2Siberian State University of Telecommunications and Information Science, Novosibirsk, Russia

Abstract. Digital technologies have made it possible to create and replicate educational content in various forms: text, video, and audio. The post-PC generation actively uses audio content. There is a tendency to demand audiobooks as a format of educational resources. The purpose of the article is to identify and describe educational technologies and reading practices related to audiobooks. The novelty of the research is the analysis of student practices of audio reading. Methods: The first stage includes a desk study of audio reading as an educational technology, its capabilities and limitations, the representation of audiobooks in universities’ electronic libraries and the use of audiobooks in the educational process, educational technologies and practices of working with audiobooks. The second stage includes an empirical study of students 'practices of accessing and using electronic libraries in the process of educational (1), leisure (2) activities, readers' preferences for the reading format (traditional, audio reading) (3). Research results: With the development of digital technologies, electronic libraries have become a popular educational resource. The e-libraries extend the representation of the audio books. The possibilities and limitations of audio reading remain debatable. Audio reading as a resource-saving technology (carefulness to vision, time optimization) has a number of advantages and at the same time requires the development of listening skills and critical perception of audio text.

1 Introduction

Digital technologies that are actively penetrating the educational process have raised a number of questions in the search for new educational technologies. How should the educational environment change under the influence of digital technologies? What digital-based educational technologies allow you to solve the problem of forming a professionally competent specialist? What educational technologies activate the student's creative potential and maximize their capabilities? There was a discussion and search for solutions.

A model of "smart education" based on the following principles is proposed: 1) free access to knowledge; 2) individual approach to learning for everyone; 3) mutual learning of a group or community [1].

* Corresponding author: nl_nsk@mail.ru
A whole field, called smart pedagogy for smart learning, is being developed, which aims to answer questions about the use of artificial intelligence in educational systems, the impact of digital technologies on the perception and cognition of reality, social interactions, and educational practices. Digital objects are transformed from tools of educational technologies or educational environments into learning subjects whose mission is to digitalize achievements to help the student and their mentor. Digital technologies allow you to build individual educational trajectories.

One of the elements of the educational smart environment is a new format of library systems that integrate educational content of various types: electronic printed books, multimedia sources (audiobooks, audio and video materials, electronic periodicals, etc.). However, despite the resources that are spent on the development of electronic libraries and the accumulation of experience in creating electronic libraries with different types of data (e-books, audiobooks, music collections, catalogues of museum collections, video materials, etc.), their use in educational practice remains insufficiently active.

The growing popularity of audiobooks and the transformation of modern reading practices, one of the most popular variants of which is audio reading, determine the problem of their inclusion in educational technologies and evaluating the use of audio content in educational practices. This led to the choice of the focus of this study, which is aimed at describing the practices of using different types of electronic library resources and identifying user preferences for the reading format (traditional, audio reading).

2 Background theory

2.1 Resources for "smart education"

There is an opinion that smart learning can be implemented in various ways, including non-formal learning opportunities. However, formal education in schools and universities is still a trend and it is their mission to generate and promote new educational technologies. Improving access to the network, enriching training terminals, creating a training support system, and improving information security are the most important steps to create a smart environment [2].

The education system is facing the pressure of Industry 4.0, which requires new competencies, the formation of which is no longer possible with the help of reproductive, monologue-based teaching methods that met the needs of the previous stage of development [3].

Dron J., examining ways to create a "smart" learning environment, implies creating an intelligent environment. The intelligence of the environment arises as a result of the interaction of structural and dynamic elements, the most significant of which (especially in online education) are creative, motivated subjects [4].

2.2 Audio reading: reading practice and educational technology

The demand for audiobooks increases [5] along with the consolidation of audio reading practices [6]. Audio reading is an alternative to paper and screen reading. Among the research on audio reading and audiobooks, a number of areas can be noted. This is a study of the history of audio culture in the twentieth century [7], the phenomenon of audio reading and its types [8]. Attempts to classify audio reading raise the question of the anthropology of audio consumption [9]. A separate direction is formed by works related to the study of audio formats [10]. The article discusses the use of audiobooks in the process
of teaching native [11] and foreign languages [12]. The attention of researchers is paid to
the reader's practice of reading different book formats (paper, screen, audio) [13].

Audiobooks have special features in comparison with a printed book: they help save
time, make reading more comfortable for the audience, allow them to perceive familiar
stories in a new way and even take care of their health, and at the same time require the
skill to maintain attention for a long time [14]. Evaluating listening to an audiobook in
comparison with reading, experts note that "this is a passive activity" in comparison with
traditional reading, which requires active behaviors, including, for example, decryption and
interpretation [15]. The issue of concentration of attention in the perception of an
audiobook remains debatable, and opposite opinions are expressed. Thus, M. Rubery notes
that "audiobooks do not require the same level of concentration as printed books" [15, p.
14], on the other hand, noting the formation of methods of "attentive listening". A
comparative analysis of book perception practices is presented in the study by B. A.
Rogowsky, where it is noted that no significant differences were found depending on
whether a part of a popular science book was presented in an audiobook, electronic text, or
in double mode, and a comparable understanding and memorization of the text is recorded
regardless of the way it is presented [16]. S. Barinova notes that an audiobook requires the
ability to maintain attention for a long time [14].

The growing popularity of audiobooks, according to experts, may be one of the main
drivers of the growth of the e-book market [17], which, according to the forecasts of the
Russian company EKSMO-AST, may show a sales growth of about 40% (in comparison,
sales of printed books are projected to increase by only 5%). Publishers are optimistic about
the development of new book formats, but buyers still prefer paper products. In 2018
printed books accounted for 92.1%, electronic books for 6.7%, and audiobooks for only
1.2%. But by 2022 demand for e-books is expected to increase by almost 15%, and for
audiobooks by 3.2% [18].

E. Lee (2020), assessing the current state of the main audiobook markets, pays attention
to the use of audiobooks for educational purposes, their distribution and institutionalization
for educational purposes [19].

K. Dalí and L. Brochu, based on the analysis of the growing popularity of audiobooks
as an accessible media and the choice for readers with and without disabilities, justify the
equal status of audiobooks with printed books, wider recognition of audiobooks, and
integration of audiobooks into the library collections of public, academic, and special
libraries [21].

The review of the sources shows that the issues of theoretical understanding of the use
of audiobooks as an educational technology require research attention, not only in the
context of learning foreign languages, but also in a broader cultural context, and practical
issues of creating and using audiobooks as educational content require attention.

3 Results

3.1 Research method

Methods and methodology. The first stage: a desk study of audio reading as an educational
technology, its capabilities and limitations, the representation of audiobooks in universities'
electronic libraries and the use of audiobooks in the educational process, educational
technologies and practices of working with audiobooks.

The second stage: an empirical study of students' practices of accessing and using
electronic libraries in the process of educational (1), leisure (2) activities, readers'
preferences for the reading format (traditional, audio reading) (3). The study was conducted
among students of higher educational institutions in Novosibirsk in March-May 2020. The sample size was 478 people.

The questionnaire included questions that reflect the opportunities that e-libraries provide to their users based on the resources placed in them: e-books, electronic periodicals, and multimedia (Figure 1).

Fig. 1. Structure of electronic library resources.

Limitations of the study. Since audiobooks were considered as one of the possible resources offered by electronic libraries, the survey did not take into account more differentiated practices of using audiobooks, such as the frequency of listening, types and genres of texts listened to, commercial purchase of books or use of university subscriptions, user experience of listening to audiobooks, subjective assessments of the perception of audio information, etc.

3.2 Audiobooks in students' reading practices

Electronic libraries include various types of texts in their content: electronic printed books, audiobooks, and video materials. The frequency of access to different types of sources varies. According to the results of the study, the least popular approach was to the media content of electronic libraries. More than half of the students who took part in the study did not turn to media sources at all and do not consider electronic libraries as a resource that provides access to audio and video materials. This may be due to technical reasons, the quality of the material, or a subjective lack of motivation to use such content.

Table 1. Distribution of answers to the question "What features of electronic libraries have You used this academic year?" (closed question).

| Answers                 | N   | %   |
|-------------------------|-----|-----|
| Very often              | 41  | 8.7 |
| Often                   | 77  | 16.3|
| Occasionally            | 112 | 23.7|
| I don't use it at all   | 243 | 51.4|
| Total, %                | 473 | 100 |
Users were asked about their preferences in choosing how to get acquainted with the source: reading, listening, and video viewing. The distribution of responses to the question is shown in Table 2.

Table 2. Distribution of answers to the question about choosing a way to read a book.

| Question                                     | Answers |
|----------------------------------------------|---------|
|                                              | N       | %       |
| Read books                                  | 252     | 53.3    |
| Listen to books                             | 15      | 3.2     |
| Both (depends on the information that is required) | 172     | 36.4    |
| Other                                       | 8       | 3.7     |
| I can't answer                               | 26      | 5.5     |
| Total, %                                    | 473     | 100     |

About 40% of students turned to audiobooks during the school year. The choice of reading form depends on the type of information that the respondent needs. The received responses confirm the growing popularity of audio reading among students. At the same time, only 3% of students listen to books all the time. This may also be due to the special chronotope of listening to audiobooks, its pace, formed earlier practices of listening to audiobooks.

4 Discussion and conclusion

Digitalization and portability of information sources create new opportunities for technology development in the educational environment. The acceleration of digitalization of education determines the interest in the development of educational technologies related to the use of audio formats of educational information (audiobooks, audio podcasts) against the background of the projected growth of Generation Z interest in audiobooks and audio reading. At the same time, the innovative use of audio content for educational purposes requires understanding and solving issues related to the search for ways to create educational audio content, taking into account its communicative and cognitive capabilities and limitations, integrating audio content into the educational process, developing educational technologies for working with audio content, and solving issues of acoustic presentation of educational information.

V. Y. Bal' notes the emerging transition from scoring printed texts to creation of texts specifically for scoring; the shift of interest from novel to story, the relevance of sound design when editorial treatment of audiobooks and audiostream, composite building of several voices of the narrators, arranges a single identical field [9, p. 56].

There is a need to develop content and stylistic strategies for preparing educational audio content, in accordance with the goals and objectives of the educational process, based on the possibilities and limitations of the audio channel of information perception. There is a need for specialists who design audio content, methods and technologies for its creation and application in the education of different types of subjects (school students, students, adults).
