ABSTRACT

Numerous therapeutic strategies are proposed and tested for SARS CO-V2 infection. Remdesivir is researched and proposed by various societies. Studies about efficacy and safety in pregnancy are limited. A case series of 22 pregnant women affected with severe COVID disease and who received remdesivir, over a period of 1 year from May 2020 to May 2021 is presented. The 12 antenatal and 10 post-partum women were included. Demographic factors, baseline, day 3 and day 7 blood values of haemoglobin, total leukocyte count, platelets, liver enzymes, serum creatinine and D-dimers were collected. Adverse events were reported. Pregnancy complications and foetal and neonatal complications were studied. Pre-eclampsia was the most common comorbidity. The 99% of pregnant women and 100% of postpartum women recovered from COVID disease after remdesivir use. Lab investigations did not change considerably during the week of remdesivir use, suggesting its safety. Incidence of adverse events reported is 36.3%, of these 9% are serious adverse events. There are no antenatal or post-natal complications. No incidence of teratogenicity, foetal or neonatal complications. Incidence of feto-maternal transmission was 9%. Remdesivir is effective in treating severe SARS-CoV2 infection and has safety profile in pregnancy with regard to maternal and foetal effects.

Keywords: Remdesivir in pregnancy, Fetal effects of remdesivir, Neonatal side effects of remdesivir, Maternal safety with remdesivir

INTRODUCTION

Corona disease caused by novel corona virus, has caused many deaths worldwide and such sudden increase in infections seem to be occurring throughout the world. Clinical trials have investigated a number of pharmacological treatment strategies in nonpregnant populations, and other pharmacologic treatment strategies are ongoing. Remdesivir is an intravenous nucleotide prodrug of an adenosine analogue. Inside the cell, pro-drug remdesivir is converted into nucleoside monophosphate or nucleotide analogue which goes into further phosphorylation events yielding active nucleoside form triphosphate analogue. The triphosphate analogue is utilized by viral RNA dependant RNA polymerase (RdRp), such utilization inhibits viral replication. Remdesivir is antiviral drug which was approved by FDA in October 2020 for treatment of COVID disease. Remdesivir improves clinical outcomes of hospitalized patients with COVID-19 and a 5-day regimen, instead of a 10-day regimen, may be sufficient for treatment. Moreover, remdesivir appears as tolerable as other comparators or placebo.1 The living guideline of WHO states that, remdesivir does improve patient-important outcomes (limited evidence).2

pregnant women are susceptible to SARS-COV2 infection as nonpregnant women. Pregnant women are excluded from clinical trials, because of concerns regarding foetal safety.3 SMFM (Society for maternal, foetal medicine) recommends that remdesivir be offered to pregnant patients with COVID-19, meeting criteria for...
compassionate use. RCOG (Royal college of obstetricians and gynaecologists) states that remdesivir should be used only if clinicians believe the benefits of treatment outweigh the risks to the individual. FOGSI (Federation of obstetricians and gynaecologists of India) also recommends that remdesivir should not be withheld from pregnant patient if otherwise indicated. GOI has issued advisory on remdesivir use stating that remdesivir is to be used only in select moderate/severe hospitalised COVID-19 patients on supplemental oxygen as it is a reserve drug approved under emergency use authorization only based on limited scientific evidence globally. Literature about the safety of remdesivir in pregnancy is very limited. We did a single centre study of remdesivir use in pregnancy, to study its efficacy and safety in pregnant women.

**CASE SERIES**

Pregnant women who were admitted with COVID and met criteria to use remdesivir were included in the study. Pregnant women with COVID who did not receive remdesivir were excluded. Criteria to start remdesivir were-hospitalized patients with severe COVID-19 (defined as SpO2≤94% on room air/requiring supplemental oxygen, or requiring mechanical ventilation, or requiring ECMO.) A total of 5 doses of remdesivir was given, with a loading dose of 200 mg on day 1, followed by 100 mg/day for remaining 4 days. Written informed consent was taken from all pregnant and postpartum women who received remdesivir and for inclusion in study. Demographic factors, comorbidities, baseline O2 support and O2 support at time of discharge were studied. Baseline blood investigations like haemoglobin, platelet count, total leukocyte count, liver transaminases, renal function tests were also studied. Antenatal adverse events, foetal risks and postnatal adverse events were also included in study. Corticosteroids and cephalosporin group of antibiotics were the concurrent medication used during hospital stay.

All data were analysed using IBM SPSS V20.0 software.

A total of 22 pregnant and just delivered pregnant women were included in study, 12 antepartum and 10 postpartum women. (Median post-partum day 3, range from 0-7). Median age group was 29 in both the groups, range 22-35. Pre-eclampsia (18.2%) was the most common comorbidity followed by gestational diabetes (13.2%) 72% (16) of women were overweight and 28% (6) were of normal BMI. Demographic factors are illustrated in Table 1.

The 99% of pregnant women and 100% of postpartum women recovered from COVID disease after remdesivir use. There was 1 maternal death due to COVID. Mean number of admission days was 9.5 days (4-28 days). Seven (58%) of antenatal women needed ventilation and Emergency delivery was done in 5 women to improve maternal outcomes and lack of evidence about safety of remdesivir use in pregnancy. One woman continued pregnancy after extubating and there was one maternal death after 20 days on ventilator. Mean number of days of ventilation was 3 days (1-4 days).

**Table 1: Demographic factors.**

| Characteristics     | Antenatal (%) | Postnatal (%) |
|---------------------|---------------|---------------|
| Age (Years)         |               |               |
| <30                 | 7 (58.3)      | 3 (30)        |
| ≥30                 | 5 (41.7)      | 7 (70)        |
| Parity              |               |               |
| Primi               | 7 (31.8)      | --            |
| Multi               | 5 (22.7)      | --            |
| Postpartum          | --            | 10 (45.4)     |
| BMI (kg/m²)         |               |               |
| 18-24.9             | 5 (41.6)      | 6 (60)        |
| 25-30               | 6 (50)        | 4 (40)        |
| ≥30                 | 1 (8.3)       | --            |
| Co-morbidities      |               |               |
| Obesity             | 1 (8.3)       | --            |
| Gestational diabetes| 2 (16.7)      | 1 (10)        |
| Pre-eclampsia       | 2 (16.7)      | 2 (20)        |
| No comorbidities    | 7 (58.3)      | 7 (70)        |
| O2 support baseline |               |               |
| Invasive            |               |               |
| Ventilator          | 1 (8.3)       | --            |
| Non-invasive        |               |               |
| NIV                 | 1 (8.3)       | 1 (10)        |
| HIFNO               | 1 (8.3)       | 4 (40)        |
| LFNO                | 3 (25)        | 1 (10)        |
| Room air            | 6 (50)        | 4 (40)        |

Baseline blood investigations which included haemoglobin, TLC, platelets, D-dimer, serum creatinine, serum bilirubin, liver transaminases were done on day 1, 3 and 6 (Table 2). Values did not change considerably with remdesivir use, suggesting safety of its use.

Incidence of adverse events reported is 36.3% (Table 3). Of these serious adverse events is 9%. Preterm delivery was done in 5 patients to improve maternal outcome. Steroid induced hyperglycaemia, fungal sinusitis, peripartum cardiomyopathy were seen as pregnancy complications, mostly due to COVID disease and concurrent steroid use. One maternal death was seen due to severe COVID disease.

We had 11 deliveries in study group, all were caesarean deliveries. Of these 9% were done in extremely preterm group (26-28 weeks), 28% were done in 28-32 weeks. gestational period and 63% were done in women more than 32 weeks. Reason for emergency caesarean delivery was, to facilitate remdesivir use (5), previous caesarean delivery (3), multiple pregnancy (1), PROM (1), breech (1). Of 10, women who continued pregnancy after taking remdesivir, 1 had induced miscarriage at 22 weeks due to fungal sinusitis, 2 had normal vaginal deliveries at term, and rest are still continuing pregnancy at time of writing this article.
There are few studies reported in literature about remdesivir use in pregnancy. Study done by Burwick et al reported 86 pregnant women who had severe COVID and received remdesivir. There are isolated case reports of remdesivir use in pregnancy. All studies have reported effectiveness of remdesivir in treating COVID disease. Our study was done with primary aim to study the effectiveness, maternal and foetal safety with remdesivir use. A phase I prospective, open label, non-randomized opportunistic study to evaluate the PK and safety of RDV when administered to pregnant and non-pregnant women of childbearing potential for treatment of COVID-19 in a cohort of 40, with 20 in each arm is planned by national institute of allergy and infectious diseases (NIAID), US. Study will complete in April 2022. Human data for the use of this agent in pregnant women with COVID-19 are extremely limited. Mulunga et al did a study of remdesivir in the treatment of Ebola virus disease, six pregnant women were assigned to receive remdesivir and there were no significant foetal/ new-born, pregnancy, or maternal adverse events reported in any of the members of this subgroup. In the case series reported by McCoy et al, 1 patient had to discontinue remdesivir due to worsening transaminitis. In our study we did not find any rise in Liver enzymes. Incidence of serious adverse events was 16% in study done by Burwick et al while we report an incidence of serious adverse events as 9%. Remdesivir was well tolerated in pregnancy with the good neonatal outcomes.

| Variables          | N  | Mean | SD  | Q1  | Q3  |

### DISCUSSION

There are few studies reported in literature about remdesivir use in pregnancy. Study done by Burwick et al reported 86 pregnant women who had severe COVID and received remdesivir. There are isolated case reports of remdesivir use in pregnancy. All studies have reported effectiveness of remdesivir in treating COVID disease. Our study was done with primary aim to study the effectiveness, maternal and foetal safety with remdesivir use. A phase I prospective, open label, non-randomized opportunistic study to evaluate the PK and safety of RDV when administered to pregnant and non-pregnant women of childbearing potential for treatment of COVID-19 in a cohort of 40, with 20 in each arm is planned by national institute of allergy and infectious diseases (NIAID), US. Study will complete in April 2022. Human data for the use of this agent in pregnant women with COVID-19 are extremely limited. Mulunga et al did a study of remdesivir in the treatment of Ebola virus disease, six pregnant women were assigned to receive remdesivir and there were no significant foetal/ new-born, pregnancy, or maternal adverse events reported in any of the members of this subgroup. In the case series reported by McCoy et al, 1 patient had to discontinue remdesivir due to worsening transaminitis. In our study we did not find any rise in Liver enzymes. Incidence of serious adverse events was 16% in study done by Burwick et al while we report an incidence of serious adverse events as 9%. Remdesivir was well tolerated in pregnancy with the good neonatal outcomes.

Limitations of this study are, study sample is very small and no comparative cohort available. Non pregnant women of similar demographic factors should be included for proper comparison.
CONCLUSION

Lot of research has been done to understand pathophysiology and clinical manifestations of SARS CoV-2 disease. It has moved from a primary lung disease to a thrombo-inflammatory disease, which can affect any organ. New therapeutic modalities are being suggested. Remdesivir is an effective drug, especially in pregnancy with its promising safety.
