UNIQUENESS OF BALANCED METRICS ON HOLOMORPHIC VECTOR BUNDLES

ANDREA LOI, ROBERTO MOSSA

Abstract. Let $E \to M$ be a holomorphic vector bundle over a compact Kähler manifold $(M, \omega)$. We prove that if $E$ admits a $\omega$-balanced metric (in X. Wang’s terminology [18]) then it is unique. This result together with [2] implies the existence and uniqueness of $\omega$-balanced metrics of certain direct sums of irreducible homogeneous vector bundles over rational homogeneous varieties. We finally apply our result to show the rigidity of $\omega$-balanced Kähler maps into Grassmannians.

1. Introduction and statement of the main results

Let $E \to M$ be a very ample holomorphic vector bundle over a compact Kähler manifold $(M, \omega)$ and let $s = (s_1, \ldots, s_N)$ be a basis of $H^0(M, E)$, the space of global holomorphic sections of $E$. Let $i_s : M \to G(r, N)$, $r = \text{rank } E$, be the Kodaira map associated to the basis $s$ (see, e.g. [13]), namely the holomorphic embedding whose expression $i_s : U \to G(r, N)$ in a local frame $(\sigma_1, \ldots, \sigma_r) : U \to E$ is given by:

$$i_s(x) = \begin{bmatrix} S_{11}(x) & \cdots & S_{1r}(x) \\ \vdots & \ddots & \vdots \\ S_{N1}(x) & \cdots & S_{Nr}(x) \end{bmatrix}, \quad x \in U,$$

(1)

where $s_j = \sum_{\alpha=1}^r S_{j\alpha} \sigma_\alpha$, $j = 1, \ldots, N$. Here the square bracket denotes the equivalence class in $G(r, N) = M^*(r, N, \mathbb{C})/GL(r, \mathbb{C})$, where $M^*(r, N, \mathbb{C})$ is the set of $r \times N$ complex matrices of rank $r$.

Consider the flat metric $h_0$ on the tautological bundle $\mathcal{T} \to G(r, N)$, i.e. $h_0(v, w) = w^* v$, and the dual metric $h_{Gr} = h_0^*$ on the quotient bundle $Q = \mathcal{T}^*$. Hence, we can endow $E = i_s^* Q$ with the hermitian metric

$$h_\omega = i_s^* h_{Gr}$$

(2)

and define a $L^2$-product on $H^0(M, E)$ by the formula:

$$\langle \cdot, \cdot \rangle_{h_\omega} = \frac{1}{V(M)} \int_M h_\omega(\cdot, \cdot) \omega^n n!,$$

1
where $\omega^n = \omega \wedge \cdots \wedge \omega$ and $V(M) = \int_M \frac{\omega^n}{n!}$.

An hermitian metric $h$ on a very ample holomorphic vector bundle $E \rightarrow M$ over a compact Kähler manifold $(M, \omega)$ is called $\omega$-balanced if there exists a basis $\mathfrak{s}$ of $H^0(M, E)$ such that $h = h_\mathfrak{s} = i^*_\mathfrak{s} h_{Gr}$ and

$$< s_j, s_k >_{h_\mathfrak{s}} = \frac{r}{N} \delta_{jk}, j, k = 1, \ldots, N = \dim H^0(M, E).$$

One also says that $\mathfrak{s}$ is a $\omega$-balanced basis of $H^0(M, E)$ if (4) is satisfied.

As an application of Theorem 1 and L. Biliotti and A. Ghigi results [2] we obtain the existence and uniqueness of $\omega$-balanced metrics over certain direct sum of homogeneous vector bundles over rational homogeneous varieties:

**Theorem 2.** Let $(M, \omega)$ be a rational homogeneous variety and $E_j \rightarrow M, j = 1, \ldots, m$, be irreducible homogeneous vector bundles over $M$ with rank $E_j = r_j$ and $\dim H^0(M, E_j) = N_j > 0, j = 1, \ldots, m$. If $\frac{r_j}{N_j} = \frac{r_k}{N_k}$ for all $j, k = 1, \ldots, m$, then the homogeneous vector bundle $E = \oplus_{j=1}^{m} E_j \rightarrow M$ admits a unique homogeneous $\omega$-balanced metric.

**Proof.** Since $\operatorname{rank} E = \sum_{j=1}^{m} r_j$ and $\dim(H^0(M, E)) = \sum_{j=1}^{m} N_j$, it is enough to prove the theorem for $m = 2$. In [2] it is proved that each $E_j$, as in
the statement, is a very ample bundle and admits a unique homogeneous \( \omega \)-balanced metric \( s^j = (s_1^j, \ldots, s_N^j), j = 1, 2 \). Then, the assumption \( \frac{r_1}{N_1} = \frac{r_2}{N_2} \), readily implies that the basis
\[
\mathbf{s} = ((s_1^1, 0), \ldots, (s_{N_1}^1, 0), (0, s_1^2), \ldots, (0, s_{N_2}^2))
\] (5)
is a homogeneous \( \omega \)-balanced basis for \( E_1 \oplus E_2 \). Then \( h_{\mathbf{s}} = i_{\mathbf{s}}^* h_{\text{Gr}} \) is the desired homogeneous balanced metric on \( E_1 \oplus E_2 \) which is unique by Theorem [1].

The proof of Theorem [1] is based on Wang’s work on balanced metrics (see [18] or the next section) and on moment map techniques developed by C. Arezzo and the first author in [1], where it is proved the unicity of balanced metrics in the sense of S. Donaldson [9]. Wang’s work is summarized in the next section where we prove Lemma [1] which is fundamental for the proof of Theorem [1] to whom Section 3 is dedicated. In the last section we prove the rigidity of \( \omega \)-balanced Kähler maps into Grassmannians.

Acknowledgements: We wish to thank Prof. Alessandro Ghigi and Prof. Reza Seyyedali for various interesting and stimulating discussions.

2. Balanced bases and moment map

Let \( E \) be a very ample holomorphic vector bundle over a compact Kähler manifold \( (M, \omega) \). Let \( J_0 \) be the (complex) structure of \( E \), denote by \( E_c \) the smooth complex vector bundle underlying \( E \) and write \( E = (E_c, J_0) \). Let \( N \) be the complex dimension of \( H^0(M, E) \) and let \( \mathcal{H} \) be the (infinite dimensional) manifold consisting of pairs \( (\mathbf{s}, J) \) where \( \mathbf{s} = (s_1, \ldots, s_N) \) is an \( N \)-uple of complex linearly independent smooth sections of \( E_c \), \( J \) is a complex structure of \( E_c \) and each section \( s_j \) is holomorphic with respect to the complex structure \( J \), i.e.
\[
ds_j \circ I_0 = J \circ ds_j, \quad j = 1, \ldots, N,
\]
where \( I_0 \) denotes the (fixed) complex structure of \( M \).

Given an hermitian metric \( h \) on \( E \) we denote by \( U_h(E_c) \) the subgroup of \( GL(E_c) \) consisting of smooth invertible bundle maps \( E_c \to E_c \) preserving the hermitian metric \( h \) and by \( SU(N) \subset U(N) \) the group of \( N \times N \) unitary matrices with positive determinant. These groups act in a natural way on \( \mathcal{H} \) as follows:
\[
\Psi \cdot (\mathbf{s}, J) = (\Psi \mathbf{s}, \Psi \cdot J), \quad \Psi \in U_h(E_c)
\]
\[
U \cdot (\mathbf{s}, J) = (U \mathbf{s}, J), \quad U \in SU(N),
\]
were \( \Psi \mathbf{s} = (\Psi s_1, \ldots, \Psi s_N) \), \( \Psi \cdot J = \Psi J \Psi^{-1} \) and \( U \mathbf{s} = (Us_1, \ldots, Us_N) \).

Since these actions commute they induce a well-defined action of the group \( \mathcal{G}_h = U_h(E_c) \times SU(N) \) on \( \mathcal{H} \). The Lie algebra of \( \mathcal{G}_h \) is \( GL(E_c) \oplus \mathfrak{su}(N) \) and its complexification \( \mathcal{G}^C_h = GL(E_c) \times SL(N) \) naturally acts on \( \mathcal{H} \) by extending the action of \( \mathcal{G}_h \).
Theorem 3 (Wang [18]). The manifold \( \mathcal{H} \) admits a Kähler form \( \Omega \) invariant for the action of \( \mathcal{G}_h \) whose moment map \( \mu_h : \mathcal{H} \to GL(E_c) \oplus \mathfrak{su}(N) \) is given by:

\[
\mu_h(s, J) = \left( \sum_{j=1}^{N} h(\cdot, s_j)s_j, < s_j, s_k >_h - \frac{1}{N}\sum_{j=1}^{N} |s_j|^2_h \delta_{jk} \right),
\]

where \( |s_j|^2_h = < s_j, s_j >_h = \frac{1}{V(M)} \int_M h(\cdot, \cdot) \frac{|s_j|^2}{m} \). Consequently, a basis \( s = (s, J_0) \) of \( H^0(M, E) \) is balanced if and only if \( \mu_{h_s}(s, J_0) = (id_E, 0) \), where \( h_s \) is the metric of \( E \) given by (2).

A key ingredient in the proof of Theorem 1 is the following:

Lemma 1. Let \( s = (s, J_0) \) be a balanced basis of \( H^0(M, E) \) and let \( (\tilde{s}, \tilde{J}) \in \mathcal{H} \) such that: \( \mu_{h_{s}}(\tilde{s}, \tilde{J}) = (id_E, 0) \) and \( (\tilde{s}, \tilde{J}) \) lies in the same \( \mathcal{G}_{h_s}^{C} \)-orbit of \( (s, J_0) \). Then \( (\tilde{s}, \tilde{J}) \) lies in the same \( \mathcal{G}_{h_{s}} \)-orbit of \( (s, J_0) \), namely there exists \( (\Psi, U) \in \mathcal{G}_{h_{s}} \) such that \( (\Psi, U) \cdot (\tilde{s}, \tilde{J}) = (U\tilde{s}, \Psi \cdot \tilde{J}) = (s, J_0) \).

Proof. Since \( a = (id_E, 0) \in GL(E_c) \oplus \mathfrak{su}(N) \) is (obviously) invariant by the coadjoint action of \( \mathcal{G}_{h_{s}} \), it is a standard fact in moment map’s theory (see [14] for a proof and also Proposition 3.1 in [1]) that

\[
\mu_{h_{s}}^{-1}(a) \cap (\mathcal{G}_{h_{s}}^{C} \cdot x) = \mathcal{G}_{h_{s}} \cdot x, \ \forall x \in \mu_{h_{s}}^{-1}(a).
\]

Then the result follows by the assumptions and by Theorem 3. \( \square \)

3. The Proof of Theorem 1

Let \( E \) be a very ample holomorphic vector bundle over a compact Kähler manifold \( (M, \omega) \). If \( s \) is any basis of \( H^0(M, E) \), \( F \in \text{Aut}(E) \) and \( U \in U(N) \), then

\[
U_{UFs} = U_{Fs} = U_{s}, \text{ where } UF_s = (UFS_1, \ldots, UFS_N)
\]

and it follows easily that \( h_s = h_{UFs} \). Then the proof of Theorem 1 will be a consequence of the following:

Theorem 4. If \( s \) and \( \tilde{s} \) are two balanced bases of \( H^0(M, E) \) then there exist a unitary matrix \( U \in U(N) \) and \( F \in \text{Aut}(E) \) such that \( \tilde{s} = UFS_{\tilde{s}} \).

Proof. Let \( h_s \) and \( h_{\tilde{s}} \) be the metric induced by \( s \) and \( \tilde{s} \) and \( \Phi \in GL(E_c) \) such that \( \Phi^* h_s = h_{\tilde{s}} \). We claim that

\[
\sum_{j=1}^{N} h_s(\cdot, \Phi \tilde{s}_j)\Phi \tilde{s}_j = id_E
\]

and

\[
< \Phi \tilde{s}_j, \Phi \tilde{s}_k >_h = \frac{r}{N}\delta_{jk}, \ j, k = 1, \ldots, N.
\]

Indeed

\[
\begin{align*}
\text{id}_E &= \sum_{j=1}^{N} h_s(\cdot, \tilde{s}_j)\tilde{s}_j = \sum_{j=1}^{N} (\Phi^* h_s)(\cdot, \tilde{s}_j)\tilde{s}_j \\
&= \sum_{j=1}^{N} h_{\tilde{s}}(\cdot, \tilde{s}_j)\tilde{s}_j
\end{align*}
\]
and if \( \sigma = (\sigma_1, \ldots, \sigma_r) : U \to E \) is a local frame then, for all \( \alpha = 1, \ldots, r \), one gets:

\[
\sigma_\alpha = \Phi(\Phi^{-1}(\sigma_\alpha)) = \Phi \left( \sum_{j=1}^{N} h_{\tilde{s}}(\Phi^{-1}(\sigma_\alpha), \tilde{s}_j) \tilde{s}_j \right)
\]

\[
= \Phi \left( \sum_{j=1}^{N} (\Phi^* h_{\tilde{s}})(\Phi^{-1}(\sigma_\alpha), \tilde{s}_j) \tilde{s}_j \right)
\]

\[
= \Phi \left( \sum_{j=1}^{N} h_{\tilde{s}}(\sigma_\alpha, \Phi \tilde{s}_j) \tilde{s}_j \right) = \sum_{j=1}^{N} h_{\tilde{s}}(\sigma_\alpha, \Phi \tilde{s}_j) \Phi \tilde{s}_j,
\]

where we have used the fact that \( \sum_{j=1}^{N} h_{\tilde{s}}(\cdot, \tilde{s}_j) \tilde{s}_j = \text{id}_E \), and (8) follows. Moreover,

\[
< \Phi \tilde{s}_j, \Phi \tilde{s}_k > h_{\tilde{s}} = \frac{1}{V(M)} \int_M h_{\tilde{s}}(\Phi \tilde{s}_j, \Phi \tilde{s}_k) \frac{\omega^n}{n!}
\]

\[
= \frac{1}{V(M)} \int_M (\Phi^* h_{\tilde{s}})(\tilde{s}_j, \tilde{s}_k) \frac{\omega^n}{n!}
\]

\[
= \frac{1}{V(M)} \int_M h_{\tilde{s}}(\tilde{s}_j, \tilde{s}_k) \frac{\omega^n}{n!} = \frac{r}{N} \delta_{jk}
\]

and also (9) is proved.

It follows by (5), (7) and (8) that \((\tilde{s}, J_0)\) and \((\Phi_{\tilde{s}} \Phi \cdot J_0)\) are in the same level set of the moment map \(\mu_{h_{\tilde{s}}}\), namely

\[
\mu_{h_{\tilde{s}}}(\tilde{s}, J_0) = \mu_{h_{\tilde{s}}}(\Phi_{\tilde{s}} \Phi \cdot J_0) = (\text{id}_E, 0).
\]

Moreover, since \(\tilde{s}\) and \(\tilde{s}\) are bases of the same vector space \(H^0(M, E)\) there exist a non zero constant \(\lambda\) and \(V \in \text{SL}(N)\) such that \(\lambda V \tilde{s} = \tilde{s}\). Therefore

\[
(\tilde{s}, J_0) = (\lambda \Phi^{-1}, V) \cdot (\Phi_{\tilde{s}} \Phi \cdot J_0)
\]

and hence \((\tilde{s}, J_0)\) and \((\Phi_{\tilde{s}} \Phi \cdot J_0)\) are elements of \(\mathcal{H}\) in the same \(\mathcal{G}_{h_{\tilde{s}}}^C\)-orbit. By Lemma [1] there exists \((\Psi, U) \in \mathcal{G}_{h_{\tilde{s}}}\) such that

\[
(\tilde{s}, J_0) = (\Psi, U) \cdot (\Phi_{\tilde{s}} \Phi \cdot J_0) = (U \Phi_{\tilde{s}} \Phi, (\Psi \Phi) \cdot J_0).
\]

Consequently, \(F = U \Psi \Phi : E_c \to E_c\) preserves the complex structure \(J_0\), i.e. \(F \in \text{Aut}(E)\) and \(\tilde{s} = UF_{\tilde{s}}\). \(\square\)

4. Rigidity of \(\omega\)-balanced Kähler maps into Grassmannians

Let \((M, \omega)\) be a compact Kähler manifold. A holomorphic map \(f : M \to G(r, N)\) is said to be \(\omega\)-balanced if there exist a very ample holomorphic vector bundle \(E \to M\) and a balanced basis \(g\) of \(H^0(M, E)\) such that \(f = ig\) (thus necessarily \(f^* Q = E\), \(r = \text{rank} E\) and \(N = \dim H^0(M, E)\)). A \(\omega\)-balanced map \(f : M \to G(r, N)\) is called a Kähler map if \(f^* \omega_{Gr} = \omega\), where \(\omega_{Gr}\) is the standard Kähler form on \(G(r, N)\), i.e. \(\text{Ric}(\omega_{Gr}) = \omega_{Gr}\).
Example 2. Let $M = \mathbb{C}P^1$ and $\omega_\lambda = \lambda \omega_{FS}$, where $\omega_{FS}$ is the Fubini-Study Kähler form and $\lambda$ is a positive real number. Then, it is not hard to see that the holomorphic map

$$f : \mathbb{C}P^1 \to G(2, 4) : [z_0, z_1] \mapsto \begin{bmatrix} z_0 & 0 \\ 0 & z_0 \\ z_1 & 0 \\ 0 & z_1 \end{bmatrix}$$

is a $\omega_\lambda$-balanced map for all $\lambda$. Moreover, $f$ is Kähler when $\lambda = 2$, i.e. $f^*\omega_{Gr} = 2\omega_{FS}$. (In general it follows by [3] and [11] that if $g$ is a $\omega$-balanced basis of $H^0(M, E)$ then $g$ is still $\lambda\omega$-balanced for $\lambda > 0$).

Note that in the previous example $f^*Q = O(1) \oplus O(1)$, where $O(1)$ is the hyperplane bundle on $\mathbb{C}P^1$, $\text{Ric}(h_g) = 2\omega_{FS}$ (where $h_g = f^*h_{Gr}$) and $f^*\omega_{Gr} = 2\omega_{FS}$. On the other hand, there exist holomorphic maps $\tilde{f} = i_g : \mathbb{C}P^1 \to G(2, 4)$ (where $g$ is a basis of $H^0(\mathbb{C}P^1, O(1) \oplus O(1))$ satisfying these three conditions but for which it cannot exist a unitary transformation $U$ of $G(2, 4)$ such that $\tilde{f} = Uf$ (cfr. [7]). An example is given by:

$$\tilde{f} : \mathbb{C}P^1 \to G(2, 4) : [z_0, z_1] \mapsto \begin{bmatrix} z_0^2 & z_0z_1 \left(\frac{\sqrt{3}}{2} - \frac{1}{2}\right) \\ -z_0z_1 \left(\frac{\sqrt{3}}{2} + \frac{1}{2}\right) & |z_0|^2 + \frac{1}{2}|z_1|^2 \sqrt{3} \\ -z_0z_1 \left(\frac{\sqrt{3}}{2} + 1\right) & \frac{1}{2}|z_1|^2 \\ z_1^2 & \frac{1}{2}|z_1|^2 \left(1 - \sqrt{3}\right) \end{bmatrix}.$$  

This phenomenon is due to the fact that the rigidity of Kähler maps into $G(r, N)$ with $r \geq 2$ does not in general hold true (see, e.g., [3], [7], [12], [20], [21]), in contrast with the case $r = 1$ where one has the celebrated Calabi’s rigidity theorem for Kähler maps into projective spaces.

On the other hand the following theorem, which is the main result of this section, shows the rigidity of $\omega$-balanced Kähler embedding.

Theorem 5. Let $E \to M$ be a very ample complex vector bundle over a compact Kähler manifold $(M, \omega)$. Assume that $E$ admits a $\omega$-balanced metric $h$ such that $\text{Ric}(h) = \omega$. Then there exists a unique (up to a unitary transformations of $G(r, N)$) $\omega$-balanced Kähler embedding $f : M \to G(r, N)$ such that $f^*Q = E$.

Proof. Let $g$ be a balanced basis of $H^0(M, E)$ and let $f = i_g : M \to G(r, N)$ be the associated Kodaira’s map. By Theorem 1 $f$ is the unique (up to a unitary transformations of $G(r, N)$) $\omega$-balanced embedding such that $f^*Q = E$. So it remains to show that $f^*\omega_{Gr} = \omega$. Fix a local frame $(\sigma_1, \ldots, \sigma_r) : U \to E$. In this local frame $f : U \to G(r, N)$ is given by (11). Then, the local expression of $h = h_g$, $\omega = \text{Ric}(h)$ and $f^*\omega_{Gr}$ are given respectively by $(S^*S)^{-1}$, $-\frac{1}{2}\partial\bar{\partial} \log \det(S^*S)^{-1}$ and $\frac{1}{2}\partial\bar{\partial} \log \det(S^*S)$. \hfill $\square$
