Contribution to pseudo spherical kinematics of pseudo spherical evolutes

Tunahan TURHAN¹*

Abstract
In this work, we give some relations about involutes and evolutes of a timelike curve in Lorentz 3−space. Also, we derive a characterization of pseudo spherical evolutes corresponding to the trajectory of a point in pseudo spherical kinematics. Then, we obtain a transformation matrix from the natural trihedron of a space curve to the geodesic trihedron of its spherical evolutes in Lorentz 3−space. Finally, we give an example to illustrate our results.

Keywords
Lorentz 3−space, pseudo spherical evolutes, pseudo spherical kinematics.

1. Introduction
The curvature theory of involutes and evolutes curves has been one of the important subject because of having many application area in kinematic and differential geometry. So, there are many important consequences and properties in the curvature theory of the such curves in differential geometry [1,2,4,8,12]. Also, many paper can be found in the literature for curves and their characterization in Lorentz 3−space [9,13,15].

Important contributions to the kinematic geometry of spherical curves have been made by Veldkamp and McCarthy [5, 14]. Veldkamp studied the similarity of spherical kinematics to plane kinematics, [14]. Then, McCarthy and Roth gave some results for the differential kinematics of spherical motion using kinematic mappings, [6]. Also, McCarthy and Ravani presented differential kinematics of spherical and spatial motions using a mapping of spatial kinematics and derived relationships for the intrinsic properties of the image curves corresponding to a mapping of spherical and spatial kinematics, [7]. Schaff and Yang defined spherical evolutes corresponding to the trajectory of a point in spherical kinematics and derived general expressions for the curvature properties of the n-th spherical evolute with respect to geodesic curvature and its derivative, [11].

In the current study, we would like to contribute to the study of kinematic geometry of pseudo spherical evolutes in Lorentz 3−space. Firstly, we remind some notations about curves in Lorentz 3−space. After that, we get some relations about involutes and evolutes of the timelike curve. Then, we give a transformation matrix from the natural trihedron of a Lorentz curve to the geodesic trihedron of its pseudo spherical evolutes in Lorentz 3−space.

2. Preliminaries
Let \( \mathbb{E}_3 \) be Lorentz 3−space with the inner product\[
< u, v > = −u_1 v_1 + u_2 v_2 + u_3 v_3
\]
and the vector product\[
u \times v = \begin{pmatrix}
u_2 & u_3 & u_2 \\
u_3 & u_1 & u_3 \\
u_1 & u_2 & u_1
\end{pmatrix},
\]
where \( u = (u_1, u_2, u_3), v = (v_1, v_2, v_3) \in \mathbb{E}_3 \).
Frenet derivative equations are given by
\[ \frac{d}{ds} \left[ \begin{array}{c} \mathbf{T} \\ \mathbf{N} \\ \mathbf{B} \end{array} \right] = \left[ \begin{array}{ccc} 0 & \kappa & 0 \\ \kappa & 0 & \tau \\ 0 & -\tau & 0 \end{array} \right] \left[ \begin{array}{c} \mathbf{T} \\ \mathbf{N} \\ \mathbf{B} \end{array} \right], \]
where \( \langle \mathbf{T}, \mathbf{T} \rangle = -1, \langle \mathbf{N}, \mathbf{N} \rangle = \langle \mathbf{B}, \mathbf{B} \rangle = 1 \) and \( \langle \mathbf{T}, \mathbf{N} \rangle = \langle \mathbf{T}, \mathbf{B} \rangle = \langle \mathbf{N}, \mathbf{B} \rangle = 0 \). \( \kappa \) and \( \tau \) are curvature and torsion of the timelike curve \( \mathbf{x}(s) \), respectively, [10].

**Theorem 2.1.** Let \( \mathbf{x}(s) \) be a timelike curve and \( \{ \mathbf{T}, \mathbf{N}, \mathbf{B} \} \) be the moving Frenet frame along the curve \( \mathbf{x}(s) \) in \( \mathbb{E}^3_1 \). The Frenet derivative equations are given by

\[
\begin{bmatrix}
\mathbf{T}' \\
\mathbf{N}' \\
\mathbf{B}'
\end{bmatrix} = \begin{bmatrix}
0 & \kappa & 0 \\
\kappa & 0 & \tau \\
0 & -\tau & 0
\end{bmatrix}
\begin{bmatrix}
\mathbf{T} \\
\mathbf{N} \\
\mathbf{B}
\end{bmatrix},
\]

where \( \langle \mathbf{T}, \mathbf{T} \rangle = -1, \langle \mathbf{N}, \mathbf{N} \rangle = \langle \mathbf{B}, \mathbf{B} \rangle = 1 \) and \( \langle \mathbf{T}, \mathbf{N} \rangle = \langle \mathbf{T}, \mathbf{B} \rangle = \langle \mathbf{N}, \mathbf{B} \rangle = 0 \). \( \kappa \) and \( \tau \) are curvature and torsion of the timelike curve \( \mathbf{x}(s) \), respectively, [10].

**Theorem 2.2.** If the timelike curve \( \mathbf{x}(t) \) has a non-unit speed, then
\[
\kappa(t) = \frac{\| \mathbf{a}(t) \times \mathbf{a}''(t) \|}{\| \mathbf{a}'(t) \|^3} \quad \text{and} \quad \tau(t) = \frac{\det(\mathbf{a}'(t), \mathbf{a}''(t), \mathbf{a}'''(t))}{\| \mathbf{a}'(t) \| \| \mathbf{a}'''(t) \|}.\]

If the timelike curve \( \mathbf{x}(s) \) has a unit speed, then
\[
\kappa(s) = \| \mathbf{a}''(s) \| \quad \text{and} \quad \tau(s) = \| \mathbf{B}'(s) \|,\]
[10].

### 3. Involutest and Evolutes of a Timelike Curve

In this section, we study characterizations of involutes-evolutes of a timelike curve. The tangents of the timelike curve \( C \) in \( \mathbb{E}^3_1 \) create a surface called as the tangent surface of \( C \). Curves on the tangent surface which are orthogonal to the creating tangents are called as involutes of the timelike curve \( C \). The equation of an involute \( I \) of the timelike curve \( C \) is written as follows
\[
y = y(s) = \bar{x} + \mathbf{a} \mathbf{u}.
\]
where \( \bar{x} \) is the position vector of point \( P \) on \( C \), \( \mathbf{a} \) is the tangent vector and \( \mathbf{u} \) is a scalar function of the arc length. If we differentiate Equation (1), in terms of the arc length parameter \( s \) of the timelike curve \( C \), we get
\[
y' = \mathbf{a}' + (\mathbf{a}' + \mathbf{a}'' \mathbf{v}) = (1 + \mathbf{a}') + \mathbf{a} \mathbf{u}. \]
If we use the definition of involutes
\[
\langle (1 + \mathbf{a}') + \mathbf{a} \mathbf{u}, \bar{k} \rangle = 0,
\]
we have, \( \frac{da}{ds} = -1 \) and \( \mathbf{a} = c - s \) where \( c \) is an arbitrary constant. So, the vector equation of an involute \( I \) (see Figure 1) of the timelike curve \( C \)
\[
y = y(s) = \bar{x} + (c-s)\bar{k}.
\]

**Figure 1.** An involute \( I \) of the timelike curve \( C \)

Every value of \( c \) corresponds to one of a single infinity of involutes of the given timelike curve \( C \). So, if \( C \) is a plane curve its tangent surface is a plane and from equation (3), we can say that the involutes of a plane curve are also plane curves [11]. Also, the notion of involutes can be used to define the converse problem. For a timelike curve \( C \), determine a curve \( E \) which accepts the curve \( C \) as an involute. The curve \( E \) is called as an evolute of \( C \). The equation of evolute \( E \) has the form
\[
z = z(s) = \bar{x} + b \mathbf{p}
\]
where \( b \) is a scalar function of arc length parameter \( s \) of the timelike curve \( C \) and the unit spacelike vector \( \mathbf{p} \) (see Figure 2) lies in the normal plane of \( C \). \( \mathbf{p} \) is given by
\[
\mathbf{p} = \sin \phi \mathbf{n} + \cos \phi \mathbf{b}.
\]

**Figure 2.** An evolute \( E \) of the timelike curve \( C \)

The spacelike vector \( \mathbf{p} \) should be tangent to the evolute \( E \). So, we can write
\[
z' = f \mathbf{p}
\]
where $f$ is a scalar function. From the notion of evolutes, the tangents to the evolutes are orthogonal to the given timelike curve $C$, so we have;

$$< \bar{p}, \bar{r}> = 0.$$  

If we differentiate Equation (4), in terms of the arc length parameter $s$ of the timelike curve $C$, we get

$$z' = \bar{r} + b' \bar{p} + b \bar{p}'. \hspace{1cm} (7)$$  

Since $< \bar{p}, \bar{p} > = 1$ and $< \bar{p}, \bar{r} > = 0$, we obtain, from Equations (6) and (7) that $b' = f$ and

$$\bar{r} + b \bar{p} = 0. \hspace{1cm} (8)$$  

If we use the Frenet formula for timelike curve and the derivative of Equation (5) into Equation (8), we get

$$\bar{r} + b[(\kappa \bar{r} + \tau \bar{b}) \sin \phi + \phi' \cos \phi \bar{n} - \cos \phi \tau \bar{n} - \phi' \sin \phi \bar{b}] = 0.$$  

So, we can write

$$[1 + \kappa b \sin \phi \bar{r} + [(\phi' - \tau) b \cos \phi \bar{n} + ((\tau - \phi') b \sin \phi) \bar{b}] = 0. \hspace{1cm} (9)$$  

Then, we have the following proposition with the aid of linear independence of $\{ \bar{r}, \bar{n}, \bar{b} \}$:

**Proposition 3.1.** Let $C$ be a timelike curve with the curvature $\kappa$ and the torsion $\tau$ in Lorentz 3–space. Then, the following equations hold

$$1 + \kappa b \sin \phi = 0,$$

$$(\phi' - \tau) \cos \phi = 0,$$

$$(\tau - \phi') \sin \phi = 0.$$  

So, we can give relations between the curvature and the torsion of the curve $C$ in the following proposition:

**Proposition 3.2.** Let $C$ be a timelike curve with curvature $\kappa$ and torsion $\tau$ in Lorentz 3–space. The relations between curvature and torsion of the curve $C$ are

$$b \sin \phi = -\frac{1}{\kappa} = -\rho \hspace{1cm} (10)$$  

and

$$\phi' = \tau. \hspace{1cm} (11)$$  

If we integrate Equation (11) with respect to $s$, we get the expression of $\phi$

$$\phi = \phi(s) = \int_0^s \tau ds + c_1, \hspace{0.5cm} c_1 = \text{const}. \hspace{1cm} (12)$$  

Also, with the aid of Equations (5) and (10), the equation of the evolute $E$ can be written as

$$z = z(s) = \bar{x} - \rho (\bar{n} + \lambda \bar{b}), \hspace{1cm} (13)$$  

where $\lambda = \lambda(s) = \cot \phi$. From the equation (12), we can say that each value of $c_1$ corresponds to one of the single infinity of evolutes of the timelike curve $C$. If $\tau = 0$, the timelike curve $C$ lies in a Lorentz plane. So, we get from Equation (12), $\phi = c_1$. A plane curve has an evolute which lies in the plane, generated by the vectors $\bar{n}$ and $\bar{b}$. This evolute corresponds to $\phi = c_1 = \frac{\pi}{2}$ and is the locus of the centers of curvature for the timelike curve $C$, [11].

### 4. Pseudo Spherical Curves

In this section, we give some relations and results for pseudo spherical curves in Lorentz 3–space. Let $C_s : I \to S^3 \subset \mathbb{E}^3$ be a pseudo-spherical curve and the unit vector $\bar{r}$ is the position vector of the point $P$ on $C_s$ (see Figure 3). The timelike tangent vector $\bar{r}$ to $C_s$ at $P$ is given by the derivative of $\bar{r}$ with respect to the arc length $s$ of $C_s$.

$$\bar{r} = \frac{d\bar{r}}{ds}. \hspace{1cm} (14)$$  

**Figure 3.** Pseudo spherical curve, $C_s$

So, $\bar{r}$ is orthogonal to $\bar{r}$ for all points on $C_s$. If $P$ and $Q$ are two neighboring points on $C_s$ separated by the arc increment $\Delta s$ along the curve and the central angle between the position vectors for $P$ and $Q$ is $\Delta \varphi$, in the limit when $Q \to P$, we obtain $ds = dq$. Then, the timelike tangent vector can be written as

$$\bar{r} = \frac{d\bar{r}}{dq}. \hspace{1cm} (15)$$  

Thus, we can use the central angle $q$ as the parameter of $C_s$ and prime to denote differentiation with respect to $q$. The spacelike vector $\bar{k} = \bar{r} \times \bar{r}$, $(\bar{r}, \bar{e}_s, \bar{e}_n) = \bar{r} \times \bar{r}$ is called the central normal to $C_s$ at $P$. The three mutually orthogonal unit vectors $[\bar{r}, \bar{n}, \bar{b}]$ define the geodesic trihedron of $C_s$ and is denoted $[\bar{r}]$. From the Frenet formula of the timelike curve, we can write

$$\bar{r}' = \kappa \bar{n}, \hspace{1cm} (16)$$  

where $\kappa$ is the curvature of $C_s$ at $P$ and $\bar{n}$ is the principal normal of $C_s$. The three vectors $[\bar{r}, \bar{n}, \bar{b}]$ define the natural trihedron $[\bar{t}]$ of $C_s$ at point $P$, together with the spacelike binormal $\bar{e}_s \bar{e}_n \bar{b} = \bar{r} \times \bar{n}$. Note that $\bar{r}$ and $\bar{k}$ lie in the normal plane...
Then, we can give the following proposition related with the natural trihedron about the common axis \( \vec{t} \) is denoted by \( q \).

The orientation angle between the geodesic trihedron and natural trihedron about the common axis \( \vec{t} \) is given by

\[
[r] = Q[t],
\]

where

\[
Q = \begin{bmatrix}
0 & -\sin q_1 & \cos q_1 \\
1 & 0 & 0 \\
0 & \cos q_1 & \sin q_1
\end{bmatrix}.
\]

Since \( \vec{r}, \vec{n} = -\sin q_1 \), \( \vec{r}, \vec{t} = 0 \) and \( \vec{r}, \vec{b} = \cos q_1 \),

from Equations (23) and (25), we obtain

\[
<\vec{r}, \vec{t}'> = \kappa \sin q_1
\]

and

\[
\kappa = -\frac{1}{\sin q_1} = -\csc q_1.
\]

So, we can give the following proposition related with the radius of curvature of \( C_s \):

**Proposition 4.2.** The radius of curvature of \( C_s \) at the point \( P \) is

\[
\rho = \frac{1}{\kappa} = -\sin q_1.
\]

Now, we find an expression for the torsion \( \tau \) of \( C_s \) at the point \( P \). So, if we take first derivative of \( <\vec{r}, \vec{b} > = \cos q_1 \), we get

\[
<\vec{r}, \vec{b}'> = -q_1' \sin q_1.
\]

From the derivative of Equation (20) and Equation (23), the second derivative of the timelike tangent is found as

\[
\frac{d^2\vec{r}}{dq^2} = \kappa' \vec{n} + \kappa \tau \vec{b} + \kappa^2 \vec{t}.
\]

From Equations (21) and (29), we have

\[
\sigma' \vec{k} = \kappa' \vec{n} + \kappa \tau \vec{b}.
\]

If we use Equation (25) into the above equation, we get

\[
\sigma' (\cos q_1 \vec{n} + \sin q_1 \vec{b}) = \kappa' \vec{n} + \kappa \tau \vec{b}.
\]

Then, we can give the following proposition related with the torsion of \( C_s \):

**Proposition 4.1.** The geodesic trihedron \([t] \) with respect to \( q \) is given by:

\[
\begin{bmatrix}
\vec{r}' \\
\vec{t}' \\
\vec{k}'
\end{bmatrix} =
\begin{bmatrix}
0 & 1 & 0 \\
1 & 0 & \sigma \\
0 & \sigma & 0
\end{bmatrix}
\begin{bmatrix}
\vec{r} \\
\vec{t} \\
\vec{k}
\end{bmatrix}
\]

or

\[
[r]' = R[r]
\]

where

\[
[r]' = [\vec{r}', \vec{t}', \vec{k}'] \quad \text{and} \quad R =
\begin{bmatrix}
0 & 1 & 0 \\
1 & 0 & \sigma \\
0 & \sigma & 0
\end{bmatrix}.
\]

Since \( ds = dq \), the Frenet formula for the natural trihedron \([t]\) can be given with respect to the central angle parameter \( q \):

\[
[t]' = K[t]
\]

where \([t]' = [\vec{t}', \vec{n}', \vec{b}']\) and \( K =
\begin{bmatrix}
0 & \kappa & 0 \\
\kappa & 0 & \tau \\
0 & -\tau & 0
\end{bmatrix} \). On the other hand, the Darboux vector associated with the geodesic trihedron is found as follows

\[
d = -\sigma \vec{r} + \vec{k}.
\]
Proposition 4.3. The torsion of $C_s$ at the point $P$ is

$$\tau = -\sigma'(1 + \sigma^2)^{-1}. \quad (31)$$

The equation (24) is normalized by Equation (21) and $\rho = -\sin q_1$. So, the instantaneous axis for the rotation of the geodesic trihedron is express as

$$\mathbf{d} = \rho (-\sigma \mathbf{r} + \mathbf{k}). \quad (32)$$

If we use the equality $\rho = -\sin q_1$, the instantaneous axis can be rewritten as

$$\mathbf{d} = \cos q_1 \mathbf{r} - \sin q_1 \mathbf{k}. \quad (33)$$

Equations (32) and (33) show that the geodesic curvature $\sigma$ can be given as

$$\sigma = \sigma(s) = \cot q_1.$$

5. Pseudo Spherical Evolutes

The pseudo spherical evolute of the spherical curve $C_s$ is defined as the locus of points which belong to the set of evolutes of $C_s$ and lies on the pseudo unit sphere. So, the pseudo spherical evolute of $C_s$ denoted by $E_s$ is pseudo spherical curve. $\mathbf{r}_e(s)$ corresponds to the vector representation of the pseudo spherical evolute. The curvature properties of $E_s$ are important tool to define the higher-order path curvature of $E_s$ at $P$.

If we replace $\mathbf{x}$ in Equation (13) with $\mathbf{r}$, we get an evolute of $C_s$ as

$$z = z(s) = \mathbf{r} - \rho (\mathbf{n} + \lambda \mathbf{b}). \quad (34)$$

From the concept of the pseudo spherical evolute, $E_s$ must lie on the unit pseudo sphere. Also, let $\mathbf{z} = \mathbf{r}_e$ be the position vector from $O$ to $P_e$, a point on $E_s$. The position vector from $O$ to $P_e$ is

$$\mathbf{r}_e = \mathbf{r}_e(s) = \mathbf{r} - \rho (\mathbf{n} + \lambda \mathbf{b}). \quad (35)$$

From the transformation given in Equations (25), (35) and $\rho = -\sin q_1$, we can write $\mathbf{r}_e$ as

$$\mathbf{r}_e = (\cos q_1 \mathbf{b} - \sin q_1 \mathbf{n}) + \sin q_1 \mathbf{n} + \lambda \sin q_1 \mathbf{b},$$

$$= (\cos q_1 + \lambda \sin q_1) \mathbf{b}.$$

Since $\mathbf{r}_e$ is a spacelike unit vector it means that

$$\cos q_1 + \lambda \sin q_1 = 1 \quad \{36\}$$

which represent the position vector of $E_s$. The parameter $\lambda$ is a function of the geodesic curvature of the original $C_s$ and defined as follows

$$\lambda = \frac{1}{\sin q_1} - \cot q_1 = -\kappa - \sigma. \quad (37)$$

The arbitrary constant $c_i$ in Equation (12) used to define $\lambda$ varies from point to point on the pseudo spherical evolute. But, the pseudo spherical evolute, corresponding to a pseudo spherical curve is similarity with the evolute corresponding to a plane curve. Equation (36) can be considered as a response to the study of Kirson, [3]. Kirson defined a point $P_e$ on the spherical evolute as the intersection of the unit sphere with the binormal vector originating from the center of the sphere $O$. The spacelike tangent of $E_s$ is

$$\mathbf{t}_e = \frac{d\mathbf{r}_e}{ds} = \frac{d\mathbf{b}}{ds} \quad (38)$$

where $s_e$ is the arc length of the pseudo evolute $E_s$. From the Frenet formula for the natural trihedron, we get

$$\mathbf{t}_e = \frac{d\mathbf{b}}{ds} \frac{dq}{ds} = -\tau \mathbf{n} \frac{dq}{ds}.$$

Then, if we use Equation (31) and $\frac{dq}{ds} > 0$, we have

$$\frac{dq}{ds_e} = \frac{1}{|\mathbf{t}|} = \frac{dq}{ds}. \quad (39)$$

Therefore $ds_e = dq_1$ for $(q_1)' > 0$ and $ds_e = -dq_1$ for $(q_1)' < 0$. The central angle $q_1$ is parameter for the pseudo evolute $E_s$. Then, we get

$$\mathbf{t}_e = -\frac{\tau}{|\mathbf{t}|} \mathbf{n} = \mp \mathbf{n}.$$

The spacelike tangent to $E_s$ is parallel to the spacelike principal normal of $C_s$ and the central normal of $E_s$ is given by

$$\mathbf{k}_e = \mathbf{e}_e \times \mathbf{r}_e \times \mathbf{t}_e = \mathbf{b} \times (\pm \mathbf{n}) = \mp \mathbf{t}.$$

The set of three unit vectors $[\mathbf{r}_e, \mathbf{t}_e, \mathbf{k}_e]$ is called the geodesic trihedron of the pseudo spherical evolute and shown with $[\mathbf{r}_e]$. So, we can give the following propositions:

Proposition 5.1. A transformation matrix between the natural trihedron of $C_s$ and the geodesic trihedron of $E_s$ is given by

$$\begin{pmatrix} \mathbf{r}_e \\ \mathbf{t}_e \\ \mathbf{k}_e \end{pmatrix} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1/\tau_e & 0 \\ \mp 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{r} \\ \mathbf{t} \\ \mathbf{k} \end{bmatrix}.$$

Proposition 5.2. The Frenet formula for $[\mathbf{r}_e] = [\mathbf{r}_e, \mathbf{n}_e, \mathbf{b}_e]$ is given by

$$\frac{d}{dq_1} \begin{bmatrix} \mathbf{r}_e \\ \mathbf{n}_e \\ \mathbf{b}_e \end{bmatrix} = \begin{bmatrix} 0 & \pm \mathbf{k}_e & 0 \\ \mp \mathbf{k}_e & 0 & \tau_e \\ 0 & -\tau_e & 0 \end{bmatrix} \begin{bmatrix} \mathbf{r}_e \\ \mathbf{n}_e \\ \mathbf{b}_e \end{bmatrix},$$

where

$$\mathbf{n}_e = \pm \frac{d\mathbf{r}_e}{dq_1} \text{ and } \mathbf{b}_e = \mathbf{n}_e \times \mathbf{t}_e.$$
are the timelike normal vector and the spacelike binormal of \( E_3 \), respectively.

For the Frenet formula for \([r_c]\) and transformation matrix between the \([r]\) and \([r_c]\), we can give the following proposition:

**Proposition 5.3.** The Frenet formula for \([r_c]\) is given by

\[
\frac{d}{dq_1} \begin{bmatrix} \tilde{r}_c \\ \tilde{t}_c \\ \tilde{k}_c \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 \\ \pm 1 & 0 & -\sigma_e \\ 0 & \mp \sigma_e & 0 \end{bmatrix} \begin{bmatrix} \tilde{r}_c \\ \tilde{t}_c \\ \tilde{k}_c \end{bmatrix}
\]

and the transformation matrix between the \([r]\) and \([r_c]\) is

\[
\begin{bmatrix} \tilde{r}_c \\ \tilde{t}_c \\ \tilde{k}_c \end{bmatrix} = \begin{bmatrix} \cos q_1 & 1 & \sin q_1 \\ \pm \sin q_1 & 0 & \cos q_1 \\ 0 & \mp 1 & 0 \end{bmatrix} \begin{bmatrix} \tilde{r} \\ \tilde{t} \\ \tilde{k} \end{bmatrix}.
\]

**Example 5.4.** Let \( C(s) = \left( \frac{3}{5} \sinh(\sqrt{5}s), \frac{3}{5} \cosh(\sqrt{5}s), \frac{2}{\sqrt{5}} \right) \) be a unit speed timelike curve such that

\[
\begin{align*}
\tilde{r} &= \left( \frac{3}{\sqrt{5}} \cosh(\sqrt{5}s), \frac{3}{\sqrt{5}} \sinh(\sqrt{5}s), \frac{2}{\sqrt{5}} \right), \\
\tilde{n} &= \left( \sinh(\sqrt{5}s), \cosh(\sqrt{5}s), 0 \right), \\
\tilde{b} &= \left( -\frac{2}{\sqrt{5}} \cosh(\sqrt{5}s), -\frac{2}{\sqrt{5}} \sinh(\sqrt{5}s), -\frac{3}{2} \right)
\end{align*}
\]

and \( \frac{\kappa}{\tau} = \frac{3}{2} \). So, from Equation (3), the involutes of the curve \( C(s) \) can be written as

\[
I(s) = \left( \frac{3}{5} \sinh(\sqrt{5}s) + (c - s) \frac{3}{\sqrt{5}} \cosh(\sqrt{5}s), \right.
\]

\[
\frac{3}{5} \cosh(\sqrt{5}s) + (c - s) \frac{3}{\sqrt{5}} \sinh(\sqrt{5}s), \frac{2c}{\sqrt{5}} \left. \right)
\]

where \( c \) is an arbitrary constant. If \( \phi = \frac{\pi}{4} \), with the aid of Equation (13), the equation of the evolute \( E(s) \) can be written as follows

\[
E(s) = \left( \frac{4}{15} \sinh(\sqrt{5}s) + \frac{2}{3\sqrt{5}} \cosh(\sqrt{5}s), \right.
\]

\[
\frac{4}{5} \cosh(\sqrt{5}s) + \frac{2}{3\sqrt{5}} \sinh(\sqrt{5}s), \frac{2s}{\sqrt{5}} - \frac{1}{\sqrt{5}} \left. \right)
\]
