle A_q(u^*_\lambda), h \rangle + \int_{\Omega} \xi(z)(u^*_\lambda)^{p-1} h \, dz + \int_{\partial \Omega} \beta(z)(u^*_\lambda)^{p-1} h \, d\sigma \]

\[ = \lambda \int_{\Omega} f(z, u^*_\lambda) \, h \, dz \quad \text{for all } h \in W^{1,p}(\Omega). \quad (3.44) \]

Also from (3.41) we have

\[ \tilde{u} \leq u^*_\lambda. \quad (3.45) \]

From (3.44) and (3.45) we conclude that \( u^*_\lambda \in S^+ \subseteq D_+ \) and \( u^*_\lambda = \inf S^+ \).

Similarly for the negative solutions. Recall that \( S^- \subseteq -D_+ \) is upward directed. Then reasoning as above we produce \( v^*_\lambda \in S^- \subseteq -D_- \) and \( v^*_\lambda = \sup S^- \).

**4. NODAL SOLUTIONS – MULTIPLICITY THEOREM**

In this section we produce nodal solutions and then formulate the multiplicity theorem for problem \( (P_{\lambda}) \) establishing five nontrivial smooth solutions all with sign information when \( \lambda \in (0, \lambda^*) \).

To generate a nodal (sign-changing) solution, we will use the extremal constant solutions \( u^*_\lambda \in D_+ \), \( v^*_\lambda \in -D_+ \) from Proposition 3.6. We form the set

\[ \{ v^*_\lambda, u^*_\lambda \} = \{ h \in W^{1,p}(\Omega) : v^*_\lambda(z) \leq h(z) \leq u^*_\lambda(z) \text{ for a.a. } z \in \Omega \}. \]

Evidently, the extremality of \( u^*_\lambda \) and \( v^*_\lambda \) implies that any nontrivial solution of \( (P_{\lambda}) \) in \( [v^*_\lambda, u^*_\lambda] \) distinct from \( u^*_\lambda \) and \( v^*_\lambda \), must be nodal. So, our aim is to produce such a solution. To this end, using \( u^*_\lambda \in D_+ \) and \( v^*_\lambda \in -D_+ \) from Proposition 3.6, we introduce the following Charathéodory function

\[ k_{\lambda}(z, x) = \begin{cases} \lambda f(z, v^*_\lambda(z)) & \text{if } x < v^*_\lambda(z), \\ \lambda f(z, x) & \text{if } v^*_\lambda(z) \leq x \leq u^*_\lambda(z), \\ \lambda f(z, u^*_\lambda(z)) & \text{if } u^*_\lambda(z) < x. \end{cases} \quad (4.1) \]
We also consider the positive and negative truncations of \( k_\lambda(z,\cdot) \), namely the Carathéodory functions
\[
k_\lambda^\pm(z,x) = k_\lambda(z,\pm x^\pm).
\]
(4.2)

We set
\[
K_\lambda(z,x) = \int_0^x k_\lambda(z,s)ds \quad \text{and} \quad K_\lambda^\pm(z,x) = \int_0^x k_\lambda^\pm(z,s)ds
\]
and consider the \( C_1 \)-functionals \( e_\lambda, e_\lambda^\pm : W^{1,p}(\Omega) \to \mathbb{R} \) defined by
\[
e_\lambda(u) = \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \int_\Omega K_\lambda(z,u)dz,
\]
\[
e_\lambda^\pm(u) = \frac{1}{p} \gamma_p(u) + \frac{1}{q} \|\nabla u\|_q^q - \int_\Omega K_\lambda^\pm(z,u)dz \quad \text{for all} \ u \in W^{1,p}(\Omega).
\]

Using (4.1), (4.2) and extremality of \( u_\lambda^* \in D_+ \) and of \( v_\lambda^* \in -D_+ \), we can easily check that
\[
K_{e_\lambda} \subseteq [v_\lambda^*, u_\lambda^*] \cap C_1(\overline{\Omega}), \quad K_{e_\lambda^+} = \{0, u_\lambda^*\}, \quad K_{e_\lambda^-} = \{0, v_\lambda^*\}.
\]
(4.3)

**Proposition 4.1.** If hypotheses \( H(\xi), H(\beta), H_0, H(f) \) hold and \( \lambda \in (0,\lambda^*) \), then problem \( (P_\lambda) \) admits a nodal solution \( y_0 \in [v_\lambda^*, u_\lambda^*] \cap C_1(\overline{\Omega}) \).

**Proof.** First we show that \( u_\lambda^* \) and \( v_\lambda^* \) are local minimizers of \( e_\lambda \).

To this end, note that \( e_\lambda^+(\cdot) \) is coercive and sequentially weakly lower semicontinuous. So, we can find \( \widehat{u}_\lambda^* \in W^{1,p}(\Omega) \) such that
\[
e_\lambda^+(\widehat{u}_\lambda^*) = \inf \left[ e_\lambda^+(u) : u \in W^{1,p}(\Omega) \right].
\]
(4.4)

As before (see the proof of Proposition 3.3 and in particular (3.20)), we have
\[
e_\lambda^+(\widehat{u}_\lambda^*) < 0 = e_\lambda^+(0),
\]
\[
\Rightarrow \quad \widehat{u}_\lambda^* \neq 0,
\]
\[
\Rightarrow \quad \widehat{u}_\lambda^* = u_\lambda^* \in D_+ \quad \text{(see (4.4) and (4.3)).}
\]
(4.5)

From (4.2) it is clear that \( e_\lambda^+|_{C_+} = e_\lambda|_{C_+} \). So, from (4.5) it follows that
\[
u_\lambda^* \in D_+ \text{ is a local } C_1(\overline{\Omega})\text{-minimizer of } e_\lambda,
\]
\[
\Rightarrow \quad u_\lambda^* \in D_+ \text{ is a local } W^{1,p}(\Omega)\text{-minimizer of } e_\lambda,
\]
(see Papageorgiou–Rǎdulescu [17, Proposition 2.12]).

Similarly, using this time \( e_\lambda^- \) we show that
\[
v_\lambda^* \in -D_+ \text{ is a local } W^{1,p}(\Omega)\text{-minimizer of } e_\lambda.
\]
(4.7)
We may assume that
\[ e_\lambda(v^*_\lambda) \leq e_\lambda(u^*_\lambda). \]

The reasoning is similar if the opposite inequality holds, using (4.7) instead of (4.6).

From (4.3) it is clear that we may assume that
\[ K_{e_\lambda} \subseteq [v^*_\lambda, u^*_\lambda] \cap C^1(\overline{\Omega}) \text{ is finite.} \] (4.8)

Otherwise we already have an infinity of smooth nodal solutions. From (4.6), (4.8) and Theorem 5.7.6 of Papageorgiou–Rădulescu–Repovš [21], we know that we can find \( \rho \in (0,1) \) small such that
\[ e_\lambda(v^*_\lambda) \leq e_\lambda(u^*_\lambda) < \inf \{ e_\lambda(u) : \|u - u^*_\lambda\| = \rho \} = m_\lambda, \quad \|v^*_\lambda - u^*_\lambda\| > \rho. \] (4.9)

Clearly \( e_\lambda(\cdot) \) is coercive (see (3.1) and (4.1)). Hence we infer that
\[ e_\lambda(\cdot) \text{satisfies the } C\text{-condition,} \] (4.10)

(see Papageorgiou–Rădulescu–Repovš [21, Proposition 5.1.15]). Then (4.9), (4.10) permit the use of the mountain pass theorem. So, we can find \( y_0 \in W^{1,p}(\Omega) \) such that
\[ y_0 \in [v^*_\lambda, u^*_\lambda] \cap C^1(\overline{\Omega}), \quad m_\lambda \leq e_\lambda(y_0). \] (4.11)

From (4.9) and (4.11) we see that \( y_0 \neq \{u^*_\lambda, v^*_\lambda\} \).

Also since \( y_0 \) is a critical point of \( e_\lambda \) of mountain pass type we have
\[ C_1(e_\lambda, y_0) \neq 0 \] (4.12)

(see Papageorgiou–Rădulescu–Repovš [21, Theorem 6.5.8]).

Since \( u^*_\lambda \in D_+, v^*_\lambda \in -D_+ \), we have \( 0 \in \text{int}_{C^1(\overline{\Omega})}[v^*_\lambda, u^*_\lambda] \) (= the interior in the \( C^1(\overline{\Omega}) \)-norm topology of \([v^*_\lambda, u^*_\lambda] \cap C^1(\overline{\Omega})\)). Also from (4.1) it is clear that
\[ e_\lambda|_{[v^*_\lambda, u^*_\lambda]} = \varphi_\lambda|_{[v^*_\lambda, u^*_\lambda]}. \]

It follows that
\[ C_k(e_\lambda|_{C^1(\overline{\Omega})}, 0) = C_k(\varphi_\lambda|_{C^1(\overline{\Omega})}, 0) \quad \text{for all } k \in \mathbb{N}_0, \]
\[ \Rightarrow C_k(e_\lambda, 0) = C_k(\varphi_\lambda, 0) \quad \text{for all } k \in \mathbb{N}_0, \]
(see Papageorgiou–Rădulescu–Repovš [21, Theorem 6.6.26]),
\[ \Rightarrow C_k(e_\lambda, 0) = 0 \quad \text{for all } k \in \mathbb{N}_0 \text{ (see the proof of Proposition 3.3).} \] (4.13)

Comparing (4.12) and (4.13), we conclude that \( y_0 \neq 0 \). On account of (4.11), we have that
\[ y_0 \in [v^*_\lambda, u^*_\lambda] \cap C^1(\overline{\Omega}) \text{ is a nodal solution of } (P_\lambda), \lambda \in (0, \lambda^*). \]
Summarizing the situation for problem \((P_\lambda)\), we can state the following multiplicity theorem.

**Theorem 4.2.** If hypotheses \(H(\xi), H(\beta), H_0, H(f)\) hold, then there exist \(\lambda^* > 0\) such that for all \(\lambda \in (0, \lambda^*)\) problem \((P_\lambda)\) has at least five nontrivial solutions \(u_0, \tilde{u} \in D_+\), \(v_0, \tilde{v} \in -D_+\), \(y_0 \in C^1(\Omega)\) nodal; moreover, it has extremal constant sign solutions \(u^*_\lambda \in D_+\) and \(v^*_\lambda \in -D_+\) and we have \(y_0 \in [v^*_\lambda, u^*_\lambda] \cap C^1(\Omega)\).
