initial antibiotic administered. Antibiotics were discontinued early in 29/82 (35.4%) of patients. Thirty-one patients (33.7%) were discharged to a skilled nursing facility.

**Conclusion.** These results indicate that the majority of patients aged 65 and older who presented to the emergency department with altered mental status and no other UTI symptoms such as dysuria, urinary frequency, or urgency were treated with antibiotics. When antibiotics were administered, the majority of patients adhering to organizational guidelines for antibiotic selection and duration. The results will be shared with Emergency Department and Internal Medicine leadership to foster practice change.

1112. Improving Urine Culture Practices in a Neurocritical Care Unit through a Multidisciplinary-Based Approach

Kari A. Mergenhagen, PharmD; Bethany A. Wattengel, PharmD; Dana Hazen, MPH, BSN, RN; William Snyderman, MPH, PhD; Josh Sadowski, BS; Kristen Kelley, MD; Cole Beeler, MD; Douglas Webb, MD; Lana Dhebo, MD; Shannon Page, MSN, AGNCS-BC, RN, ANP, ACNP; Armisha Desai, BCPS; Richard Rodgers, MD, FAANS, FACS; Brian Brewer, MC, FACS; Ranjeet Singh, MD; Lawrence Bortenschlager, MD; Indiana University Health, Indianapolis, Indiana; Indiana University Health Adult Academic Health Center, Indianapolis, Indiana; Indiana University School of Medicine, Indianapolis, Indiana

**Session:** 136. Antibiotic Stewardship: Urine Cultures

Friday, October 4, 2019: 12:15 PM

**Background.** Asymptomatic bacteriuria is common in hospitalized patients with urinary catheters. Inappropriate urine culturing as part of reflex response to fever contributes to unnecessary and excessive antibiotic use, selection for resistant organisms, increased risk for *Clostridium difficile* infections, and false elevation in cathe ter-associated urinary tract infection (CAUTI) rates. This project aimed to implement an empiric urine culture algorithm inside a unit with a historically elevated CAUTI rate due to a high prevalence of noninfectious fever.

**Methods.** A multidisciplinary quality improvement project was initiated in August 2018 by the Infection Prevention, Quality and Safety, Neurocritical Care, Trauma, and Nursing teams of an academic health center in a unit with a historically elevated CAUTI rate due to a high prevalence of noninfectious fever.

**Results.** A multidisciplinary quality improvement project was initiated in August 2018 by the Infection Prevention, Quality and Safety, Neurocritical Care, Trauma, and Nursing teams of an academic health center in a unit with a historically elevated CAUTI rate due to a high prevalence of noninfectious fever.

**Conclusion.** Implementation of a urine culture algorithm in a neurocritical care unit resulted in reduced CAUTI rate with less financial and operational waste in unnecessary orders and treatment, without resulting in adverse events to patients as a result of missed diagnosis.

1113. Outpatient Antimicrobial Stewardship: Targets for Urinary Tract Infections

Kari A. Mergenhagen, PharmD; Bethany A. Wattengel, PharmD; Sara DiTursi, PharmD; Jennifer Schroec, PharmD; John A. Sellick, DO, MS; VA Buffalo, Getzville, New York; VA WNY Healthcare System, Buffalo, New York

**Session:** 136. Antibiotic Stewardship: Urine Cultures

Friday, October 4, 2019: 12:15 PM

**Background.** Urinary tract infections (UTIs) remain one of the most commonly diagnosed infectious diseases in the United States in both the inpatient and outpatient settings, accounting for 10.5 million outpatient visits in 2007. Of these visits, 5.4 million were seen in primary care offices. Outpatient antimicrobial stewardship programs are emerging and a focused approach to UTIs is needed to help guide future programs.

**Methods.** Data were collected by retrospective chart review of outpatient males at the VA Western New York Healthcare System using encounters from January 2005 to March 2018. Appropriate treatment was defined as antimicrobial prescribing in the setting of at least 2 signs/symptoms of UTI. Categorical data were analyzed using the chi-square test and continuous data using the Student t-test. Factors that differed significantly (P < 0.05) between the comparator groups were built into a multivariate logistic regression model to determine factors associated with inappropriate prescribing, which were presented as an Odds Ratio (OR) and 95% Confidence Interval (CI).

**Results.** A total of 607 outpatients met criteria for inclusion, of which 40% were patients aged 65 years or older. UTIs were treated more often in older patients (OR 4.7; 95% CI, 2.9–7.0). Rates of inappropriate antibiotic prescribing were significantly lower in outpatient urinary tract infections compared to inpatient urinary tract infections (OR 2.6; 95% CI, 1.3–4.9). These results indicate that the majority of patients aged 65 and older who presented to the emergency department with altered mental status and no other UTI symptoms such as dysuria, urinary frequency, or urgency were treated with antibiotics. When antibiotics were administered, the majority of patients adhering to organizational guidelines for antibiotic selection and duration. The results will be shared with Emergency Department and Internal Medicine leadership to foster practice change.

1114. Oral β-lactams for the Treatment of *Escherichia coli* Bacteremia Secondary to Complicated Urinary Tract Infections Including Pyelonephritis

Nicole Harrington, PharmD, BCPS; David Oran, PharmD; Stephen May, PharmD, Adjunctive Care, PharmD; Millian Laude, PharmD, BCPS; Thanh D. Lee, MD; Indiana University Health, New York, New York; Newark, Delaware

**Session:** 136. Antibiotic Stewardship: Urine Cultures

Friday, October 4, 2019: 12:15 PM

**Background.** Complicated urinary tract infections (cUTI) including pyelonephritis may result in bacteremia, increasing the rate of morbidity and mortality. The Infectious Diseases Society of America recommends a fluoroquinolone as empiric therapy or trimethoprim/sulfamethoxazole as definitive therapy for acute pyelonephritis (AP). Oral β-lactams (BL) are considered sub-optional based on historical efficacy data with aminopenicillins and variable bioavailability. Increasing resistance and toxicity with preferred agents, justifies further evaluation of oral BL for cUTI bacteremia secondary to urinary source.

**Methods.** This was a single-center, retrospective cohort study of patients with cUTI bacteremia secondary to AP or cUTI who received oral step-down therapy with a BL or non-BL. The primary outcome was the rate of clinical success defined by micro biological criteria for successful culture-related readmission. Secondary outcomes were time to oral step-down, total days of therapy, length of hospital stay, incidence of therapy escalation, 30-day readmissions, and antibiotic-associated adverse events.

**Results.** A total of 46 patients were included, with 23 patients in each group. The difference in duration of therapy in each group was 15 days. No patients required therapy escalation after oral step-down or had infection-related readmission within 30 days of discharge.

**Conclusion.** The observed clinical success rate of 91.3% remains consistent with previous studies evaluating oral BL as step-down therapy for Enterobacteriaceae bloodstream infections. The results of this study support the safety and efficacy of oral BL as step-down therapy for *E. coli* bacteremia due to cUTI, although larger studies may be beneficial.

1115. Reducing Broad-Spectrum Antibiotics for Uncomplicated Urinary Tract Infections: A Multimodal Stewardship Intervention

Maryrose R, Laguia-Vila, MD; Mary L. Stauze, PharmD; Mary Lourdes Brundige, PharmD; Jose Alcantara-Contreras, MD; Hongmei Yang, PhD; Ebibing Lautenbach, MD, MPH, MSCE; Gnhwa Dumayti, MD; Rochester Regional Health, Rochester, New York; Rochester General Hospital, Rochester, New York; University of Rochester Medical Center, Rochester, New York; University of Pennsylvania, Philadelphia, New York; New York Rochester Emerging Infections Program at the University of Rochester Medical Center, Rochester, New York

**Session:** 136. Antibiotic Stewardship: Urine Cultures

Friday, October 4, 2019: 12:15 PM

**Background.** Urinary tract infections (UTIs) are the second most common reason for antibiotics in hospitalized patients, with most receiving broad-spectrum antibiotics (BSA) regardless of infection severity. The antimicrobial stewardship program (ASP) conducted a multimodal stewardship intervention targeting reduction in one BSA, ceftriaxone, and promoted narrow-spectrum antibiotics (NSA) such as cefazolin and cefepime for uncomplicated UTIs.

**Methods.** Phase 1: In February 2018, the ASP created a pocket card (Figure 1) containing (1) a urinary antibiotic outlining the most common urine pathogens and their local susceptibility to NSA and (2) NSA guidelines for UTIs with 0–1 systemic inflammatory response syndrome (SIRS) criteria. ASP performed a daily prospective audit with feedback on all new orders of ceftriaxone and promoted prescription of NSA. Phase 2: In August 2018, a Best Practice Alert (BPA) in the electronic medical record (EMR) was designed to interrupt providers ordering ceftriaxone with the indication of a UTI, and prompted NSA prescription instead. Quarterly didactic sessions on UTI antibiotic use and BPA functionality were done. We compared antimicrobials usage rates across the 3 study phases (pre-intervention, phase I and phase II) by computing rate ratios (RRs) using Poisson regression.

**Results.** Compared with pre-intervention, phase 1 resulted in a significant decrease in ceftriaxone orders (RR: 1.06, CI: 1.03–1.09; P < 0.001) and cefazolin orders for UTI (RR: 1.14, P < 0.001) and an increase in cefazolin DOT (RR: 0.89, P = 0.029) and orders for UTI (RR: 0.12, P = 0.001). It also resulted in a significant increase in cefepime DOT (RR: 0.92, P = 0.002) and orders for UTI (RR: 0.58, P < 0.001). In phase 2, an additional significant reduction in ceftriaxone DOT (RR: 1.04, CI: 1.01–1.08, P = 0.018) and orders for UTI (RR: 1.62, P < 0.001) and an increase in cefazolin DOT usage.

**Conclusion.** Outpatient antibiotic prescribing for UTIs is suboptimal. Outpatient stewardship programs may wish to educate providers on symptoms of UTI. Interestingly, those with signs and symptoms consistent with UTI were more likely to have a urine culture and/or imaging completed suggesting that providers were aware of a true diagnosis of a UTI. Stewardship programs should pay special attention to patients with nonclassic symptoms, as they are often inaccurately treated.
