Transcriptional Regulation of Epithelial to Mesenchymal Transition Related Genes by Lipopolysaccharide in Human Cervical Cancer Cell Line HeLa

Shaian Tavakolian, Hossein Goudarzi, Gita Eslami, Ebrahim Faghihloo*

Abstract

Objective: Cancer is one of the common diseases in the world, and cervical cancer is the fourth one. In this type of cancer, many risk factors, especially infectious diseases, such as human papilloma virus (HPV) and gram-negative bacteria can have important effects on the expression of epithelial to mesenchymal transition related genes like Snail, E-cadherin, and ZEB-1, responsible for connecting cell tissues. In this study, we have investigated the effect of Escherichia coli O111:B4 Lipopolysaccharide (LPS) on HPV positive cell line (HeLa), the expression level of the (Snail, E-cadherin, and ZEB-1), HPV oncogenes (E6, E7) and also microRNA-9, 192. Materials and Methods: HeLa cell line was treated with LPS to analyze Snail, E-cadherin, ZEB-1, E6, E7 and also microRNA-9, 192 expression by quantitative real-time PCR in 24, 48 and 72 hours. Results: Quantitative real-time PCR revealed a significant reduction in E-cadherin mRNA level at 10ug/L of LPS in three time-points and after 24 hours at 5ug/L of LPS; however, ZEB-1 at 10ug/L of LPS and Snail at 5, 10ug/L of LPS are up-regulated. E7 also illustrated a slight increase, but we did not find any relationship between E7 and LPS treatment. Additionally, there are upward trends in microRNA-9, 192 levels. Conclusion: The result of this study, LPS is able to reduce E-cadherin expression, caused by increase in repressor E-cadherin protein expression and some microRNAs, probably. Since bacterial infection can be in cervical site, it is likely to be effective in reducing the E-cadherin expression in the EMT and enhance cancer process, therefore; removing these infections by using the appropriate antibiotics may result in slowing down this process, which requires more research.

Introduction

Cancer is one of the most causes of death, and there are multiple types of cancer in the world. Among different types of this disease, cervical cancer causes more than 200,000 deaths, annually (Pisani et al., 2002). This cancer is the fourth common cancer in the world (Lai et al., 2019), and the diagnosis of more than 75,000 new cases of invasive cervical malignancy is estimated in the United States (Louie et al., 2002).

Many risk factors seem to be involved in the progression of cervical cancer, including radiation, environmental pollution, (Scheurer et al., 2014; Eslamizadeh et al., 2018) alcohol consumption, smoking (Kapeu et al., 2009), and even infectious diseases (Salimi et al., 2017; Faghihloo et al., 2014; Vaezjalali et al., 2013). Nowadays, it has been accepted that human papilloma virus (HPV) has a strong relationship with cervical cancer (Franco, 1995; Faghihloo et al., 2014; Mirzaei et al., 2018) HPV is a non-enveloped virus, and has double stranded DNA (Favre, 1995). E6 and E7 are the HPV oncoproteins with significant roles in cervical cancer development, and with disrupting tumor suppression like P53, E6 is able to accelerate the progression of cancer (Thomas et al., 1999); in addition, binding E7 to Rb promotes the degradation of tumor suppressor protein proteasome (Syrjänen and Syrjänen, 1999).

Furthermore, many bacteria are able to live in vaginal site, especially gram- negative ones. When the balance of immune system and this flora destroyed, bacteria can replicate; therefore, bacteria tend to produce some inflammatory mediators, probably (Donders et al., 2014). One of the common agents in structure of flora, especially in gram-negative bacteria is cell wall, called Lipopolysaccharide (LPS) (Sharma et al., 2014) LPS can induce NF-kB and TLR-4 expression, which call immune cells to inflammatory site.

Metastasis stage is a hardly curable disease in all kind of cancers, and cervical metastasis is no exception. In invasive cervical cancer, connecting adhesive proteins are reduced between cells; hence, tumor cells are able to spread in all parts of body, replicate, and create...
tumor cell (Granados López and López, 2014; Insing et al., 2014) This process has been defined as epithelial to mesenchyme transition (EMT), related to the low expression of connecting inter cellular proteins (Kalluri and Neilson, 2003) E-cadherin is one of the important EMT related protein families, which is involved in the adhesion between cells. Some other EMT related proteins like ZEB-1 and Snail may also regulate the expression of E-cadherin (Grootelcaes and Frisch, 2000), and reduce the expression of adhesive cell proteins; therefore, metastasis can occur (Vaure and Liu, 2014).

It is supposed that, the level of EMT related genes and HPV oncoproteins (E6, E7) and some microRNAs such as mir-9, mir-192 expression can have an effect on cancer progression. Virtually, it has been reported, there is a strong relationship between cervical cancer and HPV; however, the effect of bacterial LPS on cervical cancer, and the relationship between HPV and LPS on EMT related genes expression in cervical cancer is not clear. In this study, human cervical cancer cell line (Hela) was treated with LPS, and the expression of EMT-related genes was evaluated.

Materials and Methods

Cell culture and treatment

HeLa cell line (cervical carcinoma), which is HPV positive, cultured in Dulbecco’s Modified Eagle Medium (DMEM, gibco ) with 2 mM/ L-glutamine (Sigma-Aldrich, MO, USA), supplemented with 10% fetal bovine serum (Life Technologies, Camarillo, CA, USA), and 100 units/ ml penicillin/streptomycin (Invitrogen, Life Technologies, Camarillo, CA, USA). Cells were incubated in 37°C and 5% CO₂ ( IR.SBMU.MSP.REC.1396.879.).

Lipopolysaccharide preparation

Escherichia coli (E.coli) O111:B4 Lipopolysaccharide (LPS) was prepared from (Sigma-Aldrich, MO, USA). In order to make five different concentrations (1, 2, 5, 10, and 20 ug/l), LPS was dissolved in phosphate buffered saline (PBS).

Proliferation assay

Escherichia coli O111:B4 Lipopolysaccharide (LPS) was evaluated by MTT assay with using the 3-(4, 5-Dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide (MTT). Briefly, HeLa cell line was incubated in 96 well-plates with a condition of 37°C and 5% CO₂ until cells reach sufficient population. Medium containing LPS and after that incubated in 95°C and after that incubated in 95°C for 5 minutes. All cDNAs were diluted (2 times in sterile water), and as template for quantitative real-time PCR analysis.

Quantitative real-time PCR

The expression of cellular genes (Snail, E-cadherin, ZEB-1, and GAPDH) and microRNA (microRNAs -9,192) were analyzed by using the BIOFACT™ 2X real-time PCR master mix (for SYBR Green I; BIOFACT, South Korea); Furthermore, in this study, the expression of E6 and E7 genes in HPV positive cell line (HeLa cell line) were evaluated.

SYBR master mix, 1 μl of forward primer, 1 μl of reverse primer, 2 μl of 1/2 diluted cDNA and 6 μl of sterile water were combined. To confirm our results, all samples were run in triplicate at the same time. The primers of all genes were documented in Table 1.

We have two temperature profiles for cellular and microRNA genes: 95°C for 10 minutes; 40 cycles of 95°C for 30 Seconds, 55°C for 30 Seconds, and 72°C for 30 Seconds for cellular genes, and 95°C for 10 minutes;40 cycles of 95°C for 20 Seconds, 60°C for 20 Seconds, and 72°C for 20 Seconds for microRNA. Melting curve program was between 60 and 95°C.

The threshold cycle (ct) of all genes in treated cell line was compared with the ct of control cell line, then all cellular and microRNA were normalized with housekeeping gene (GAPDH and u6), respectively, by the 2–ΔΔct method.

Statistical analysis

Graph-Pad Prism software was used to analyze the difference between groups, and ANOVA test shows the comparison between mRNA levels. We consider the P-value less than 0.05 (P<0.05) as statistically significant.
for the differences.

Results

Optimization of the LPS concentration

The best LPS concentrations to measure the expression of cellular and microRNA are 1, 5 and 10 ug/L of LPS in 24, 48 and 72 hours. The data was not shown.

LPS down-regulates the expression of E-cadherin

After treating with LPS in 24, 48 and 72 hours, RNA was extracted by RNX-plus, and cDNA was synthesized. Quantitative real-time was employed to analyze EMT related genes. The E-cadherin has revealed a noticeable down-regulation in all times of 10ug/L of LPS and 24 hours after treating with 5ug/L of LPS (Figure 1).

LPS up-regulates the expression of Snail

In our study, 5 and 10ug/L of LPS can have a strong influence on expression of Snail. We have found in this period of time Snail has an up-ward trend expression, but 1ug/L of LPS ,Snail has not a meaningful increase (Figure 2).

ZEB-1 is over expressed by treating LPS

Analysis of another gene (ZEB-1) has demonstrated a meaningful increase in 48 and 72 hours after treating with 10ug/L of LPS in HeLa cell line. Generally, LPS induces an increase in ZEB-1 expression at 1 and 5ug/L of LPS, 10ug/L of LPS in HeLa cell line. Generally, LPS induces an increase in ZEB-1 expression at 1 and 5ug/L of LPS,

| Primer name              | Sequence                        |
|-------------------------|---------------------------------|
| ZEB-1 (Forward)         | 5'-GATGATGAAATGCGAGTGCAGATGC-3' |
| ZEB-1 (Reverse)         | 5'-CTGGGTCTCTTCTAGGTCGC-3'      |
| Snail 1 (Forward)       | 5'-CAGACCCACTCAGATGCAA-3'       |
| Snail 1 (Reverse)       | 5'-CATATTAGTCACACCTCGT-3'       |
| E7 (Forward)            | CCGTCAGATGAGCTAGCTAAGGCAAC      |
| E7 (Reverse)            | CCGAGATCTTACTGCTGGGATGCACACC   |
| E-cadherin (Forward)    | AGGGGTTAACGCAACAGCA             |
| E-cadherin (Reverse)    | GGTATTGGGGGACATACGAT           |
| GAPDH (Forward)         | ATGTTCGTAGTGCTTCTGAA            |
| GAPDH (Reverse)         | GGTGCATACGTTGGTGTT             |
| U6 (Forward)            | 5'-GAGAAGATTACATGGCCCCT-3'     |
| U6 (Reverse)            | 5'-ATATGGAAACGCTTCAGGAATTTGC-3'|
| miRNA -9-5P (Forward)   | 5'-CTTTGTTATCTAGCTGTAGGACTGCTG-3' |
| Forward miRNA -192-5P   | 5'-CTGACCTAGTAAATCGACCGT-3'    |
| Universal Reverse       | 5'-ATCCAGTGCCAGGTTCCG-3'       |

Table 1. the Primer of Cellular Genes and microRNA, Evaluated with Real-Time PCR

Figure 1. HeLa Cell Line was Treated with LPS by 1, 5 and 10 mmol/L, when the Cells Reached 80% Confluency. In all times of 10 mmol/L of LPS and 24 hours after treating with 5 mmol/L of LPS, E-cadherin expression have been raised.

Figure 2. HeLa Cell Line have been Cultured with DMEM Containing LPS at Concentration of 1, 5 and 10 mmol/L. Snail Expression was Revealed a Remarkable Growth in 5 and 10 mmol/L of LPS.
but it was not meaningful, statistically (Figure 3).

LPS increases E7 HPV expression
LPS is able to increase the level of E7 HPV expression, but in our study, we have not found any meaningful relationship between LPS and the expression of E7 HPV (Figure 4).

MicroRNA-9 and 192 expression is up-regulated by LPS
We analyzed two microRNAs (microRNA-9 and 192) expression. There are an increase in amount of microRNA-9 (almost 12 times) and 192 (almost 8 times) expression (Figure 5).

Discussion
Epigenetic changes may result in changes in gene expression. EMT related genes, such as Snail, ZEB-1 are important gene groups help cells in different organs to connect each other, especially Snail, E-cadherin, and ZEB-1. Down, or up-regulation of these genes can have some effects on cancer progression and invasive
metastasis (Adhya and Basu, 2010).

Cervical cancer is the second most important cancer in women, all around the world (Ferlay et al., 2012), and risk factors, ranging from pollution, radiation, smoking and consumption of alcohol to infectious diseases can affect the EMT related genes expression (Scheurer et al., 2014). We studied the effect of gram-negative bacterial cell wall.

LPS, which is known endotoxin, is a vital structure in all kinds of bacteria, composed of lipid and polysaccharide. This molecule has a complex structure, which can be divided in 3 parts: outer hydrophilic O-antigenic polysaccharide side chain, a hydrophilic core polysaccharide and a hydrophobic lipid, and this hydrophobic lipid acts as an endotoxin (Kilár et al., 2013). We have purchased E.coli O111:B4 LPS to find what might be the relation between bacterial flora and HPV expression, and how EMT related genes expression changes.

Our result shows, 10 ug/L of LPS is able to decrease 1.5 times E-cadherin expression. Other studies have the same results for example, Porphyromonas gingivalis-LPS was examined in human gingival epithelial cells, and E-cadherin expression destruct epithelial barrier function (Abe-Yutori et al., 2017) LPS on some cells like macrophages can activate TNF and IL-6 secretion by Raw264.7 pathway, which induces a decrease in E-cadherin expression (Van den Bosche et al., 2015). Other studies have used some LPS antagonist, for example it has studied the effects of Shikonin, an antagonist of LPS, and observed that it can prevent down-regulation of E-cadherin from the effect of LPS in breast cancer cell line (Hong et al., 2015).

Another important EMT related genes is Snail, after treating HeLa cell line with LPS, considerable increase in amount of Snail is observed. Briefly, LPS at concentration of 5 and 10 ug/l is able to increase the expression of Snail, in HeLa cell line, almost duplicate and triplicate, respectively. This result is similar to some other studies, for example in study of Jing, when human hepatocellular carcinoma cell line (HCC) is treated with LPS. In this case in HCC, LPS is able to activate TLR-4 receptor, promoted NF-kB signaling, and Snail increases, subsequently (Jing et al., 2012), furthermore; activation of TLR-4 by LPS can also induce VEGF, Therefore; VEGF causes increase in Snail expression and metastasis progress (Zhu et al., 2016). The study has offered to use Curcumin as an antagonist of LPS. Curcumin can regulate the snail over-expression, induced by LPS (Huang et al., 2013).

We have supposed, LPS with effecting on Snail can lose E-cadherin expression. It seems, Snail is a repressor binding to the E-cadherin promoter, and leads to lose of E-cadherin expression (Cano et al., 2000; Takagi et al., 1998). Actually, in order to repress E-cadherin promoter, Snail requires histone deacetylase activity (Jiang et al., 2013) Peinado has suggested, trichostatin a can inhibit histone deacetylase activity, therefore; snail is not able to reduce E-cadherin expression (Peinado et al., 2014).

In this study, we examined the ZEB-1 expression by treating HeLa cell line with LPS. 10ug/L of LPS is able to increase in ZEB-1 expression. It seems, ZEB-1 with the same mechanism of snail can inhibit the expression of E-cadherin (Comijn et al., 2001). We have supposed, LPS by increasing ZEB-1 level can down-regulate the E-cadherin expression. Recently, it has been suggested that Claudin-1, like LPS can up-regulate ZEB-1 expression, consequently E-cadherin is repressed (Singh et al., 2011).

HeLa is a HPV positive cell line, and E7 integrated in HeLa genome. Our result is demonstrated, LPS can cause a slight increase in amount of E7 expression, but there is no meaningful correlate between LPS and E7. Probably, E7 may repress the E-cadherin by DNA methyltransferase 1 (DNMT1) expression. Launson et al., (2010) Caberg also has supposed, decrease in E-cadherin expression perhaps result from repressing RB by E7 (Caberg et al., 2008). One of other mechanisms has reported that E7 may be over-express cdc6, which is one of key factors to reduce E-cadherin expression (Faghihloo et al., 2016). We suppose, LPS by over-expression of E7, reduce E-cadherin. It has shown valproic acid has the same effect on E7, and E-cadherin down-regulate, subsequently. (Faghihloo et al., 2016)

MicroRNA is able to regulate EMT genes (Abba et al., 2016) Observations have shown, different microRNAs can mediate the expression of E-cadherin (Wong et al., 2014). Furthermore, in this study, LPS treatment was able to increase in amount of microRNA-9 and 192 expressions almost 12 and 8 times, respectively. The result of other studies confirm our experiment for example, Flavia Bazzoni has suggested, LPS activate TLR-4, therefore NF-kB signaling initiate, and microRNA-9 increase (Bazzoni et al., 2009). Wu et al., (2012) also found after treating LPS, microRNA-192 over-expressed. Probably, microRNA-9 is able to suppress E-cadherin (Zhou et al., 2017) LPS over-expresses microRNA-9 and 192, and these microRNAs can down-regulate E-cadherin expression, probably.

In conclusion, LPS is able to have effects on EMT related genes, such as E-cadherin, Snail and ZEB-1; therefore, gram-negative bacterial infectious diseases in cervix probably can have the same mechanism, and the cervical cancer progression can occur due to LPS in gram- negative bacteria in this site. To prevent cervical cancer progression in early stages, using appropriate antibiotics, is suggested.
