ESTIMATES IN THE HARDY-SOBOLEV SPACE OF THE ANNULUS
AND STABILITY RESULT

IMED FEKI, Department of Mathematics, Faculty of Sciences, Sfax University,
B.P 1171, Sfax 3018, Tunisia

Abstract. The main purpose of this work is to establish some logarithmic estimates of optimal type in the Hardy-Sobolev space \( H^{k,\infty} \), \( k \in \mathbb{N}^* \) of an annular domain. These results are considered as a continuation of a previous study in the setting of the unit disk by L. Baratchart and M. Zerner: On the recovery of functions from pointwise boundary values in a Hardy-sobolev class of the disk. J.Comput.Appl.Math 46(1993), 255-69 and by S. Chaabane and I. Feki: Logarithmic stability estimates in Hardy-Sobolev spaces \( H^{k,\infty} \). C.R. Acad. Sci. Paris, Ser. I 347(2009), 1001-1006.

As an application, we prove a logarithmic stability result for the inverse problem of identifying a Robin parameter on a part of the boundary of an annular domain starting from its behavior on the complementary boundary part.

Keywords: Annular domain; Poisson Kernel; Hardy-Sobolev space; Logarithmic estimate; Robin parameter

1. INTRODUCTION

The purpose of this paper is to establish logarithmic estimates of optimal type in the Hardy-Sobolev space \( H^{1,\infty}(G_s) \) where \( s \in ]0,1[ \) and \( G_s \) is the annulus of radius \( (s,1) \). More precisely we study the behavior on the whole boundary of the annulus \( G_s \) with respect to the uniform norm of any function \( f \) in the unit ball of the Hardy-Sobolev space \( H^{1,\infty}(G_s) \) starting from its behavior on any open connected subset \( I \subset \partial G_s \) with respect to the \( L^1 \)-norm. Our result can be viewed as an extension of those established in [7,15,16].

The particular case where \( I = \Gamma \) has been considered by L. Leblond, M. Mahjoub and J. R. Partington in [15]. The authors proved in this case that the \( L^2 \)-norm of

This research has been supported by the Laboratory of Applied Mathematics and Harmonic Analysis: L. A. M. H. A. LR 11ES52
any function \( f \) in the unit ball of the Hardy-Sobolev space \( H^{1,2}(G_s) \) on the inner boundary \( sT \) is controlled by the corresponding norm taken on the outer boundary \( T \). In the same context, H. Meftahi and F. Wieolonsky gave recently in [10] an explicit logarithmic inequality exhibiting the dependence with respect to the inner radius \( s \) of the above control. The first estimate of this kind remounts to L. Baratchart and M. Zerner where the authors proved in [2], a \( \log/\log \) control with \( L^2 \)-norm in the Hardy-Sobolev space \( H^{1,2} \) of the unit disk \( \mathbb{D} \). In [1], Alessandrini and al. have proved with quite different method an estimate of \( 1/\log^\alpha \)-type, \( 0 < \alpha < 1 \). Recently, the author of this paper together with S. Chaabane [5] proved in the uniform norm some optimal logarithmic estimates in the Hardy-Sobolev space \( H^{k,\infty} \) of the unit disk \( \mathbb{D} \).

For more regular functions, we improve inequality (3.6) amid the class of bounded \( H^{k,\infty}(G_s) \) functions. These logarithmic estimates allow us to prove stability result for the inverse problem of recovering a Robin coefficient on a part of the boundary of an annular domain starting from its behavior on the complementary boundary part. The particular case where the inaccessible part of the boundary is the inner circle has been proved in [15]. We can also refer the reader to [1, 5, 7, 15, 16] for stability estimates in the case of simply or doubly connected domains.

2. Notation and preliminary results

Let \( \mathbb{D} \) be the open unit disk in \( \mathbb{C} \) with boundary \( T \) and let \( G_s \) denote the annulus:

\[
G_s = \{ z \in \mathbb{C}; \ s < \left| z \right| < 1 \}; \quad 0 < s < 1.
\]

The boundary of the annular domain \( G_s \) consists of two pieces \( sT \) and \( T \): \( \partial G_s = sT \cup T \). Let \( I \) be any connected open subset of the boundary of \( G_s \) and let \( J = \partial G_s \setminus I \). We also equip the boundary \( \partial G_s \) with the usual Lebesgue measure \( \mu \) normalized so that the circles \( T \) and \( sT \), each have unit measure. Furthermore, we denote by \( \lambda = \mu(I)/(2\pi) \), we assume that \( \lambda \in [0,1] \) and we defined by:

\[
\| f \|_{L^1(I)} = \frac{1}{2\pi\lambda} \int_I |f(re^{i\theta})|d\theta,
\]

for the \( L^1 \)-norm of \( f \) on \( I \), where \( r = s \) if \( I \subset sT \) and \( r = 1 \) if \( I \subset T \).

In the sequel, the Hardy space \( H^\infty(G_s) \) is defined as the space of bounded analytic functions on \( G_s \). According to (101, Theorem 7.1), the Hardy space \( H^\infty(G_s) \) can be identified to the direct sum:

\[
H^\infty(G_s) = H^\infty(\mathbb{D}) \oplus H^\infty_0(\mathbb{C} \setminus s\mathbb{D}),
\]

for the \( L^1 \)-norm of \( f \) on \( I \), where \( r = s \) if \( I \subset sT \) and \( r = 1 \) if \( I \subset T \).
where the Hardy space $H_0^\infty(\mathbb{C} \setminus s\mathbb{D})$ is defined as the set of analytic functions in $\mathbb{C} \setminus s\mathbb{D}$, with a zero limit at infinity. Hence we can regard it as a closed subspace $H^\infty(\partial G_s)$ of $L^\infty(\partial G_s)$. Equivalent definitions of Hardy spaces on annular domains are discussed by several authors \([3, 10, 11, 18, 19]\). We can also refer the reader to \([14]\) for a more comprehensive details on Hardy spaces.

For $k \in \mathbb{N}^*$, we designate by $H_k,^\infty(G_s)$, the Hardy-Sobolev space of order $k$ of the annulus:

$$H_k,^\infty(G_s) = \{ f \in H^\infty(G_s) / f^{(j)} \in H^\infty(G_s), \quad j = 0, ..., k \},$$

where $f^{(j)}$ denotes the $j^{th}$ complex derivative of $f$. We endow $H_k,^\infty(G_s)$ with the norm inherited from the space $L^\infty(\partial G_s)$:

$$||f||_{H_k,^\infty(G_s)} = \max_{0 \leq j \leq k} \left( ||f^{(j)}||_{L^\infty(sT)} + ||f^{(j)}||_{L^\infty(T)} \right).$$

Let $B_{k,^\infty} = \{ f \in H_k,^\infty(G_s); \ ||f||_{H_k,^\infty(G_s)} \leq 1 \}$ be the closed unit ball of $H_k,^\infty$.

Next, we introduce the Poisson kernel $p$ for the annulus $G_s$. Following Sarason \([19]\) and Hwai \([13]\), we consider the following holomorphic function:

$$F(t, r) = \frac{1}{2q_0} \tanh \left( -\frac{\pi t}{2q_0} + i\left( \frac{\pi}{4} + \frac{\pi}{2q_0} \log \frac{r}{\sqrt{s}} \right) \right),$$

where $q_0 = -\log s$, $0 < s < r < 1$ and $t \in \mathbb{R}$.

The imaginary part $P(t, r)$ of $F(t, r)$ is the harmonic function given by:

$$P(t, r) = \frac{1}{2q_0} \frac{\cos \left( \frac{\pi}{q_0} \log \frac{r}{\sqrt{s}} \right)}{\cosh \frac{\pi t}{2q_0} - \sin \left( \frac{\pi}{q_0} \log \frac{r}{\sqrt{s}} \right)}.$$

Referring to \([13\text{ p. 92}]\), we recall the following lemma.

**Lemma 2.1.** The harmonic function $P$ satisfies the following properties:

i) $P(t, r) > 0$ for $s < r < 1$ and $t \in \mathbb{R}$.

ii) $\int_{-\infty}^{+\infty} P(t, r) \, dt + \int_{-\infty}^{+\infty} P(t, \frac{s}{r}) \, dt = 1$ for $s < r < 1$.

iii) There exists a non negative constant $C$ such that for every $|t| \leq \pi$ and $j$ large enough, we have:

$$|P(t + 2\pi j, r)| \leq \min \left( \frac{C}{j^4}, \frac{C \cos \left( \frac{\pi}{q_0} \log \frac{r}{\sqrt{s}} \right)}{t^4} \right).$$
This lemma allows us to define the Poisson kernel $p$ for the annular domain $G_s$:

$$p(t, r) = \sum_{j=-\infty}^{+\infty} P(t + 2\pi j, r) \quad \text{for} \quad |t| \leq \pi \quad \text{and} \quad s < r < 1.$$ 

We also have from [19], the following lemma.

**Lemma 2.2.**

i) $p(t, r)$ is a harmonic function on the annulus $G_s$.

ii) $p(t, r) > 0$ for $s < r < 1$ and $|t| \leq \pi$.

iii) $\frac{1}{2\pi} \int_0^{2\pi} p(t, r) \, dt + \frac{1}{2\pi} \int_0^{2\pi} p(t, \frac{s}{r}) \, dt = 1$ for $s < r < 1$.

In the next lemma, we recall the Poisson-Jensen formula for the annulus, see ([19 p.25]). This will be of interest later.

**Lemma 2.3.** Let $f \not\equiv 0$ be a function in $H^q(G_s)$ for $1 \leq q \leq \infty$. Then for all $re^{it} \in G_s$, we have

$$\log |f(re^{it})| \leq \frac{1}{2\pi} \int_0^{2\pi} p(t, r) \log |f(e^{it})| \, dt + \frac{1}{2\pi} \int_0^{2\pi} p(t, \frac{s}{r}) \log |f(se^{it})| \, dt.$$ 

3. Optimal logarithmic estimates in $H^{k,\infty}$

Our objective in this section, is to establish some logarithmic estimates in the Hardy-Sobolev space $H^{k,\infty}(G_s)$, $k \in \mathbb{N}^*$ that can be viewed as a continuation of the results already established by [5, 15, 16]. We start by recording a variant of the Hardy-Landau-Littlewood inequality which will crucially be used in the proofs of Theorem 3.5 and Theorem 3.7, see [4, chapter VIII p.147] and [17].

**Lemma 3.1.** Let $I$ be a bounded interval and let $j \in \mathbb{N}$ such that $j \geq 2$. Then, there exists a nonnegative constant $C_{\infty}(I, j)$ such that

$$(3.1) \quad ||g'||_{L^\infty(I)} \leq C_{\infty}(I, j) ||g||_{W^{j,\infty}(I)}^{1/j} ||g||_{L^\infty(I)}^{1-1/j} \quad \text{for all} \quad g \in W^{j,\infty}(I).$$

Next, we give a lower bound for the Poisson kernel $p$ which will be useful for the proof of Lemma 3.3.

**Lemma 3.2.** There exists a nonnegative constant $C_s$ depending only on $s \in ]0, 1[$, such that for every $|t| \leq \pi$, we have

$$p(t, r) \geq \frac{2C_s}{\log s} (\log s - \log r) \quad \text{if} \quad s < r \leq \sqrt{s}.$$

$$p(t, r) \geq \frac{2C_s}{\log s} \log r \quad \text{if} \quad \sqrt{s} \leq r < 1.$$
Proof. Remind the reader that \( q_0 = -\text{logs} \). Let \( r \in [s, 1] \), then \( \frac{\pi}{q_0} \text{logs} \left( \frac{r}{\sqrt{s}} \right) \in ] - \frac{\pi}{2}, \frac{\pi}{2} [ \) and therefore

\[
P(t + 2\pi j, r) \geq \frac{1}{2q_0} \left( 1 + \cosh \frac{\pi}{q_0} (t + 2\pi j) \right) \cos \left( \frac{\pi}{q_0} \text{logs} \left( \frac{r}{\sqrt{s}} \right) \right).
\]

Since

\[
C_s(t) = \frac{1}{2q_0} \sum_{j=-\infty}^{+\infty} \frac{1}{1 + \cosh \frac{\pi}{q_0} (t + 2\pi j)} < \infty \quad \text{for every } |t| \leq \pi,
\]

we deduce that

\[
(3.2) \quad p(t, r) \geq C_s \cos \left( \frac{\pi}{q_0} \text{logs} \left( \frac{r}{\sqrt{s}} \right) \right), \quad C_s = \inf_{|t| \leq \pi} C_s(t).
\]

In the case where \( r \in [s, \sqrt{s}] \), we have \( \frac{\pi}{q_0} \text{logs} \left( \frac{r}{\sqrt{s}} \right) \in ] - \frac{\pi}{2}, 0 [ \). Using the inequality \( \cos x \geq -\frac{2}{\pi} x + 1 \) for \( x \in ] - \frac{\pi}{2}, 0 [ \), we obtain

\[
p(t, r) \geq \frac{2C_s}{\log s} (\log s - \log r).
\]

Otherwise, \( r \in [\sqrt{s}, 1] \) and \( \frac{\pi}{q_0} \text{logs} \left( \frac{r}{\sqrt{s}} \right) \in [0, \frac{\pi}{2}] \). Using the inequality \( \cos x \geq -\frac{2}{\pi} x + 1 \) for \( x \in [0, \frac{\pi}{2}] \), we obtain

\[
(3.3) \quad p(t, r) \geq \frac{2C_s}{\log s} \log r,
\]

which achieves the proof of the Lemma.

We adapt the same arguments developed in [2, lemma 4.1] with some slight shifts to prove the following

**Lemma 3.3.** Let \( g \in H^\infty(G_s) \) and \( m \geq ||g||_{L^\infty(\partial G_s)} \). Then, for every \( z \in \mathbb{C} \), we have

\[
|g(z)| \leq m \left\| \frac{g}{m} \right\|_{L^1(I)} 2\frac{C_s}{\log s} (\log s - \log |z|) \quad \text{if } s < |z| \leq \sqrt{s},
\]

\[
|g(z)| \leq m \left\| \frac{g}{m} \right\|_{L^1(I)} \log |z| \quad \text{if } \sqrt{s} \leq |z| < 1.
\]
Proof. Let $h = \frac{g}{m}$ and let $z = re^{it} \in G_s$. From Lemma 2.3 and the fact that $\log|h|$ is a non positive subharmonic function, we get

$$
\log(|h(re^{it})|) \leq \frac{1}{2\pi} \int_0^{2\pi} p(t - \theta, r) \log(|h(e^{i\theta})|) \frac{d\theta}{2\pi} + \frac{1}{2\pi} \int_0^{2\pi} p(t - \theta, \frac{s}{r}) \log(|h(se^{i\theta})|) \frac{d\theta}{2\pi}.
$$

If we suppose that $I \subset T$, then by using the facts that $p(t, r) > 0$ and that $\log|h| \leq 0$, we deduce that

$$
\log(|h(re^{it})|) \leq \frac{1}{2\pi} \int_I p(t - \theta, r) \log(|h(e^{i\theta})|) \frac{d\theta}{2\pi},
$$

consequently, from Lemma 3.2, we obtain

$$
\log(|h(z)|) \leq \frac{2\lambda C_s}{\log s} \left( \log s - \log|z| \right) \frac{d\theta}{2\pi} \quad \text{if} \quad s < |z| \leq \sqrt{s},
$$

$$
\log(|h(z)|) \leq \frac{2\lambda C_s}{\log s} \log r \int_I \log(|h(e^{i\theta})|) \frac{d\theta}{2\pi} \quad \text{if} \quad \sqrt{s} < |z| < 1.
$$

By using Jensen’s inequality, we deduce that

$$
|g(z)| \leq m \left\| \frac{g}{m} \frac{2\lambda C_s}{\log s} (\log s - \log|z|) \right\|_{L^1(I)} \quad \text{if} \quad s < |z| \leq \sqrt{s},
$$

$$
|g(z)| \leq m \left\| \frac{g}{m} \frac{2\lambda C_s}{\log s} \log|z| \right\|_{L^1(I)} \quad \text{if} \quad \sqrt{s} < |z| < 1.
$$

If we suppose that $I \subset sT$, then by using again the facts that $p(t, r) > 0$ and that $\log|h| \leq 0$, we get

$$
\log(|h(re^{it})|) \leq \frac{1}{2\pi} \int_I p(t - \theta, \frac{s}{r}) \log(|h(se^{i\theta})|) \frac{d\theta}{2\pi},
$$

and the proof can be completed in a similar way as in the first case.

Let $f \in H^\infty(G_s)$ and let $t$ be a real number such that $|t| \leq \pi$. We designate by $F_t$ the radial primitive of $f$ that vanishes at $s$ and defined by:

$$
F_t(r) = \int_s^r f(xe^{it}) \, dx \quad \text{for all} \quad r \in I = [s, 1[.
$$

From Lemma 3.3, we obtain
Lemma 3.4. Let \( f \in H^\infty(G_s) \) and \( m \geq \|f\|_{L^\infty(\partial G_s)}. \) We suppose that \( f \) is not identically zero and that \( \|f\|_{L^1(I)} < e^{-\frac{q_0m}{2\lambda C_s}}. \) Then for all \( |t| \leq \pi \) and \( r \in ]s,1[ \) we get

\[
|F_t(r)| \leq \frac{(2s + 1)q_0m}{|2\lambda C_s \ log \|f\|_{L^1(I)}|}
\]

**Proof.** Let \( |t| \leq \pi \) and let \( r \in ]s,1[. \) From \([3.4]\) and the monotonicity of the function \( \eta(y) = \int_s^y |f(xe^{it})| dx, \) we have

\[
|F_t(r)| \leq \int_s^{\sqrt{\pi}} |f(xe^{it})| \ dx + \int_{\sqrt{\pi}}^1 r |f(xe^{it})| \ dx,
\]

then according to Lemma \([3.3]\) we get

\[
|F_t(r)| \leq m \int_s^{\sqrt{\pi}} \left| \frac{f}{m} \right|_{L^1(I)}^{\frac{2\lambda \logx}{L_1^1(I)}} dx + m \int_{\sqrt{\pi}}^1 \left| \frac{f}{m} \right|_{L^1(I)}^{\frac{2\lambda \logx}{L_1^1(I)}} dx
\]

\[
\leq \frac{ms}{|1 + \frac{2\lambda C_s}{q_0} \ log \|f\|_{L^1(I)}|} + \frac{m}{|1 - \frac{2\lambda C_s}{q_0} \ log \|f\|_{L^1(I)}|}.
\]

From the assumption that \( \|f\|_{L^1(I)} < e^{-\frac{q_0m}{2\lambda C_s}}, \) we have

\[
\frac{1}{|1 + \frac{2\lambda C_s}{q_0} \ log \|f\|_{L^1(I)}|} \leq \frac{2}{|2\lambda C_s \ log \|f\|_{L^1(I)}|},
\]

and therefore, we conclude the desired inequality

\[
|F_t(r)| \leq \frac{(2s + 1)q_0m}{|2\lambda C_s \ log \|f\|_{L^1(I)}|}.
\]

We are now in a position to establish the main control theorem in the Hardy-Sobolev space \( H^{1,\infty}(G_s). \)

**Theorem 3.5.** Let \( f \in B_{1,\infty} \) and \( m \geq \|f\|_{L^\infty(\partial G_s)}. \) We suppose that \( f \) is not identically zero and that \( \|f\|_{L^1(I)} < e^{-\frac{q_0m}{2\lambda C_s}}. \) Then

\[
\|f\|_{L^\infty(\partial G_s)} \leq \frac{C_2^2(\mathcal{I}, 2)/(1 - 1/2c)}{|\lambda_0 Log \|f\|_{L^1(I)}|},
\]

where \( \lambda_0 = \min \left( \frac{2\lambda C_s}{(1 + 2s_0 \ q_0)^{1/2}}, \right). \)

Moreover, for \( I = \mathbb{T}, \) there exists a sequence of functions \( f_n \in B_{1,\infty} \) such that

\[
\lim_{n \to +\infty} \|f_n\|_{L^\infty(\partial G_s)} \left| Log \|f_n\|_{L^1(I)} \right| \geq s |logs|.
\]
Proof. Let for every $|t| \leq \pi$, $F_t$ be the radial primitive of $f$ defined by equation (3.4) and let $m \geq \max(||f||_{L^\infty(\partial G_s)}, 1)$. According to Lemma 3.4, we have

$$|F_t(r)| \leq \frac{m}{|\lambda_0 \ log \frac{r}{m||f||_{L^1(I)}}|}, \quad \text{where} \quad \lambda_0 = \min(1, \frac{2\lambda C_s}{(1 + 2s) q_0}).$$

(3.8)

Since $f \in B_{1,\infty}$, then according to the Hardy-Landau-Littlewood inequality (3.1), there exists a non negative constant $C = C_{\infty}(I, 2)$ such that

$$||f||_{L^\infty(\partial G_s)} \leq C ||F||_{L^\infty(G_s)}^{1/2},$$

and consequently,

$$||f||_{L^\infty(\partial G_s)} \leq C \left(\frac{m}{|\lambda_0 \ log \frac{m||f||_{L^1(I)}}{m||f||_{L^1(I)}}|} \right)^{1/2}.$$

(3.9)

Making use of (3.8) and (3.9) for the new estimate $m_1$ of $||f||_{L^\infty(\partial G_s)}$, one obtains

$$||f||_{L^\infty(\partial G_s)} \leq C \left(\frac{m_1}{|\lambda_0 \ log \frac{m_1||f||_{L^1(I)}}{m_1||f||_{L^1(I)}}|} \right)^{1/2}.$$

(3.10)

Let $\eta(x) = x|\log x|^{1/2}$ and $\alpha = 1 - \frac{1}{2}$. Since $m \geq 1$, $\lambda_0 \leq 1$ and $g(x) \leq x^\alpha$ in $[0, 1]$, we get

$$\left|\frac{f}{m_1}\right|_{L^1(I)} = \left(\frac{m\lambda_0}{C}\right)^{1/2} \eta \left(\left|\frac{f}{m}\right|_{L^1(I)}\right) \leq \left|\frac{f}{m}\right|_{L^1(I)}.$$

From (3.10) and the monotonicity of the mapping $\varepsilon(x) = \frac{1}{\log x}$, we obtain

$$||f||_{L^\infty(\partial G_s)} \leq C^{1+1/2} \left(\frac{m(1/2)^{2} \left(\frac{1}{2}\right)^{1/2}}{|\lambda_0 \ log \frac{||f||_{L^1(I)}}{||f||_{L^1(I)}}|^{1/2(1+1/2)}}\right).$$

Proceeding thus repeatedly, we obtain for every $k \in \mathbb{N}^*$,

$$||f||_{L^\infty(\partial G_s)} \leq C_k^{b_k} \left(\frac{m(1/2)^{2} \left(\frac{1}{2}\right)^{1/2}}{|\lambda_0 \ log \frac{||f||_{L^1(I)}}{||f||_{L^1(I)}}|^{a_k}}\right),$$

where $a_k$, $b_k$ and $c_k$ are three recurrent sequences satisfying

$$a_1 = \frac{1}{2} \left(1 + \frac{1}{2}\right), \quad b_1 = 1 + \frac{1}{2}, \quad c_1 = \frac{1}{2}, \quad a_{k+1} = \frac{1 + a_k}{2}, \quad b_{k+1} = 1 + \frac{b_k}{2}, \quad c_{k+1} = \frac{1 + c_k}{2}.$$
The proof of inequality (3.6) is completed by letting \( k \to +\infty \).

To prove equation (3.7), we consider the sequence of functions, \( u_n(z) = \frac{1}{z^n}; \ n \in \mathbb{N}^* \).

Let \( I = \mathbb{T} \) and let \( f_n = \frac{u_n}{\|u_n\|_{H^1,\infty(G_s)}} \) be the \( H^1,\infty(G_s) \) normalized function of \( u_n \). Then,

\[
\|f_n\|_{L^\infty(\partial G_s)} = \frac{1}{n(1 + s^n)}, \quad \|f_n\|_{L^\infty(I)} = \frac{1}{n(1 + \frac{1}{s^n})} \quad \text{and} \quad \|f_n\|_{L^\infty(\partial G_s)} = 1 + \frac{1}{s^n}.
\]

Let \( A_n = \|f_n\|_{L^\infty(\partial G_s)} \mid \log \|f_n\|_{L^1(I)} \rangle \), then we have

\[
A_n = s^{1 - \frac{s^n}{n(1 + s^n)}} \left| \log n - \log (1 + s^n) - (n + 1) \log s \right|.
\]

Hence, \( \lim_{n \to \infty} A_n = s|\log s| \) and this completes the proof.

**Remark 1.** The estimate (3.6) still holds in more general situations of a smooth doubly-connected domain \( G \subset \mathbb{R}^2 \) (we can see [12] for more details on conformal mapping).

**Remark 2.** The estimate (3.6) of Theorem 3.5 is of optimal type: it is impossible to find a function \( \varepsilon \) which tends to zero at zero such that for all \( f \in B_{1,\infty} \),

\[
\|f\|_{L^\infty(\partial G_s)} \leq \frac{1}{\log \|f\|_{L^1(I)}} \varepsilon \left( \|f\|_{L^1(I)} \right).
\]

**Remark 3.** The estimate (3.6) of Theorem 3.5 is false in the general setting of bounded function \( f \in H^\infty(G_s) \) (we consider the \( H^\infty \)-normalized function of \( u_n \)).

**Remark 4.** The question under investigations is to give the optimal constant \( C \) in equation (3.6).

\[
C = \max_{f \in B_{1,\infty}} \|f\|_{L^\infty(\partial G_s)} \mid \log \|f\|_{L^1(I)} \rangle.
\]

The following corollary is a direct consequence of Theorem 3.5.

**Corollary 3.6.** Let \( K > 0 \) and \( f \in H^1,\infty(G_s) \) such that \( \|f\|_{H^1,\infty(\partial G_s)} \leq K \) and \( \|f\|_{L^1(I)} < e^{-\frac{n}{s^n}} \). Then, we have

\[
\|f\|_{L^\infty(\partial G_s)} \leq \frac{C^2_s(2, 2) \max(1, K)/(1 - 1/2e)}{|\lambda_0 \log \|f\|_{L^1(I)}|}.
\]

If we suppose that \( f \) is more regular, then we can improve inequality (3.6) in the same way as in the proof of Theorem 3.5.
**Theorem 3.7.** Let $k \in \mathbb{N}^*$. There exists a non negative constant $C$ depending only on $k, s$ and $\lambda$ such that for every $f \in B_{k,\infty}$ satisfying $||f||_{L^1(I)} < e^{-\frac{\pi}{2\lambda}}$ also satisfies

$$\|f\|_{L^\infty(\partial G_s)} \leq \frac{C(k)}{\log\|f\|_{L^1(I)}^k}.$$  

Moreover, for $I = \mathbb{T}$, there exists a sequence $f_n$ of $B_{k,\infty}$ such that

$$\lim_{n \to +\infty} \|f_n\|_{L^\infty(I)} \left|\log\|f_n\|_{L^1(I)}\right|^k \geq s|\log s|^k.$$  

(3.11)

**Proof.** For every $|t| \leq \pi$, we have according to the proof of the previous theorem that the radial primitive $F_t$ of $f$ satisfies inequality (3.8). Since $f \in B_{k,\infty}$, then from the Hardy-Landau-Littlewood inequality (3.1) applied to $j = k+1$, we prove that there exists a non negative constant $C = C_{\infty}(I, k+1)$ such that

$$(3.12) \quad \|f\|_{L^\infty(\partial G_s)} \leq m_1 := C \left( \frac{m}{\lambda_0 \log\|f\|_{L^1(I)}} \right)^{\frac{1}{k+1}}.$$  

Similarly to the proof of Theorem 3.5, consider $\rho = \frac{k}{k+1}$, $g_\rho(x) = x|\log x|\rho$ and $\sigma = 1 - \frac{\rho}{e}$. Then we have $g_\rho(x) \leq x\sigma$ in $[0, 1]$ and consequently we establish for every $j \in \mathbb{N}^*$ the following inequality

$$\|f\|_{L^\infty(\partial G_s)} \leq C_b j^{(\rho)j^+\left(\frac{1}{\rho}\right)c_j} \left|\lambda_0 \log\|f\|_{L^1(I)}\right|^{\alpha_j},$$

where $a_j$, $b_j$, and $c_j$ are three recurrent sequences satisfying

$$a_1 = \rho(1 + \rho); \quad b_1 = 1 + \rho; \quad c_1 = \rho; \quad a_{j+1} = \rho(1 + a_j); \quad b_{j+1} = 1 + \rho b_j \quad \text{and} \quad c_{j+1} = \rho(1 + c_j).$$

Then by letting $j \to +\infty$, we obtain

$$\|f\|_{L^\infty(\partial G_s)} \leq \frac{C_k (s)}{\log\|f\|_{L^1(I)}^k}.$$  

To prove equation (3.11), we consider the same sequence as in the proof of equation (3.7), with the suitable $H^{k,\infty}(G_s)$ normalization norm.

**Corollary 3.8.** Let $K > 0$, $j$ and $k$ be some integers with $0 \leq j < k$. Let $f \in H^{k,\infty}$ such that $||f||_{H^{k,\infty}(G_s)} \leq K$ and $||f||_{H^j,\infty(I)} < e^{-\frac{\pi}{2\lambda}}$. Then, there exist non negative constants $C, \varepsilon$ depending only on $K, k, j, s$ and $\lambda$ such that

$$\|f\|_{H^j,\infty(\partial G_s)} \leq \frac{C}{\log\|f\|_{L^1(I)}^{k-j}}.$$  

provided that $\|f\|_{L^1(I)} < \varepsilon.$
Proof. Let $K_1 = \max(K, 1)$ and let $g = f/K_1$, then the derivative $g^{(i)}$ of order $i \in \{0, ..., j\}$ belongs to $B_{k-i, \infty}$ and satisfy the assumptions of Theorem 3.7. Hence, there exists a non-negative constant $C_1$ depending only on $K, k, i, s$ and $\lambda$ such that

$$\|g^{(i)}\|_{L^\infty(\partial G_s)} \leq \frac{C_1}{|\log \|g^{(i)}\|_{L^1(I)}|^{k-i}}. \tag{3.13}$$

According to [17, Theorem 1] and the assumption that $g \in B_{k, \infty}$, there exist a non-negative constant $C_2$ such that

$$\|g^{(i)}\|_{L^1(I)} \leq C_2 \|g\|^{1-i/k}_{L^1(I)}, \tag{3.14}$$

we derive from (3.13) and the monotonicity of the mapping $\eta_i(x) = 1/(\log(1/x))^{k-i}$ that

$$\|g^{(i)}\|_{L^\infty(\partial G_s)} \leq C_1 \eta_i(C_2 \|g\|^{1-i/k}_{L^1(I)}). \tag{3.14}$$

Let us choose $\varepsilon > 0$ small enough such that

$$\eta_i(C_2 \|g\|^{1-i/k}_{L^1(I)}) \leq 2 \eta_i(\|g\|_{L^1(I)}), \tag{3.15}$$

then from (3.14) and (3.15), we obtain

$$\|g^{(i)}\|_{L^\infty(\partial G_s)} \leq \frac{2C_1}{|\log \|g\|_{L^1(I)}|^{k-i}}. \tag{3.16}$$

Taking the maximum over all $i = 0, ..., j$ we achieved the proof of the corollary.

As an immediate consequence, we prove that if the $L^1$-norm of a bounded $H^{k, \infty}(\partial G_s)$ function is known to be small on a connected open subset $I$ of $\partial G_s$ it remains also small (with uniform norm) on the whole boundary $\partial G_s$. The same result with $L^2$-norm has been established by Leblond and al. in [15].

Corollary 3.9. Let $j$ and $k$ be some integers with $0 \leq j < k$, and let $I \subset \partial G_s$ be any connected open subset. Let $(f_p)$ be a sequence of functions in the unit ball of the Hardy-Sobolev spaces $H^{k, \infty}(\partial G_s)$ such that $\|f_p\|_{L^1(I)} \to 0$. Then $\|f_p\|_{H^{j, \infty}(\partial G_s)} \to 0$.

In the particular case where $I = \mathbb{T}$, the following corollary provides logarithmic estimates with respect to the $L^\infty$-norm similar to those proved with the $L^2$-norm by Leblond and al. in [15].
Corollary 3.10. Let \( I = T, k \) and \( j \) be some integers with \( 0 \leq j < k \). Then, there exist non negative constants \( C, \varepsilon \) depending only on \( K, k, j \) and \( I \) such that whenever \( f \in B_{k, \infty} \) and satisfies \( \| f \|_{H^j(T)} < e^{-\frac{\pi}{\sqrt{\varepsilon}}} \), we have
\[
\| f \|_{H^j(\mathbb{S}^1)} \leq \frac{C}{\log \| f \|_{L^1(T)}^{k-j}}
\]
provided that \( \| f \|_{L^1(I)} < \varepsilon \).

4. Application

In this section, we prove a logarithmic stability result for the inverse problem of identification of a Robin parameter in two dimensional annular domain. Let \( I \) be any connected open subset of the boundary of the annular \( G_s \) and let \( J = \partial G_s \setminus I \). We consider the following inverse problem (I.P).

Given a function \( \varphi \) and a prescribed flux \( \phi \) on \( I \), find a function \( q \in Q^n_{ad} \) such that the solution \( u \) to the problem
\[
\begin{align*}
\Delta u &= 0 \quad \text{in} \quad G_s, \\
\partial_n u &= \Phi \quad \text{on} \quad I, \\
\partial_n u + qu &= 0 \quad \text{on} \quad J,
\end{align*}
\]
also satisfies \( u|_I = \varphi \).

where \( \partial_n \) stands for the partial derivative with respect to the outer normal unit vector to \( \partial G_s \) and the admissible set \( Q^n_{ad} \) of smooth Robin coefficient is defined by:
\[
Q^n_{ad} = \left\{ q \in C^0_0(J), \ |q^{(k)}| \leq c', \ 0 \leq k \leq n, \ \text{and} \ q \geq c \right\},
\]
where \( c, c' \) are non negative constants and \( K \) is a nonempty connected subset of \( J \) far from the boundary of \( J \). For \( q \in Q^n_{ad} \), we denote by \( u_q \) the solution of the Neumann-Robin problem \((N.R)\).

Referring to [6, 8, 9], we have the following

Lemma 4.1. (6 8 9) Let \( n \in \mathbb{N}, \ \Phi \in W^{n,2}(I) \) with non-negative value such that \( \phi \neq 0 \) and assume that \( q \in Q^n_{ad} \) for some constants \( c, c' > 0 \). Then the solution \( u_q \) of the inverse problem \((I.P)\) belongs to \( W^{n+3/2,2}(G_s) \).

Furthermore, there exist non negative constants \( \alpha, \beta \) such that for every \( q \in Q^n_{ad} \) and every \( \Phi \in W^{n,2}(I) \), we have
\[
u_q \geq \alpha > 0 \quad \text{and} \quad \| u \|_{W^{n+1,2}(\mathbb{S})} \leq \beta.
\]

The following identifiability result proves the uniqueness of the solution \( q \) of the inverse problem \((I.P)\).
Lemma 4.2. ([9]) The mapping

\[ F: \mathbb{Q}^n_{ad} \ni q \rightarrow L^2(\Gamma_d) \]

is well defined, continuous and injective.

According to Theorem 3.7 we establish the following stability result.

**Theorem 4.3.** Let \( n \geq 2 \) and \( \phi \in W^{n,2}_0(I) \) such that \( \phi \neq 0 \) and \( \phi \geq 0 \). Then, there exists a non negative constant \( C \) such that for any \( q_1, q_2 \in \mathbb{Q}^n_{ad} \), we have

\[ \| q_1 - q_2 \|_{L^\infty(J)} \leq \frac{C}{\log \| u_{q_1} - u_{q_2} \|_{L^1(I)}} \]

provided that \( \| u_{q_1} - u_{q_2} \|_{L^1(I)} < e^{-\frac{\alpha \gamma}{\alpha^2}} \).

**Proof.** Referring to (15, Lemma 12), we introduce for every \( i = 1, 2 \), the analytic function \( f_i \) in \( G_s \) satisfying \( u_{q_i} = Ref_i \) and \( f_i \in H^{n+1,2}(\partial G_s) \). Moreover, Lemma 4.1 together with the Gagliardo-Nirenberg inequalities prove that there exists non negative constants \( M, K \) depending only on \( s \) and the class \( \mathbb{Q}^n_{ad} \) such that

\[ \| f_i \|_{H^{n,\infty}(G_s)} \leq M \| f_i \|_{H^{n+1,2}(G_s)} \leq K \quad \text{for} \quad i = 1, 2 \]

Using the equation \( \partial_n u + qu = 0 \) on \( J \), we get for \( f = f_1 - f_2 \) that

\[ q_1 - q_2 = -\frac{1}{Re f_1} \frac{\partial Im f_1}{\partial \theta} + \frac{1}{Re f_2} \frac{\partial Im f_2}{\partial \theta} = -\frac{1}{Re f_1} \frac{\partial Im f}{\partial \theta} + \frac{\partial Im f_2}{\partial \theta} \frac{Re f_1}{Re f_2} \]

It follows from Lemma 4.1 that

\[ \| q_1 - q_2 \|_{L^\infty(J)} \leq \frac{1}{\alpha} \| f \|_{W^{1,\infty}(J)} + \frac{\beta}{\alpha^2} \| f \|_{L^\infty(J)} \]

Hence, from (4.1) and Corollary 3.8 we get

\[ \| q_1 - q_2 \|_{L^\infty(J)} \leq \frac{C}{\log \| u_{q_1} - u_{q_2} \|_{L^1(I)}} \]

provided that \( \| u_{q_1} - u_{q_2} \|_{L^1(I)} < e^{-\frac{\alpha \gamma}{\alpha^2}} \).

The particular case where \( I = T \), has been recently established by Leblond and al. in [15].

**Corollary 4.4.** Let \( n \geq 2 \), let \( \phi \in W^{n,2}_0(T) \) such that \( \phi \neq 0 \) and \( \phi \geq 0 \). Then, there exists a non negative constant \( C \) such that for any \( q_1, q_2 \in \mathbb{Q}^n_{ad} \), we have

\[ \| q_1 - q_2 \|_{L^\infty(T)} \leq \frac{C}{\log \| u_{q_1} - u_{q_2} \|_{L^1(T)}} \]

provided that \( \| u_{q_1} - u_{q_2} \|_{L^1(T)} < e^{-\frac{\alpha \gamma}{\alpha^2}} \).
