Abstract

Given two \(k\)-graphs \(F\) and \(H\), a perfect \(F\)-tiling (also called an \(F\)-factor) in \(H\) is a set of vertex disjoint copies of \(F\) that together cover the vertex set of \(H\). Let \(t_{k-1}(n, F)\) be the smallest integer \(t\) such that every \(k\)-graph \(H\) on \(n\) vertices with minimum codegree at least \(t\) contains a perfect \(F\)-tiling. Mycroft (JCTA, 2016) determined the asymptotic values of \(t_{k-1}(n, F)\) for \(k\)-partite \(k\)-graphs \(F\). Mycroft also conjectured that the error terms \(o(n)\) in \(t_{k-1}(n, F)\) can be replaced by a constant that depends only on \(F\). In this paper, we improve the error term of Mycroft’s result to a sub-linear term when \(F = K_3^3(m)\), the complete 3-partite 3-graph with each part of size \(m\). We also show that the sub-linear term is tight for \(K_3^3(2)\), the result also provides another family of counterexamples of Mycroft’s conjecture (Gao, Han, Zhao (arXiv, 2016) gave a family of counterexamples when \(H\) is a \(k\)-partite \(k\)-graph with some restrictions.) Finally, we show that Mycroft’s conjecture holds for generalized 4-cycle \(C_3^4\) (the 3-graph on six vertices and four distinct edges \(A, B, C, D\) with \(A \cup B = C \cup D\) and \(A \cap B = C \cap D = \emptyset\), i.e. we determine the exact value of \(t_2(n, C_3^4)\).

1 Introduction

A \(k\)-graph \(H\) is a pair \((V, E)\), where \(V\) is a set of vertices and \(E\) is a collection of subsets of \(V\) with uniform size \(k\), we call \(|V|\) the order of \(H\) and \(|E|\) the size of \(H\), also
denoted by $|H|$. We write graph for 2-graph for short. Given two $k$-graphs $F$ and $H$, an $F$-tiling in $H$ is a collection of vertex disjoint copies of $F$ in $H$. An $F$-tiling is perfect if every vertex of $H$ is covered. A perfect $F$-tiling in $H$ is also called an $F$-factor. If $F$ is a single edge then an $F$-factor in $H$ is a perfect matching in $H$. As for matchings, a natural question for tiling is to determine the minimum degree threshold for finding a perfect $F$-tiling. Given a subset $S$ of vertices in a $k$-graph $H$, the degree of $S$, denote by $d_H(S)$, is the number of edges of $H$ containing $S$. The minimum $s$-degree $\delta_s(H)$ of $H$ is the minimum of $d_H(S)$ over all $S \subseteq V(H)$ of size $s$. For integer $n$ divisible by $|V(F)|$, define $t_s(n, F)$ to be the smallest integer $t$ such that every $k$-graph $H$ on $n$ vertices with $\delta_s(H) \geq t$ contains a perfect $F$-tiling. We write $[n]$ for the set $\{1, \ldots, n\}$, $n \in \mathbb{N}$ and $r\mathbb{N}$ for the set of positive integers divisible by integer $r$.

Tiling problems have been widely studied for graphs. The celebrated Hajnal-Szemerédi theorem [8] states that $t_1(n, K_r) = (1 − 1/r)n$ for $n \in r\mathbb{N}$. Alon and Yuster [1] generalized Hajnal-Szemerédi theorem to $t_1(n, H) = (1 − 1/\chi(H) + o(1))n$ for every $H$ with chromatic number $\chi(H)$ and order $h$ and $n \in h\mathbb{N}$; later, Komlós, Sárközy, and Szemerédi [15] proved that the error term $o(1)$ can be replaced by a constant $c = c(H)$. In [19], Kühn and Osthus improved Alon-Yuster result to $t_1(n, H) \leq (1 − 1/\chi^*(H))n + O(1)$, where $\chi^*(H)$ depends on the relative sizes of the colour classes in the optimal colourings of $H$ and satisfies $\chi(H) − 1 \leq \chi^*(H) \leq \chi(H)$. See [18] for a survey on graph tiling.

For $k \geq 3$, we know much less and tiling problem becomes much harder. There are a number of research results on perfect matching problem, see [26] for a survey.

For complete $k$-graphs and related, the research focus on the case $k = 3$. Let $K_3^3$ be the complete 3-graph on four vertices, and $K_4^3 - e$ be the 3-graphs obtained from $K_4^3$ by deleting $\ell$ edges. Kühn and Osthus [17] showed that $t_2(n, K_3^3 - 2e) = (1/4 + o(1))n$, and Czygrinow, DeBiasio and Nagle [3] determined its exact value for large $n$. Lo and Markström [20] proved that $t_2(n, K_4^{(3)} - e) = (1/2 + o(1))n$ and the exact value of $t_2(n, K_4^{(3)} - e)$ was determined for large $n$ by Han, Lo, Treglown and Zhao [10] recently. Lo and Markström [21] also proved that $t_2(n, K_4^{(3)}) = (3/4 + o(1))n$, and the exact value of $t_2(n, K_4^{(3)})$ was determined for large $n$ by Keevash and Mycroft [14].

A $(k, \ell)$-cycle $C_s^{(k,\ell)}$ is a $k$-graph on $s$ vertices so that whose vertices can be ordered cyclically in such a way that the edges are sets of consecutive $k$ vertices and every two consecutive edges share exactly $\ell$ vertices. Gao and Han [6] and Czygrinow [2] determined the exact value of $t_2(n, C_6^{(3,1)})$ and $t_2(n, C_7^{(3,1)}) (s \geq 6)$, respectively, and
Gao, Han and Zhao [7] determined $t_{k-1}(n, C_s^{(k,1)})$ for $k \geq 4$. Han, Lo, and Sanhueza-Matamala [11] proved $t_{k-1}(n, C_s^{(k,k-1)}) \leq (1/2 + 1/(2s) + o(1))n$ where $k \geq 3$ and $s \geq 5k^2$ and this bound is asymptotically best possible for infinitely many pairs of $s$ and $k$.

In the study of tiling problems, another family of hypergraphs which was well studied are $k$-partite $k$-graphs. A $k$-graph $F$ on vertex set $V$ is said to be $k$-partite if $V$ can be partitioned into vertex classes $V_1, \ldots, V_k$ so that for any $e \in F$ and $1 \leq j \leq k$ we have $|e \cap V_j| = 1$. The partition $V_1, \ldots, V_k$ of $V$ is called a $k$-partite realisation of $V$. Define

$$\mathcal{S}(F) := \bigcup_{\chi \in \mathcal{F}} \{|V_1|, \ldots, |V_k|\} \quad \text{and} \quad \mathcal{D}(F) := \bigcup_{\chi \in \mathcal{F}} \{|V_i| - |V_j| : i, j \in [k]\},$$

where in each case the union is taken over all $k$-partite realisations $\chi = \{V_1, \ldots, V_k\}$ of $V$. The greatest common divisor of $F$, denoted by $\gcd(F)$, is then defined to be the greatest common divisor of the set $\mathcal{D}(F)$ (if $\mathcal{D}(F) = \{0\}$ then $\gcd(F)$ is undefined). The smallest class ratio of $F$, denoted by $\sigma(F)$, is defined by

$$\sigma(F) := \min_{S \in \mathcal{S}(F)} \frac{S}{|V(F)|}.$$

Note in particular that $\sigma(F) \leq 1/k$, with equality if and only if $|V_1| = |V_2| = \ldots = |V_k|$ for any $k$-partite realisation $\chi = \{V_1, V_2, \ldots, V_k\}$ of $F$. A complete $k$-partite $k$-graph with vertex classes $V_1, \ldots, V_k$ is a $k$-graph on $V = V_1 \cup \ldots \cup V_k$ and edge set $E = \{e : |e \cap V_i| = 1 \text{ for each } i \in [1, k]\}$. Observe that a complete $k$-partite $k$-graph has only one $k$-partite realisation up to permutations of the vertex classes $V_1, \ldots, V_k$. Hence, we write $K^k(V_1, \ldots, V_k)$ for a complete $k$-partite $k$-graph with vertex classes $V_1, \ldots, V_k$ and if the sizes of $V_i$ are emphasized, we write $K^k(|V_1|, \ldots, |V_k|)$ for $K^k(V_1, \ldots, V_k)$, if $|V_1| = \ldots = |V_k| = m$ we write $K^k(m)$ for $K^k(V_1, \ldots, V_k)$ and call $K^k(m)$ the balanced complete $k$-partite $k$-graph. Mycroft [23] proved a general result on tiling $k$-partite $k$-graphs.

**Theorem 1.1** (Theorem 1.1, 1.2, 1.3 in [23]). Let $H$ be a $k$-partite $k$-graph. Then for any $\alpha > 0$ there exists $n_0$ such that if $G$ is a $k$-graph on $n \geq n_0$ vertices for which $|V(H)|$ divides $n$ and

$$\delta_{k-1}(G) \geq \begin{cases} n/2 + \alpha n & \text{if } \mathcal{S}(F) = \{1\} \text{ or } \gcd(\mathcal{S}(F)) > 1; \\ \sigma(F)n + \alpha n & \text{if } \gcd(F) = 1; \\ \max\{\sigma(F)n, \frac{n}{p}\} + \alpha n & \text{if } \gcd(\mathcal{S}(F)) = 1 \text{ and } \gcd(F) > 1, \end{cases}$$

(1)
then $G$ contains a perfect $F$-tiling, where $p$ is the smallest prime factor of $\gcd(F)$. Moreover, the equality holds in (1) for a large class of $k$-partite $k$-graphs including all complete $k$-partite $k$-graphs.

Furthermore, Mycroft also conjectured that the error terms in (1) can be replaced by a (sufficiently large) constant that depends only on $F$.

**Conjecture 1.2** ([23]). Let $F$ be a $k$-partite $k$-graph. Then there exists a constant $C = C(F)$ such that the error terms in (1) can be replaced by $C$.

Gao, Han and Zhao [7] improved the error term for complete $k$-partite $k$-graphs $F = K^k(a_1, \ldots, a_{k-1}, a_k)$ with $\gcd(F) = 1$ and disproved Conjecture 1.2 for all complete $k$-partite $k$-graphs $F$ with $\gcd(F) = 1$ and $a_{k-1} \geq 2$. Han, Zang, and Zhao [13] determined $t_k(n, K)$ asymptotically for all complete $3$-partite $3$-graphs $K$. In this paper, we focus on balanced complete $3$-partite $3$-graphs. One of our main results is the following.

**Theorem 1.3.** Let $m \geq 2$ be an integer. There exists an integer $n_0 \in \mathbb{N}$ such that the following holds. Suppose that $H$ is a $3$-graph on $n \geq n_0$ vertices with $n \in 3m\mathbb{N}$. If $\delta_2(H) \geq n/2 + m^{1/3}n^{1/3} - 1/m$ then $G$ contains a $K^3(m)$-factor.

For $K^3(2)$, we show that the lower bound of $\delta_2(G)$ is tight up to a factor.

**Proposition 1.4.** There exists an integer $n_1 \in \mathbb{N}$. For every $n \geq n_1$, there exists a $3$-graph $H$ on $n$ vertices with $\delta_2(H) \geq n/2 + \sqrt{2n}/5 - 3$ containing no $K^3(2)$-factor.

Clearly, Theorem 1.3 improves the error term on in (1) to $Cn^{1-1/m}$ when $F = K^3(m)$, and Proposition 1.4 shows that the error term $C\sqrt{n}$ can not be replaced by a constant for $F = K^3(2)$ and henceforth for $F = K^3(2m)$, which gives another family of counterexamples for Conjecture 1.2 (Gao, Han and Zhao [7] gave a family of counterexample for Conjecture 1.2 when $F = K^k(a_1, \ldots, a_{k-1}, a_k)$ with $\gcd(F) = 1$ and $a_{k-1} \geq 2$. Note that $\gcd(F)$ is undefined for $F = K^3(m)$). Hence our counterexample is different from the one given in [7]).

Given integer $k$, let $C_4^k$ be the family of $k$-graphs which contains four distinct edges $A, B, C, D$ with $A \cup B = C \cup D$ and $A \cap B = C \cap D = \emptyset$, which was first introduced by Erdős [4], and also is called the generalized 4-cycles. For $k = 2$ or 3, we write $C_4^k$ for $C_4^k$ instead because there is only one graph, up to isomorphism, in $C_4^k$ in these cases. Note that $C_4^3$ is a supported subgraph of $K^3(2)$.
Let \( X_1, X_2, \ldots, X_t \) be \( t \) pairwise disjoint sets of size \( k - 1 \) and let \( Y \) be a set of \( s \) elements disjoint from \( \cup_{i \in [t]} X_i \). Define \( K^{k}_{s,t} \) be the \( k \)-graph with vertex set \((\cup_{i \in [t]} X_i) \cup Y\) and edge set \( \{X_i \cup \{y\} : i \in [t], y \in Y\} \). In [24], Mubayi and Verstraëte investigated the Turán number of \( K^{3}_{s,t} \). We show that Conjecture 1.2 is valid for \( K^{3}_{m,m} \), in particular for generalized 4-cycle since \( K^{3}_{2,2} = C^{3}_{4} \). More precisely, we prove the following theorem.

**Theorem 1.5.** For any integer \( m \), there exists an integer \( N \) such that for all \( n \in 3m\mathbb{N} \) and \( n \geq N \), each 3-graph \( H \) on \( n \) vertices with

\[
\delta_2(H) \geq \begin{cases} 
\left\lceil \frac{n}{2} \right\rceil - 1, & \text{if } n \equiv 1 \pmod{4} \\
\left\lfloor \frac{n}{2} \right\rfloor - 1, & \text{otherwise.}
\end{cases}
\]

contains a \( K^{3}_{m,m} \)-factor.

To show the lower bound in Theorem 1.5 is tight, we give a construction of extremal 3-graph for \( K^{3}_{m,m} \).

**Construction 1.6.** Given two disjoint sets \( A, B \), let \( \mathcal{B}[A, B] \) be a 3-graph with vertex set \( A \cup B \) and edge set \( E = \{e : |e| = 3 \text{ and } |e \cap A| = 1 \text{ or } 3\} \).

Clearly, \( \delta_2(\mathcal{B}[A, B]) = \min\{|A| - 2, |B| - 1\} \), and each copy of \( K^{3}_{m,m} \) intersects \( B \) with an even number of vertices and hence \( \mathcal{B}[A, B] \) does not contain a \( K^{3}_{m,m} \)-factor provided that \( |B| \) is odd. Now, suppose that \( n \in 3m\mathbb{N} \). Choose \( |A| = n/2 + 1, |B| = n/2 - 1 \) if \( n \equiv 0 \pmod{4} \); \( |A| = \lfloor n/2 \rfloor, |B| = \lceil n/2 \rceil \) if \( n \equiv 1 \pmod{4} \); \( |A| = |B| = n/2 \) if \( n \equiv 2 \pmod{4} \); and \( |A| = \lceil n/2 \rceil, |B| = \lfloor n/2 \rfloor \) if \( n \equiv 3 \pmod{4} \). We have \( \delta_2(\mathcal{B}[A, B]) = \lfloor n/2 \rfloor - 2 \) if \( n \equiv 1 \pmod{4} \), and \( \delta_2(\mathcal{B}[A, B]) = \lceil n/2 \rceil - 2 \), otherwise. But \( \mathcal{B}[A, B] \) does not contain a \( K^{3}_{m,m} \)-factor. The extremal 3-graph constructed here implies that (2) is tight.

In the following we give some notation used in this paper. For an \( r \)-graph \( H = (V, E) \) and a vertex set \( U \subseteq V \), write \( H[U] \) for the subgraph of \( H \) induced by \( U \) and \( \binom{V}{k} \) for the set of all subsets of size \( k \) of \( U \). For an \( S \subseteq V \), the *neighbourhood* of \( S \), denoted by \( N_H(S) \) or \( N(S) \) if there is no confusion from the context, is the set of subsets \( T \subseteq V \) such that \( S \cup T \subseteq E(H) \), the *link graph* of \( S \), denoted by \( H_S \), is the \( (r - |S|) \)-graph with vertex set \( V(H) \setminus S \) and edge set \( N_H(S) \). For a 3-graph \( H = (V, E) \) and \( u, v, w \in V \), we write \( uv \) and \( uvw \) for the sets \( \{u, v\} \) and \( \{u, v, w\} \), respectively. Let \( V_1, \ldots, V_r \) be a partition of \( V(H) \). An edge \( e = v_1v_2v_3 \) is of type \( V_1V_2V_3 \) if \( v_j \in V_{i_j} \) for \( j \in [3] \) and \( i_j \in [r] \), write \( E(V_1V_2V_3) \) for the set of edges of type \( V_1V_2V_3 \) and \( e(V_1V_2V_3) = |E(V_1V_2V_3)| \). A subgraph \( F \) of \( H \) is said to be of type \((t_1, \ldots, t_r)\) if \( |V(F) \cap V_i| = t_i \) for each \( i \in [r] \).
2 Lemmas and proofs of main results

To show Proposition 1.4, we first revisit a construction of $K^k(1, \ldots, 1, t + 1)$-free $(t \geq 1)$ $k$-graph $G$ with $e(G) \sim \frac{k^t}{k!}n^{k-\frac{1}{2}}$ edges given by Mubayi [24]. We only need the special case that $k = 3$ and $t = 1$. Let $q$ be a prime power and $F_q$ be the $q$-element finite field.

Construction 2.1 ([24]). Let $G_q$ be a $3$-graph with vertex set $V(G_q) = (F_q \setminus \{0\}) \times (F_q \setminus \{0\})$, a $3$-elements set $\{(a_i, a'_i) : i \in [3]\}$ forms an edge in $G_q$ if and only if

$$\prod_{i \in [3]} a_i + \prod_{i \in [3]} a'_i = 1_F.$$

As shown in [24], $G_q$ is $K^3(1, 2, 2)$-free and $\delta_2(G_q) \geq q - 3$.

Construction 2.2. Let $G'_q$ be a copy of $G_q$. Define $H_q$ to be a $3$-graph with vertex set $V(G_q) \cup V(G'_q)$, each edge of $H_q$ intersect $V(G_q)$ in precisely two vertices and a $3$-elements set $\{(a_i, a'_i) : i \in [3]\}$ with $(a_i, a'_i) \in V(G_q)$ for $i = 1, 2$ and $(a_3, a'_3) \in V(G'_q)$ forms an edge in $H_q$ if and only if

$$\prod_{i \in [3]} a_i + \prod_{i \in [3]} a'_i = 1_F.$$

For convenience, we use ordered triple $(a, b, c)$ denote an edge of $H_q$ with $a, b \in V(G_q)$ and $c \in V(G'_q)$.

Remark. By the constructions of $G_q$ and $H_q$, we know that an edge $e = abc \in E(G_q)$ corresponds to three edges $e_1 = (a, b, c), e_2 = (a, c, b), e_3 = (b, c, a)$ in $H_q$, and $H_q$ possibly contains some edges of the form $(a, b, a)$ or $(a, b, b)$. The following fact shows that $H_q$ inherits the property from $G_q$.

Fact 1. The $3$-graph $H_q$ is $K^3(1, 2, 2)$-free and $\delta_2(H_q) \geq q - 3$.

Proof. Clearly, $\delta_2(H_q) \geq q - 3$ since $G_q$ is a subgraph of $H_q$. We show that $H_q$ is also $K^3(1, 2, 2)$-free. As shown in [24], for $(p_1, q_1), (p_2, q_2) \in (F_q \setminus \{0\}) \times (F_q \setminus \{0\})$, the equation system

$$\begin{cases}
px + p'x = 1_F \\
p_2x + p'y = 1_F
\end{cases}$$

has at most one solution $(x, y)$ if $(p_1, p'_1) \neq (p_2, p'_2)$. Suppose that $H_q$ contains a copy of $K^3(1, 2, 2)$, say $K^3(\{a\}, \{b_1, b_2\}, \{c_1, c_2\})$. Let $a = (u, u'), b_1 = (v_1, v'_1)$ and
b_2 = (v_2, v'_2). Without loss of generality, we may assume a, b_1, b_2 \in V(G_q). Now let p_1 = uv_1, p'_1 = u'v'_1, p_2 = uv_2, and p'_2 = u'v'_2. Since \((v_1, v'_1) \neq (v_2, v'_2)\), we have \((p_1, p'_1) \neq (p_2, p'_2)\). So the equation system (3) has at most one solution, this is a contradiction to \(K^3(\{a\}, \{b_1, b_2\}, \{c_1, c_2\}) \subseteq H_q\).

**Proof of Proposition 1.4.** For sufficiently large \(n\), without loss of generality, we may assume \(n \in 6\mathbb{N}\), choose an odd prime power \(q\) and \(n_0 = (q - 1)^2\) such that \(n/2 + 2/5\sqrt{n/2} \leq n_0 \leq n/2 + 1/2\sqrt{n/2}\). Let \(F_q\) be the \(q\)-element finite field and let \(A, B\) be the sets obtained by deleting any one element and \(2n_0 - n - 1\) elements from \((F_q \setminus \{0\}) \times (F_q \setminus \{0\})\), respectively. Then \(|A| = n_0 - 1\) and \(|B| = n - n_0 + 1\), both of them are odd. Let \(H'\) be the subgraph of \(H_q\) induced by \(A \cup B\) with \(A \subseteq V(G_q)\) and \(B \subseteq V(G'_q)\). By Fact 1 \(H'\) is \(K^3(1, 2, 2)\)-free and \(d_{H'}(ab) \geq q - 4\) for all \(a \in A, b \in B\). Let \(H = B[A, B] \cup H'\). Then \(\delta_2(H) \geq \min\{|A|-2, |B|-1+\sqrt{m_0}-3\} \geq n/2+2/5\sqrt{n/2}-3\).

We claim that \(H\) does not contain a \(K^3(2)\)-factor. Suppose to the contrary that \(H\) contains a \(K^3(2)\)-factor. Since \(|A|\) is odd, \(H\) must contain a \(K^3(2)\) such that \(|V(K^3(2)) \cap A|\) is odd. Such a copy of \(K^3(2)\) must be of type \((5, 1)\) or \((3, 3)\). Note that copies of \(K^3(2)\) in \(B[A, B]\) must intersect \(A\) in an even number of vertices. It is an easy task to check that a copy of \(K^3(2)\) of type \((5, 1)\) or \((3, 3)\) forces a copy of \(K^3(1, 2, 2)\) in \(H'\), a contradiction.

The proof of Theorems 1.3 and 1.5 are separated into non-extremal case and extremal case. For the non-extremal case, we use the standard absorbing method, which has been introduced by Rödl, Ruciński and Szemerédi in [27] and widely used in different research papers for example in [3, 13, 21].

Roughly speaking, our proof follows two steps: first, we use an ”absorbing lemma” to find a small absorbing set \(W \subseteq V(H)\) with the property that given any ”sufficiently small” set \(U \subseteq V(H) \setminus W\), both \(H[W]\) and \(H[W \cup U]\) contain \(K^3(m)\)-factors; second, we use an ”almost tiling lemma” to find a \(K^3(m)\)-tilling in \(H \setminus W\) that covers all but at most \(o(n)\) vertices. The first step will be completed in Lemma 2.3 and the second step has been done by an almost tiling lemma given by Mycroft in [28], we restate it in Lemma 2.4.

Given \(\gamma > 0\), \(H\) and \(G\) are two 3-graphs on the same vertex set \(V\). We say that \(H\) \(\gamma\)-contains \(G\) if \(|E(G) \setminus E(H)| \leq \gamma|V|^3\), and \(H\) is called \(\gamma\)-extremal if there is a balanced partition of \(V = A \cup B\) such that \(|A| \leq |B|\) and \(H\) \(\gamma\)-contains \(B[A, B]\).

**Lemma 2.3** (Absorption lemma). Let \(0 < \epsilon_2 \ll \epsilon_1 \ll \gamma \ll 1\) and \(m\) be an positive integer. Suppose that \(H\) is a 3-graph of order \(n\) with \(\delta_2(H) \geq (1/2 - \gamma)n\). If \(H\) is not
3γ-extremal, then there exists a set \( W \subset V(H) \) with \(|W| \leq \epsilon_1 n\) and \(|W| \in 3m\mathbb{N}\), so that for any \( U \subset V(H) \setminus W \) with \(|U| \leq \epsilon_2 n\) and \(|U| \in 3m\mathbb{N}\), both \( H[W] \) and \( H[U \cup W] \) contain \( K^3(m) \)-factors.

**Lemma 2.4** (Almost tiling lemma, Lemma 1.5 in [23]). Let \( K \) be a \( k \)-partite \( k \)-graph. Then there exists a constant \( C = C(K) \) such that for any \( \alpha > 0 \) there exists an integer \( n_0 = n_0(K, \alpha) \) with the property that every \( k \)-graph \( H \) on \( n \geq n_0 \) vertices with \( \delta_{k-1}(H) \geq (\sigma(K) + \alpha)n \) admits a \( K \)-tiling covering all but at most \( C \) vertices of \( H \).

Lemmas 2.5 and 2.6 deal with the extremal case for \( K^3(m) \) and \( K^3_{m,m} \), respectively.

**Lemma 2.5.** Let \( m \geq 2 \) be an integer. There exist \( \gamma > 0 \) and \( n_0 \in \mathbb{N} \) such that the following holds. Suppose that \( H \) is a 3-graph on \( n \geq n_0 \) vertices with \( \delta_2(H) \geq n/2 + m^{1/3} n^{1-1/m} \), \( n \in 3m\mathbb{N} \). If \( H \) is \( \gamma \)-extremal, then \( H \) contains a \( K^3(m) \)-factor.

**Lemma 2.6.** There exist \( \gamma > 0 \) and \( n_0 \in \mathbb{N} \) such that the following holds. Suppose that \( H \) is a 3-graph on \( n \geq n_0 \) vertices with \( \delta_2(H) \) satisfying (2), where \( n \in 3m\mathbb{N} \). If \( H \) is \( \gamma \)-extremal, then \( H \) contains a \( K^3_{m,m} \)-factor.

**Proof of Theorems 1.3 and 1.5.** Let \( 0 < \alpha \ll 1 \) and \( 1/n \ll \epsilon_2 \ll \epsilon_1 \ll \gamma \ll 1 \) with \( n \in 3m\mathbb{N} \). Let \( H \) be a 3-graph of order \( n \) with \( \delta_2(H) \geq n/2 + m^{1/3} n^{1-1/m} \) (resp. \( \delta_2(H) \)) satisfying (2).

I. \( H \) is 3γ-extremal. Then, by Lemma 2.5, \( H \) contains a \( K^3(m) \)-factor (resp. \( K^3_{m,m} \)-factor by Lemma 2.6).

II. \( H \) is not 3γ-extremal. Note that \( K^3_{m,m} \) is a spanning subgraph of \( K^3(m) \) by the definition of \( K^3_{m,m} \). If \( H \) has a \( K^3(m) \)-factor then it also contains a \( K^3_{m,m} \)-factor. By Lemma 2.3 we can choose an absorbing set \( W \subset V(H) \) with \(|W| \leq \epsilon_1 n\) and \(|W| \in 3m\mathbb{N}\) so that for any \( U \subset V(H) \setminus W \) with \(|U| \leq \epsilon_2 n\) and \(|U| \in 3m\mathbb{N}\), both \( H[W] \) and \( H[U \cup W] \) contain \( K^3(m) \)-factors. Let \( H' \) be the 3-graph obtained from \( H \) by deleting the vertices of \( W \). Then \(|V(H')| = n'$ \geq (1 - \epsilon_1)n \) and \( \delta_2(H') \geq n'/2 - 1 + \epsilon_1 \geq (1/3 + \alpha)n' \). Note that \( \sigma(K^3(m)) = 1/3 \). The codegree condition in Lemma 2.4 for \( H' \) and \( K^3(m) \) is satisfied. By Lemma 2.4, \( H' \) contains a \( K^3(m) \)-tiling \( M_1 \) covering all but at most \( C \) vertices. Let \( U = V(H') \setminus V(M_1) \). Then \(|U| = n - |W| - |V(M_1)| \in 3m\mathbb{N} \) and \(|U| \leq \epsilon_2 n\). Hence \( H[U \cup W] \) contains a \( K^3(m) \)-factor \( M_2 \). Then \( M_1 \cup M_2 \) is a \( K^3(m) \)-factor in \( H \). We are done.
The rest of the paper is organized as follows. In Section 3, we give the proof of the absorption lemma used in the paper, i.e. Lemma 2.3, and in Section 4, we deal with the extremal case, i.e. we prove Lemmas 2.5 and 2.6.

3 Absorption lemma

To prove the absorption lemma, we need some preliminaries. Let $H = (V, E)$ be a $k$-graph of order $n$, and $F$ be a $k$-graph of order $t$. Given an integer $i \geq 1$, a constant $\eta > 0$, and two vertices $x, y \in V$, a vertex set $S \subset V$ is called an $(x, y)$-connector of length $i$ with respect to $F$ if $S \cap \{x, y\} = \emptyset$, $|S| = ti - 1$ and both $H[S \cup \{x\}]$ and $H[S \cup \{y\}]$ contain $F$-factors. Two vertices $x$ and $y$ are called $(i, \eta)$-close with respect to $F$ if there exist at least $\eta n^{ti-1}$ $(x, y)$-connectors of length $i$ with respect to $F$ in $H$. Let

$$\tilde{N}_{F,i,\eta}(x) = \{y : x \text{ and } y \text{ are } (i, \eta)\text{-close with respect to } F\}.$$ 

A subset $U \subset V$ is said to be $(F, i, \eta)$-closed in $H$ if any two vertices in $U$ are $(i, \eta)$-close with respect to $F$. If $V$ is $(F, i, \eta)$-closed in $H$ then we simply say that $H$ is $(F, i, \eta)$-closed.

The following lemma given by Lo and Markström [21] referred to as absorption lemma provides a absorbing set for any sufficiently small vertex set if $H$ is $(F, i, \eta)$-closed.

**Lemma 3.1** (Lemma 1.1 in [21]). Let $t$ and $i$ be positive integers and $\eta > 0$. Then there exist $\eta_1, \eta_2$ such that $0 < \eta_2 \ll \eta_1 \ll \eta$ and an integer $n_0 = n_0(i, \eta)$ satisfying the following: Suppose that $F$ is a $k$-graph of order $t$ and $H$ is an $(F, i, \eta)$-closed $k$-graph of order $n \geq n_0$. Then there exists a vertex subset $U \subset V(H)$ of size at most $\eta n$ with $|U| \in t\mathbb{Z}$ such that, for every vertex set $W \subset V \setminus U$ of size at most $\eta_2 n$ with $|W| \in t\mathbb{Z}$, both $H[U]$ and $H[U \cup W]$ contain $F$-factors.

**Lemma 3.2** also given in [21] allows us to find close pairs with respect to a $k$-partite $k$-graph $F$.

**Lemma 3.2** (Lemma 4.2 in [21]). Let $k \geq 2$ be an integer and $\alpha > 0$. Given a $k$-partite $k$-graph $F$, there exist a constant $\eta_0 = \eta_0(k, F, \alpha) > 0$ and an integer $n_0 = n_0(k, F, \alpha)$ such that the following holds: Let $H$ be a $k$-graph of order $n \geq n_0$...
and \(x, y \in V(H)\). If
\[
|\{S \mid S \subseteq N(x) \cap N(y) \text{ with } |N(S)| \geq \alpha n\}| \geq \alpha \left(\frac{n}{k-1}\right),
\]
then \(x\) and \(y\) are \((F, 1, \eta)\)-close for all \(0 < \eta \leq \eta_0\).

The following lemma in [12] gives us a partition of \(V(H)\) with bounded number of parts such that each of them is closed with respect to \(F\).

**Lemma 3.3** (Lemma 6.3 in [12]). Given \(\delta > 0\), integers \(c, k, t \geq 2\) and \(0 < \eta \ll 1/c, \delta, 1/t\), there exists a constant \(\eta' > 0\) such that the following holds for all sufficiently large \(n\): Let \(F\) be a \(k\)-graph on \(t\) vertices. Assume a \(k\)-graph \(H\) on \(n\) vertices satisfies that \(|\tilde{N}_{F, 1, \eta}(v)| \geq \delta n\) for any \(v \in V(H)\) and every set of \(c + 1\) vertices in \(V(H)\) contains two vertices that are \((F, 1, \eta)\)-close. Then we can find a partition of \(V(H)\) into \(V_1, \ldots, V_r\) with \(r \leq \min\{2c, 1/\delta'\}\) such that for any \(i \in [r]\), \(|V_i| \geq (\delta - \eta)n\) and \(V_i\) is \((F, 2^{c-1}, \eta')\)-closed in \(H\).

Actually here we use a variant absorbing method which is so-called lattice-based absorption developed by Han in [9]. The following definitions are introduced by Keevash and Mycroft [14]. Given a \(k\)-graph \(H = (V, E)\) and a partition \(\mathcal{P} = \{V_1, \ldots, V_r\}\) of \(V\), the **index vector** \(i_\mathcal{P}(S)\) of a subset \(S \subseteq V\) with respect to \(\mathcal{P}\) is the vector whose \(i\)-th coordinate is the size of the intersection of \(S\) and \(V_i\). A vector \(v \in \mathbb{Z}^r\) is called an \(s\)-**vector** if all its coordinates are nonnegative and their sum equals to \(s\). Given a \(k\)-graph \(F\) of order \(t\) and \(\mu > 0\), a \(t\)-vector \(v\) is called a \(\mu\)-**robust \(F\)-vector** if there are at least \(\mu nt\) copies \(F'\) of \(F\) in \(H\) satisfying \(i_\mathcal{P}(V(F')) = v\). Let \(I^\mu_{\mathcal{P}, F}(H)\) be the set of all \(\mu\)-robust \(F\)-vectors and \(L^\mu_{\mathcal{P}, F}(H)\) be the lattice (i.e., the additive subgroup) generated by \(I^\mu_{\mathcal{P}, F}(H)\). For \(j \in [r]\), let \(u_j \in \mathbb{Z}^r\) be the \(j\)-th unit vector, namely, \(u_j\) has 1 on the \(j\)-th coordinate and 0 on other coordinates. A transferral is a vector of the form \(u_i - u_j\) for some distinct \(i, j \in [r]\).

The following lemma in [13] states that if \(L^\mu_{\mathcal{P}, F}(H)\) contains all transferrals then \(H\) is closed.

**Lemma 3.4** (Lemma 3.9 in [13]). Let \(i_0, k, r_0 > 0\) be integers and let \(F\) be a \(k\)-graph on \(t\) vertices. Given constants \(\epsilon, \eta, \mu > 0\), there exist \(\eta' > 0\) and an integer \(i'_0 \geq 0\) such that the following holds for sufficiently large \(n\): Let \(H\) be a \(k\)-graph on \(n\) vertices with a partition \(\mathcal{P} = \{V_1, \ldots, V_r\}\) such that \(r \leq r_0\) and for each \(j \in [r]\), \(|V_j| \geq \epsilon n\) and \(V_j\) is \((F, i_0, \eta)\)-closed in \(H\). If \(u_j - u_\ell \in L^\mu_{\mathcal{P}, F}(H)\) for all \(1 \leq j < \ell \leq r\), then \(H\) is \((F, i'_0, \eta')\)-closed.
The following lemma helps us to count the number of copies of $K^3(m)$.

**Lemma 3.5** (Corollary 2 in [5]). Let $F$ be a $k$-partite $k$-graph of order $t$. For every $\epsilon > 0$, there exists a constant $\mu > 0$ and an integer $n_0$ such that every $k$-graph $H$ of order $n \geq n_0$ with $e(H) > \epsilon n^k$ contains at least $\mu n^t$ copies of $F$.

We also need the following lemma from [10].

**Lemma 3.6** (Lemma 3.3 in [10]). Let $0 < 1/n \ll \gamma < 1/100$. Suppose that $H$ is a $3$-graph of order $n$ with $\delta_2(H) \geq (1/2 - \gamma)n$. Let $X, Y$ be any bipartition of $V(H)$ with $|X|, |Y| \geq n/5$. If $H$ is not $3\gamma$-extremal, then $H$ contains at least $\gamma^2 n^3$ $XXY$-edges and at least $\gamma^2 n^3$ $XYY$-edges.

Now it is ready to give the proof of our absorption lemma, we restate it here.

**Lemma 3.7.** Let $0 < \epsilon_2 \ll \epsilon_1 \ll \gamma \ll 1$ and $m$ be an positive integer. Suppose that $H$ is a $3$-graph of order $n$ with $\delta_2(H) \geq (1/2 - \gamma)n$. If $H$ is not $3\gamma$-extremal, then there exists a set $W \subset V(H)$ with $|W| \leq \epsilon_1 n$ and $|W| \in 3m\mathbb{N}$ so that for any $U \subset V(H) \setminus W$ with $|U| \leq \epsilon_2 n$ and $|U| \in 3m\mathbb{N}$, both $H[W]$ and $H[U \cup W]$ contain $K^3(m)$-factors.

**Proof.** Assume $\gamma$ is sufficiently small and let $\alpha = \gamma/3$. Let $F = K^3(m)$. If we prove that $H$ is $(F, i, \eta)$-closed for some parameters $i > 0$ and $0 < \eta \ll \gamma$, then by Lemma 3.1 with $t = 3m$ we obtain the desired absorbing set. So in the following it is sufficient to show that $H$ is $(F, i, \eta)$-closed for some parameters $i > 0$ and $0 < \eta \ll \gamma$.

**Claim 1.** For each $v \in V(H)$ and some $0 < \eta \ll \gamma$, $\tilde{N}_{F, i, \eta}(v) \geq (1/2 - 2\gamma)n$.

**Proof of Claim 7:** Fix $v \in V(H)$, we have

$$|N(v)| \geq \frac{(1/2 - \gamma)n(n-1)}{2} = (1/2 - \gamma)\binom{n}{2}. \quad (4)$$

Note that $|N(S)| \geq (1/2 - \gamma)n \geq \alpha n$ for any 2-elements set $S \subset V(H)$. By Lemma 3.2 we have $u \in \tilde{N}_{F, i, \eta}(v)$ if $|N(v) \cap N(u)| \geq \alpha \binom{n}{2}$ for any $0 < \eta \leq \eta_0 = \eta_0(k, F, \alpha)$. Let $G$ be a bipartite graph with partition classes $N(v)$ and $V(H) \setminus \{v\}$, and a 2-elements set $S \in N(v)$ and a vertex $w \in V(H) \setminus \{v\}$ are adjacent in $G$ if and only if $S \cup \{w\} \in E(H)$. Then we have

$$e(G) = \sum_{S \in N(v)} d_G(S) = \sum_{S \in N(v)} (|N(S)| - 1) < |\tilde{N}_{F, i, \eta}(v)| \cdot |N(v)| + n \cdot \alpha \binom{n}{2}.$$
Together with \(|N(S)| \geq (1/2 - \gamma)n\), we have
\[
|\tilde{N}_{F,1,\eta}(v)| \geq (1/2 - \gamma)n - 1 - \frac{n \cdot \alpha(n)}{(1/2 - \gamma)(n/2)} \geq (1/2 - 2\gamma)n.
\]

Given any three vertices \(x_1, x_2, x_3 \in V(H)\), by \(\square\) and the inclusion-exclusion principle, we have
\[
\sum_{1 \leq i < j \leq 3} |N(x_i) \cap N(x_j)| = \sum_{i=1}^{3} |N(x_i)| - |\cup_{i=1}^{3} N(x_i)| + |\cap_{i=1}^{3} N(x_i)|
\]
\[
\geq 3(1/2 - \gamma) \binom{n}{2} - |\cup_{i=1}^{3} N(x_i)| + |\cap_{i=1}^{3} N(x_i)|
\]
\[
\geq 3\alpha \binom{n}{2} + \binom{n}{2} - |\cup_{i=1}^{3} N(x_i)| + |\cap_{i=1}^{3} N(x_i)|
\]
\[
\geq 3\alpha \binom{n}{2}.
\]

By the pigeonhole principle, there exists at least one pair \(x_i, x_j\) such that \(|N(x_i) \cap N(x_j)| \geq \alpha(n/2)\), by Lemma \([3.2]\) such a pair \(x_i, x_j\) is \((F, 1, \eta)\)-close.

Now apply Lemma \([3.3]\) to \(F\) and \(H\) with \(\delta = (1/2 - 2\gamma)\), \(c = 2\) and \(\eta \ll \gamma\), we have that there exist a constant \(\eta' > 0\) and a partition \(\mathcal{P}\) of \(V\) with at most 2 parts such that each part has size at least \((1/2 - 3\gamma)n\) and is \((F, 2, \eta')\)-closed in \(H\). If \(|\mathcal{P}| = 1\), then \(H\) is \((F, 2, \eta')\)-closed, as desired. So, we assume \(|\mathcal{P}| = 2\) and \(\mathcal{P} = \{X, Y\}\). Since \(H\) is not \(3\gamma\)-extremal, by Lemma \([3.6]\) we have both \(e(XXY)\) and \(e(XYY)\) are at least \(\gamma^2n^3\).

Define
\[
E_0 = \{xy : x \in X, y \in Y, d_X(xy) \geq \gamma^2n, d_Y(xy) \geq \gamma^2n\},
\]
\[
E_1 = \{xy : x \in X, y \in Y, d_X(xy) \geq \gamma^2n, d_Y(xy) < \gamma^2n\},
\]
and
\[
E_2 = \{xy : x \in X, y \in Y, d_X(xy) < \gamma^2n, d_Y(xy) \geq \gamma^2n\}.
\]

Then \(E(K(X, Y)) = E_0 \cup E_1 \cup E_2\). So \(|E_i| \leq e(K(X, Y)) \leq \frac{n^3}{\mu} \) for any \(i \in \{0, 1, 2\}\).

By Lemma \([3.4]\) to show that \(H\) is closed it suffices to show \(u_1 - u_2 \in L_{\mu, \nu}(H)\) for some \(\mu\), or equivalently, we need to show that \(H\) contains at least \(\mu n^{3m}\) copies of \(K^3(m)\) of types \((i, 3m - i)\) and \((i + 1, 3m - i - 1)\) for some \(i\), respectively. We split the following proof into two cases depending on the size of \(E_0\). The next claim deals with the case when \(|E_0|\) is sufficiently large.
Claim 2. There exists $\mu_1 > 0$ for any given integers $0 \leq s, t \leq m$ with $s + t = m$ such that the following holds: If $|E_0| \geq \gamma^4 n^2$, then $H$ contains at least $\mu_1 n^{3m}$ copies of $K^3(m)$ of type $(m + s, m + t)$.

Proof of Claim 2: Choose $0 < \gamma_1 \ll \gamma$. Given $x \in X, y \in Y$, let $k_{s,t}(xy)$ be the number of copies of $K^3(\{x\}, \{y\}, M)$ where $|M \cap X| = s$ and $|M \cap Y| = t$. Given $S \subset X$ and $T \subset Y$ such that the following holds: If $|X| \geq \gamma_1 n^2$, then there exists $G(S, T)$ be the bipartite graph with vertex set $X \cup Y$ and edge set consisting of all pairs $xy$ such that $x \in X, y \in Y$ and $xyz \in E(H)$ for all $z \in S \cup T$. Then by double counting we have

$$\sum_{x \in X, y \in Y} k_{s,t}(xy) = \sum_{S \in \binom{X}{s}, T \in \binom{Y}{t}} |G(S, T)|.$$

In the following, we write LHS (resp. RHS) for left-hand side (resp. right-hand side) for short. Note that $|E_0| \geq \gamma^4 n^2$, we have

$$LHS = \sum_{x \in X, y \in Y} \left( \begin{array}{c} d_X(xy) \\ s \end{array} \right) \left( \begin{array}{c} d_Y(xy) \\ t \end{array} \right) \geq |E_0| \left( \begin{array}{c} \gamma^2 n \\ s \end{array} \right) \left( \begin{array}{c} \gamma^2 n \\ t \end{array} \right) \geq \gamma_1 n^{m+2}.$$

On the other hand,

$$RHS = \left( \sum_{|G(S, T)| < \gamma_1 n^2} + \sum_{|G(S, T)| \geq \gamma_1 n^2} \right) |G(S, T)| \leq \gamma_1 n^2 + \sum_{|G(S, T)| \geq \gamma_1 n^2} |X||Y|.$$

So the number of pairs $(S, T)$ such that $|G(S, T)| \geq \gamma_1 n^2$ is at least

$$\left( \gamma_1 n^{m+2} - \gamma_1 n^2 \left( \begin{array}{c} |X| \\ s \end{array} \right) \left( \begin{array}{c} |Y| \\ t \end{array} \right) \right) / |X||Y| \geq \frac{1}{2} \gamma_1 n^{m+2}/(n^2/4) = 2\gamma_1 n^m.$$

Fix such a pair $(S, T)$, by Lemma 3.5 there is a positive constant $\mu_0$ such that $G(S, T)$ contains at least $\mu_0 n^{2m}$ copies of $K^2(m)$, which gives us at least $\mu_0 n^{2m}$ copies of $K^3(m)$ of type $(m + s, m + t)$. Choose $0 < \mu_1 \ll \mu_0$. Summing up all of such pairs $(S, T)$, we get at least $2\gamma_1 n^m \mu_0 n^{2m} \geq \mu_1 n^{3m}$ copies of $K^3(m)$ of type $(m + s, m + t)$ in $H$. \hfill \qed

Claim 3. Given integers $0 \leq s, t \leq m$ with $s + t = m$, there exists $\mu'_1 > 0$ such that the following holds: If $|E_0| < \gamma^4 n^2$, then $H$ contains at least $\mu'_1 n^{3m}$ copies of $K^3(m)$ of the same type either $(2m + s, t)$ or $(t, 2m + s)$. 

13
Proof of Claim 3: Without loss of generality, assume that \(|E_1| \leq |E_2|\). First, we show \(3\gamma^2 n^2 \leq |E_1| \leq \frac{1}{4} n^2\). The upper bound is trivial by the assumption that \(|E_1| \leq |E_2|\). Now suppose that \(|E_1| < 3\gamma^2 n^2\). Then, we have

\[ e(XXY) = \frac{1}{2} \sum_{x \in X, y \in Y} d_X(xy) \]
\[ < \frac{1}{2} \left( |E_0| \cdot |X| + |E_1| \cdot |X| + |E_2| \cdot \gamma^2 n \right) \]
\[ < \frac{1}{2} \left( (\gamma^4 + 3\gamma^2) n^2 \cdot \left( \frac{1}{2} + 3\gamma \right) n + \frac{n^2}{4} \cdot \gamma^2 n \right) \]
\[ < \gamma^2 n^3, \]

a contradiction to \(e(XXY) \geq \gamma^2 n^3\). Thus, we have \(|E_1| \geq 3\gamma^2 n^2\). Note that for \(xy \in E_1\), we have \(d_X(xy) \geq (1/2 - \gamma - \gamma^2) n\) and hence \((1/2 - \gamma - \gamma^2) n \leq |X|, |Y| \leq (1/2 + \gamma + \gamma^2) n\).

Let \(Y' = \{y \in Y : d_{E_0}(y) \leq \gamma^2 n\}\). Since \(|E_0| \leq \gamma^4 n^2\), there are at most \(\gamma^2 n\) vertices \(y\) in \(Y\) such that \(d_{E_0}(y) > \gamma^2 n\). Thus we have \(|Y'| \geq |Y| - \gamma^2 n\).

We claim that either \(d_{E_1}(y) \leq 3\gamma^2 n\) or \(d_{E_1}(y) > |X| - 3\gamma n\), for all \(y \in Y'\). Fix \(y \in Y'\). Let \(e_y\) be the number of edges \(x_1x_2y\) of the form \(XXY\) such that exactly one of \(\{x_1, x_2\}\) belongs to \(E_1\). On one hand, we have

\[ e_y \geq ((1/2 - \gamma - \gamma^2) n - d_{E_1}(y)) \cdot d_{E_1}(y) \geq (|X| - 2\gamma n - 2\gamma^2 n - d_{E_1}(y)) \cdot d_{E_1}(y), \]

since for each \(x \in N_{E_1}(y)\), there are at least \((1/2 - \gamma - \gamma^2) n - d_{E_1}(y)\) edges \(xx'y\) of the form \(XY\) with \(x' \in N_{E_0}(y) \cup N_{E_2}(y)\) and \(|X| \leq (1/2 + \gamma + \gamma^2) n\). On the other hand, we have

\[ e_y \leq |X| \cdot d_{E_0}(y) + \gamma^2 n \cdot d_{E_2}(y) \leq 2\gamma^2 n |X|, \]

since \(d_X(x'y) < \gamma n^2\) for \(x'y \in E_2\), and the last inequality holds since \(d_{E_0}(y) \leq \gamma^2 n\) and \(d_{E_2}(y) \leq |X|\). Therefore, we have

\[ (|X| - 2\gamma n - 2\gamma^2 n - d_{E_1}(y)) \cdot d_{E_1}(y) \leq 2\gamma^2 n |X|, \]

And hence we have either \(d_{E_1}(y) \leq 3\gamma^2 n\) or \(d_{E_1}(y) > |X| - 3\gamma n\), for all \(y \in Y'\).

Let \(Y_0 = \{y : d_{E_1}(y) \geq |X| - 3\gamma n, y \in Y'\}\). Clearly,

\[ |Y_0| \geq \frac{|E_1| - (|Y| - |Y'|)|X| - |Y| \cdot 3\gamma^2 n}{|X|} \geq \frac{3\gamma^2 n^2 - \gamma^2 n |X| - |Y| \cdot 3\gamma^2 n}{|X|} \geq \gamma^2 n. \]

14
Now we claim that there are at least $(1 - 14\gamma)(\binom{|X|}{2})$ pairs $x_1, x_2 \in \binom{X}{2}$ such that $d_Y(x_1, x_2) \geq \frac{1}{10} \gamma^2 n$. Clearly,

$$e(XXY_0) = \frac{1}{2} \sum_{x \in X, y \in Y_0} d_X(xy)$$

$$\geq \frac{|Y_0|(1/2 - \gamma - \gamma^2)n(|X| - 3\gamma n)}{2}$$

$$\geq \frac{|Y_0||X|(1 - 5\gamma)|X|(1 - 7\gamma)}{2}$$

$$\geq (1 - 12\gamma)\binom{|X|}{2}|Y_0|.$$

On the other hand, if the number of pairs $x_1, x_2 \in \binom{X}{2}$ with $d_Y(x_1, x_2) \geq \frac{1}{10} \gamma^2 n$ is less than $(1 - 14\gamma)(\binom{|X|}{2})$, we have

$$e(XXY_0) = \sum_{x_1, x_2 \in \binom{X}{2}} d_Y(x_1, x_2)$$

$$< (1 - 14\gamma)\binom{|X|}{2}|Y_0| + 14\gamma \binom{|X|}{2} \frac{1}{10} \gamma^2 n$$

$$\leq (1 - 12\gamma)\binom{|X|}{2}|Y_0| - 2\gamma \binom{|X|}{2}|Y_0| + 14\gamma \binom{|X|}{2} \frac{1}{10}|Y_0|$$

$$= (1 - 12\gamma)\binom{|X|}{2}|Y_0| - \frac{3}{5} \gamma \binom{|X|}{2}|Y_0|$$

$$< (1 - 12\gamma)\binom{|X|}{2}|Y_0|,$$

a contradiction.

Next, we claim that there are at least $(\frac{1}{2} - 11\gamma)(\binom{|X|}{2})$ pairs $x_1, x_2 \in \binom{X}{2}$ such that $d_X(x_1, x_2) \geq \gamma n$. In fact,

$$\sum_{x_1 x_2 \in \binom{X}{2}} d_X(x_1 x_2) = \sum_{x_1 x_2 \in \binom{X}{2}} d_H(x_1 x_2) - \sum_{x_1 x_2 \in \binom{X}{2}} d_Y(x_1 x_2)$$

$$\geq \left(\frac{1}{2} - \gamma\right) n \cdot \binom{|X|}{2} - \frac{1}{2} \sum_{x \in X, y \in Y} d_X(xy)$$

$$\geq \left(\frac{1}{2} - \gamma\right) n \cdot \binom{|X|}{2} - \frac{1}{2} \left(\gamma^4 n^2 \cdot |X| + \frac{n^2}{8} \cdot |X| + \frac{n^2}{4} \cdot \gamma^2 n\right)$$

$$\geq \left(\frac{1}{2} - \gamma\right) n \cdot \binom{|X|}{2} - \frac{n}{4} \left(\gamma^4 n \cdot |X| + \frac{n}{8} \cdot |X| + \frac{n}{4} \cdot \gamma^2 n\right)$$

$$\geq \left(\frac{1}{4} - 3\gamma\right) n \binom{|X|}{2},$$
the third inequality holds since $d_X(xy) \leq |X|$ for any $xy \in E_0 \cup E_1$, $d_X(xy) < \gamma^2 n$ for $xy \in E_2$ and $|E_0| < \gamma^4 n^2$, $|E_1| \leq \frac{n^2}{2}$ and $|E_2| \leq \frac{n^2}{2}$; the last inequality holds since $(1/2 - 3\gamma)n \leq |X| \leq (1/2 + 3\gamma)n$. Since
\[
\frac{(\frac{1}{2} - 3\gamma)n(|X|)}{|X|} - \gamma n\left(\frac{|X|}{2}\right) \geq \frac{1}{2} - 4\gamma \left(\frac{|X|}{2}\right) \geq \frac{1}{2} - 11\gamma \left(\frac{|X|}{2}\right),
\]
there are at least $(\frac{1}{2} - 11\gamma)\left(\frac{|X|}{2}\right)$ pairs $x_1x_2 \in \binom{X}{2}$ such that $d_X(x_1x_2) \geq \gamma n$.

Therefore, there are at least $(1 - 14\gamma + \frac{1}{2} - 11\gamma - 1)\left(\frac{|X|}{2}\right) \geq \frac{n^2}{100}$ pairs $x_1x_2 \in \binom{X}{2}$ such that $d_X(x_1x_2) \geq \gamma n$ and $d_Y(x_1x_2) \geq \frac{1}{10}\gamma^2 n$.

As what we have done in the proof of Claim 2, for $x_1x_2 \in \binom{X}{2}$, let $k'_{s,t}(x_1x_2)$ be the number of 3-partite 3-graphs $K^3(\{x_1\}, \{x_2\}, M)$ with $|M \cap X| = s$ and $|M \cap Y| = t$. Similarly, given $S \subset X$ and $T \subset Y$ with $|S| = s$ and $|T| = t$, let $G'(S, T)$ be the graph with vertex set $X$ and edge set consisting of all pairs $x_1x_2 \in \binom{X}{2}$ such that $x_1x_2z \in H$ for all $z \in S \cup T$. Then, by double counting, we have
\[
\sum_{x_1x_2 \in \binom{X}{2}} k'_{s,t}(x_1x_2) = \sum_{S \in \binom{X}{s}, T \in \binom{Y}{t}} |G'(S, T)|.
\]

Since there are at least $\frac{n^2}{100}$ pairs $x_1x_2 \in \binom{X}{2}$ such that $d_X(x_1x_2) \geq \gamma n$ and $d_Y(x_1x_2) \geq \frac{1}{10}\gamma^2 n$, we have
\[
\text{LHS} = \sum_{x_1x_2 \in \binom{X}{2}} \left(\frac{d_X(x_1x_2)}{s}\right) \left(\frac{d_Y(x_1x_2)}{t}\right) \geq \left(\frac{\gamma n}{s}\right) \left(\frac{\gamma n}{t}\right) \cdot \frac{n^2}{100} \geq \gamma'_1 n^{m+2}.
\]

On the other hand,
\[
\text{RHS} = \left(\sum_{|G'(S, T)| < \gamma'_1 n^2} + \sum_{|G'(S, T)| \geq \gamma'_1 n^2} \right) |G'(S, T)|
\leq \sum_{|G'(S, T)| < \gamma'_1 n^2} \gamma'_1 n^2 + \sum_{|G'(S, T)| \geq \gamma'_1 n^2} \left(\frac{|X|}{2}\right).
\]

So the number of pairs $(S, T)$ such that $|G'(S, T)| \geq \gamma'_1 n^2$ is at least
\[
\left(\gamma'_1 n^{m+2} - \gamma'_1 n^2 \left(\frac{|X|}{s}\right) \left(\frac{|Y|}{t}\right)\right) \left(\frac{|X|}{2}\right) \geq \frac{1}{2}\gamma'_1 n^{m+2}/(n^2/3) \geq \gamma'_1 n^m.
\]

Fix such a pair $(S, T)$, by Lemma 3.5, $G'(S, T)$ contains at least $\mu'_0 n^{2m}$ copies of $K^2(m)$, which give us at least $\mu'_0 n^{2m}$ copies of $K^3(m)$ of type $(2m + s, t)$. Therefore, $H$ contains at least $\gamma'_1 n^m \cdot \mu'_0 n^{2m} \geq \mu'_1 n^{3m}$ copies of $K^3(m)$ of type $(2m + s, t)$.

This completes the proof. □
4 Extremal case

In this section, we prove Lemmas 2.5 and 2.6. Let $G$ and $H$ be two $k$-graphs on the same vertex set $V$ and let $G \setminus H$ be the graph $(V, E(G) \setminus E(H))$. Suppose that $|V| = n$ and $0 \leq \alpha \leq 1$, we say a vertex $v \in H$ is $\alpha$-good with respect to $G$ if $d_{G \setminus H}(v) \leq \alpha n^{k-1}$, otherwise call it $\alpha$-bad. We call $H$ $\alpha$-good with respect to $G$ if all of vertices in $H$ are $\alpha$-good with respect to $G$. First we deal with a special case when $H$ is $\alpha$-good with respect to the extremal graph. We need a lemma from [13] which follow with some extra work from a perfect packing theorem of Lu and Székely [22]. Given $V = A \cup B$, let $\mathcal{D}[A, B]$ be the $k$-graph on $V$ consisting of all edges of type $AB^{k-1}$.

Lemma 4.1 (Lemma 6.1 in [13]). Let $K$ be a complete $k$-partite $k$-graph of order $t$ with the first part of size $a_1$. Given $0 < \rho \ll 1/m$ and a sufficiently large integer $n$, suppose $H$ is a $k$-graph on $n \in t\mathbb{Z}$ vertices with a partition of $V(H) = X \cup Y$ such that $a_1 |Y| = (t - a_1) |X|$. Furthermore, assume that $H$ is $\rho$-good with respect to $\mathcal{D}[X, Y]$. Then $H$ contains a $K$-factor.

Lemma 4.2. Let $\alpha, \epsilon$ be any given constants with $0 < \epsilon \ll \alpha$ and $m$ be an integer. Suppose that $H$ is a $3$-graph with large enough order $n$ and $V(H)$ has a partition $A \cup B$ with $|\{A| - |B|\} < \epsilon n$ such that $H$ is $\alpha$-good with respect to $\mathcal{B}[A, B]$. Then $H$ contains a $K^3(m)$-tiling covering all but at most $2\epsilon n$ vertices. Furthermore, if $n \in 12m\mathbb{Z}$ and $|A| = |B|$. Then $H$ contains a $K^3(m)$-factor.

Proof. Without loss of generality, assume $|A| \leq |B|$. Let $|A| = 6mn' + s$ and $|B| = 6mn' + t$, where $0 \leq s < 6m$ and $t = |B| - |A| + s < 2\epsilon n$. Let $A_0$ and $B_0$ be the sets obtained from $A$ and $B$ by deleting $s$ and $t$ vertices from $A$ and $B$, respectively. Then $|A_0 \cup B_0| = 12mn' \in 12m\mathbb{N}$. Let $H_0 = H[A_0 \cup B_0]$ and $n_0 := V(H_0)$. Then $H_0$ must be $\alpha'$-good with respect to $\mathcal{B}[A_0, B_0]$ for some constant $\alpha' > 0$. Partition $A_0$ into three subsets $A_1$, $A_2$, $A_2'$ with $|A_1| = 3mn'$, $|A_2| = mn'$ and $|A_2'| = 2mn'$. Let $H_1 = H'[A_1 \cup B_0]$ and $H_2 = H'[A_2 \cup A_2']$. Then we have $|V(H_1)| = \frac{3}{4}n_0$ and $|V(H_2)| = \frac{1}{4}n_0$. One can examine that $H_1$ is $\frac{16}{9}\alpha'$-good with respect to $\mathcal{D}[A_1, B_0]$ and $H_2$ is $16\alpha'$-good with respect to $\mathcal{D}[A_2, A_2']$. Set $K = K^3(m)$ and $t = 3m$. Applying Lemma 4.1 to $H_1$ and $H_2$ with parameters $\frac{16}{9}\alpha'$ and $16\alpha'$, we obtain $K^3(m)$-factors $\mathcal{M}_1$ in $H_1$ and $\mathcal{M}_2$ in $H_2$, respectively. Therefore, $\mathcal{M}_1 \cup \mathcal{M}_2$ is a desired $K^3(m)$-factor of $H_0$.

If $n \in 12m\mathbb{Z}$ and $|A| = |B|$ then $H_0 = H$. Hence $\mathcal{M}_1 \cup \mathcal{M}_2$ is a $K^3(m)$-factor of $H$. □
Remark: Note that, in the above proof, the $K^3(m)$-factors $\mathcal{M}_1$ and $\mathcal{M}_2$ have the following property:
(1) Each member in $\mathcal{M}_1$ (resp. $\mathcal{M}_2$) has type $(m,2m)$ (resp. $(3m,0)$) with respect to the partition $A \cup B$, and
(2) both $|\mathcal{M}_1| (\sim \frac{n}{4})$ and $|\mathcal{M}_2| (\sim \frac{n}{12})$ are large enough.

The following classical result [16] also will be used.

Lemma 4.3 (Kővári-Sós-Turán, 1954). For all $t \geq s \geq 2$, the Turán function of the complete bipartite graph $K^2(s,t)$ is

$$ex_2(n, K^2(s,t)) \leq \frac{1}{2}((t-1)^{1/s}n^{2-1/s} + (s+1)n).$$

4.1 Proofs of Lemmas 2.5 and 2.6

Since $H$ is $\gamma$-extremal, there is a partition $V = A \cup B$ such that $|A| \leq |B| \leq \lfloor n/2 \rfloor$ and $H$ is $\gamma$-extremal with respect to $\mathcal{B}[A,B]$. Set $\gamma_1 = \sqrt{7}$. By the definition of $\gamma$-extremal, all but at most $\gamma_1n$ vertices in $V$ are $\gamma_1$-good with respect to $\mathcal{B}[A,B]$. Let $A_0$ and $B_0$ be the sets of $\gamma_1$-bad vertices in $A$ and $B$, respectively. Then $|A_0 \cup B_0| \leq \gamma_1n$.

For a vertex $x \in A_0 \cup B_0$, we call it $B$-acceptable if $|E(H_x) \cap E(K^2(A,B))| \geq n^2/40$; otherwise we call it $A$-acceptable. Note that $|E(H_x)| \geq \delta_1(H) \geq (n-1)(\lfloor n/2 \rfloor - 1)/2$.

If $x$ is $A$-acceptable then $|E(H_x) \cap (A_2)| \geq \frac{2}{3}|\binom{A}{2}|$ and $|E(H_x) \cap (B_2)| \geq \frac{2}{3}|\binom{B}{2}|$. Now move all $A$-acceptable vertices into $A$ and $B$-acceptable vertices into $B$, we get a new partition $V = A' \cup B'$ with the property that

1) $n/2 - \gamma_1n \leq |A'|, |B'| \leq n/2 + \gamma_1n$ (since $|A_0 \cup B_0| \leq \gamma_1n$);
2) $H$ $\gamma_2$-contains $\mathcal{B}[A',B']$ for some constant $\gamma_2 \gg \gamma_1$.

Moreover, we can partition $A'$ into $A_1, A_2$ so that:

A1) Every vertex in $A_1$ is $\gamma_2$-good with respect to $\mathcal{B}[A',B']$;
A2) $|A_2| \leq \gamma_1n$;
A3) for every $x \in A_2$, $|E(H_x) \cap (A_2)| \geq \frac{2}{3}|\binom{A}{2}|$ and $|E(H_x) \cap (B_2)| \geq \frac{2}{3}|\binom{B}{2}|$.

Similarly, there is a partition $B_1, B_2$ of $B'$ so that:

B1) Every vertex in $B_1$ is $\gamma_2$-good with respect to $\mathcal{B}[A',B']$;
B2) $|B_2| \leq \gamma_1n$;
B3) for every $x \in B_2$, $|E(H_x) \cap E(K^2(A',B'))| \geq \frac{n^2}{50}$.

Our strategy is to find vertex-disjoint $K^3(m)$-tiling $K_1, K_2, K_3, K_4$ in $H$ so that the union of them is a $K^3(m)$-factor of $H$, in which $K_1$ is so-called 'parity breaking' copies dealing with the case $|B| \not\equiv 0 \pmod{2m}$, $K_2$ covers all vertices in $A_2 \cup B_2$, and $K_3$
is used to guarantee the divisibility condition required by Lemma 4.2 after removing the vertices covered by \( K_1 \) and \( K_2 \). Furthermore, \( K_1, K_2, K_3 \) are all small enough such that the graph obtained by deleting \( K_1, K_2, K_3 \) is \( \gamma_3 \)-good for some constant \( \gamma_3 \). Finally, we apply Lemma 4.2 to obtain \( K_4 \).

In Claims 4 and 5, we show that such 'parity breaking' copies of \( K^3(m) \) (resp. \( K^3_m,m \)) do exist.

**Claim 4.** If \( \delta_2(H) \geq n/2 + m^{1/m} n^{1-1/m} \), then \( H \) contains either \( 2m - 1 \) disjoint copies of \( K^3(m) \) of type \((m+1,2m-1)\) or \( 2m - 1 \) disjoint copies of \( K^3(m) \) of type \((3m-1,1)\).

**Proof of Claim 4:** If we can find a copy of \( K^3(m) \) of type \((m+1,2m-1)\) or \((3m-1,1)\) avoiding any given vertex set \( W \subset V \) with \( |W| \leq C \) for some constant \( C \geq 6m^2 \), then we can greedily find \( 2m - 1 \) disjoint copies of \( K^3(m) \) of desired type because we always can find a new copy of \( K^3(m) \) avoiding the vertices of copies of \( K^3(m) \) we have found (since \( C \geq 6m^2 \)). So the rest of the proof is to show the statement is true.

Choose any vertex set \( W \subset V \) with \( |W| \leq C \) for some constant \( C \geq 6m^2 \). We split the proof into two cases depending on the size of \( B' \).

First assume that \( |B'| \leq n/2 \). For any \( a \in A', b \in B' \), we have \( |N_H(ab) \cap A'| \geq m^{1/m} n^{1-1/m} \) since \( \delta_2(H) \geq n/2 + m^{1/m} n^{1-1/m} \). Construct an auxiliary bipartite graph \( G \) as follows: set \( V(G) = A' \cup B' \) and \( E(G) \) consists of all pairs \( ab \) with \( a \in A', b \in B' \) and \( |N_H(ab) \cap B'| \geq (1 - \sqrt[2]{\gamma_2})|B'| \). Since \( H \) contains \( \gamma_2 \)-good \( B[A', B'] \), there are at most \( \gamma_2 n^3 \) \( A'B'B' \)-edges missing in \( H \). Clearly, we have that at most \( 2\gamma_2 n^3/(\sqrt[2]{\gamma_2}B') \leq 8\sqrt[2]{\gamma_2} n^2 \) pairs \( ab \) missing in \( G \). By double-counting the number of ordered pairs \((v,e)\) with \( v \in A' \setminus W \) and \( e \in N_H(v) \cap E(G-W) \), we have

\[
\sum_{v \in A' \setminus W} |N_H(v) \cap E(G-W)| \geq (|G| - Cn) \cdot (m^{1/m} n^{1-1/m} - |A' \cap W|).
\]

Note that \((|G| - Cn)(m^{1/m} n^{1-1/m} - |A' \cap W|)/|A' \setminus W| \geq \frac{1}{2} (m - \frac{1}{2})^{1/m} n^{2-1/m} \). We can choose a vertex \( v \in A' \setminus W \) such that \( |N_H(v) \cap E(G-W)| \geq \frac{1}{2} (m - \frac{1}{2})^{1/m} n^{2-1/m} \). Lemma 4.3 implies that there exists a copy of \( K^2(m) \), denoted by \( M \), in \( N_H(v) \cap E(G-W) \). By the definition of \( E(G) \),

\[
\left| \left( \bigcap_{e \in M} N_H(e) \right) \cap (B' \setminus W) \right| \geq |B'| - m^2 \sqrt[2]{\gamma_2} |B'| - C \geq m - 1
\]

for sufficiently large \( n \) and small \( \gamma_2 \). Pick such any \( m - 1 \) vertices together with \( v \) and \( V(M) \), we obtain a copy of \( K^3(m) \) of type \((m + 1, 2m - 1)\) avoiding \( W \).
Now assume $|B'| > n/2$. For any pair $aa' \in \binom{A'}{2}$, we have $|N_H(aa') \cap B'| \geq m^{1/m}n^{1-1/m}$. Construct another auxiliary graph $G'$ as follows: set $V(G') = A'$ and $E(G')$ consists of all pairs $aa' \in \binom{A'}{2}$ with $|N_H(aa') \cap A'| \geq (1 - \sqrt[3]{2})|A'|$. Similarly, since there are at most $2m^3 \ \exists A'\exists A'$-edges missing in $H$, there are at most $3\sqrt[3]{2}m^3/(\sqrt[3]{2}|A'|) \leq 8\sqrt[3]{2}m^2$ edges $aa'$ missing in $G'$. By double-counting the number of ordered pairs $(v, e)$ with $v \in B' \setminus W$ and $e \in N_H(v) \cap E(G' - W)$, we have

$$\sum_{v \in B' \setminus W} |N_H(v) \cap E(G' - W)| \geq (|G'| - C|A'|)(m^{1/m}n^{1-1/m} - |B' \cap W|)/|B' \setminus W| > \frac{1}{2}m^{1/m}|A'|^{2-1/m}.$$ 

Note that $(|G'| - C|A'|)(m^{1/m}n^{1-1/m} - |B' \cap W|)/|B' \setminus W| > \frac{1}{2}m^{1/m}|A'|^{2-1/m}$. We can choose a vertex $v \in B' \setminus W$ such that $|N_H(v) \cap E(G' - W)| > \frac{1}{2}m^{1/m}|A'|^{2-1/m}$. Lemma 13 implies that there is a copy of $K^2(m)$, denoted by $M'$, in $N(v) \cap E(G' - W)$. By the definition of $E(G')$,

$$\left| \bigcap_{e \in M'} N(e) \cap (A' \setminus W) \right| \geq |A'| - m^2\sqrt[3]{2}|A'| - C \geq m - 1.$$ 

Pick any such $m - 1$ vertices together with $v$ and $V(M')$, we obtain a copy of $K^3(m)$ of of type $(3m - 1, 1)$ avoiding $W$. This completes the proof of claim 4. □

**Claim 5.** If $\delta_2(H)$ satisfies (2) in Theorem 13, then $H$ contains a copy $K$ of $K^3_{m,m}$ of type $(m + 1, 2m - 1)$ or $(3m - 1, 1)$, unless $|B'| = \lfloor n/2 \rfloor$ when $n \equiv 1 \pmod{4}$. Furthermore, for any $0 \leq t \leq m$, $H$ contains a copy $K'$ of $K^3_{m,m}$ of type $(m + 2t, 2m - 2t)$ disjoint from $K$.

**Proof:** If there exists a pair $a_1a'_1 \in \binom{A'}{2}$ such that $|N_H(a_1a'_1) \cap B'| \geq 2\gamma_1 n$, then we can choose $m$ distinct vertices $b_1, \ldots, b_m \in N_H(a_1a'_1) \cap B_1$ since $2\gamma_1 n - |B_2| > m$. Note that for a $\gamma_2$-good vertex $b \in B'$,

$$|E(H_b) \cap E(K^2(A', B'))| \geq |A'||B'| - \gamma_2 n^2 > \frac{m}{m + 1}|A'||B'|,$$

we have

$$\left| \bigcap_{i=1}^m E(H_{b_i}) \cap E(K^2(A', B')) \right| \geq \frac{1}{m + 1}|A'||B'|.$$ 

Thus, $\bigcap_{i=1}^m E(H_{b_i}) \cap E(K^2(A', B'))$ contains a matching of order $m - 1$, choose such a matching $a_2b_2, \ldots, a_mb_m$. So the subgraph of $H$ induced by $\{a'_1, a_1, a_2, \ldots, a_m\} \cup \{b_1, \ldots, b_m\} \cup \{b'_2, \ldots, b'_m\}$ contains a copy of $K^3_{m,m}$ of type $(m + 1, 2m - 1)$.  

20
Now assume \(|N_H(a_1a_2) \cap B'| < 2\gamma_1n\) for any \(a_1a_2 \in \binom{A'}{2}\). Then \(|N_H(a_1a_2) \cap A'| > n/2 - 2 - 2\gamma_1n\). Let \(F\) be the spanning subgraph consisting of all the edges of type \(A'A'B'\) of \(H\). We claim that if there is some \(b \in B'\) such that \(|F_b| > 2m\gamma_1n\), then \(H\) contains a copy of \(K^3_{m,m}\) of type \((3m - 1,1)\). In fact, assume that there is some \(b \in B'\) with \(|F_b| > 2m\gamma_1n\). First, suppose that \(F_b\) contains a matching of size \(m\). Let \(a_1a'_1, \ldots , a_mA'_m\) be a matching of \(F_b\). Since

\[
\left| \bigcap_{i=1}^{m} N_H(a_i a'_i) \cap A' \right| > m(n/2 - 2 - 2\gamma_1n) - (m - 1)|A'| > |A'|/2,
\]

one can choose \(m - 1\) distinct vertices \(a''_1, \ldots , a''_{m-1} \in \bigcap_{i=1}^{m} N_H(a_i a'_i) \cap A'\). And then the edges \(a_i a'_i a''_j , \ldots , a_i a'_i b \in E(H) (i \in [m], j \in [m - 1])\) form a copy of \(K^3_{m,m}\) of type \((3m - 1,1)\). Now suppose that \(M\) is a maximum matching in \(F_b\) of size at most \(m - 1\). Clearly, \(V(M)\) is a vertex cover of \(F_b\) and thus there exists a vertex \(a\) in \(V(M)\) of degree at least \(\frac{2m\gamma_1n}{2(m-1)} \geq |A_2| + m\). That is to say, there are \(m\) distinct \(\gamma_2\)-good vertices \(a''_1, \ldots , a''_{m}\) in \(N_A(ab)\). Note that for a \(\gamma_2\)-good vertex \(a''_i \in A'\), \(|E(H_{a''_i}) \cap E(K^1(A'))| \geq \binom{|A'|}{2} - \gamma_2n^2 > \frac{m}{m+1}\binom{|A'|}{2}\), we have

\[
\left| \bigcap_{i=1}^{m} E(H_{a''_i}) \cap E(K^1(A')) \right| \geq \frac{1}{m+1}\binom{|A'|}{2}.
\]

Thus \(\bigcap_{i=1}^{m} E(H_{a''_i}) \cap E(K^1(A'))\) contains a matching of order \(m - 1\), choose such a matching \(a_2a'_2, \ldots , a_m a'_m\). Therefore, the subgraph of \(H\) induced by \(\{a''_1, \ldots , a''_m\} \cup \{a_2, a'_2, \ldots , a_m, a'_m\}\) contains a copy of \(K^3_{m,m}\) of type \((3m - 1,1)\), as desired. So the rest of the case is to show that such a vertex \(b \in B'\) with \(|F_b| \geq 2m\gamma_1n\) does exist.

If \(n \equiv 1 \pmod{4}\) and \(|B'| \leq \lfloor n/2 \rfloor - 1\) or \(n \equiv 1 \pmod{4}\) and \(|B'| \leq \lceil n/2 \rceil - 1\), then for every pair \(ab\) with \(a \in A'\), \(b \in B'\), we have \(|N_H(ab) \cap A'| \geq 1\). Hence for any \(b \in B'\), we have \(\delta(F_b) \geq 1\) and so \(|F_b| \geq \lceil |A'|/2 \rceil \geq 2m\gamma_1n\), we are done. Now assume \(|B'| \geq \lfloor n/2 \rfloor\). Then for any pair \(ab' \in \binom{A'}{2}\), we have \(|N_H(aa') \cap B'| \geq 1\). Since

\[
\left( \frac{|A'|}{2} \right) / |B'| \geq \left( \frac{n/2 - \gamma_1n}{2} \right) / (n/2 + \gamma_1n) > 2m\gamma_1n,
\]

there exist at least one vertex \(b \in B'\) such that \(|F_b| > 2m\gamma_1n\).

Next, we show that \(H\) contains a copy \(K'\) of \(K^3_{m,m}\) of type \((m+2t, 2m-2t)\) disjoint from \(K\), \(0 \leq t \leq m\). Choose any \(m\) distinct \(\gamma_2\)-good vertices \(a_1, \ldots , a_t \in A' \setminus V(K)\) and \(b_{t+1}, \ldots , b_m \in B' \setminus V(K)\). Since \(|E(H_{a_i}) \cap \binom{A'}{2}| \geq \binom{|A'|}{2} - \gamma_2n^2\), there exists at
Let \( a' \in A' \) with \( |N_{H_n}(a') \cap A'| \geq |A'| - \sqrt{\gamma_2 n} \), that is we can choose \( t \) distinct vertices \( a'_1, \ldots, a'_t \in A' \) such that \( |N_{A'}(a_i a'_i)| \geq |A'| - \sqrt{\gamma_2 n} \) for \( 1 \leq i \leq t \). Similarly, since \( |E(H_b) \cap E(K^2(A', B'))| \geq |A'| |B'| - \gamma n^2 \), we can choose \( m - t \) distinct vertices \( b_{t+1}', \ldots, b'_m \in B' \setminus V(K) \) such that \( |N_{A'}(b_j b'_j)| \geq |A'| - \sqrt{\gamma_2 n} \) for \( t + 1 \leq j \leq n \). Therefore, we have \( |(\cap_{i=1}^t N_{A'}(a_i a'_i)) \cap (\cap_{i=t+1}^m N_{A'}(b_i b'_j)) \cap A'| \geq |A'|/2 \). So we can pick \( m \) vertices \( a'_1, \ldots, a'_m \in (\cap_{i=1}^t N_{A'}(a_i a'_i)) \cap (\cap_{i=t+1}^m N_{A'}(b_i b'_j)) \cap A' \) different from \( a_i, b_i, a'_i, b'_i, i \in [m] \). Clearly, the subgraph of \( H \) induced by \( \{ a_i, a'_i : i \in [t] \} \cup \{ b_i, b'_i : t + 1 \leq i \leq m \} \cup \{ a''_i : i \in [m] \} \) contains a copy of \( K_{m,m}^3 \) of type \((m + 2t, 2m - 2t)\). This completes the proof. \( \blacksquare \)

The next claim shows that we can find a small \( K^3(m) \)-tiling to cover the vertices in \( A_2 \cup B_2 \).

**Claim 6.** Suppose that \( \delta_2(H) \geq \lfloor \frac{n}{2} \rfloor - 1 \). Let \( W \subset V(H) \) with \( |W| \leq \gamma_2 n \). Every vertex \( x \in (A_2 \cup B_2) \setminus W \) can be covered by a copy of \( K^3(m) \) of type \((m, 2m)\) avoiding \( W \).

**Proof of Claim 6.** Recall that every vertex in \( A_1 \cup B_1 \) is \( \gamma_2 \)-good with respect to \( B[A, B] \). Let \( G \) be the graph on vertex set \( V \) and edge set consisting of all pairs \( xy \in \binom{V}{2} \) satisfying \( d_{B[H]}(xy) \leq \sqrt{\gamma_2 n} \). By the definition of \( \gamma_2 \)-good, for each vertex \( x \in A_1 \cup B_1 \), we have \( d_G(x) \geq n - \sqrt{\gamma_2 n} \).

If \( x \in A_2 \setminus W \), by A3), we have \( |H_x'[B_1 \setminus W]| \geq \frac{2}{3} \binom{|B'|}{2} - \gamma_1 n^2 - 2\gamma_n^2 \geq \frac{1}{2} \binom{|B'|}{2} \). Hence \( |E(H_x'[B_1 \setminus W]) \cap E(G)| \geq \frac{1}{3} \binom{|B'|}{2} \). Thus, by Lemma 4.3, \( H_x'[B_1 \setminus W] \cap G \) contains a copy of \( K^2(m) \), denoted by \( M \). Since \( d_H(e) \geq |A'| - \sqrt{\gamma_2 n} \) for any \( e \in M \), we have \( |\cap_{e \in M} N_H(e) \cap A'| \geq |A'| - m^2 \sqrt{\gamma_2 n} \). Hence we can choose \( \{ a_1, \ldots, a_{m-1} \} \subset (\cap_{e \in M} N_H(e) \cap A') \setminus W \). Therefore, the subgraph of \( H \) induced by \( \{ x, a_1, \ldots, a_{m-1} \} \cup V(M) \) contains a copy of \( K^3(m) \) of type \((m, 2m)\) covering \( x \).

Now suppose \( x \in B_2 \setminus W \). B3) together with A2), B2) imply that

\[
|E(H_x) \cap E(G[A_1 \setminus W, B_1 \setminus W])| \geq \frac{n^2}{50} - 2\gamma_1 n^2 - \gamma_2 n^2 - \sqrt{\gamma_2 n^2} \geq \frac{1}{100} |A'| |B'|.
\]

By Lemma 4.3, \( H_x \cap G[A_1 \setminus W, B_1 \setminus W] \) contains a copy of \( K^2(m) \) avoiding \( W \), denoted by \( M' \). Since \( d_H(e) \geq |B'| - \sqrt{\gamma_2 n} \) for any \( e \in M' \), we have \( |\cap_{e \in M'} N_H(e) \cap B'| \geq |B'| - m^2 \sqrt{\gamma_2 n} \). Hence we can choose \( m - 1 \) distinct vertices \( b_1, \ldots, b_{m-1} \in (\cap_{e \in M'} N_H(e) \cap B') \setminus W \). Therefore, the subgraph of \( H \) induced by \( \{ x, b_1, \ldots, b_{m-1} \} \cup V(M) \) contains a copy of \( K^3(m) \) of type \((m, 2m)\) covering \( x \), as desired. \( \blacksquare \)

**Proof of Lemma 2.5.** Let \( t \equiv |B'| \pmod{2m} \) such that \( 0 \leq t \leq 2m - 1 \). Let \( K_t \) be \( 2m - t \) disjoint copies of \( K^3(m) \) of type \((m + 1, 2m - 1)\) or \( t \) disjoint copies of \( K^3(m) \)
of type \((3m - 1,1)\) in \(H\) guaranteed by Claim 4. Note that \(|V(K_1)| \leq 6m^2\) is small enough. We can apply Claim 6 recursively to \(H\) to obtain a \(K^3(m)\)-tiling \(K_2\) covering all vertices of \((A_2 \cup B_2) \setminus V(K_1)\). Moreover, every copy of \(K^3(m)\) in \(K_2\) is of type \((m,2m)\). Let \(A'' := A' \setminus V(K_1 \cup K_2)\) and \(B'' := B' \setminus V(K_1 \cup K_2)\). Clearly, \(|B''| \equiv 0 \pmod{2m}\). Since \(n \in 3m\mathbb{N}\), we have \(|A'' \cup B''| \equiv 0 \pmod{3m}\) and \(|A''| \equiv 0 \pmod{m}\).

Since \(|K_1| < 2m\) and \(|K_2| \leq 2\gamma_1 n\), we have \(n/2 - 5m\gamma_1 n \leq |A''|, |B''| \leq n/2 + \gamma_1 n\). Let \(|A''| = (6a + s)m, |B''| = (6b' + 2t')m\). Then it is easy to check that \(s \equiv t' \pmod{3}\). So we can set \(|A''| = (6a + s)m\) and \(|B''| = (6b + 2s)m\) for some \(0 \leq s \leq 5\). Now, each vertex in \(A'' \cup B''\) is \(\gamma_2\)-good with respect to \(B(A'', B'')\) for some constant \(\gamma_2 \gg \gamma_2\).

By Lemma 4.2, we can find \(6(b - a) + s\) disjoint copies of \(K^3(m)\) of type \((m,2m)\) if \(b - a \geq 0\), or \(2(a - b)\) disjoint copies of \(K^3(m)\) of type \((3m,0)\) and \(s\) disjoint copies of \(K^3(m)\) of type \((m,2m)\) if \(b - a < 0\). Let \(K_3\) be these copies of \(K^3(m)\). Thus, \(|K_3| \leq 6(b - a) + s \leq 6\gamma_1 n\). Let \(A'^* = A'' \setminus V(K_3)\) and \(B'^* = B'' \setminus V(K_3)\). Then we have \(|A'^*| = |B'^*| \equiv 0 \pmod{6m}\) and \(|A'^*| = |B'^*| \geq n/2 - 10\gamma_1 mn\). Clearly, \(A'^* \subset A_1\) and \(B'^* \subset B_1\). Let \(H'^* = H[A'^* \cup B'^*]\). Since both \(|A_2|\) and \(|B_2|\) are small, it can be checked that there is some constant \(\gamma_3 \gg \gamma_2\) such that every vertex in \(H'^*\) is \(\gamma_3\)-good with respect to \(B[A'^*, B'^*]\). By Lemma 1.2 \(H'^*\) contains a \(K^3(m)\)-factor, say \(K_4\). Therefore, \(K_1 \cup K_2 \cup K_3 \cup K_4\) is a \(K^3(m)\)-factor of \(H\).

Proof of Lemma 2.6: The proof is similar to the one of Lemma 2.5. Note that \(n \in 3m\mathbb{N}\) and \(\delta_2(H)\) satisfies condition (2). Let \(t \equiv |B'| \pmod{2m}\) with \(0 \leq t \leq 2m - 1\). If \(t\) is even (note that \(|B'| = [n/2]\) and \(n \equiv 1 \pmod{4}\) belongs to this case), by Claim 5 for \(m - t/2\), we can find a copy \(K'\) of \(K^3_{m,m}\) of type \((3m - t, t)\) in \(H\). Set \(K_1 = \{K'\}\). Now assume \(t\) is odd. Then we can find two disjoint copies \(K, K'\) of \(K^3_{m,m}\) of types \((m+1,2m-1)\) and \((3m-t-1, t+1)\) (by Claim 5 for \(m - (t+1)/2\)) or of types \((3m-1,1)\) and \((3m - t + 1, t - 1)\) (by Claim 5 for \(m - (t-1)/2\)). In this case, set \(K_1 = \{K, K'\}\). For each case, we have \(|B' \setminus V(K_1)| \equiv 0 \pmod{2m}\) and \(|A' \setminus V(K_1)| \equiv 0 \pmod{2m}\). Since \(K^3_{m,m}\) is a spanning subgraph of \(K^3(m)\), the existence of \(K^3_{m,m}\)-tiling \(K_2, K_3, K_4\) follows from that of \(K^3(m)\)-tilings \(K_2, K_3, K_4\) in \(H\) with the same argument as in Lemma 2.6. Finally we have \(K_1 \cup K_2 \cup K_3 \cup K_4\) is a \(K^3_{m,m}\)-factor of \(H\).
