Valday, Russia
The proposed by Symanzik approach for modeling of interaction of a macroscopic material body with quantum fields is considered. Its application in quantum electrodynamics enables one to establish the most general form of the action functional describing the interaction of 2-dimensional material surface with photon and fermion fields. The models making it possible to calculate the Casimir energy and Casimir-Polder potential for non-ideal conducting material are presented. Applications of the models to descriptions of interaction of the spinor field with a material plane are considered.

The proposed by Symanzik action functional describing the interaction of the quantum field with material body has the form:

\[ S(\varphi) = S_V(\varphi) + S_{\text{def}}(\varphi) \]

where

\[ S_V(\varphi) = \int L(\varphi(x))d^Dx, \quad S_{\text{def}}(\varphi) = \int_\Gamma L_{\text{def}}(\varphi(x))d^{D'}x, \]

and \( \Gamma \) is a subspace of dimension \( D' \leq D \) in \( D \)-dimensional space.
From the basic principles of QED (gauge invariance, locality, renormalizability) it follows that for thin film without charges and currents, which shape is defined by equation $\Phi(x) = 0$, $x = (x_0, x_1, x_2, x_3)$, the action describing its interaction with photon field $A_\mu(x)$ and Dirac Fields $\bar{\psi}(x), \psi(x)$ reads

$$S_{\text{def}}(\varphi) = S_\Phi(A) + S_\Phi(\bar{\psi}, \psi).$$

The action $S_\Phi(A)$ is a surface Chern-Simon action

$$S_\Phi(A) = \frac{a}{2} \int \varepsilon^{\lambda\mu\nu\rho} \partial_\lambda \Phi(x) A_\mu(x) F_{\nu\rho}(x) \delta(\Phi(x)) dx$$

where $F_{\nu\rho}(x) = \partial_\nu A_\rho - \partial_\rho A_\nu$, $\varepsilon^{\lambda\mu\nu\rho}$ denotes totally antisymmetric tensor ($\varepsilon^{0123} = 1$), $a$ is a constant dimensionless parameter.
The fermion defect action can be written as

$$S_{\Phi}(\bar{\psi}, \psi) = \int \bar{\psi}(x) [\lambda + u^{\mu} \gamma_{\mu} + \gamma_{5}(\tau + v^{\mu} \gamma_{\mu}) + \omega^{\mu\nu} \sigma_{\mu\nu}] \psi(x) \delta(\Phi(x)) \, dx$$

Here, $\gamma_{\mu}, \mu = 0, 1, 2, 3,$ are the Dirac matrices, $\gamma_{5} = i\gamma_{0}\gamma_{1}\gamma_{3}\gamma_{3}$, $\sigma_{\mu\nu} = i(\gamma_{\mu}\gamma_{\nu} - \gamma_{\nu}\gamma_{\mu})/2$, and $\lambda, \tau, u_{\mu}, v_{\mu}, \omega^{\mu\nu} = -\omega^{\nu\mu}$, $\mu, \nu = 0, 1, 2, 3$ are 16 dimensionless parameters.
Formulation of model

It is the most general form of gauge invariant action concentrated on the defect surface being invariant in respect to reparametrization of one and not having any parameters with negative dimensions.
The full action of the model, which satisfies the requirement of locality, gauge invariance and renormalizability, has the form

\[ S(\bar{\psi}, \psi, A) = -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} + \bar{\psi}(i\hat{\partial} - m + e\hat{A})\psi \]

\[ + S_{\text{def}}(A) + S_{\text{def}}(\bar{\psi}, \psi) . \]

Due to the requirements of renormalizability the fields interaction is described by standard contribution \( e\bar{\psi}\hat{A}\psi \) to the QED action.
Casimir energy for two parallel planes

\[
D_{2P}^{lm}(\vec{k}, x_3, y_3) = \frac{P^{lm}(\vec{k})}{2|\vec{k}|} \left\{ \frac{A}{C} - e^{i|\vec{k}|(x_3-y_3)} \right\} - \frac{L^{lm}(\vec{k})B}{2C|\vec{k}|^2}
\]

with \( D_{2P}^{l3} = D_{2P}^{3m} = 0 \), \( D_{2P}^{33}(\vec{k}, x_3, y_3) = -i\delta(x_3 - y_3)/|\vec{k}|^2 \),

\[
C = (1 + a_1 a_2(e^{2i|\vec{k}|r} - 1))^2 + (a_1 + a_2)^2,
\]

\[
A = (a_1 a_2 - a_1^2 a_2^2(1 - e^{2i|\vec{k}|r}))(e^{i|\vec{k}|(|x_3|+|y_3-r|)} + e^{i|\vec{k}|(|x_3-r|+|y_3|)})e^{i|\vec{k}|r} +
\]

\[
+ (a_1^2 + a_1 a_2^2(1 - e^{2i|\vec{k}|r}))e^{i|\vec{k}|(|x_3|+|y_3|)} +
\]

\[
+ (a_2^2 + a_1 a_2^2(1 - e^{2i|\vec{k}|r}))e^{i|\vec{k}|(|x_3-r|+|y_3-r|)},
\]

\[
B = a_1 a_2(a_1 + a_2) \left( e^{i|\vec{k}|(|x_3|+|y_3-r|)} + e^{i|\vec{k}|(|x_3-r|+|y_3|)} \right) e^{i|\vec{k}|r} -
\]

\[
- a_1(1 + a_2(a_2 + a_1 e^{2i|\vec{k}|r}))e^{i|\vec{k}|(|x_3|+|y_3|)} -
\]

\[
- a_2(1 + a_1(a_1 + a_2 e^{2i|\vec{k}|r}))e^{i|\vec{k}|(|x_3-r|+|y_3-r|)}.
\]
The energy density $E_{2P}$ of defect is defined as

$$\ln G(0) = \frac{1}{2} \text{Tr} \ln(D_{2P}D^{-1}) = -iTSE_{2P}$$

where $T = \int dx_0$ is time of existence of defect, and $S = \int dx_1 dx_2$, is area of one. It is expressed in an explicit form in terms of polylogarithm function $\text{Li}_4(x)$ in the following way:

$$E_{2P} = \sum_{j=1}^{2} E_j + E_{\text{Cas}}, \quad E_j = \frac{1}{2} \int \ln(1 + a_j^2) \frac{d\vec{k}}{2\pi^3}, \quad j = 1, 2,$$

$$E_{\text{Cas}} = -\frac{1}{16\pi^2 r^3} \sum_{k=1}^{2} \text{Li}_4 \left( \frac{a_1 a_2}{a_1 a_2 + i(-1)^k(a_1 + a_2) - 1} \right)$$
Casimir energy for two parallel planes

Here $E_j$ is an infinite constant, which can be interpreted as self-energy density on the $j$-th planes, and $E_{\text{Cas}}$ is an energy density of their interaction. Function $\text{Li}_4(x)$ is defined as

$$\text{Li}_4(x) = \sum_{k=1}^{\infty} \frac{x^k}{k^4} = -\frac{1}{2} \int_0^\infty k^2 \ln(1 - xe^{-k}) dk.$$ 

For identical defect planes ($a_1 = a_2 = a$) the force $F_{2P}(r, a)$ between them is given by

$$F_{2P}(r, a) = -\frac{\partial E_{\text{Cas}}(r, a)}{\partial r} = -\frac{\pi^2}{240r^4} f(a).$$
Function $f(a)$ determining the Casimir forces between two parallel planes. It is even ($f(a)=f(-a)$), has the minimum $f(a_m) = -0.11723$ at $a_m = 0.5892$, and $f(a_0) = 0$ at $a_0 = 1.03246$. 
We will consider the material plane $x_3 = 0$ as a defect. In this case, in the Dirac part of the action

$$S(\bar{\psi}, \psi) = \int \bar{\psi}(x)(i\hat{\partial} - m + \Omega(x_3))\psi(x)dx,$$

the interaction of the spinor field with the plane is described with matrix $\Omega(x_3) = Q\delta(x_3)$. Since $\Omega(x_3)$ and $\delta(x_3)$ have the dimension of mass, the matrix $Q$ is dimensionless. For homogeneous isotropic material plane in more general case, the matrix $Q$ could be presented in the form:

$$Q = r_1 l + ir_2 \gamma_5 + r_3 \gamma_3 + r_4 \gamma_5 \gamma_3 +$$
$$+ r_5 \gamma_0 + r_6 \gamma_5 \gamma_0 + ir_7 \gamma_0 \gamma_3 + ir_8 \gamma_1 \gamma_2$$

with $l$ - identity 4x4 matrix, $\gamma_3$, $\gamma_5 = i\gamma_0 \gamma_1 \gamma_2 \gamma_3$ are Dirac matrices.
Movement of spinor particle in the field of defect $\Omega(x_3)$ is described by a modified Dirac equation

$$(i\hat{\partial} - m + \Omega(x_3))\psi(x) = 0.$$ 

It is one of the Euler-Lagrange equations, which is obtained by variational differentiating of the action over $\bar{\psi}(x)$. Taking the derivative over $\psi(x)$ we obtain the second equation

$$(\partial_\mu \bar{\psi}(x))\gamma^\mu + \bar{\psi}(x)(m - \Omega(x_3)) = 0.$$ 

The condition $\bar{\psi}(x) = \psi^*(x)\gamma_0$ fulfils if $\gamma_0\Omega^+(x) = \Omega(x]\gamma_0$. It is the case for real values of parameters $r_j, j = 1, ..., 8$. 
Let us introduce the convenient notations. For $2 \times 2$ -matrix $M$ with elements $M_{ij}$, $i, j = 1, 2$, we define the $4 \times 4$ -matrices $M^{(+)}$, $M^{(-)}$ in the following way

$$M^{(+)} = \begin{pmatrix} M_{11} & 0 & M_{12} & 0 \\ 0 & 0 & 0 & 0 \\ M_{21} & 0 & M_{22} & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}, \quad M^{(-)} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & M_{11} & 0 & M_{12} \\ 0 & 0 & 0 & 0 \\ 0 & M_{21} & 0 & M_{22} \end{pmatrix}. $$

Let $\mathcal{M}^{(\pm)}$ is the set of all the matrices $M^{(\pm)}$, then for arbitrary matrices $M_1^{(\pm)}$, $M_2^{(\mp)}$,

$$M_1^{(\pm)} M_2^{(\mp)} = 0, \quad M_1^{(\pm)} M_2^{(\pm)} \in \mathcal{M}^{(\pm)}.$$
If we denote $\tau_0$ the unit $2 \times 2$ - matrix, $\tau_j$, $j = 1, 2, 3$, the Pauli matrices, and $\tau_j^{(+)}$, $\tau_j^{(-)}$ the corresponding $4 \times 4$ -matrices, then the matrix $Q$ can be presented as

$$Q = Q^{(+)} + Q^{(-)}, \quad Q^{(\pm)} = \sum_{j=0}^{3} q_j^{(\pm)} \tau_j^{(\pm)}$$

where $q_0^{(\pm)} = r_1^{\pm}$, $q_1^{(\pm)} = i r_2^{\pm}$, $q_2^{(\pm)} = \mp i r_3^{\mp}$, $q_3^{(\pm)} = \mp r_4^{\mp}$, and $r_{ij}^{\pm} = r_i \pm r_j$. 
We denote $\psi(x)$ the solution of the modified Dirac equation, and $\psi_-(x) = \psi(x)$ for $x_3 < 0$, $\psi_+(x) = \psi(x)$ for $x_3 > 0$. The spinors $\psi(x)_\pm$ for $x_3 \neq 0$ satisfy the free Dirac equation and boundary condition

$$\lim_{x^3 \to +0} \psi_+(x) = S \lim_{x^3 \to -0} \psi_-(x),$$

One can choose the regularization procedure for $\delta(x_3)$ in such a way that the matrix $S$ is expressed in terms of $Q$ as

$$S = \exp\{-i\gamma^3 Q\}.$$
It follows from \( Q^\dagger = \gamma_0 Q \gamma_0 \) that

\[
S^\dagger \gamma^0 \gamma^3 S = \gamma^0 \gamma^3
\]

where \( S^\dagger \) is the hermitian conjugated matrix \( S \) and

\[
S = S^{(+)} + S^{(-)},
\]

\[
S^{(\pm)} = e^{i \chi_{\pm}} \left( \varsigma_{0\pm} \tau_0^{(\pm)} + i \varsigma_{1\pm} \tau_1^{(\pm)} + \varsigma_{2\pm} \tau_2^{(\pm)} + \varsigma_{3\pm} \tau_3^{(\pm)} \right),
\]

\[
\varsigma_0^2 + \varsigma_1^2 - \varsigma_2^2 - \varsigma_3^2 = 1
\]

where \( \chi_{\pm} \) and \( \varsigma_{j\pm}, j = 0, 1, 2, 3 \) are real parameters.
The free Dirac equation in coordinate space reads

\[(i\hat{\partial} - m)\psi(x) = 0.\]

By substitution \(\psi(x)\) in the form

\[\psi(x) = \frac{1}{(2\pi)^4} \int e^{-ipx} \psi(\bar{p}) d\bar{p}, \quad \bar{p} = (p^0, p^1, p^2)\]

one obtains

\[(\hat{p} - m)\psi(\bar{p}) = 0.\]

For real \(p_3\) the considered spinor \(\psi(x)\) describes the scattering state and the imaginary \(p_3\) - the bound state.
The general solution $\psi(\bar{p})$ of the Dirac equation can be presented as an arbitrary linear combination of linear independent spinors

$$
\psi_1(\bar{p}) = \begin{cases}
1 \\
0 \\
-\frac{p_3}{m+p_0} \\
-\frac{p_1-ip_2}{m+p_0}
\end{cases}, \quad \psi_2(\bar{p}) = \begin{cases}
0 \\
1 \\
-\frac{p_1+ip_2}{m+p_0} \\
-\frac{p_3}{m+p_0}
\end{cases}, \quad p_3 = \pm \sqrt{\bar{p}^2 - m^2}
$$

for $p_0 > 0$ and

$$
\psi'_1(\bar{p}) = \begin{cases}
\frac{p_1-ip_2}{m-p_0} \\
\frac{p_3}{p_0-m} \\
0 \\
1
\end{cases}, \quad \psi'_2(\bar{p}) = \begin{cases}
\frac{p_3}{m-p_0} \\
\frac{p_1+ip_2}{m-p_0} \\
1 \\
0
\end{cases}.
$$

for $p_0 < 0$. 
Substituting $p_3 \rightarrow \pm i\kappa$ with $\kappa = |\kappa| = \sqrt{m^2 + p_1^2 + p_2^2 - p_0^2}$ we obtain the spinors describing the bound states

$$\psi_{\pm}(\bar{p}) = \psi(p)|_{p_3\rightarrow \mp i\kappa}.$$ 

They can be presented as follows

$$\psi_+ (\bar{p}) = a_1 \psi_{1+} (\bar{p}) + a_2 e^{i\phi} \psi_{1+} (\bar{p}), \quad \psi_- (\bar{p}) = d_1 \psi_{1-} (\bar{p}) + d_2 e^{i\phi} \psi_{1-} (\bar{p}),$$

$$\psi'_+ (\bar{p}) = a'_1 \psi'_{1+} (\bar{p}) + a'_2 e^{i\phi} \psi'_{1+} (\bar{p}), \quad \psi'_- (\bar{p}) = d'_1 \psi'_{1-} (\bar{p}) + d'_2 e^{i\phi} \psi'_{1-} (\bar{p}).$$
Modified Dirac equations

Here

\[
\psi_1 \pm (\bar{p}) = \begin{cases} 
1 \\
0 \\
\pm ik \\
f e^{i\phi}
\end{cases}, \quad \psi_2 (\bar{p}) = \begin{cases} 
0 \\
1 \\
f e^{-i\phi} \\
\mp ik
\end{cases},
\]

\[
\psi'_1 \pm (\bar{p}) = \begin{cases} 
-f e^{-i\phi} \\
\pm ik \\
0 \\
1
\end{cases}, \quad \psi'_2 \pm (\bar{p}) = \begin{cases} 
\mp ik \\
f e^{i\phi} \\
1 \\
0
\end{cases},
\]

\[
k = \frac{\kappa}{m + |p_0|}, \quad \frac{p_1 + ip_2}{m + |p_0|} = -\frac{p_1 + ip_2}{m + |p_0|} = f e^{i\phi}, \quad f = |f|.
\]

The spinors \(\psi_\pm, \psi'_\pm\) fulfill the relations

\[
\psi_+ (\bar{p}) = S \psi_- (\bar{p}), \quad \psi'_+ (\bar{p}) = S \psi'_- (\bar{p}), \quad S = e^{-i\gamma^3 Q}.
\]

which can be presented as systems of linear equations for coefficients \(a_1, a_2, d_1, d_2, a'_1, a'_2, d'_1, d'_2\) contained in \(\psi_\pm, \psi'_\pm\).
We consider the quantities of the form
\[ \bar{\psi}_\pm(\bar{p}, x_3) \Gamma \psi_\pm(\bar{p}, x_3) = \bar{\psi}_\pm(\bar{p}) \Gamma \psi_\pm(\bar{p}) e^{-2\kappa|x_3|} \]
with 4 × 4 basic Dirac matrices \( \Gamma \) using convenient notations

\[ N_{0+} = a_1^* a_1 + a_2^* a_2, \quad N_{1+} = a_1^* a_2 + a_2^* a_1, \]
\[ N_{2+} = a_1^* a_1 - a_2^* a_2, \quad N_{3+} = i(a_1^* a_2 - a_2^* a_1), \]
\[ N_{0-} = d_1^* d_1 + d_2^* d_2, \quad N_{1-} = d_1^* d_2 + d_2^* d_1, \]
\[ N_{2-} = d_1^* d_1 - d_2^* d_2, \quad N_{3-} = i(d_1^* d_2 - d_2^* d_1), \]

\( \vec{\gamma} = \{\gamma^1, \gamma^2, \gamma^3\}, \quad \vec{\sigma} = \{\sigma^1, \sigma^2, \sigma^3\}, \quad \sigma^j = \sum_{k,l=1}^{3} \varepsilon^{jkl} \gamma^k \gamma^l, \quad j = 1, 2, 3 \)

with totally antisymmetric \( \varepsilon^{jkl} \), \( \varepsilon^{123} = 1 \).
For scalar and pseudoscalar invariant densities

\[ \bar{\psi}_\pm(x)\psi_\pm(x) = e^{-2\kappa|x^3|}d_\pm(\bar{p}), \quad \bar{\psi}_\pm(x)\gamma_5\psi_\pm(x) = ie^{-2\kappa|x^3|}d_{5\pm}(\bar{p}), \]

components of electric and axial 4-currents

\[ \bar{\psi}(x)\gamma^\mu\psi(x) = e^{-2\kappa|x^3|}j_{\pm\mu}(\bar{p}), \quad \bar{\psi}(x)\gamma^\mu\gamma_5\psi(x) = e^{-2\kappa|x^3|}j_{5\pm\mu}(\bar{p}), \]

for anomalous electric and magnetic dipole moments

\[ \bar{\psi}_\pm(x)\tilde{\gamma}^0\psi_\pm(x) = ie^{-2\kappa|x^3|}\vec{e}_\pm(\bar{p}), \quad \bar{\psi}_\pm(x)\vec{\sigma}\psi_\pm(x) = ie^{-2\kappa|x^3|}\vec{m}_\pm(\bar{p}), \]

we obtain the following results
Properties of bound states

\[ d_{\pm} = N_{0\pm} \left(1 - f^2 - k^2\right) \pm 2N_{3\pm} fk, \quad d_{5\pm} = \pm 2N_{2\pm}, \]

\[ j_{\pm}^0 = N_{0\pm} \left(1 + f^2 + k^2\right) \mp 2N_{3\pm} fk, \quad j_{5\pm}^0 = 2N_{1\pm} f, \]

\[ j_{\pm}^1 = j_{\pm}^\| \cos(\phi) + j_{\pm}^\perp \sin(\phi), \quad j_{5\pm}^1 = j_{5\pm}^\| \cos(\phi) - j_{5\pm}^\perp \sin(\phi), \]

\[ j_{\pm}^2 = j_{\pm}^\| \sin(\phi) - j_{\pm}^\perp \cos(\phi), \quad j_{5\pm}^2 = j_{5\pm}^\| \sin(\phi) + j_{5\pm}^\perp \cos(\phi), \]

\[ j_{\pm}^3 = 0, \quad j_{5\pm}^3 = N_{2\pm} \left(1 - f^2 + k^2\right) \]

\[ j_{\pm}^\| = 2(N_{0\pm} f \mp N_{3\pm} k), \quad j_{\pm}^\perp = \pm 2N_{1\pm} k, \]

\[ j_{5\pm}^\| = N_{1\pm} \left(1 + f^2 - k^2\right), \quad j_{5\pm}^\perp = N_{3\pm} \left(f^2 + k^2 - 1\right) \mp 2N_{0\pm} fk, \]
Properties of bound states

\[ e_\pm^1 = e_\pm^\perp \sin(\phi), \quad e_\pm^2 = -e_\pm^\perp \cos(\phi), \quad e^3 = -2(N_3 \pm f \mp N_0 \pm k), \]
\[ m_\pm^1 = m_\pm^\parallel \cos(\phi) - m_\pm^\perp \sin(\phi), \quad m_\pm^2 = m_\pm^\parallel \sin(\phi) + m_\pm^\perp \cos(\phi), \]
\[ m_\pm^3 = N_2 \pm \left( k^2 - f^2 - 1 \right), \quad e^\perp = 2fN_2, \]
\[ m_\parallel = iN_1 \pm \left( f^2 - k^2 - 1 \right), \quad m_\perp = \left( N_3 \pm \left( 1 + f^2 + k^2 \right) \mp 2N_0 \pm fk \right). \]
We see also that

\[ j_0^0 p^0 - j_1^1 p^1 - j_2^2 p^2 = md_\pm, \quad j_5^0 p^0 - j_5^1 p^1 - j_5^2 p^2 = 0, \]

\[ \kappa j_5^3 = md_5 \pm = 0, \quad m \bar{e}_\pm \bar{m}_\pm = -\kappa j_5^3 d_\pm, \quad \bar{e}_\pm \bar{m}_\pm = d_\pm d_5 \pm, \]

\[ \bar{e}_\pm^2 - \bar{m}_\pm^2 = d_5 \pm^2 - d_\pm^2, \quad d_\pm p^0 - j_0^0 m = \kappa \bar{e}_\pm^3 \]

\[ N_{0\pm} = \frac{(d_\pm + j_0^0)}{2}, \quad N_{1\pm} = \frac{j_5^0}{2f}, \quad N_{2\pm} = \frac{j_5^3 (m + p^0)}{2m}, \]

\[ N_{3\pm} = \frac{d_\pm (1 + f^2 + k^2) + j_0^0 (f^2 + k^2 - 1)}{4fk}. \]
Let us denote

\[ a = \begin{pmatrix} a_1 \\ a_2 \end{pmatrix}, \quad d = \begin{pmatrix} d_1 \\ d_2 \end{pmatrix}, \]

and

\[ K_+ = \frac{1}{f} \begin{pmatrix} f & 0 \\ -ik & 1 \end{pmatrix}, \quad K_- = \frac{1}{f} \begin{pmatrix} ik & 1 \\ f & 0 \end{pmatrix}, \]

\[ L_+ = \begin{pmatrix} 1 & 0 \\ -ik & f \end{pmatrix}, \quad L_- = \begin{pmatrix} 0 & 1 \\ f & ik \end{pmatrix}, \]

\[ s_\pm = \begin{pmatrix} \varsigma_0 \pm \varsigma_3 \pm i(\varsigma_1 \pm \varsigma_2) \\ i(\varsigma_1 \pm \varsigma_2) \pm \varsigma_0 \pm \varsigma_3 \end{pmatrix} \]
It follows from $\psi_+ = S\psi_-$, $S(\pm) = e^{i\chi_{\pm}}s^{(\pm)}$ that the vectors $a, d$ fulfill the equations

$$a = e^{i\chi_+} T_+ d, \quad a = e^{i\chi_-} T_- d, \quad T_\pm = K_{\pm} s_{\pm} L_{\pm}.$$  

Hence, $d$ satisfies the homogeneous equation

$$Td = 0,$$

where

$$T = e^{i\frac{\chi_+ + \chi_-}{2}} \left( e^{i\chi} T_+ - e^{-i\chi} T_- \right), \quad \chi = \frac{\chi_+ - \chi_-}{2}$$

which has nontrivial solution, if the determinant of the matrix $T$ is equal to zero.
The matrix $T$ can be presented in the form

$$ T = \frac{e^{i(\chi_+ + \chi_-)/2}}{f} \begin{pmatrix} t_{11} & t_{12} \\ t_{21} & t_{22} \end{pmatrix}, $$

with

$$ t_{11} = \left( e^{i\chi}(k(\varsigma_1 - \varsigma_2) + \varsigma_0 + \varsigma_3) + e^{-i\chi}(k(\varsigma_1 - \varsigma_2) - \varsigma_0 + \varsigma_3) \right) $$

$$ t_{12} = i \left( e^{i\chi} f^2 k(\varsigma_1 - \varsigma_2) + e^{-i\chi}(k^2(\varsigma_1 - \varsigma_2) - 2k\varsigma_0 - \varsigma_1 - \varsigma_2) \right) $$

$$ t_{21} = -i \left( e^{i\chi}(k^2(\varsigma_1 - \varsigma_2) + 2k\varsigma_0 - \varsigma_1 - \varsigma_2) + e^{-i\chi} f^2 k(\varsigma_1 - \varsigma_2) \right) $$

$$ t_{22} = \left( e^{i\chi}(k(\varsigma_1 - \varsigma_2) + \varsigma_0 - \varsigma_3) + e^{-i\chi}(k(\varsigma_1 - \varsigma_2) - \varsigma_0 - \varsigma_3) \right) $$
Thus, $d \neq 0$ is the solution of equation $Td = 0$ if

$$t_{11} t_{22} - t_{12} t_{21} = 2 f^2 \left(\cos(\chi_+ - \chi_-) - \varsigma_0 - \varsigma_0 + \varsigma_1 - \varsigma_1 + \varsigma_2 - \varsigma_2 + \varsigma_3 - \varsigma_3 + \right) -$$

$$- \left((k^2 - f^2)(\varsigma_1 - \varsigma_2) - 2k\varsigma_0 - \varsigma_1 - \varsigma_2 \right) \times$$

$$\times \left((k^2 - f^2)(\varsigma_1 + \varsigma_2) + 2k\varsigma_0 + \varsigma_1 - \varsigma_2 \right) = 0.$$
The general solution of equations for $a, d$ can be written in the form

$$
 d = c \left\{ \begin{array}{c} t_{12} \\ -t_{11} \end{array} \right\}, \quad a = c' \left\{ \begin{array}{c} t'_{12} \\ -t'_{11} \end{array} \right\}.
$$

Here, $c$ is an arbitrary constant and

$$
 t'_{12} = t_{12} |_{\chi \to -\chi, \ k \to -k, \ \varsigma_0 \to -\varsigma_0}, \\
 t'_{11} = t_{11} |_{\chi \to -\chi, \ k \to -k, \ \varsigma_0 \to -\varsigma_0}, \\
 c' = c f e^{2i(\chi_+ + \chi_-)} (h_{11} g_{12} - g_{11} h_{12}) \over h_{12} e^{i\chi_-} - g_{12} e^{i\chi_+},
$$

$$
 h_{11} = k (s_1 + s_2) + s_0 + s_3, \quad g_{11} = k (s_1 - s_2) - s_0 + s_3, \\
 h_{12} = f^2 k (s_1 + s_2), \quad g_{12} = k^2 (s_1 - s_2) - 2k s_0 - s_1 - s_2.
$$
The solvability condition (dispersion relation) can be presented as

\[(p_1^2 + p_2^2)(\cos(\chi_+ - \chi_-) - s_0 s_0 + s_1 s_1 + s_2 s_2 + s_3 s_3) - 2(p_0 s_1 + m s_2 + \kappa s_0)(p_0 s_1 + m s_2 - \kappa s_0) = 0.\]

In virtue of \(p_0^2 + \kappa^2 - p_1^2 - p_2^2 - m^2 = 0\), it follows from dispersion relation that \(p_0, \kappa, m\) satisfy the equation

\[(p_0^2 + \kappa^2 - m^2)(\cos(\chi_+ - \chi_-) - s_0 s_0 + s_1 s_1 + s_2 s_2 + s_3 s_3) - 2(p_0 s_1 + m s_2 + \kappa s_0)(p_0 s_1 + m s_2 - \kappa s_0) = 0.\]

describing the relation between the dimensionless magnitudes \(p_0/m, \kappa/m\) characterizing the bound state. Its solution is presented on the \((p_0 - \kappa)\)-plane by hyperbola or by two straight lines.
Since for Dirac particle the physical value of $p_0, \kappa$ are positive, the bound state can be realized if there are points of the $(p_0 - \kappa)$-plot presenting the dispersion relation in the region $p_0 > 0, \kappa > 0$. This part of plot can be connected or disconnected, and the possible values of $p_0, \kappa$ for bound state can be both restricted and non-restricted from above.
Dispersion relation

By \( \varsigma_0 \pm = \varsigma_2 \pm = 0 \) the dispersion law has the form

\[
p_0^2 - v_F^2 (p_1^2 + p_2^2) = 0, \quad v_F = \sqrt{\frac{\cos(\chi_+ - \chi_-) + \varsigma_1 - \varsigma_1^+ - \varsigma_3 - \varsigma_3^+}{2(\varsigma_1 - \varsigma_1^+)}},
\]

\[\varsigma_1^2 - \varsigma_3^2 = 1,\]

and

\[0 \leq v_F \leq 1, \quad \kappa^2 = m^2 + (p_1^2 + p_2^2)(1 - v_F^2).\]

It describes the propagation of massless particle in the defect plane with the Fermi-velocity \( v_F \). The motion of such particles explains numerous effects in graphene.
The main results

- In the framework of the Symanzik approach, we build the model of QED field interaction with 2D material. The action of the model consist of the usual QED action and extra defect contribution. The action contains parameters, that characterize the material property.

- The characteristics of photons and Dirac particles scattering on the defect plane can be calculated in the model, also the properties of states localized near the defect plane can be investigated.

- The model and obtained on its basis results could be used for the theoretical description of the interaction of electrons, positrons and neutrons with two-dimensional materials (graphite, thin films, sputters, sharp boundaries of a solid body). Simple modifications of the model allows to take into account the effects of external electromagnetic fields.
Thank you for your attention!
