NON-RESONANT FREDHOLM ALTERNATIVE AND ANTI-MAXIMUM PRINCIPLE FOR THE FRACTIONAL $p-$LAPLACIAN

LEANDRO M. DEL PEZZO AND ALEXANDER QUAAS

Abstract. In this paper we extend two nowadays classical results to a nonlinear Dirichlet problem to equations involving the fractional $p-$Laplacian. The first result is an existence in a non-resonant range more specific between the first and second eigenvalue of the fractional $p-$Laplacian. The second result is the anti-maximum principle for the fractional $p-$Laplacian.

Dedicated to Paul H. Rabinowitz

Keywords. Fractional $p-$Laplacian, existence results, non-resonant, anti-maximum principle.

1. Introduction

This paper deals with existence and qualitative results for the following nonlinear Dirichlet problem with the fractional $p-$Laplacian

$$(1.1) \quad \begin{cases} (-\Delta_p)^s u = \lambda |u|^{p-2}u + f(x) & \text{in } \Omega, \\
                          u = 0 & \text{in } \Omega^c := \mathbb{R}^N \setminus \Omega.
\end{cases}$$

Here and in the rest of this introduction, $\Omega$ is a smooth bounded open of $\mathbb{R}^N$, $s \in (0, 1)$, and $p \in (1, \infty)$. The fractional $p-$Laplacian is a nonlocal version of the $p-$Laplacian and is an extension of the fractional Laplacian ($p = 2$). More precisely, the fractional $p-$Laplacian is defined as

$$(1.2) \quad (-\Delta_p)^s u(x) = 2K \text{ P.V.} \int_{\mathbb{R}^N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))}{|x-y|^{N+sp}} \, dy,$$

with

$$K = p(1-s) \left( \int_{S^{N-1}} |\omega, e|^p d\mathcal{H}^{N-1}(\omega) \right)^{-1}, \quad e \in S^{N-1}.$$

where $S^{N-1}$ denotes the unit sphere in $\mathbb{R}^N$ and $\mathcal{H}^{N-1}$ denotes the $N-1$–dimensional Hausdorff measure. For more details, see [14, 17].

A pioneer work on existence of nonlinear one dimensional integral equation (with $L^2$ kernels) under non-resonant case can be found in [27]. Beside that let as recall that the Fredholm alternative fails for $p-$Laplacian and the situation is more much complex that in the linear case. This can be found in a large number of results around Fredholm type alternative for the $p-$Laplacian, see for instance [9, 23, 28, 29, 30, 31, 43, 50, 51] and the references therein.
For the fractional Laplacian, the standard Fredholm alternative for compact operator can be applied. Observe that the spectrum for the fractional Laplacian is studied in [48, 46].

Let start by describing our existence results. Denote by $\lambda_1(s,p)$ and $\lambda_2(s,p)$ the first and second eigenvalues respectively for the fractional $p-$Laplacian with Dirichlet boundary condition. See Section 2 for the definition and basic properties of the eigenvalues of the fractional $p-$Laplacian.

First, by standard minimization argument, we show that if $\lambda < \lambda_1(s,p)$, then there is a unique weak solution of (1.1), see Section 3. Then, also in Section 3, we show the existence of solution to (1.2) for $\lambda \in (\lambda_1(s,p), \lambda_2(s,p))$ and $f \in W^{-s,p'}(\Omega)$. This existence part relies in an homotopy deformation of the degree as in [5], see also [4, 13, 6].

More precisely, we can prove the following Theorem.

**Theorem 1.1.** Let $f \in W^{-s,p'}(\Omega)$. If $\lambda_1(s,p) < \lambda < \lambda_2(s,p)$ then there is a weak solution of (1.1).

Let us observe that Fredholm type alternative for fully non-linear operator can be found in [11, Section 5]. Notice that using the ideas of [11] and [21] a different homotopy (respect to $s$) can be use to prove the above Theorem. Beside that let also mention that from [21] other existence results can be proved using bifurcation from infinity for (1.1). This results can be found for the case of the $p-$Laplacian for example in [9].

Our second aim is to show an anti-maximum principle for the fractional $p-$Laplacian. This principle has shown to be a powerful tool when analyzing nonlinear elliptic problems, see [8, 18, 36, 12] and the references therein. For the $p-$Laplacian operator, the anti-maximum principle is proven in [32], see also [10, 35]. On the other hand, the link between bifurcation theory and anti-maximum principle was observed by the first time in [8] (see for instance [8, Theorem 27] for a improvement of the the anti-maximum principle for the $p$-Laplacian operator).

In Section 4, before proving our anti-maximum principle we show the following maximum principle.

**Theorem 1.2.** Let $f \in W^{-s,p'}(\Omega)$ be such that $f \not\equiv 0$.

1. If $f \geq 0$ and $\lambda < \lambda_1(s,p)$, then $u > 0$ a.e. in $\Omega$ for any super-solution $u$ of (1.1).

2. If $f \leq 0$, and $\lambda < \lambda_1(s,p)$, then $u < 0$ a.e. in $\Omega$ for any sub-solution $u$ of (1.1).

Thus, we show the following anti-maximum principle.

**Theorem 1.3.** Let $f \in W^{-s,p'}(\Omega)$ be such that $f \not\equiv 0$. Then there is $\delta = \delta(f) > 0$ such that

1. if $f \geq 0$ and $\lambda \in (\lambda_1(s,p), \lambda_1(s,p) + \delta)$ then any weak solution $u$ of (1.1) satisfies $u < 0$ a.e. in $\Omega$.

2. if $f \leq 0$ and $\lambda \in (\lambda_1(s,p), \lambda_1(s,p) + \delta)$ then any weak solution $u$ of (1.1) satisfies $u > 0$ a.e. in $\Omega$. 
Let’s comment that, for the spectral fractional Laplacian (this is a different operator than $(-\Delta)^s$), the anti-maximum principle is only proved in the case $s = 1/2$, see [7]. In fact, we would like to mention that the proof in [7] can be easily extended to the case $s \in (0, 1)$. See also [34] where the anti-maximum principle is shown for non-singular kernel. So, as far we know, Theorem 1.3 is new even for the case $p = 2$. Therefore, we extent in particular the now classical anti-maximum principle of Clement and Peletier (see [18]) for all the range $s \in (0, 1)$ and $p \in (1, \infty)$.

We want to observe that, our proof of the previous theorem is not a straightforward adaptation of the proof given in the local case due to we do not have a suitable Hopf’s lemma for the fractional $p$–Laplacian. To overcome this problem we will use Picone’s identity (see Lemma 2.9) and show a lower bound for the measures of the negative (positive) sets of the weak super(sub)-solutions of (1.1) (see Lemma 4.5 and Remark 4.6 below).

In the linear case ($p=2$), thanks to the regularity results up to the boundary and the Hopf lemma, we can prove a more general result improving Theorems 1.2 and 1.3.

**Theorem 1.4.** Let $\Omega$ be a bounded domain with $C^{1,1}$ boundary, $w_1$ be a positive eigenfunction of $(-\Delta)^s$ associated to $\lambda_1(s, 2)$. For any $f \in L^\infty(\Omega)$ with $\int_\Omega f(x)w_1dx \neq 0$, there is $\delta = \delta(f) > 0$ such that

1. if $\int_\Omega f(x)w_1dx > 0$ then any weak solution $u$ of (1.1) satisfies

   (a) $u < 0$ in $\Omega$ if $\lambda \in (\lambda_1(s, 2), \lambda_1(s, 2) + \delta)$;

   (b) $u > 0$ in $\Omega$ if $\lambda \in (\lambda_1(s, 2) - \delta, \lambda_1(s, 2))$;

2. if $\int_\Omega f(x)w_1dx < 0$ then any weak solution $u$ of (1.1) satisfies

   (a) $u > 0$ in $\Omega$ if $\lambda \in (\lambda_1(s, 2), \lambda_1(s, 2) + \delta)$;

   (b) $u < 0$ in $\Omega$ if $\lambda \in (\lambda_1(s, 2) - \delta, \lambda_1(s, 2))$.

The paper is organize as follows. In Section 2 we review some preliminaries including the eigenvalue problems. In Section 3 we prove our existence results. Finally, in Section 4 we prove Theorems 1.2, 1.3 and 1.4.

2. Preliminaries

Let’s start by introducing the notation and definitions that we will use in this work. We also gather some preliminaries properties which will be useful in the forthcoming sections.

Here and hereafter, $s \in (0, 1)$, $p \in (1, \infty)$ and we will denote by $\Omega$ an open set in $\mathbb{R}^N$. Given a subset $A$ of $\mathbb{R}^N$ we set $A^c = \mathbb{R}^N \setminus A$, and $A^2 = A \times A$. For all function $u: \Omega \rightarrow \mathbb{R}$ we define

$$u_+(x) := \max\{u(x), 0\} \quad \text{and} \quad u_-(x) := \max\{-u(x), 0\},$$

$$\Omega_+ := \{x \in \Omega: u(x) > 0\} \quad \text{and} \quad \Omega_- := \{x \in \Omega: u(x) < 0\}.$$
2.1. Fractional Sobolev spaces.

The fractional Sobolev spaces $W^{s,p}(\Omega)$ is defined to be the set of functions $u \in L^p(\Omega)$ such that

$$\|u\|_{W^{s,p}(\Omega)} := \left( \|u\|^p_{L^p(\Omega)} + |u|^p_{W^{s,p}(\Omega)} \right)^{\frac{1}{p}},$$

where $\|u\|_{L^p(\Omega)} := \int_\Omega |u(x)|^p dx$.

The fractional Sobolev spaces admit the following norm

$$\|u\|_{W^{s,p}(\Omega)} := \|u\|^p_{L^p(\Omega)} + |u|^p_{W^{s,p}(\Omega)}.$$ 

The space $W^{s,p}(\mathbb{R}^N)$ is defined similarly.

We will denote by $\tilde{W}^{s,p}(\Omega)$ the space of all $u \in W^{s,p}(\Omega)$ such that $\tilde{u} \in W^{s,p}(\mathbb{R}^N)$, where $\tilde{u}$ is the extension by zero of $u$. The dual space of $\tilde{W}^{s,p}(\Omega)$ is denoted by $W^{-s,p}'(\Omega)$ and the corresponding dual pairing is denoted by $\langle \cdot, \cdot \rangle$.

Remark 2.1. By [26, Lemma 6.1], if $\Omega$ is bounded then there is a suitable constant $C = C(N,s,p) > 0$ such that for any $u \in \tilde{W}^{s,p}(\Omega)$ we get

$$|u|^p_{W^{s,p}(\mathbb{R}^N)} \geq \int_{\Omega \times \Omega} \frac{|u(x)|^p}{|x-y|^{N+sp}} dxdy = \int_{\Omega} |u(x)|^p \int_{\Omega} \frac{1}{|x-y|^{N+sp}} dydx \geq \frac{C}{|\Omega|^{s/p}} \|u\|^p_{L^p(\Omega)},$$

where $|\Omega|$ denotes the Lebesgue measure of $\Omega$. Hence, the seminorm $| \cdot |_{W^{s,p}(\mathbb{R}^N)}$ is a norm in $\tilde{W}^{s,p}(\Omega)$ equivalent to the standard norm.

If $\Omega$ is bounded, we set

$$\tilde{W}^{s,p}(\Omega) := \left\{ u \in L^p_{loc}(\mathbb{R}^N) : \exists U \supset \Omega \text{ s.t. } u \in W^{s,p}(U), |u|_{s,p} < \infty \right\},$$

where

$$|u|_{s,p} := \int_{\mathbb{R}^N} \frac{|u(x)|^{p-1}}{(1+|x|)^{N+sp}} dx.$$ 

Observe that $\tilde{W}^{s,p}(\Omega) \subset \tilde{W}^{s,p}(\Omega)$.

We will denote by $p^*_s$ the fractional critical Sobolev exponent, that is

$$p^*_s := \begin{cases} \frac{Np}{N-sp} & \text{if } sp < N, \\ +\infty & \text{if } sp \geq N. \end{cases}$$

Remark 2.2. If $\mathcal{X} = W^{s,p}(\Omega)$ or $\tilde{W}^{s,p}(\Omega)$ or $\tilde{W}^{s,p}(\Omega)$ and $u \in \mathcal{X}$ then $u_+, u_- \in \mathcal{X}$ owing to

$$|u_- - u_-(y)| \leq |u(x) - u(y)| \quad \text{and} \quad |u_+ - u_+(y)| \leq |u(x) - u(y)|,$$

for all $x, y \in \Omega$.

Further information on fractional Sobolev spaces and many references may be found in [1, 25, 26, 38, 39].
2.2. **Dirichlet Problems.**

Let $\Omega$ be a bounded open set in $\mathbb{R}^N$, $s \in (0, 1)$, and $f \in W^{-s,p'}(\Omega)$. We say that $f \geq \langle \Delta_p \rangle$ if for any $u \in W^{s,p}(\Omega)$, $v \geq 0$ we have that $\langle f, v \rangle \geq \langle \Delta_p, v \rangle$.

We say that $u \in \hat{W}^{s,p}(\Omega)$ is a weak super-solution of

\[ (-\Delta_p)^s u = f(x) \quad \text{in } \Omega, \]
\[ u = 0 \quad \text{in } \Omega^c, \]

if $u \geq 0$ a.e. in $\Omega^c$ and

\[ \mathcal{K} \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(v(x) - v(y))}{|x - y|^{N+sp}} \, dx dy \geq \langle f, v \rangle, \]

for each $v \in \hat{W}^{s,p}(\Omega)$, $v \geq 0$.

A function $u \in \hat{W}^{s,p}(\Omega)$ is a weak sub-solution of (2.1) if $-u$ is a weak super-solution. Finally, a function $u \in \hat{W}^{s,p}(\Omega)$ is a weak solution of (2.1) if and only if it is both a weak super-solution and a weak sub-solution.

Our next result is a minimum principle.

**Lemma 2.3.** Let $f \in W^{-s,p'}(\Omega)$ be such that $f \geq 0$, and $u$ be a weak super-solution of (2.1). Then either $u > 0$ a.e. in $\Omega$ or $u = 0$ a.e. in $\Omega$.

**Proof.** Since $u$ is a weak super-solution of (2.1), it follows from the comparison principle (see [39, Proposition 2.10]) that $u \geq 0$ in $\mathbb{R}^N$. Moreover, if $\Omega$ is connected, by [15, Theorem A.1], we get if $u \neq 0$ a.e. in $\Omega$ then $u > 0$ a.e. in $\Omega$.

Then, we only need to show that $u \neq 0$ in $\Omega$ if only if $u \neq 0$ in all connected components of $\Omega$. That is, we only need to show that if $u \neq 0$ in $\Omega$ then $u \neq 0$ in all connected components of $\Omega$.

Suppose, to the contrary, that is $u \neq 0$ and there is a connected component $U$ of $\Omega$ such that $u \equiv 0$ in $U$. Moreover, for any nonnegative function $v \in \hat{W}^{s,p}(U)$ we get

\[ 0 \leq \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(v(x) - v(y))}{|x - y|^{N+sp}} \, dx dy \]
\[ = -2 \int_U \int_{U^c} \frac{|u(x)|^{p-2}u(x)v(y)}{|x - y|^{N+sp}} \, dx dy \]

due to $u \equiv 0$ in $U$. Then $u = 0$ a.e. in $U^c$, that is $u = 0$ a.e. in $\mathbb{R}^N$, which is a contradiction with the fact that $u \neq 0$ a.e. in $\Omega$. \hfill $\Box$

To prove the Theorem 1.1, we will use the homotopy property of the Leray-Schauder degree. For this reason, we need to recall some properties of the Dirichlet problem for the fractional $p$–Laplace equations.

Let $f \in W^{-s,p'}(\Omega)$. If $\Omega$ is a smooth bounded domain, using the fractional Sobolev compact embedding theorem (see [1, 25]), it is easily seen that (2.1) has a unique weak solution $u_f \in \hat{W}^{s,p}(\Omega)$. Moreover, the operator

\[ \mathcal{R}_{s,p} : W^{-s,p'}(\Omega) \to \hat{W}^{s,p}(\Omega) \]
\[ f \to u_f \]

is continuous, see [21]
Now, let $\Omega$ be a smooth bounded domain, $f \in W^{-s,p'}(\Omega)$ and $t \in \mathbb{R}$, we define the operator $T_t : \tilde{W}^{s,p}(\Omega) \to \tilde{W}^{s,p}(\Omega)$ by

$$T_t(u) := R_{s,p}(\lambda|u|^{p-2}u + tf).$$

Notice that by the fractional Sobolev compact embedding theorem and the continuity of $R_{s,p}$ we have that $T_t$ is a completely continuous operator.

2.3. Eigenvalue Problems.

Now we study the following eigenvalue problems

$$\begin{align*}
(-\Delta_p)^s u &= \lambda|u|^{p-2}u \quad \text{in } \Omega, \\
u &= 0 \quad \text{in } \Omega^c,
\end{align*}$$

We say that $\lambda$ is an eigenvalue of $(-\Delta_p)^s$ if there is a function $u \in \tilde{W}^{s,p}(\Omega) \setminus \{0\}$ such that for any $v \in \tilde{W}^{s,p}(\Omega)$

$$K \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(v(x) - v(y))}{|x - y|^{N+sp}} dx dy = \lambda \int_{\Omega} |u|^{p-2}uv dx.$$ 

The function $u$ is a corresponding eigenfunction of $(-\Delta_p)^s$ associated to $\lambda$.

Before showing the existence of a sequence of eigenvalues, we need to introduce some additional notation. Following [17], we define

$$S^{s,p} := \left\{ u \in \tilde{W}^{s,p}(\Omega) : \|u\|_{L^p(\Omega)} = 1 \right\},$$

and

$$W^{s,p}_m := \{ K \subset S^{s,p} : K \text{ is symmetric and compact, } i(K) \geq m \}$$

for $m \in \mathbb{N}$. Here $i$ denotes the Krasnosel’skiǐ genus.

For the proof of the following theorem see [16, 17, 33, 21, 40] (for the local case, see [19, 44, 3, 41, 42]).

**Theorem 2.4.** Let $\Omega$ a smooth bounded domain of $\mathbb{R}^N$. Then there is a sequence of eigenvalues of $(-\Delta_p)^s$

$$\lambda_m(s,p) = \inf_{K \in W^{s,p}_m} \max_{u \in K} \mathcal{K}|u|_{W^{s,p}(\mathbb{R}^N)}.$$

Moreover

- If $u$ is an eigenfunction of $(-\Delta_p)^s$ then $u \in L^\infty(\Omega)$.
- $\lambda_1(s,p)$ is the first eigenvalue of $(-\Delta_p)^s$, that is
  $$\lambda_1(s,p) = \inf \left\{ \mathcal{K}|u|^p_{W^{s,p}(\mathbb{R}^N)} : u \in S^{s,p} \right\},$$
- $\lambda_1(s,p)$ is simple and isolated.
- Any eigenfunction of $(-\Delta_p)^s$ associated to $\lambda_1(s,p)$ have constant sign.
- If $u$ is an eigenfunction of $(-\Delta_p)^s$ associated to $\lambda > \lambda_1(s,p)$ then $u$ must be sign-changing.
\* $\lambda_2(s,p)$ is the second eigenvalue

$$\lambda_2(s,p) = \inf_{\gamma \in \Gamma(w_1,-w_1)} \max_{u \in \text{Im} \gamma(0,1)} K|u|_{W^{s,p}(\mathbb{R}^N)}^p$$

$$= \inf \{ \lambda : \lambda > \lambda_1(s,p) \text{ is an eigenvalue of } (-\Delta_p)^s \},$$

where $w_1$ is an eigenfunction of $(-\Delta_p)^s$ associated to $\lambda_1(s,p)$ and $\Gamma(w_1,-w_1)$ is the set of continuous paths on $S^{s,p}$ connecting to $w_1$ and $-w_1$.

**Remark 2.5.** It is not difficult to see that, if $u \in \widetilde{W}^{s,p}(\Omega)$ is such that

$$\lambda_1(s,p) = \frac{K|u|_{W^{s,p}(\mathbb{R}^N)}^p}{\|u\|_{L^p(\Omega)}^p}$$

then $u$ is eigenfunction of $(-\Delta_p)^s$ associated to $\lambda_1(s,p)$.

Let finally observe that in [21], we also prove that $\lambda_1(\cdot, p)$ is continuous.

**2.4. Regularity results.**

Here, we study the regularity up to the boundary of weak solutions of (1.1) when $f \in L^\infty(\Omega)$. For this, we need the following results

**Lemma 2.6.** Let $f \in L^\infty(\Omega)$ and $\lambda \in \mathbb{R}$. If $u$ is a weak solution of (1.1) then $u \in L^\infty(\Omega)$.

**Proof.** In this proof, we borrow ideas from [33, 47].

If $ps > N$, then $u \in L^\infty(\Omega)$ due to the fractional Sobolev embedding theorem. For the rest of the proof, we assume $sp \leq N$.

Let $u$ be a weak solution of (1.1). Up to multiplying $u$ by a small constant we may assume that

$$\|u\|_{L^p(\Omega)} = \sqrt{\delta}$$

where $\delta > 0$ will be selected below.

For any $k \in \mathbb{N}$, we define $v_k := (u - 1 + 2^{-k})_+$ and $U_k = \|v_k\|_{L^p(\Omega)}^p$. Observe that, for any $k \in \mathbb{N}$ we have that

$$v_k \in \widetilde{W}^{s,p}(\Omega), \quad v_{k+1} \leq v_k \text{ a.e. in } \mathbb{R}^N \quad \text{and}$$

$$\{x \in \Omega : v_{k+1} > 0\} \subset \{x \in \Omega : v_k > 2^{-(k+1)}\}. \quad (2.3)$$

Moreover $U_k \to \|(u - 1)_+\|_{L^p(\Omega)}$ as $k \to \infty$. Then, for any $k \in \mathbb{N}$

$$K|v_k|_{W^{s,p}(\Omega)}^p = K \int_{\Omega^2} \frac{|v_{k+1}(x) - v_{k+1}(y)|^p}{|x - y|^{N+sp}} \, dxdy$$

$$\leq K \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(v_{k+1}(x) - v_{k+1}(y))}{|x - y|^{N+sp}} \, dxdy$$

$$= \lambda \int_{\Omega} v_{k+1}^p \, dx + \int_{\Omega} f(x)v_{k+1} \, dx$$

$$\leq |\lambda|U_k + \|f\|_{L^\infty(\Omega)} \int_{\Omega} v_{k+1} \, dx$$

$$\leq |\lambda|U_k + \|f\|_{L^\infty(\Omega)} \{x \in \Omega : v_{k+1} > 0\}^{1-1/p} U_k^{1/p}.$$

By (2.3), we get

$$U_k = \|v_k\|_{L^p(\Omega)} \geq 2^{-p(k+1)} \{x \in \Omega : v_{k+1} > 0\}$$

(2.4)
then
\begin{equation}
    (2.5) \quad K|v_k|^p_{W^{s,p}(\Omega)} \leq \left( |\lambda| + \|f\|_{L^\infty(\Omega)}^2 \right)^{2(p-1)} 2^{(p-1)k} U_k.
\end{equation}

Thus, given \( q \in (p,p^*_s) \), by the H"older inequality, the fractional Sobolev embedding theorem, (2.4) and (2.5), we have that

\[
U_{k+1} \leq \|v_{k+1}\|_{L^p(\Omega)}^p \{ x \in \Omega : v_{k+1} > 0 \}^{1-v/p} \\
\leq C|v_k|^p_{W^{s,p}(\Omega)} \left( 2p(k+1)U_k \right)^{1-v/p} \\
\leq C \left( |\lambda| + \|f\|_{L^\infty(\Omega)}^2 \right)^{2(p-1)} 2^{(p-1)v/p} 2^{(2p-1-v/p)k} U_k^{1-v/p} \\
\leq \left\{ 1 + C \left( |\lambda| + \|f\|_{L^\infty(\Omega)}^2 \right)^{2(p-1)} 2^{(2p-1-v/p)} \right\}^k U_k^{1-v/p} \\
= C^k U_k^p
\]

where \( C > 1 \) and \( p = 2 - v/p > 1 \).

Now, we choose the number \( \delta > 0 \) sufficiently small that

\[ \delta^p < \frac{1}{C^{2/(p-1)}} \]

and proceeding as in the end of the proof of [49, Proposition 7], we can conclude that \( u \leq 1 \) a.e. in \( \Omega \). By replacing \( u \) with \( -u \) we obtain \( \|u\|_{L^\infty(\Omega)} \leq 1 \).

Then, by the previous lemma, [39, Theorem 1.1.] and [45, Proposition 1.1 and Theorem 1.2], we have

**Theorem 2.7.** Let \( \Omega \) be a bounded domain with \( C^{1,1} \) boundary, \( f \in L^\infty(\Omega) \), \( \lambda \in \mathbb{R} \), and \( \delta(x) = \text{dist}(x,\partial\Omega) \). Then, there is \( \alpha \in (0,s] \) and \( C \), depending on \( \Omega \) such that for all weak solution \( u \) of (1.1), \( u \in C^{\alpha}(\Omega) \) and

\[ \|u\|_{C^{\alpha}(\Omega)} \leq C \left( |\lambda|\|u\|_{L^\infty(\Omega)} + \|f\|_{L^\infty(\Omega)} \right). \]

In additional, if \( p = 2 \) then \( \alpha = s \) and

\[ u/s \in C^\beta(\Omega) \quad \text{and} \quad \|u/s\|_{C^\beta(\Omega)} \leq D \left( |\lambda|\|u\|_{L^\infty(\Omega)} + \|f\|_{L^\infty(\Omega)} \right) \]

where \( \beta \in (0,\min\{s,1-s\}) \). The constants \( \beta \) and \( D \) depend only on \( \Omega \) and \( s \).

Finally, in the linear case, as a consequence of the fractional Hopf lemma (See [37, 22]), we have the next result.

**Lemma 2.8.** Let \( \Omega \) be a bounded domain with \( C^{1,1} \) boundary, \( \delta(x) = \text{dist}(x,\partial\Omega) \), and \( w_1 \) be an eigenfunction of \(-\Delta)^s\). If \( \{v_n\}_{n \in \mathbb{N}} \subset C^\beta(\Omega) \) is such that \( v_n/s \in C(\Omega) \) and

\[ v_n \to w_1 \quad \text{and} \quad \frac{v_n}{\delta^s} \to \frac{w_1}{\delta^s} \]

strongly in \( \Omega \), then there is \( n_0 \in \mathbb{N} \) such that \( v_n > 0 \) for all \( n \geq n_0 \).

2.5. Picone inequality.

For the proof of the following Picone inequality, see [2, Lemma 6.2 ].

**Lemma 2.9.** For every \( a_1, a_2 \geq 0 \) and \( b_1, b_2 > 0 \)

\[ |a_1 - a_2|p \geq |b_1 - b_2|p-2(b_1 - b_2) \left( \frac{a_1^p}{b_1^{p-1}} - \frac{a_2^p}{b_2^{p-1}} \right). \]
The equality holds if and only if \((a_1, a_2) = k(b_1, b_2)\) for some constant \(k\).

3. NON–RESONANT FREDHOLM ALTERNATIVE PROBLEM

Let’s start this section proving the following existence results for equation (1.1) with \(\lambda < \lambda_1(s, p)\). One of the principal results, that we will use through the rest of this work, is the fractional Sobolev compact embedding theorem. For this reason, throughout the rest of this work \(\Omega\) is a smooth bounded domain of \(\mathbb{R}^N\).

Theorem 3.1. Let \(f \in W^{-s, p'}(\Omega)\). If \(\lambda < \lambda_1(s, p)\) then there is a weak solution of (1.1).

Proof. The proof of this theorem is standard. First observe that weak solutions of (1.1) are critical points of the functional \(J: \widetilde{W}^s, p(\Omega) \to \mathbb{R}\), where

\[
J(u) := \frac{K}{p^*} |u|_{W^{s, p}(\mathbb{R}^N)}^p - \frac{\lambda}{p} |u|_{L^p(\Omega)}^p - (f, u).
\]

It follows from \(\lambda < \lambda_1(s, p)\) that \(J\) is bounded below, coercive, strictly convex and sequentially weakly lower semi continuous. Thus \(J\) has a unique critical point which is a global minimum. \(\square\)

Our next aim is to prove Theorem 1.1, to this end we will use the homotopy property of the Leray-Schauder degree. We first prove an a priori bound for the fixed points of \(T_t\).

Lemma 3.2. If \(\lambda_1(s, p) < \lambda < \lambda_2(s, p)\) then there exists \(R > 0\) such that for all \(t \in [0, 1]\) there is no solution of \((I - T_t)u = 0\) for \(|u|_{W^{s, p}(\mathbb{R}^N)} \geq R\).

Proof. Suppose, to the contrary, that for all \(n \in \mathbb{N}\) there exist \(t_n \in [0, 1]\) and \(u_n \in \widetilde{W}^s, p(\Omega)\) such that \((I - T_{t_n})u_n = 0\) and \(|u_n|_{W^{s, p}(\mathbb{R}^N)} \to \infty\) as \(n \to \infty\). Let define

\[
v_n = \frac{u_n}{|u_n|_{W^{s, p}(\mathbb{R}^N)}} \quad \forall n \in \mathbb{N}.
\]

Then for all \(n \in \mathbb{N}\), we have that \(v_n\) is a weak solution of

\[
\begin{cases}
(-\Delta_p)^s u = \lambda_n |u|^{p-2} u + \frac{t_n f(x)}{|u_n|_{W^{s, p}(\mathbb{R}^N)}^{p-1}} & \text{in } \Omega, \\
u = 0 & \text{in } \Omega^c.
\end{cases}
\]

Using the fractional Sobolev compact embedding theorem, up to a subsequence (still denoted by \(v_n\))

\[
v_n \rightharpoonup v \quad \text{weakly in } \widetilde{W}^s, p(\Omega),
\]

\[
v_n \to v \quad \text{strongly in } L^p(\Omega).
\]

Thus, \(|v|_{W^{s, p}(\mathbb{R}^N)} = 1\) and since \(t_n f/|u_n|_{W^{s, p}(\mathbb{R}^N)}^{p-1} \to 0\) strongly in \(W^{-s, p'}(\Omega)\), we have that \(v\) is a weak solution of (1.1) with \(f = 0\) getting a contradiction since \(\lambda_1(s, p) < \lambda < \lambda_2(s, p)\). \(\square\)

Now we are in position to proof Theorem 1.1.
Proof of Theorem 1.1. By Lemma 3.2, the Leray-Schauder degree $d(I-T_t, B(0, R), 0)$ is well defined and constant for all $t \in [0, 1]$ by the invariance of the degree by homotopy. Thus $d(I-T_t, B(0, R), 0) = -1$ since $d(I-T_0, B(0, R), 0) = -1$ by Theorem 5.3 of [21], from here the existence result follows. □

Observe that, in the above proof, the fact $d(I-T_0, B(0, R), 0) \neq 0$ can be established without using the results of [21] as a consequence of Borsuk theorem (see for example [24, Theorem 8.3]).

4. MAXIMUM AND ANTI-MAXIMUM PRINCIPLE

In this section, we will denote by $w_1$ the positive eigenfunction of $(-\Delta_p)^s$ associated to $\lambda_1(s, p)$ whose $L^p$-norm is equal to 1. Since $w_1 \in L^\infty(\Omega)$, by [39], there is $\alpha \in (0, 1)$ such that $w_1 \in C^\alpha(\Omega)$.

We start proving Theorem 1.2.

Proof of Theorem 1.2. We only prove the first statement; the other statement can be proved in an analogous way.

Since $u \geq 0$ a.e. in $\Omega^c$ we have that $u_- \in \tilde{W}^{s,p}(\Omega)$. Then

$$K \int_{\mathbb{R}^N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_-(x) - u_-(y))}{|x-y|^{N+sp}}
= -\lambda \int_{\Omega} |u_-|^p dx + \langle f, u_- \rangle,$$

consequently

$$\lambda \int_{\Omega} |u_-|^p dx =
= -K \int_{\mathbb{R}^N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_-(x) - u_-(y))}{|x-y|^{N+sp}}
dx dy + \langle f, u_- \rangle
\geq K \int_{\mathbb{R}^N} \frac{|u_-(x) - u_-(y)|^p}{|x-y|^{N+sp}}
dx dy.$$

Thus, if $u_- \neq 0$ then

$$\lambda \geq K \frac{\int_{\mathbb{R}^N} \frac{|u_-(x) - u_-(y)|^p}{|x-y|^{N+sp}} dx dy}{\int_{\Omega} |u_-|^p dx} \geq \lambda_1(s, p),$$

a contradiction. Therefore $u \geq 0$ in $\mathbb{R}^N$. Moreover, proceeding as in the proof of Lemma 2.3, we have that $u \neq 0$ in all connected components of $\Omega$. Finally, by [20, Theorem 2.9], $u > 0$ a.e. in $\Omega$.

Before proving Theorem 1.3, we show some previous results.

Lemma 4.1. Let $\lambda \geq \lambda_1(s, p)$, and $f \in W^{-s,p'}(\Omega)$ be such that $f \geq 0$ and $f \neq 0$. Then the problem (1.1) has no non-negative weak super-solutions.
Proof. Suppose, to the contrary, there is a non-negative weak super-solution \( u \) of (1.1). Then, by Lemma 2.3, \( u > 0 \) a.e. in \( \Omega \). By the definition of \( \overline{W}^{s,p}(\Omega) \), let \( U \supset \Omega \) be such that

\[
\|u\|_{W^{s,p}(U)} + \int_{\mathbb{R}^N} \frac{|u|^{p-1}}{(1 + |x|)^{N+sp}} dx < \infty,
\]

\( n \in \mathbb{N} \) and \( u_n := u + \frac{1}{n} \).

We begin by proving that \( v_n := \frac{u_n}{u_n^p} \in \overline{W}^{s,p}(\Omega) \). It is immediate that \( v_n > 0 \) in \( \Omega \), \( v_n = 0 \) in \( \Omega^c \), and since \( w_1 \in L^\infty(\Omega) \) we have that \( v_n \in L^p(\Omega) \).

On the other hand

\[
|v_n(x) - v_n(y)| \leq n^{p-1} |w_1(x)| - w_1(y)| + \|w_1\|_{L^\infty(\Omega)} \frac{|u_n(x)^p - u_n(x)^{p-1}|}{u_n(x)^p} |u_n(x)^p - u_n(y)^p| \leq \frac{2n}{n} \|w_1\|_{L^\infty(\Omega)} n^{p-1} |w_1(x) - w_1(y)| + n \|w_1\|_{L^\infty(\Omega)} (p-1) \left( \frac{1}{u_n(y)} + \frac{1}{u_n(x)} \right) |u(x) - u(y)| \leq C(n, p, \|w_1\|_{L^\infty(\Omega)}) (|w_1(x) - w_1(y)| + |u(x) - u(y)|),
\]

for all \( (x, y) \in \mathbb{R}^N \times \mathbb{R}^N \). Hence \( v_n \in W^{s,p}(U) \) for all \( n \in \mathbb{N} \) due to \( w_1, u \in W^{s,p}(U) \).

Then, since \( v_n = 0 \) in \( \Omega^c \), and \( v_n \in W^{s,p}(U) \) with \( \Omega \subset U \), we have

\[
\int_{\mathbb{R}^N} \frac{|v_n(x) - v_n(y)|}{|x - y|^{N+sp}} dx dy = \int_{U^2} \frac{|v_n(x) - v_n(y)|}{|x - y|^{N+sp}} dx dy + 2 \int_{\Omega \times U^c} \frac{|v_n(x)|}{|x - y|^{N+sp}} dx dy = \int_{U^2} \frac{|v_n(x) - v_n(y)|}{|x - y|^{N+sp}} dx dy + 2n \|w_1\|_{L^\infty(\Omega)} \int_{\Omega \times U^c} \frac{dx dy}{|x - y|^{N+sp}} < \infty,
\]

that is \( v_n \in W^{s,p}(\mathbb{R}^N) \). Therefore, \( v_n \in \overline{W}^{s,p}(\Omega) \).

Now, set

\[
L(u_1, u_n) := |w_1(x) - w_1(y)|^p - |u_n(x) - u_n(y)|^{p-2} (u_n(x) - u_n(y)) \left( \frac{w_1(x)^p}{u_n(x)^{p-1}} - \frac{w_1(x)^p}{u_n(y)^{p-1}} \right)
\]

By Lemma 2.9, we have
implies that if \( f \) is a weak super-solution of \((1.1)\) with \( f \geq 0 \), then the problem \((1.1)\) has no weak super-solutions.

Since \( \lambda_1(s, p) \leq \lambda \), by the Fatou's lemma and the dominated convergence theorem

\[
\int \Omega \frac{L(w_1, u)(x, y)}{|x - y|^{N + sp}} \, dx \, dy = 0.
\]

Then, again by Lemma 2.9, \( L(w_1, u)(x, y) = 0 \) a.e. in \( \Omega \). and \( u = kw_1 \) a.e. in \( \Omega \) for some constant \( k > 0 \). Then

\[
\lambda_1(s, p) \int_{\Omega} u(x)^{p-1} \varphi(x) \, dx =
\]

\[
= K \int_{\mathbb{R}^N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(\varphi(x) - \varphi(y))}{|x - y|^{N + sp}} \, dx \, dy
\]

\[
\geq \lambda \int_{\Omega} u(x)^{p-1} \varphi(x) \, dx + \langle f, \varphi \rangle,
\]

for any \( \varphi \in \dot{W}^{s,p}({\Omega}) \), \( \varphi \geq 0 \). This is a contradiction since \( \lambda \geq \lambda_1(s, p) \) and \( f \geq 0 \), \( f \not\equiv 0 \). \( \square \)

Remark 4.2. Observe that, Lemma 4.1 implies that if \( \lambda \geq \lambda_1(s, p) \), and \( f \in W^{-s,p'}(\Omega) \) is such that \( f \leq 0 \) and \( f \not\equiv 0 \), then the problem \((1.1)\) has no non-positive weak sub-solutions.

Corollary 4.3. Let \( f \in W^{-s,p'}(\Omega) \) be such that \( f \geq 0 \) and \( f \not\equiv 0 \). Then the problem

\[(1.1)\] with \( \lambda = \lambda_1(s, p) \) has no weak super-solutions.

Proof. We argue by contradiction. If there would exists a weak super-solution \( u \) of \((1.1)\) with \( \lambda = \lambda_1(s, p) \). By Lemma 4.1, \( u \not\equiv 0 \) in \( \Omega \). Since \( u_- \in \dot{W}^{s,p}({\Omega}) \) we get,
by the characterization of $\lambda_1(s,p)$ given in Theorem 2.4,

$$- \lambda_1(s,p) \int_\Omega u_- x^p dx \leq \lambda_1(s,p) \int_\Omega |u(x)|^{p-2} u(x) u_- x dx + \langle f, u_- \rangle$$

$$\leq K \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_- (x) - u_- (y))}{|x-y|^{N+sp}} dxdy$$

$$\leq -K \int_{\Omega^c} \frac{|u_- (x) - u_- (y)|^p}{|x-y|^{N+sp}} dxdy - 2K \int_{\Omega^c} \frac{(u_- (x) + u_+ (y))^{p-1} u_- (x)}{|x-y|^{N+sp}} dxdy$$

$$\leq -K \int_{\mathbb{R}^{2N}} \frac{|u_- (x) - u_- (y)|^p}{|x-y|^{N+sp}} dxdy.$$

Therefore

$$\lambda_1(s,p) \geq K \int_{\mathbb{R}^{2N}} \frac{|u_- (x) - u_- (y)|^p}{|x-y|^{N+sp}} dxdy$$

that is $u_-$ is a corresponding eigenfunction to $\lambda_1(s,p)$ (see Remark 2.5). Then there is $k > 0$ such that $u_- = kw_1$, and therefore $u_- > 0$ in $\Omega$, that is $u < 0$ in $\Omega$. Moreover

$$\lambda_1(s,p) \int_\Omega |u(x)|^{p-2} uv dx$$

$$= -K \int_{\mathbb{R}^{2N}} \frac{|u_- (x) - u_- (y)|^{p-2}(u_- (x) - u_- (y))(v(x) - v(y))}{|x-y|^{N+sp}} dxdy$$

$$\geq K \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(v(x) - v(y))}{|x-y|^{N+sp}} dxdy$$

$$\geq \lambda_1(s,p) \int_\Omega |u(x)|^{p-2} uv dx + \langle f, v \rangle$$

for any $v \in \tilde{W}^{s,p}(\Omega)$, $v \geq 0$. This is a contradiction since $f \geq 0$, and $f \neq 0$. \qed

**Remark 4.4.** Note that, it follows straightforward from Corollary 4.3 that if $f \in W^{-s,F'}(\Omega)$ is such that $f \leq 0$ and $f \neq 0$. Then the problem (1.1) with $\lambda = \lambda_1(s,p)$ has no weak sub-solutions.

**Lemma 4.5.** Let $\lambda \geq \lambda_1(s,p)$, and $f \in W^{-s,F'}(\Omega)$ be such that $f \geq 0$ and $f \neq 0$. Then there exist $\alpha > 1$ and a constant $C > 0$ such that for all $u$ is a weak super-solution of (1.1) we have that

$$\left( \frac{C}{\lambda} \right)^\alpha \leq |\Omega_-|,$$

where $\Omega_- = \{ x \in \Omega : u(x) < 0 \}$.

**Proof.** Let $u$ be a weak super-solution of (1.1). By Lemma 4.1, $u_- \neq 0$ in $\Omega$. Taking $u_-$ as test function, we have that

$$K \int_{\mathbb{R}^{2N}} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_- (x) - u_- (y))}{|x-y|^{N+sp}} dxdy$$

$$\geq \lambda \int_\Omega |u_-|^p dx + \langle f, u_- \rangle.$$
If \( p < q < p^*_s \), by fractional Sobolev embedding theorem, then there is a constant \( C \) such that

\[
CK\|u_\cdot\|^p_{L^q(\Omega)} \leq C\|u_\cdot\|^p_{W^{s,p}(\mathbb{R}^N)} \\
\leq -\mathcal{K} \int_{\mathbb{R}^2N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_-(x) - u_-(y))}{|x - y|^{N+sp}} dxdy \\
\leq -\mathcal{K} \int_{\mathbb{R}^2N} \frac{|u(x) - u(y)|^{p-2}(u(x) - u(y))(u_-(x) - u_-(y))}{|x - y|^{N+sp}} dxdy + \langle f, u_\cdot\rangle \\
\leq \lambda \int_\Omega |u_\cdot|^p dx,
\]

and using the Hölder inequality

\[
CK\|u_\cdot\|^p_{L^q(\Omega)} \leq \lambda \|u_\cdot\|^p_{L^q(\Omega)} |\Omega_\cdot|^{1-p/q},
\]

which, by using that \( u_\cdot \not\equiv 0 \) in \( \Omega \), concludes the proof. \( \square \)

**Remark 4.6.** As an immediate consequence of Lemma 4.5, we have that if \( \lambda \geq \lambda_1(s,p) \), and \( f \in W^{-s,p}(\Omega) \) is such that \( f \leq 0 \) and \( f \not\equiv 0 \), then there exist \( \alpha > 1 \) and a constant \( C > 0 \) such that for all \( u \) is a weak sub-solution of (1.1) we have that

\[
\left( \frac{C}{\lambda} \right)^\alpha \leq |\Omega_+|,
\]

where \( \Omega_+ = \{ x \in \Omega : u(x) > 0 \} \).

Next, we prove our first anti-maximum principle.

**Proof of Theorem 1.3.** Again, we only prove the first statement; as before the another statement can be proved in an analogous way.

Suppose, to the contrary, there are sequences \( \{\lambda_n\}_{n \in \mathbb{N}} \) and \( \{u_n\}_{n \in \mathbb{N}} \) such that \( \lambda_n \downarrow \lambda_1(s,p) \) and \( u_n \) is a weak solution of (1.1) with \( \lambda = \lambda_n \) and \( (u_n)_+ \not\equiv 0 \) for all \( n \in \mathbb{N} \).

We claim that

\[
(4.1) \quad \|u_n\|_{L^q(\Omega)} \to \infty
\]

for all \( p \leq q < p^*_s \).

Suppose not, that is there is \( q \in (p,p^*_s) \) such that \( \{u_n\}_{n \in \mathbb{N}} \) is bounded in \( L^q(\Omega) \). Then, using that \( u_n \) is a weak solution of (1.1) for all \( n \in \mathbb{N} \), Hölder’s inequality and \( \lambda_n \downarrow \lambda_1(s,p) \), we have that \( \{u_n\}_{n \in \mathbb{N}} \) is bounded in \( \widetilde{W}^{s,p}(\Omega) \). Then, since \( T_1 \) is a completely continuous operator (see Subsection 2.2), up to a subsequence (still denoted by \( u_n \))

\[
u_n \to u \quad \text{strongly in } \widetilde{W}^{s,p}(\Omega),
\]

where \( u \) is a weak solution of (1.1) with \( \lambda = \lambda_1(s,p) \). By Corollary 4.3, this is a contradiction. We have prove our claim.

Set \( q \in (p,p^*_s) \) and

\[
v_n := \frac{u_n}{\|u_n\|_{L^q(\Omega)}} \quad \forall n \in \mathbb{N}.
\]
Then for all \( n \in \mathbb{N} \) \( v_n \) is a weak solution of
\[
\begin{align*}
(\Delta_p)^s u &= \lambda_n |u|^{p-2} u + \frac{f(x)}{\|u_n\|_{L^q(\Omega)}^{p-1}} \quad \text{in } \Omega, \\
u &= 0 \quad \text{in } \Omega^c.
\end{align*}
\]

Now, using again that \( T_1 \) is a completely continuous operator and the fractional Sobolev compact embedding theorem, up to a subsequence (still denoted by \( v_n \))
\[
v_n \to v \quad \text{strongly in } \widetilde{W}^{s,p}(\Omega),
\]
\[
v_n \to v \quad \text{strongly in } L^q(\Omega).
\]

Thus, \( v \neq 0 \) in \( \Omega \) and, \( v \) is a weak solution of (2.2) since \( \lambda_n \to \lambda_1(s,p) \) and \( f/\|u_n\|_{L^q(\Omega)} \to 0 \) strongly in \( W^{-s,p'}(\Omega) \). That is \( v \) is an eigenfunction of \( (\Delta_p)^s \) associated to \( \lambda_1(s,p) \). Therefore either \( v > 0 \) in \( \Omega \) or \( v < 0 \) in \( \Omega \). The case \( v > 0 \) is a contradiction by Lemma 4.5. To complete the proof of the theorem it remains to consider the case when \( v < 0 \).

If \( v < 0 \) then \( (v_n)_+ \to 0 \) strongly in \( L^q(\Omega) \). Therefore, using (4.1), it turns out that \( \|(u_n)_+\|_{L^q(\Omega)} \to \infty \).

On the other hand, by the Sobolev embedding theorem, there is a constant \( C \) independent of \( n \) such that
\[
C \|u_n\|_{L^q(\Omega)} \leq \|u_n\|_{W^{s,p}(\mathbb{R}^N)} \leq K \int_{\mathbb{R}^N} |u_n(x) - u_n(y)|^{p-2} (u_n(x) - u_n(y)) (u_n)_+ (x) - (u_n)_+ (y) dx dy.
\]
\[
\leq \lambda_n \int_{\Omega} |\nabla u_n|^p dx + \langle f(x), (u_n)_+ \rangle
\]
\[
\leq \lambda_n \|u_n\|_{L^q(\Omega)} \|\{x \in \Omega: u_n(x) > 0\}\|^{1-\eta/q} + \|f\|_{W^{-s,p'}(\Omega)} \|u_n\|_{W^{s,p}(\mathbb{R}^N)}
\]
for all \( n \in \mathbb{N} \). Then
\[
C \leq \lambda_n \|\{x \in \Omega: u_n(x) > 0\}\|^{1-\eta/q} + \frac{\|f\|_{W^{-s,p'}(\Omega)}}{\|(u_n)_+\|_{L^q(\Omega)}} \|v_n\|_{W^{s,p}(\mathbb{R}^N)},
\]
for all \( n \in \mathbb{N} \). Therefore
\[
\frac{C}{\lambda_1(s,p)} \leq \liminf_{n \to \infty} \|\{x \in \Omega: u_n(x) > 0\}\|^{1-\eta/q},
\]
which is a contradiction with the fact that \( (v_n)_+ \to 0 \) strongly in \( L^q(\Omega) \).

Finally, We show our anti-maximum principle for the linear case.

**Proof of Theorem 1.4.** As before, we only prove the first statement; the other statements can be proved in an analogous way.

It is suffices to prove that, for any two sequences \( \{\lambda_n\}_{n \in \mathbb{N}} \) and \( \{u_n\}_{n \in \mathbb{N}} \) such that \( \lambda_n \searrow \lambda_1(s,2) \) and \( u_n \) is a weak solution of (1.1) with \( \lambda = \lambda_n \), there is \( n_0 \in \mathbb{N} \) such that \( u_n < 0 \) in \( \Omega \) for all \( n \geq n_0 \). For such sequences, by Lemma 2.6, \( u_n \in L^\infty(\Omega) \) for all \( n \in \mathbb{N} \).

We claim that
\[
\|u_n\|_{L^\infty(\Omega)} \to \infty.
\]
Suppose not, that is \( \{u\}_{n \in \mathbb{N}} \) is bounded in \( L^\infty(\Omega) \). Then, using that \( u_n \) is a weak solution of (1.1) for all \( n \in \mathbb{N} \), Hölder’s inequality and \( \lambda_n \searrow \lambda_1(s,p) \), we have
that \( \{u_n\}_{n \in \mathbb{N}} \) is bounded in \( \widetilde{W}^{s,2}(\Omega) \). Then, since \( T_1 \) is a completely continuous operator, up to a subsequence (still denoted by \( u_n \))
\[
u_n \to u \quad \text{strongly in } \widetilde{W}^{s,2}(\Omega),
\]
where \( u \) is a weak solution of \((1.1)\) with \( \lambda = \lambda_1(s,2) \). Then
\[
\lambda_1(s,2) \int_\Omega uw_1 \, dx = K \int_{\mathbb{R}^N} \frac{(u(x) - u(y))(w_1(x) - w_1(y))}{|x - y|^{N + 2s}} \, dxdy
\]
\[
= \lambda_1(s,2) \int_\Omega uw_1 \, dx + \int_\Omega fw_1 \, dx.
\]
Therefore
\[
\int_\Omega fw_1 \, dx = 0,
\]
and we have a contradiction. Thus our claim is proved.

Set
\[
v_n := \frac{u_n}{\|u_n\|_{L^\infty(\Omega)}} \forall n \in \mathbb{N}.
\]
Then for all \( n \in \mathbb{N} \) \( v_n \) is a weak solution of
\[
\begin{cases}
(\Delta)^s u = \lambda_n |u|^{p-2}u + \frac{f(x)}{\|u_n\|_{L^\infty(\Omega)}} & \text{in } \Omega, \\
u = 0 & \text{in } \Omega^c.
\end{cases}
\]

Now, using again that \( T_1 \) is a completely continuous operator and the fractional Sobolev compact embedding theorem, up to a subsequence (still denoted by \( v_n \))
\[
v_n \to v \quad \text{strongly in } \widetilde{W}^{s,2}(\Omega).
\]
Thus, \( v \neq 0 \) in \( \Omega \) and, \( v \) is a weak solution of \((2.2)\) since \( \lambda_n \to \lambda_1(s,2) \) and \( f/\|u_n\|_{L^\infty(\Omega)} \to 0 \) strongly in \( \Omega \). That is \( v \) is an eigenfunction of \((\Delta)^s\) associated to \( \lambda_1(s,2) \). Therefore either \( v > 0 \) in \( \Omega \) or \( v < 0 \) in \( \Omega \).

On the other hand, for any \( n \in \mathbb{N} \)
\[
(\lambda_1(s,2) - \lambda_n) \int_\Omega w_1 v_n \, dx = \frac{1}{\|u_n\|_{L^\infty(\Omega)}} \int_\Omega f(x)w_1 \, dx > 0
\]
then, since \( \lambda_1(s,2) < \lambda_n \) for any \( n \in \mathbb{N} \), we have that
\[
\int_\Omega w_1 v_n \, dx < 0 \quad \forall n \in \mathbb{N}
\]
Therefore \( v < 0 \) in \( \Omega \).

In addition, by Theorem 2.7 and the Arzela–Ascoli theorem, up to a subsequence (still denoted by \( v_n \))
\[
v_n \to w_1 \quad \text{and} \quad \frac{v_n}{\delta^s} \to \frac{w_1}{\delta^s}
\]
strongly in \( \overline{\Omega} \). Here \( \delta(x) = \text{dist}(x, \partial \Omega) \). Then, by Lemma 2.8, there is \( n_0 \in \mathbb{N} \) such that \( v_n < 0 \) for all \( n \in \mathbb{N} \). That is there is \( n_0 \in \mathbb{N} \) such that \( u_n < 0 \) for all \( n \geq n_0 \). \( \square \)
