QUASI-HOPF ALGEBRAS ASSOCIATED WITH $\mathfrak{sl}_2$ AND COMPLEX CURVES

BENJAMIN ENRIQUEZ AND VLADIMIR RUBTSOV

Abstract. We construct quasi-Hopf algebras quantizing double extensions of the Manin pairs of Drinfeld, associated to a curve with a meromorphic differential, and the Lie algebra $\mathfrak{sl}_2$. This construction makes use of an analysis of the vertex relations for the quantum groups obtained in our earlier work, PBW-type results and computation of $R$-matrices for them; its key step is a factorization of the twist operator relating “conjugated” versions of these quantum groups.

Introduction. In [7], V. Drinfeld introduced Manin pairs, attached to an absolutely simple Lie algebra over a complex curve $X$ with a meromorphic differential $\omega$. In the case where the genus of $X$ is zero or one, special cases of his construction give rise to Manin triples, whose quantization are the Yangians, quantum affine algebras and elliptic algebras. Drinfeld posed the problem of quantizing these general Manin pairs, in the sense of quasi-Hopf algebras.

In this paper, we solve this problem in the untwisted case where the Lie algebra is equal to $\mathfrak{a} \otimes \mathbb{C}(X)$, $\mathfrak{a} = \mathfrak{sl}_2$, for an arbitrary curve $X$.

In that case, Drinfeld’s Manin pair presents itself as follows. Let $S$ be a finite set of points of $X$ containing the zeroes and poles of $\omega$, $k_s$ be the local field at each $s \in S$, and $k = \bigoplus_{s \in S} k_s$. Endow $\mathfrak{a} \otimes k$ with the scalar product given by the tensor product of the Killing form of $\mathfrak{a}$ and $\langle f, g \rangle_k = \sum_{s \in S} \text{res}_s(fg\omega)$. Let $R$ be the ring of functions on $X$, regular outside $S$; it can be viewed as a subring of $k$. The ring $R$ is a Lagrangian (that is, maximal isotropic) subspace of $k$ (a proof of this fact is in the Appendix), so that $(\mathfrak{a} \otimes k, \mathfrak{a} \otimes R)$ forms a Manin pair.

In our earlier paper [10], we introduced a double extension $(\mathfrak{g}, \mathfrak{g}_R)$ of this Manin pair. The Lie algebra $\mathfrak{g}$ is a direct sum $(\mathfrak{a} \otimes k) \oplus \mathbb{C}D \oplus \mathbb{C}K$, with $K$ a central element and $D$ a derivation element, and $\mathfrak{g}_R$ is equal to $(\mathfrak{a} \otimes R) \oplus \mathbb{C}D$. In [10], we considered a certain Manin triple $(\mathfrak{g}, \mathfrak{g}_+, \mathfrak{g}_-)$, obtained from this pair by a classical twist, and we constructed a quantization $U_h \mathfrak{g}$ of this Manin triple.

Let us describe in more detail the Manin triple of [10]. Let $\mathfrak{a} = \mathfrak{n}_+ \oplus \mathfrak{h} \oplus \mathfrak{n}_-$ be a Cartan decomposition of $\mathfrak{a}$. Let $\Lambda$ be a Lagrangian complement of $R$ in $k$. The Lie algebra $\mathfrak{g}_+$ is then defined as $(\mathfrak{h} \otimes R) \oplus (\mathfrak{n}_+ \otimes k) \oplus \mathbb{C}D$, and $\mathfrak{g}_-$ as $(\mathfrak{h} \otimes \Lambda) \oplus (\mathfrak{n}_- \otimes k) \oplus \mathbb{C}K$.

Date: August 1996; revised May 1998.
The Manin triple \((g, g_+, g_-)\) has the following interpretation. Recall that the affine Weyl group of \(g\) is the semi-direct product of a group of translations, isomorphic to \(\mathbb{Z}^S\), with the Weyl group of \(a^S\). The triple \((g, g_+, g_-)\) can then be viewed as the limit, for the length of the Weyl group element becoming infinite, of the triple obtained from \((g, g_R, g_A)\) [with \(g_A = (a \otimes \Lambda) \oplus \mathbb{C}K\)] by conjugation by an affine Weyl group element corresponding to a positive translation. A similar procedure had been employed earlier by Drinfeld in [6]. We recall the results of [10] in sections 1 and 2.

Let us now describe the main points of the present work. We first construct a subalgebra \(U_\hbar g_R \subset U_\hbar g\); this inclusion deforms the inclusion of Lie algebras \(g_R \subset g\) (section 4). This construction is as follows. The main difficulty of [10] was to produce the correct relations for the quantum counterparts of the algebras generated by \(n_\pm \otimes k\). These relations are presented in terms of generating series; they are usually called vertex relations. We observe that there exists a system of such relations, in which the products of generating series are multiplied by scalar functions belonging to \(R \otimes R\). This system can be modified so as to define vertex relations for an algebra \(U_\hbar g_R\) (sect. 4.1), which turns out to be a deformation of the enveloping algebra \(U g_R\) (section 4.2). To show that this algebra is indeed a subalgebra of \(U_\hbar g\), we have to establish Poincaré-Birkhoff-Witt (PBW) type results for \(U_\hbar g\) (Prop. 3.5). These results follow from general similar results on algebras presented by vertex relations (section 3.1) and rely isomorphism with a formal version of the Feigin-Odesski shuffle algebras (see [13]).

Let \(\Delta\) denote the coproduct of \(U_\hbar g\). The subalgebra \(U_\hbar g_R\) then satisfies \(\Delta(U_\hbar g_R) \subset U_\hbar g \hat{\otimes} U_\hbar g_R\) (see Prop. 4.4). This motivates the following construction.

Consider the Manin triple \((\hat{g}, \hat{g}_+, \hat{g}_-),\) obtained from \((g, g_R, g_A)\) as the limit of conjugations by negative translations (or equivalently, from \((g, g_+, g_-)\) by conjugation by \(\text{card}(S)\) copies of the nontrivial element of the Weyl group of \(a\)). Using the results of [10], it is easy to produce a quantization \((U_\hbar \hat{g}, \hat{\Delta})\) of this Manin triple. We then show that the Hopf algebras \(U_\hbar g\) and \(U_\hbar \hat{g}\) are isomorphic as algebras (Prop. 2.3), and their coproducts are conjugated under some \(F \in U_\hbar g \hat{\otimes} 2\) (Prop. 5.4), which also satisfies cocycle identities (Prop. 5.3); in other words, both Hopf algebras are connected by a twist, in the sense of [7]. Let us explain how this result is obtained.

\(F\) is constructed as \(\sum_i \alpha^i \otimes \alpha_i\), for \((\alpha^i), (\alpha_i)\) dual bases of the subalgebras \(U_\hbar n_+\) and \(U_\hbar n_-\) of \(U_\hbar g\) generated by the deformations of \(n_\pm \otimes k\). The universal \(R\)-matrices of \((U_\hbar g, \Delta)\) and \((U_\hbar \hat{g}, \hat{\Delta})\) are then expressed simply as the products of \(F\) and a factor \(K\) depending on the Cartan modes (Prop. 5.2). One checks that \(K\) is a twist connecting \(\Delta\) and \(\Delta'\) (Lemmas 5.2 and 5.3). \((\Delta'\) is \(\Delta\) composed with the permutation of factors.) Therefore, since \(R^{-1}\) is a twist connecting \(\Delta'\) and \(\Delta\), it follows that \(F\) is a twist connecting \(\Delta\) and \(\hat{\Delta}\) (Props. 5.3 and 5.4).

On the other hand, we have \(\hat{\Delta}(U_\hbar g_R) \subset U_\hbar g_R \hat{\otimes} U_\hbar g\) (Prop. 4.4).
It is then easy to see that any factorization of $F$ of the form $F = F_2 F_1$, $F_1 \in U_h\mathfrak{g} \otimes U_h\mathfrak{g}_R$, $F_2 \in U_h\mathfrak{g}_R \otimes U_h\mathfrak{g}$, yields an algebra morphism $\Delta_R$ from $U_h\mathfrak{g}_R$ to $U_h\mathfrak{g}_R^\otimes 2$, by the formula $\Delta_R = \text{Ad}(F_1) \circ \Delta$. Moreover, the associator $\Phi$ of the quasi-Hopf algebra obtained from $U_h\mathfrak{g}$ by the twist by $F_1$, belongs to $U_h\mathfrak{g}_R^{\otimes 3}$ (Prop. 5.4). A simple argument shows that the antipode $S_R$ of $U_h\mathfrak{g}$ corresponding to this twist, preserves $U_h\mathfrak{g}_R$. This shows that $(U_h\mathfrak{g}_R, \Delta_R, \Phi, S_R)$ is a sub-quasi-Hopf algebra of the twist by $F_1$ of $(U_h\mathfrak{g}, \Delta)$.

To obtain a factorization of $F$ is thus the key point of our construction. This is achieved in section 6.1. Any possible solution $(F_1, F_2)$ of the factorization identity is expressed simply in terms of left and right $U_h\mathfrak{g}_R$-module maps $\Pi, \Pi'$ from $U_h\mathfrak{g}$ to $U_h\mathfrak{g}_R$ applied to $F$, and of variable elements of $U_h\mathfrak{g}_R^{\otimes 2}$. The difficulty is to show that for some choice of those elements, the factorization identity is satisfied. This is equivalent to showing that $F^{-1}[(\Pi \otimes 1)F]$ and $[(1 \otimes \Pi')F]F^{-1}$ belong to $U_h\mathfrak{g} \otimes U_h\mathfrak{g}_R$, resp. to $U_h\mathfrak{g}_R \otimes U_h\mathfrak{g}$. For this, we use the pairing between the quantizations $U_h\mathfrak{g}_+$ and $U_h\mathfrak{g}_-$ of $\mathfrak{g}_+$ and $\mathfrak{g}_-$, and the computation of the orthogonals of their intersections with $U_h\mathfrak{g}_R$ (Prop. 5.3).

We close the paper by some remarks related to our construction. We observe that the quasi-Hopf algebras $U_h\mathfrak{g}$ and $U_h\mathfrak{g}_R$ fit in an inductive system w.r.t. the relation $S \subset S'$, and that the corresponding inductive limit is a quantization of double extensions of the adelic versions of Drinfeld’s Manin pairs (section 5.3). We also find an algebra automorphism of $U_h\mathfrak{g}$, deforming the action of the generator of the Weyl group of $\mathfrak{a}$ (section 5.4). Section 6 is devoted to analogues and generalizations of $U_h\mathfrak{g}$. In 7.1, we exploit the fact that the central terms occur only in the exponential form $\exp(hK\partial)$ [where $\partial$ is the derivation of $k$ defined by $\partial f = df/\omega$] to construct analogues of $U_h\mathfrak{g}$, where $\exp(hK\partial)$ is replaced by a more general automorphism of $k$. In 7.2, we construct analogues of those algebras and of their Weyl group automorphism, associated with discrete sets.

An expression of $F$ was given in an earlier version of this work. However, this expression is not correct, as it was pointed out in [4]. In Remark 7.1, we discuss this problem and how this modifies the proofs of the results of [8, 9], which remain valid.

Let us now mention some possible extensions of this work. It is natural to ask how the algebras introduced here depend on the pair $(X, \omega)$. The algebra $U_h\mathfrak{g}$ probably possesses level 1 modules similar to those studied in the Yangian and quantum affine cases. It would then be interesting to study quantum Knizhnik-Zamolodchikov type equations for traces of corresponding intertwining operators. Another subject of interest could be the representation theory of $U_h\mathfrak{g}_R$. In [14], we studied level zero representations of $U_h\mathfrak{g}$, indexed by formal discs around each point of $S$; these representations are also $U_h\mathfrak{g}_R$-modules, and as such their parameter could probably take values outside those discs.

Finally, the question arises whether the formulas defining $U_h\mathfrak{g}$ can be written is closed form (rather than in the sense of formal series) and can be analytically
continued to complex values of $\hbar$. In general, the solution to this problem might be related to functional equations satisfied by the structure constants of this algebra. Let us however mention two cases where the answer to this question is positive. One of them is when $X$ is an elliptic curve, and $\omega = dz$. This case was treated by G. Felder and one of us ([8]). We showed, using arguments of the present paper, the connection of the algebra $U_{\hbar g}$ with the elliptic quantum groups of [12]. The other case was treated in [11]. There we study the case of a genus > 1 curve $X$, with differential $\omega$ regular and having only double poles. In that case, the structure constants of $U_{\hbar g}$ involve some theta-functions and odd theta-characteristics of $X$. Also let us mention the work [3], where “analytic” algebras with close analogy to $U_{\hbar g}$ were introduced.

We would like to express our thanks to V. Fock, C. Fronsdal, S. Khoroshkin, D. Lebedev, S. Majid, N. Reshetikhin and M. Semenov-Tian-Shansky for discussions about this work. The second author is supported by grant RFFI-96-01-01101.

1. Manin pairs and triples

This shows that subsection Completed tensor products and algebras

Let $V, W$ be complex Tate’s vector spaces (see [2] for the definition; the only examples of Tate’s vector spaces we will use are either discrete or isomorphic to the sum of a finite number of copies of a field of Laurent power series in one variable).

The completed tensor product of $V$ and $W$ is defined as the inverse limit

$$\lim_{\leftarrow a, b} (V \otimes W/V_a \otimes W_b),$$

$V_a, W_b$ being a system of vector spaces, that consitute neighborhoods of zero in $V, W$, and denoted by $V \hat{\otimes} W$. For example, with $V = \mathbb{C}((v))$ and $W = \mathbb{C}((w))$ endowed with the $v$- and $w$-adic topologies, we have $V \hat{\otimes} W = \mathbb{C}[[v, w]][v^{-1}, w^{-1}]$ which we will denote as $\mathbb{C}((v, w))$.

With the same notation, the completed tensor algebra of $V$ is defined as

$$\bigoplus_{i \geq 0} V^{\otimes i},$$

and endowed with the obvious product, and denoted by $T(V)$. These objects are independent of the basis of neighborhoods chosen.

$V \hat{\otimes} W$ (resp. $T(V)$) is a separated complete topological vector space (resp. algebra), with a basis of neighborhoods of zero given by $\lim_{\leftarrow a, b} (V_n \otimes W_m/V_a \otimes W_b)$ (resp. the subalgebras generated by the $V_n$).

We will also define $V \hat{\otimes} W$ as the inverse limit

$$\lim_{\leftarrow a, b} (V \otimes W)/(V_a \otimes W + V \otimes W_b),$$

whose topology is defined by the basis of neighborhoods of zero given by $\lim_{\leftarrow a, b} (V_n \otimes W + V \otimes W_m)/(V_a \otimes W + V \otimes W_b)$. 
1.1. **Manin pairs and triples.** Let $X$ be a smooth, connected, compact complex curve, and $\omega$ be a nonzero meromorphic differential on $X$. Let $S$ be a finite set of points of $X$, containing the set $S_0$ of its zeros and poles. For each $s \in S$, let $k_s$ be the local field at $s$ and

$$k = \oplus_{s \in S} k_s.$$ 

Let $R$ be the ring of meromorphic functions on $X$, regular outside $S$; $R$ can be viewed as a subring of $k$. $R$ is endowed with the discrete topology and $k$ with its usual (formal series) topology. Let us define on $k$ the bilinear form

$$\langle f, g \rangle_k = \sum_{s \in S} \text{res}_s(fg\omega),$$

and the derivation

$$\partial f = df/\omega.$$ 

We will use the notation $r(A) = r \otimes A$, for any ring $A$ over $\mathbb{C}$ and complex Lie algebra $r$.

Let $\mathfrak{a} = \mathfrak{sl}_2(\mathbb{C})$. Define on $\mathfrak{a}(k)$ the bilinear form $\langle \cdot, \cdot \rangle_{\mathfrak{a}(k)}$ by

$$\langle x \otimes \epsilon, y \otimes \eta \rangle_{\mathfrak{a}(k)} = \langle x, y \rangle_{\mathfrak{a}} \langle \epsilon, \eta \rangle_k$$

for $x, y \in \mathfrak{a}, \epsilon, \eta \in k$, $\langle \cdot, \cdot \rangle_{\mathfrak{a}}$ being the Killing form of $\mathfrak{a}$, the derivation $\partial_{\mathfrak{a}(k)}$ by $\partial_{\mathfrak{a}(k)}(x \otimes \epsilon) = x \otimes \partial \epsilon$, for $x \in \mathfrak{a}, \epsilon \in k$, and the cocycle

$$c(\xi, \eta) = \langle \xi, \partial_{\mathfrak{a}(k)} \eta \rangle_{\mathfrak{a}(k)}.$$ 

Let $\hat{\mathfrak{g}}$ be the central extension of $\mathfrak{a}(k)$ by this cocycle. We then have

$$\hat{\mathfrak{g}} = \mathfrak{a}(k) \oplus \mathbb{C}K,$$

with bracket such that $K$ is central, and $[\xi, \eta] = ([\bar{\xi}, \bar{\eta}], c(\bar{\xi}, \bar{\eta})K)$, for any $\xi, \eta \in \hat{\mathfrak{g}}$ with first components $\bar{\xi}, \bar{\eta}$.

Let us denote by $\partial_{\mathfrak{g}}$ the derivation of $\hat{\mathfrak{g}}$ defined by $\partial_{\mathfrak{g}}(\xi, 0) = (\partial_{\mathfrak{a}(k)}\xi, 0)$ and $\partial_{\mathfrak{g}}(K) = 0$.

Let $\mathfrak{g}$ be the skew product of $\hat{\mathfrak{g}}$ with $\partial_{\mathfrak{g}}$. We have

$$\mathfrak{g} = \hat{\mathfrak{g}} \oplus \mathbb{C}D,$$

with bracket such that $\hat{\mathfrak{g}} \to \mathfrak{g}$, $\xi \mapsto (\xi, 0)$ is a Lie algebra morphism, and $[D, (\xi, 0)] = (\partial_{\mathfrak{g}}(\xi), 0)$ for $\xi \in \hat{\mathfrak{g}}$.

View $\mathfrak{a}(k)$ as a subspace of $\mathfrak{g} = \hat{\mathfrak{g}} \oplus \mathbb{C}D = \mathfrak{a}(k) \oplus \mathbb{C}K \oplus \mathbb{C}D$, by $\xi \mapsto (\xi, 0, 0)$. Define on $\mathfrak{g}$ the pairing $\langle \cdot, \cdot \rangle_{\mathfrak{g}}$ by $\langle K, D \rangle_{\mathfrak{g}} = 1$, $\langle K, \mathfrak{a}(k) \rangle_{\mathfrak{g}} = \langle D, \mathfrak{a}(k) \rangle_{\mathfrak{g}} = 0$, $\langle \xi, \eta \rangle_{\mathfrak{g}} = \langle \xi, \eta \rangle_{\mathfrak{a}(k)}$ for $\xi, \eta \in \mathfrak{a}(k)$.

Endow $\mathfrak{a}(k)$ with $\langle \cdot, \cdot \rangle_{\mathfrak{a}(k)}$. The subspace $\mathfrak{a}(R) \subset \mathfrak{a}(k)$ is a maximal isotropic subalgebra of $\mathfrak{a}(k)$, as follows from Lemma 7.2. Drinfeld’s Manin pair is $(\mathfrak{a}(k), \mathfrak{a}(R))$ (see [7]). In [10], we introduced the following extension of this pair. Let $\mathfrak{g}_R = \mathfrak{a}(R) \oplus \mathbb{C}D$; $\mathfrak{g}_R \subset \mathfrak{g}$ is a maximal isotropic subalgebra of $\mathfrak{g}$. The extended Drinfeld’s Manin pair of [10] is then $(\mathfrak{g}, \mathfrak{g}_R)$. 

QUASI-HOPF ALGEBRAS ASSOCIATED WITH $\mathfrak{sl}_2$ AND COMPLEX CURVES 5
In [4], we also introduced the following Manin triple. Let \( \Lambda \) be a Lagrangian complement to \( R \) in \( k \), commensurable with \( \oplus_{s \in S} O_s \) (where \( O_s \) is the completed local ring at \( s \)). Let \( n_+ = C e, n_- = C f, h = Ch. \) Let
\[
g_+ = h(R) \oplus n_+(k) \oplus \mathbb{C} D, \quad g_+ = (h \otimes \Lambda) \oplus n_+(k) \oplus \mathbb{C} K,
\]
then \( g = g_+ \oplus g_- \), and both \( g_+ \) and \( g_- \) are maximal isotropic subalgebras of \( g \). The Manin triple is then \((g, g_+, g_-)\).

We will also consider the following Manin triple, that we may consider as being obtained from the previous one by the action of the nontrivial element of the Weyl group of \( a \). Let
\[
\tilde{g}_+ = h(R) \oplus n_+(k) \oplus \mathbb{C} D, \quad \tilde{g}_- = (h \otimes \Lambda) \oplus n_+(k) \oplus \mathbb{C} K,
\]
then \((\tilde{g}, \tilde{g}_+, \tilde{g}_-)\) again forms a Manin triple.

**Remark 1. Generalizations.** It is straightforward to generalize the centerless versions of the Manin pairs and triples introduced above, as well as (as we will see) of their quantizations, to the case of a Frobenius algebra (i.e. a commutative ring \( k_0 \) with a linear form \( \theta \in (k_0)^* \), such that \( (a, b) \mapsto (a, b)_{k_0} = \theta(ab) \) is a non-degenerate inner product), with a maximal isotropic subalgebra \( R_0 \).

It is also easy to generalize the Manin pairs and triples \((g, g_+, g_-), (\tilde{g}, \tilde{g}_+, \tilde{g}_-)\) and \((g, g_R), \) as well as their quantizations in the sense of formal series, to the case where the Frobenius algebra is endowed with a derivation \( \partial_0 \), such that \( \theta \circ \partial_0 = 0 \).

### 1.2. Classical twists.

According to [3], to each of the Manin triples \((g, g_+, g_-)\) and \((\tilde{g}, \tilde{g}_+, \tilde{g}_-)\) is associated a Lie bialgebra structure on \( g \) denoted by \( \delta, \bar{\delta} : g \to g \otimes g \) the corresponding cocycle maps.

Let \( g_\Lambda = (a \otimes \Lambda) \oplus \mathbb{C} K \subset g; g_\Lambda \) is a Lagrangian complement of \( g_R \) in \( g \). It induces a Lie quasi-bialgebra structure on \( g_R \), and from [4] follows also that there is a Lie quasi-bialgebra structure on \( g \), associated to the Manin pair \((g, g_R)\) and to \( g_\Lambda; \) we denote by \( \delta_R : g \to g \otimes g \) the corresponding cocycle map.

These Lie (quasi-)bialgebra structures on \( g \) are related by the following classical twist operations.

Let \((e_i)_{i \in \mathbb{N}}, (e_i)_{i \in \mathbb{N}} \) be dual bases of \( R \) and \( \Lambda \); we choose them is such a way that \( e_i \) tends to 0 when \( i \) tends to \( \infty \). Let \( e^i, e_i, i \in \mathbb{Z} \) be dual bases of \( k \), defined by \( e_i = e_i, e^i = e^i, i \geq 0, e_i = e^{-i-1}, e^i = e_{-i-1}, i < 0 \).

#### Lemma 1.1.

Let \( f = \sum_{i \in \mathbb{Z}} e^i \otimes f[e_i]; f = f_1 + f_2, \) with
\[
f_1 = \sum_{i \in \mathbb{N}} e[e_i] \otimes f[e^i],
\]
and
\[
f_2 = \sum_{i \in \mathbb{N}} e[e^i] \otimes f[e_i].
\]
For $\xi \in g$, we have
$$\delta_R(\xi) = \delta(\xi) + [f_1, \xi \otimes 1 + 1 \otimes \xi], \quad \bar{\delta}(\xi) = \delta_R(\xi) + [f_2, \xi \otimes 1 + 1 \otimes \xi].$$

Proof. This is a consequence of the fact that the cocycle maps $\delta, \bar{\delta}, \delta_R$ are respectively equal to $\xi \mapsto \left[ \sum_j \lambda_j \otimes \mu_j, \xi \otimes 1 + 1 \otimes \xi \right], \xi \mapsto \left[ \sum_j \lambda'_j \otimes \mu'_j, \xi \otimes 1 + 1 \otimes \xi \right]$, where $(\lambda_j), (\mu_j)$, resp. $(\lambda'_j), (\mu'_j)$; $(\lambda_j^{(R)}), (\mu_j^{(R)})$ are dual bases of $g_+, g_-$, resp. $g'_+, g'_-$; $g_R, g_{\Lambda}$.

2. Quantization of Manin triples

2.1. Results on kernels. Recall that we have introduced dual bases $(e^i)_{i \in \mathbb{N}}, (e_i)_{i \in \mathbb{N}}$ of $R$ and $\Lambda$. Let $a_0 \in R\hat{\otimes}k$ be equal to $a_0 = \sum_i e^i \otimes e_i$. Note that $R\hat{\otimes}k$ is an algebra, to which belongs $a_0$. Let
$$\gamma = (\partial \otimes 1)a_0 - (a_0)^2;$$
then

Lemma 2.1. (see [10]) $\gamma$ belongs to $R \otimes R$.

Let $h$ be a formal variable and let $T : k[[h]] \to k[[h]]$ be the operator equal to
$$T = \frac{\text{sh}(h\partial)}{h\partial}.$$ Let us use the notation $x \mapsto \bar{x}$ for the operation of exchanging the two factors of $(k\hat{\otimes}k)[[h]]$.

Proposition 2.1. (see [10] and [11], Prop. 1.11) For certain elements $\phi \in (R \otimes R)[[h]], \psi_+, \psi_- \in h(R \otimes R)[[h]]$ depending on $\gamma, \bar{\gamma}$ and their derivatives by universal formulas, we have the following identities in $(R\hat{\otimes}k)[[h]]$
$$\sum_i T e^i \otimes e_i = \phi + \frac{1}{2h} \ln \frac{1 + a_0 \psi_-}{1 + a_0 \psi_+}, \quad \sum_i e^i \otimes T e_i = -\bar{\phi} + \frac{1}{2h} \ln \frac{1 - a_0 \bar{\psi}_+}{1 - a_0 \bar{\psi}_-}.$$

Lemma 2.2. (see [10]) The expression $\sum_i T e^i \otimes e_i - e^i \otimes T e_i$ belongs to $S^2(R)[[h]]$. We will denote by $\tau$ any element of $(R \otimes R)[[h]]$, such that
$$\tau + \bar{\tau} = \sum_i T e^i \otimes e_i - e^i \otimes T e_i,$$
and define the linear map $U : \Lambda[[h]] \to R[[h]]$ by
$$U \lambda = \langle \tau, 1 \otimes \lambda \rangle.$$

Note that $\sum_i T e^i \otimes e_i$ is well-defined in $(R \hat{\otimes} k)[[h]]$, because $e_i$ tends to zero as $i$ tends to infinity. Since $\partial$ is a continuous map from $k$ to itself, the same is true for the sequence $\partial^k e_i$. So $\sum_i e^i \otimes T e_i$ is well-defined in the same space; $\sum_i e^i \otimes e_i - e^i \otimes T e_i$ is well-defined in $(k \hat{\otimes} k)[[h]]$ for the same reasons.

**Remark 2.** (see [1]) Let $q = e^h$, and $f$ be the function defined by $f(x) = \frac{e^x - 1}{h}$ and $\tau_0 = \sum_i f(\partial) e^i \otimes e_i - e^i \otimes f(\partial) e_i$ (since $\partial$ is a continuous map from $k$ to itself, each $\sum_i e^i \otimes \partial^k e_i$ is well-defined in $R \hat{\otimes} k$, so that $\tau_0$ is well-defined in $(R \hat{\otimes} k)[[h]]$).

Note that the formal series $f(\partial) - f(-\partial)$ is divisible by $\partial_z + \partial_w$ in $\mathbb{C}[\partial_z, \partial_w][[h]]$, and denote their ratio by $\frac{f(\partial) - f(-\partial)}{\partial_z + \partial_w}$.

Attach indices $z$ and $w$ to the first and second factors of $(k \hat{\otimes} k)[[h]]$. We have

$$\tau_0 = \frac{f(\partial_z) - f(-\partial_w)}{\partial_z + \partial_w}(\gamma - \tilde{\gamma}),$$

and $\tau_0$ satisfies the identity (1).

Consider now the quantity $\exp(2h \sum_{i \in \mathbb{N}} e^i \otimes (T + U) e_i)$; it belongs to $(R \hat{\otimes} k)[[h]]$.

Let for each $s \in S$, $z_s$ be a local coordinate on $X$ near $s$.

**Lemma 2.3.** For any $\alpha \in k$, we have

$$(\alpha \otimes 1 - 1 \otimes \alpha + \psi_-(\alpha \otimes 1 - 1 \otimes \alpha) a_0) q^2 \sum_i (T + U) e_i \otimes e_i$$

$$= (\alpha \otimes 1 - 1 \otimes \alpha + \psi_+(\alpha \otimes 1 - 1 \otimes \alpha) a_0) q^{2(\tau - \phi)}.$$  

For any $\alpha \in k$, $(\alpha \otimes 1 - 1 \otimes \alpha) a_0$ belongs to $\prod_{s,t \in S} \mathbb{C}((z_s, w_t))$. If $\alpha$ belongs to $R$, then $\alpha \otimes 1 - 1 \otimes \alpha) a_0$ belongs to $R \otimes R$.

**Proof.** The first part of the lemma is proved using that $\tau = \sum_{i \in \mathbb{N}} U e_i \otimes e_i$, the second identity of Prop. 2.2 and

$$(\alpha \otimes 1 - 1 \otimes \alpha) \tilde{a}_0 = -(\alpha \otimes 1 - 1 \otimes \alpha) a_0, \quad \forall \alpha \in k $$

(4) follows from the fact that $a_0 + \tilde{a}_0$ verifies $(a_0 + \tilde{a}_0, id \otimes \beta)_k = \beta$ for any $\beta \in k$; the product is taken with the second components of a decomposition of $a_0 + \tilde{a}_0$.

Let us pass to the second part of the lemma. For $N$ integer, set

$$k_N = \prod_{s \in S} z_s^{-N} \mathbb{C}[[z_s]].$$

For any $\alpha \in k$, there exists an integer $N_\alpha$ such that $(\alpha \otimes 1 - 1 \otimes \alpha) a_0$ belongs to $k \hat{\otimes} k_{N_\alpha}$. Since $(\alpha \otimes 1 - 1 \otimes \alpha) \tilde{a}_0$ belongs to $k_{N_\alpha} \hat{\otimes} k$, and using (4), we obtain that $(\alpha \otimes 1 - 1 \otimes \alpha) \tilde{a}_0$ belongs to $(k \hat{\otimes} k_{N_\alpha}) \cap (k_{N_\alpha} \hat{\otimes} k) \subset \prod_{s,t \in S} \mathbb{C}((z_s, w_t))$.

The third part of the lemma follows from the following statement. Let $\alpha \in R$, then for any $\beta \in R$, one checks that

$$\langle (\alpha \otimes 1 - 1 \otimes \alpha) a_0, \beta \otimes id \rangle_k = \langle (\alpha \otimes 1 - 1 \otimes \alpha) a_0, id \otimes \beta \rangle_k = 0,$$
where the products are taken with the first and second components of a decomposition of \((\alpha \otimes 1 - 1 \otimes \alpha) a_0\).

\[\text{Remark 3.}\] Attach indices \(z\) and \(w\) to the first and second factors of \(k \otimes k\). Let \(P\) be a differential operator, acting on \(k\). The quantity \(K_P(z, w) = \sum_{i \in \mathbb{Z}} P e^i \otimes e_i = \sum_{i \in \mathbb{Z}} (P e^i)(z) e_i(w)\) can be considered as a kernel for the operator \(P\), because of the identity
\[(P f)(w) = \text{res}_{w \in S} K_P(z, w) f(w) \omega_w, \quad \forall f \in k.
\]
Suppose that \(P\) preserves \(R\). Then \(\bar{K}_P(z, w) = \sum_{i \in \mathbb{Z}} P e^i \otimes e_i = \sum_{i \in \mathbb{Z}} (P e^i)(z) e_i(w)\) can also be considered as a kernel for \(P\), because
\[(P f)(w) = \text{res}_{w \in S} \bar{K}_P(z, w) f(w) \omega_w, \quad \forall f \in R.
\]

\[\text{Remark 4.}\] The map \(R \mapsto R \otimes R, \alpha \mapsto (\alpha \otimes 1 - 1 \otimes \alpha) a_0\) defines a nontrivial element of the Hochschild cohomology \(H^1(R, R \otimes R)\) (where \(R \otimes R\) is the \(R\)-bimodule, with left action by multiplication on the first factor on the tensor product and right action by multiplication on the second one).

Note that there is a natural map \(H^1(R, R \otimes R) \rightarrow H^1(k, k \otimes_R (R \otimes R) \otimes_R k)\); \(k \otimes_R (R \otimes R) \otimes_R k\) is equal to \(\prod_{s,t \in S} \mathbb{C}((z_s, w_t))\), so the image by this map of the above class is nonzero [since \(a_0 \notin \prod_{s,t \in S} \mathbb{C}((z_s, w_t))\)].

\[\text{2.2. Presentation of } U_{h\mathfrak{g}}.\] In \([10]\), we introduced a Hopf algebra \(U_{h\mathfrak{g}}\) quantizing \((\mathfrak{g}, \delta)\).

It is the quotient of \(T(\mathfrak{g})[[h]]\) by the following relations. Let \(e, f, h\) be the Chevalley basis of \(\mathfrak{sl}_2(\mathbb{C})\). Denote in \(T(\mathfrak{g})[[h]]\), the element \(x \otimes \epsilon \in \mathfrak{a}(k) \subset \mathfrak{g}\) of \(\mathfrak{g}\) by \(x[e]\) and let for \(r \in R\), \(h^+[r] = h[r], h^-[\lambda] = h[\lambda]\). Introduce the generating series
\[e(z) = \sum_{i \in \mathbb{Z}} e_i \epsilon_i(z), \quad f(z) = \sum_{i \in \mathbb{Z}} f_i \epsilon_i(z),
\]
\[h^+(z) = \sum_{i \in \mathbb{N}} h^+[e_i] \epsilon_i(z), \quad h^-(z) = \sum_{i \in \mathbb{N}} h^-[e_i] \epsilon_i(z).
\]
The relations for \(U_{h\mathfrak{g}}\) are (Fourier modes of)
\[h^+[r], h^+[r'] = 0, \quad (5)
\]
\[[K, \text{anything}] = 0, \quad [h^+[r], h^-[\lambda]] = \frac{2}{\hbar} \langle (1 - q^{-K\partial}) r, \lambda \rangle, \quad (6)
\]
\[[h^-[\lambda], h^-[\lambda']] = \frac{2}{\hbar} \left( \langle T((q^{K\partial}\lambda) R), q^{K\partial}\lambda' \rangle + \langle U\lambda, \lambda' \rangle - \langle U((q^{K\partial}\lambda) A), q^{K\partial}\lambda' \rangle \right), \quad (7)
\]
\[[h^+[r], e(w)] = 2r(w)e(w), \quad [h^-[\lambda], e(w)] = 2\langle (T + U)(q^{K\partial}\lambda) A\rangle(w)e(w), \quad (8)
\]
\begin{align}
[h^+[r], f(w)] &= -2r(w)f(w), \quad [h^-[\lambda], f(w)] = -2[(T + U)\lambda](w)f(w), \\
[z_s - w_s + \psi_{-}(z, w)a_0(z, w)(z_s - w_s)]e(z)e(w) &= q^{2(\tau - \phi)(z, w)}[z_s - w_s + \psi_{+}(z, w)a_0(z, w)(z_s - w_s)]e(w)e(z), \quad \forall s \in S \\
q^{2(\tau - \phi)(z, w)}[z_s - w_s + \psi_{+}(z, w)a_0(z, w)(z_s - w_s)]f(z)f(w) &= [z_s - w_s + \psi_{-}(z, w)a_0(z, w)(z_s - w_s)]f(w)f(z), \quad \forall s \in S \\
[e(z), f(w)] &= \frac{1}{\hbar}[\delta(z, w)q^{((T+U)h^+)(z)} - (q^{-K\partial_w}\delta(z, w))q^{-h^-(w)}],
\end{align}

\begin{align}
[D, h^+[r]] &= h^+[\partial r], \quad [D, h^-(z)] = -((\partial h^-)(z) - \sum_{i \in \mathbb{N}}[(1 + q^{-K\partial})Ae_i](z)h^+[e^i] + \mathcal{A}(z), \\
[D, x^\pm(z)] &= -(\partial x^\pm)(z) + h\sum_{i \in \mathbb{N}}(Ae_i)(z)h^+[e^i]x^\pm(z),
\end{align}

for any \( r, r' \in R, \lambda, \lambda' \in \Lambda, x^\pm = e, f \), with \( A : \Lambda[[\hbar]] \to R[[\hbar]] \) defined by

\begin{align}
A\lambda = T((\partial\lambda)_R) + \partial(U\lambda) - U((\partial\lambda)_\Lambda), \quad \forall \lambda \in \Lambda,
\end{align}

and

\begin{align}
\mathcal{A}(z) = \sum_{i \in \mathbb{N}}[(1 + q^{-K\partial})Ae_i](z)[(1 - q^{-K\partial})e^i](z) + \frac{2}{\hbar}[(q^{-K\partial} - 1)Ae_i](z)e^i(z).
\end{align}

Note that \( \mathcal{A} \) is anti-self-adjoint, so that \( \sum_{i \in \mathbb{N}}Ae^i \otimes e_i = -\sum_{i \in \mathbb{N}}e^i \otimes Ae_i \), and \( \sum_{i \in \mathbb{N}}(Ae_i)(z)e^i(z) = 0 \).

For any positive integer \( n \), define the completed tensor power \( (U_{h\hbar})^\otimes n \) as the quotient of \( T(g^n)[[\hbar]] \) by the ideal generated by the usual \( n \) copies of the above relations.

The formulas

\begin{align}
\Delta(K) &= K \otimes 1 + 1 \otimes K \\
\Delta(h^+[r]) &= h^+[r] \otimes 1 + 1 \otimes h^+[r], \quad \Delta(h^-(z)) = h^-(z) \otimes 1 + 1 \otimes (q^{-K\partial}h^-)(z), \\
\Delta(e(z)) &= e(z) \otimes q^{((T+U)h^+)(z)} + 1 \otimes e(z), \\
\Delta(f(z)) &= f(z) \otimes 1 + q^{-h^-}(z) \otimes (q^{-K\partial}f)(z), \\
\Delta(D) &= D \otimes 1 + 1 \otimes D + \sum_{i \in \mathbb{N}}\frac{\hbar}{4}h^+[e^i] \otimes h^+[Ae_i],
\end{align}
$r \in R$, for the coproduct,
\[ \varepsilon(h^+[r]) = \varepsilon(h^-[\lambda]) = \varepsilon(x[\epsilon]) = \varepsilon(D) = \varepsilon(K) = 0, \] (22)
x = e, f, r \in R, \lambda \in \Lambda, \epsilon \in k$, for the counit,
\[ S(h^+[r]) = -h^+[r], \quad (Sh^-)(z) = -(q^{K\partial}h^-)(z), \quad S(D) = -D + \frac{\hbar}{4} \sum_{i \in \mathbb{N}} h^+[e^i]h^+[Ae_i], \] (23)
\[ (Se)(z) = -e(z)q^{(T+U)h^+}(z), \quad (Sf)(z) = -\left(q^{K\partial}(q^{h^-}f)\right)(z), \quad S(K) = -K, \] (24)
r \in R, for the antipode, define a topological (with respect to the completion introduced above) Hopf algebra structure on $U_h^\mathfrak{g}$.

**Notation.** We have posed $\delta(z, w) = \sum_{i \in \mathbb{Z}} \epsilon^i(z)\epsilon_i(w)$; this is an element of $k \hat{\otimes} k$.
The indices $R$ and $\Lambda$ denote the projections on the first and second factor of the decomposition $k[[\hbar]] = R[[\hbar]] \oplus \Lambda[[\hbar]]$.

In (10), (11), we have attached indices $z$ and $w$ to the first and second factors of $k \hat{\otimes} k$. Recall that $a_0(z, w)(z_s - w_t)$ belongs to $\mathbb{C}((z_s, w_t))$.

$K_1, K_2$ respectively mean $K \otimes 1, 1 \otimes K$. The $K, f(z)$ and $h^-(z)$ used here correspond to $2K, \frac{1}{\pi}(q^{-K\partial}f)(z)$ and $(q^{-K\partial}h^-)(z)$ of $[10]$ respectively. \hfill \Box

**Remark 5.** Variants of the vertex relations (10) and (11). Due to the Hochschild cocycle properties explained in rem. [4], relations (10) and (11) are equivalent to the following ones,

\[ [\alpha(z) - \alpha(w) + \psi_-(z, w)a_0(z, w)(\alpha(z) - \alpha(w))]e(z)e(w) = q^{2(\tau - \phi)(z, w)}[\alpha(z) - \alpha(w) + \psi_+(z, w)a_0(z, w)(\alpha(z) - \alpha(w))]e(w)e(z), \quad \forall \alpha \in k \] (25)

\[ q^{2(\tau - \phi)(z, w)}[\alpha(z) - \alpha(w) + \psi_+(z, w)a_0(z, w)(\alpha(z) - \alpha(w))]f(z)f(w) = \] (26)

\[ = [\alpha(z) - \alpha(w) + \psi_-(z, w)a_0(z, w)(\alpha(z) - \alpha(w))]f(w)f(z), \quad \forall \alpha \in k; \]

note that for any $\alpha \in k$, $a_0(z, w)(\alpha(z) - \alpha(w))$ belongs to $\prod_{s,t \in S} \mathbb{C}((z_s, w_t)) = k \hat{\otimes} k$.

**Remark 6.** Due to (3), the $e - e$ and $f - f$ relations (10) and (11) can be informally written as

\[ e(z)e(w) = q^{2\sum_i((T+U)e_i)(z)e_i(w)}e(w)e(z), \quad f(z)f(w) = q^{2\sum_i e^i(z)((T+U)e_i)(w)}f(w)f(z). \] (27)

\hfill \Box
Remark 7. The relations (14) can be rewritten as
\[ [D, q^{-(T+U)h^+}(z)x(z)] = -\partial_z(q^{-(T+U)h^+}(z)x(z)), \]
x = e, f.

2.3. Presentation of \( U_{\hbar}\mathfrak{g} \). The Lie bialgebra \((\mathfrak{g}, \hat{\delta})\) also admits a quantization. We denote by \( U_{\hbar}\mathfrak{g} \) the corresponding Hopf algebra. It is the quotient of \( T(\mathfrak{g})[[\hbar]] \) by the following relations. Let us overline in the case of \( U \)

\[ \lambda \]

\[ \sum_{i \in \mathbb{N}} [(1 + q^{\hat{K}\partial})Ae_i](z)[(q^{\hat{K}\partial} - 1)e_i](z) + \frac{2}{\hbar}[(1 - q^{\hat{K}\partial})Ae_i](z)(q^{\hat{K}\partial}e^i)(z). \]

The coalgebra structure of \( U_{\hbar}\mathfrak{g} \) is defined by the coproduct
\[ \hat{\Delta}(\hbar - [\lambda]) = \hbar - [\lambda] \otimes 1 + 1 \otimes \hbar, \]

\[ \hat{\Delta}(\hbar^+[r]) = \hbar^+[r] \otimes 1 + 1 \otimes \hbar^+[r], \]

\[ \hat{\Delta}(\hbar^-(z)) = (q^{\hat{K}\partial} \hbar^-)(z) \otimes 1 + 1 \otimes \hbar^-(z), \]

\[ \hat{\Delta}(\hbar)[e] = \hbar[e] \otimes \hbar[Ae_i], \]

r \in R, the counit
\[ \varepsilon(\hbar^+[r]) = \varepsilon(\hbar^-[\lambda]) = \varepsilon(\hbar[e]) = \varepsilon(D) = \varepsilon(\hbar) = 0, \]
\[ S(h^+[r]) = -\bar{h}^+[r], \ (\bar{S}h^-)(z) = -(q^{-K\partial}\bar{h}^-)(z), \ \bar{S}(\bar{D}) = -\bar{D} + \sum_{i \in \mathbb{N}} \bar{h}^+\bar{e}i\bar{h}^+[\lambda_i], \tag{41} \]

\[ (\bar{S}e)(z) = \left(q^{-K\partial}(\bar{e}q\bar{h}^-)\right)(z), \ (\bar{S}f)(z) = -q^{-(T+U)\bar{h}^+}(z)\bar{f}(z), \ \bar{S}(\bar{K}) = -\bar{K}, \tag{42} \]

\( r \in R. \)

Then

**Proposition 2.2.** (see [10]) Define \( U_{h\mathfrak{g}}^+ \) and \( U_{h\mathfrak{g}}^- \) as the subalgebras of \( U_h\mathfrak{g} \) and \( U_{h\mathfrak{g}} \) generated by \( \mathfrak{g}^\pm \) and \( \mathfrak{g}_\pm \), respectively. The pairs \((U_{h\mathfrak{g}}^+, \Delta)\) and \((U_{h\mathfrak{g}}^-, \Delta')\), as well as \((U_{h\mathfrak{g}}^+, \Delta)\) and \((U_{h\mathfrak{g}}^-, \Delta')\), form dual Hopf algebras, quantizing the Lie bialgebra structures defined by \((\mathfrak{g}^\pm, \pm\delta)\) and \((\mathfrak{g}_\pm, \pm\delta)\). The pairs \((U_{h\mathfrak{g}}, \Delta)\) and \((U_{h\mathfrak{g}}, \Delta)\) are the double Hopf algebras of \((U_{h\mathfrak{g}}^+, \Delta)\) and \((U_{h\mathfrak{g}}^+, \Delta)\) respectively, and define quantizations of the Lie bialgebras \((\mathfrak{g}, \delta)\) and \((\mathfrak{g}, \delta)\).

Here \( \Delta' \) denotes \( \Delta \) composed with the permutation of factors.

Then

**Proposition 2.3.** The map

\[ x[\epsilon] \mapsto \bar{x}[\epsilon], h^+[r] \mapsto \bar{h}^+[r], K \mapsto \bar{K}, D \mapsto \bar{D}, h^-[\lambda] \mapsto \bar{h}^-[\lambda], \]

\( x = e, f, \epsilon \in k, r \in R, \lambda \in \Lambda \), extends to an algebra isomorphism from \( U_{h\mathfrak{g}} \) to \( U_{h\mathfrak{g}} \).

In what follows, we will denote elements of \( U_{h\mathfrak{g}} \) as elements of \( U_{h\mathfrak{g}} \), implicitly making use of this isomorphism.

3. PBW results for \( U_{h\mathfrak{g}} \)

3.1. PBW result for algebras presented by vertex relations. We will now prove a PBW statement, which was used implicitly in [10].

Let \( \zeta \) be an indeterminate, and let \( V \) be the field of Laurent series \( \mathbb{C}((\zeta)) \). Let \( \gamma_n = \zeta^n, n \in \mathbb{Z} \), and let us organize the \( (\gamma_n)_{n \in \mathbb{Z}} \) in the generating series

\[ \gamma(z) = \sum_{i \in \mathbb{Z}} \gamma_n z^{-n}. \]

Let \( \hbar \) be a formal variable, and \( \mathcal{A} \) be the quotient of \( T(V)[[\hbar]] \) by the relations obtained as the Fourier modes of

\[ (z - w + A(z, w))\gamma(z)\gamma(w) = (z - w + B(z, w))\gamma(w)\gamma(z), \tag{43} \]

for \( A, B \in \hbar \mathbb{C}((z, w))[[\hbar]] \).
Lemma 3.1. Assume that $A, B$ satisfy the relation
\[(z - w + B(z, w))(w - z + B(w, z)) = (z - w + A(z, w))(w - z + A(w, z)),\]
and the series $z - w + A$ and $z - w + B$ do not define the same ideal of $\mathbb{C}((z, w))[[h]]$. Then any element of $\mathcal{A}$ can be written as a sum
\[\sum_{k=0}^{k} \sum_{p=0}^{\infty} i_1 < ... < i_p, \alpha_i \geq 1} \lambda^{(\alpha_1, ..., \alpha_p)} \gamma_i^{\alpha_1} \cdots \gamma_i^{\alpha_p},\]
k \geq 0, $\lambda^{(\alpha_1, ..., \alpha_p)}$ scalars, such that the number of indices $((i_1, \ldots, i_p), (\alpha_1, \ldots, \alpha_p))$ with $i_1 = M$ and $\lambda^{(\alpha_1, ..., \alpha_p)} \neq 0$, is finite for all $M$ and zero for $M$ large enough.

Proof. (44) implies that the divisors of $z - w + A$ and $z - w - \tilde{B}$ coincide. Therefore, the relations (43) can be put in the form
\[\bar{q}_- (z, w) \gamma(z) \gamma(w) = \bar{q}_+ (z, w) \gamma(w) \gamma(z),\]
with $\bar{q}_+ (z, w) = z - w + \bar{C}(z, w)$ and $\bar{q}_- = -\kappa \bar{q}_+^{(21)}$, with $\bar{C} \in h \mathbb{C}((z, w))[[h]]$ and $\kappa \in 1 + h \mathbb{C}((z, w))[[h]]$, $\kappa \kappa^{(21)} = 1$.

Set $q_+ = \kappa^{-1/2} \bar{q}_+$, $q_- = \kappa^{-1/2} \bar{q}_-$, then relations (45) can be written as
\[q_+ (z, w) \gamma(z) \gamma(w) = q_- (z, w) \gamma(w) \gamma(z),\]
with $q_- (z, w) = -q_+ (w, z)$.

Let us prove now that the $\gamma_i^{\alpha_1} \cdots \gamma_i^{\alpha_p}$ form a generating family of $\mathcal{A}$.

Let $\mathcal{A}_2$ be the span in $\mathcal{A}$ of infinite series $\sum_{n,m \geq N} a_{n,m} e_p e_q$. (43) allows us to write, for any $n, m \in \mathbb{Z}$,
\[\rho_{n,m} = [\gamma_{n+1}, \gamma_m] - [\gamma_n, \gamma_{m+1}],\]
as a series in $h \mathcal{A}_2[[h]]$. We rearrange this system of relations in the following way. Let
\[\tau_{n-k,n+k} = \rho_{n-k,n+k} + \rho_{n-k+1,n+k-1} + \cdots + \rho_{n-1,n+1}\]
for $k > 0$,
\[\tau_{n+1-k,n+k} = \rho_{n+1-k,n+k} + \rho_{n+2-k,n+k-1} + \cdots + \rho_{n,n+1}\]
for $k \geq 1$,
\[\tau_{n+k,n-k} = \rho_{n+k,n-k} + \rho_{n+k-1,n-k+1} + \cdots + \rho_{n,n}\]
for $k \geq 0$,
\[\tau_{n+1+k,n-k} = \rho_{n+1+k,n-k} + \rho_{n+2+k,n-k+1} + \cdots + \rho_{n+1,n}\]
for $k \geq 0$, then the system of expressions for the $\rho_{n,m}$ is equivalent to a system of expressions for the $\tau_{n,m}$.

Note that
\[\tau_{n-k,n+k} = -[\gamma_{n-k}, \gamma_{n+k+1}] + [\gamma_n, \gamma_{n+1}]\]
for $k > 0$,
\[ \tau_{n+1-k,n+k} = [\gamma_{n+1-k}, \gamma_{n+k+1}] \]
for $k \geq 1$,
\[ \tau_{n+k,n-k} = [\gamma_{n+k+1}, \gamma_{n-k}] - [\gamma_{n}, \gamma_{n+1}] \]
for $k \geq 0$,
\[ \tau_{n+1+k,n-k} = [\gamma_{n+2+k}, \gamma_{n-k}] \]
for $k \geq 0$.

The expression for $\tau_{n,n}$ yields an expression for $[\gamma_{n}, \gamma_{n+1}]$. Substracting this expression to the expressions for $\tau_{n-k,n+k}$ and adding to the expression for $\tau_{n+k,n-k}$, we derive expressions for the $[\gamma_{n}, \gamma_{m}]$. This means that an arbitrary monomial in the $\gamma_i$'s can be expressed as a linear combination of the $(\gamma^{\alpha_1}_{i_1} \cdots \gamma^{\alpha_p}_{i_p})_{i_1 < \cdots < i_p, \alpha_i \geq 1}$ of the form described.

Let us now prove that $(\gamma^{\alpha_1}_{i_1} \cdots \gamma^{\alpha_p}_{i_p})_{i_1 < i_2 < \cdots < \alpha_i \geq 1}$ forms a topological basis of $A$. For this, we will construct an isomorphism of $A$ with a Feigin-Odesski-type (of shuffle) algebra (see [13]). Define $FO$ as the direct sum $\oplus_{n \geq 0} FO^{(n)}$, where $FO^{(n)}$ is the the subspace of $C((z_1)) \cdots ((z_n))[[h]]$ formed by the elements $\lambda$ such that $\Pi_{i<j} q_-(z_i, z_j)\lambda$ belongs to $k^{\otimes n}[[h]]$ and is totally antisymmetric in $z_1, \ldots, z_n$.

Define a product of $FO$ as follows: let $\epsilon$ and $\eta$ belong to $FO^{(n)}$ and $FO^{(m)}$, then their product $\epsilon \ast \eta$ lies in $FO^{(n+m)}$ and is equal to
\[
(\epsilon \ast \eta)(z_1, \cdots, z_{n+m}) = \frac{n!m!}{(n+m)!} \sum_{\sigma \in Sh_{n,m}} \prod_{i<j, \sigma(i) > \sigma(j)} q(z_i, z_j) (z_1, \cdots, z_{\sigma(1)}, \cdots, z_{\sigma(n)}) (z_{\sigma(n+1)}, \cdots, z_{\sigma(n+m)}),
\]
where $Sh_{n,m}$ is the set of shuffle transformations of $\{1, \ldots, n+m\}$, that is the set of permutations $\sigma$ of that set such that $\sigma(i) < \sigma(j)$ is $i < j \leq n$ if $m+1 \leq i < j$, and $q(z, w)$ is the ratio $q_+(z, w)/q_-(z, w)$, expanded for $w << z$. It is then clear that the product (47) is well-defined and associative.

The space $FO^{(n)}$ can also be described as follows:

**Proposition 3.1.** Define a symmetrization map $S_q$ from $k^{\otimes n}[[h]]$ to $C((z_1)) \cdots ((z_n))[[h]]$ by
\[
S_q(\epsilon) = \sum_{\sigma \in S_n} \epsilon(z_{\sigma(1)}, \cdots, z_{\sigma(n)}) \prod_{i<j, \sigma(i) > \sigma(j)} q(z_i, z_j)
\]
(recall that $k^{\otimes n} = C[[z_1, \cdots, z_n]][z_1^{-1}, \cdots, z_n^{-1}]$).

Then $FO^{(n)}$ is both equal to the image by $S_q$ of $k^{\otimes n}[[h]]$ and of its subspace of totally symmetric elements.

**Proof.** It is clear that both images lie in $FO^{(n)}$. To prove that any element of $FO^{(n)}$ is in $S_q(k^{\otimes n}[[h]] S_n)$, pick any totally antisymmetric $a$ in $k^{\otimes n}$; we should
Proposition 3.3. Write it in the form
\[
a = \left( \sum_{\sigma \in S_n} \prod_{i< j, \sigma(i) > \sigma(j)} q_{+}(z_i, z_j) \prod_{i< j, \sigma(i) < \sigma(j)} q_{-}(z_i, z_j) \right) \epsilon(z_1, \ldots, z_n),
\]
with \(\epsilon\) totally symmetric in \(k\hat{\otimes}^n[[h]]\). The sum
\[
\sum_{\sigma \in S_n} \prod_{i< j, \sigma(i) > \sigma(j)} q_{+}(z_i, z_j) \prod_{i< j, \sigma(i) < \sigma(j)} q_{-}(z_i, z_j)
\]
lies in \(n! \prod_{i< j}(z_i - z_j) + h^n k\hat{\otimes}^n[[h]]\). Since it is also totally antisymmetric, it is of the form \(n! \prod_{i< j}(z_i - z_j)(1 + \sum_{i \geq 1} h^i \kappa_i), \kappa_i \in k\hat{\otimes}^n\). Since \(a\) is totally antisymmetric, we can write it as a product \(\prod_{i< j} z_i\cdot j\cdot s, s\) totally symmetric in \(k\hat{\otimes}^n[[h]]\). We then set \(\epsilon = s/(1 + \sum_{i \geq 1} h^i \kappa_i)\).

We then have:

**Proposition 3.2.** \((\gamma_{i_1}^{a_1} \cdots \gamma_{i_p}^{a_p})_{i_1 < i_2 < \cdots}, a_i \geq 1\) is a free family of \(A\).

**Proof.** There is an algebra map \(i\) from \(A\) to \(FO\), mapping each \(\gamma[\epsilon]\) to \(\epsilon\) in \(FO^{(1)}\) (for \(\epsilon = \sum_{i} \epsilon_i z_i^i\)), we set \(\gamma[\epsilon] = \sum_{i} \epsilon_i \gamma_i\). This map also sends the product \(\gamma[\epsilon_1] \cdots \gamma[\epsilon_n] \) to \(S_q(\epsilon_1 \otimes \cdots \otimes \epsilon_n)\). Let us show that the image by \(i\) of \((\gamma_{i_1}^{a_1} \cdots \gamma_{i_p}^{a_p})_{i_1 < \cdots < i_p, a_i \geq 1}\) forms a free family in \(FO\).

From Prop. 3.1 follows that multiplication by \(\prod_{i< j} q_{-}(z_i, z_j)\) – call this map \(m\) – defines an isomorphism of \(FO^{(n)}\) with the image of the endomorphism \(Sym_q\) of \(k\hat{\otimes}^n[[h]]\), defined by
\[
Sym_q(\epsilon) = \sum_{\sigma \in S_n} \epsilon(z_{\sigma(1)}, \ldots, z_{\sigma(n)}) \prod_{i< j, \sigma(i) > \sigma(j)} q_{+}(z_i, z_j) \prod_{i< j, \sigma(i) < \sigma(j)} q_{-}(z_i, z_j).
\]
Moreover, we have \(Sym_q(\epsilon_1 \otimes \epsilon_2 \cdots) = m \circ i(\gamma[\epsilon_1] \gamma[\epsilon_2] \cdots)\).

Suppose now that some combination \(\sum_{i_1 \leq i_2 < \cdots} \lambda_{i_1, i_2, \cdots} \gamma_{i_1} \gamma_{i_2} \cdots\) is zero in \(A\). It follows that the image by \(Sym_q\) of the combination \(\sum_{i_1 \leq i_2 < \cdots} \lambda_{i_1, i_2, \cdots} \gamma_{i_1} \gamma_{i_2} \cdots\) is zero. Let \(\alpha\) be the smallest \(h\)-adic valuation of all \(\lambda_{i_1, i_2, \cdots}\), then the leading term in \(h\) of this equality gives \(\prod_{i< j}(z_i - z_j) \sum_{\sigma \in S_n} \epsilon^\sigma = 0\), with \(\epsilon = \sum_{i_1 \leq i_2 < \cdots} \lambda^{(a)}_{i_1, i_2, \cdots} \epsilon_i \otimes \epsilon_{i_2} \cdots\), which implies the \(\sum_{\sigma \in S_n} \epsilon^\sigma = 0\), so that \(\lambda^{(a)}_{i_1, i_2, \cdots} = 0\), and all \(\lambda_{i_1, i_2, \cdots}\) are zero.

As a consequence of Lemma 3.1 and Prop. 3.2 we get

**Proposition 3.3.** \((\gamma_{i_1}^{a_1} \cdots \gamma_{i_p}^{a_p})_{i_1 < \cdots < i_p, a_i \geq 1}\) is a topological basis of \(A\).

We have also

**Proposition 3.4.** \(i\) is an algebra isomorphism between \(A\) and \(FO\).

**Proof.** We have seen that \(i(\gamma[\epsilon_1] \cdots \gamma[\epsilon_n]) = S_q(\epsilon_1 \otimes \cdots \otimes \epsilon_n)\), so that \(i\) is surjective.

From Prop. 3.3 and the proof of Prop. 3.2 follows that the image by \(i\) of a basis of \(A\) is a free family of \(FO\), so that \(i\) is injective.

\(\square\)
The composition of the above algebra morphisms with the multipli-
techniques version without prime.

Similarly, let $B^-$ be the quotient of the algebra $T(k)[[h]]$ by the following relations: let $f'(e)$ denote the element of $T(k)[[h]]$ corresponding to $e \in k$, and $f'(z) = \sum_{i \in Z} f'(e_i) e_i(z)$, the relations are the Fourier coefficients of (11), with the series replaced by their analogues with primes.

Finally, let $B^0$ be the quotient of the algebra $T(k \oplus \mathbb{C}K' \oplus \mathbb{C}D')[[h]]$ by the following relations: let $e \in k$ denote the element of $T(k \oplus \mathbb{C}K' \oplus \mathbb{C}D')[[h]]$ corresponding to $e$, the relations are (11), with $h^+[r], h^-[\lambda]$ replaced by $h'[r], h'[\lambda]$. There are algebra morphisms from $B^\pm, B^0$ to $U_h\mathfrak{g}$, associating to each generator its version without prime.

We then have

**Lemma 3.2.** The composition of the above algebra morphisms with the multiplication of $U_h\mathfrak{g}$ defines a linear map

$$i_0 : B^+ \otimes B^0 \otimes B^- \to U_h\mathfrak{g},$$

which is a linear isomorphism (the tensor products are completed over $\mathbb{C}[[h]]$).

**Proof.** We first consider the case of the algebra $U_h\mathfrak{g}'$, defined as the algebra with the same generators (except $D$) and relations as $U_h\mathfrak{g}$. Let $B^0$ be the analogue of algebra $B^0$ without generator $D'$. In that case, we obtain easily that $(b^+_i b^0_j h^-_k)_{i,j,k}$ is a base of $U_h\mathfrak{g}'$, and $(b^+_i)_i, (b^0_j)_j, (h^-_k)_k$ are images of bases of $B^+, B^0, B^-$. Then we check that the r.h.s. of formulas (13), (14) define a derivation of $U_h\mathfrak{g}'$. We then apply the PBW result for crossed products of algebras by derivations, and obtain for $U_h\mathfrak{g}$ a base $(b^+_i b^0_j h^-_k D^*)_{i,j,k,s \geq 0}$. We finally make use of (14), $x^f = f$, to pass (by triangular transformations) from this base to $(b^+_i b^0_j D^* h^-_k)_{i,j,k,s \geq 0}$.

Since $(b^0_j D^*)_i,j,s \geq 0$ is the image of a base of $B^0$, this final base has the desired form. \qed

**Lemma 3.3.** $B^\pm$ are topologically spanned by $e^{\epsilon_{i_1}} \cdots e^{\epsilon_{i_p} \alpha_i}$, $i_1 < \ldots < i_p$, $\alpha_i \geq 1$, resp. $f^{\epsilon_{i_1}} \cdots f^{\epsilon_{i_p} \alpha_p}$, $i_1 < \ldots < i_p$, $\alpha_i \geq 1$.

**Proof.** This follows directly from the analogue of Prop. 3.3 (where $\mathbb{C}((\zeta))$ is replaced by a direct sum $\oplus_{s \in S} \mathbb{C}((\zeta))$), the fact that $(z_a - w_a) a_0 \neq -(z_a - w_a) a_0$, and the computation of [10] preceding Thm. 5:

$$e^{2h} \left[ \psi_0 (\gamma, \partial z \gamma, ...) + \tau \right] \left[ z - w + \beta \psi^- (\gamma, \partial z \gamma, ...) \right] = \left[ z - w + \beta \psi^- (\gamma, \partial z \gamma, ...) \right] \cdot \left[ z - w + \beta \psi^+ (\gamma, \partial z \gamma, ...) \right],$$

where $\psi^+ (\gamma, \partial z \gamma, ...) = 0$.
where $\beta(z, w) = (z - w)a_0$, and this is in turn written
\[
e^{2\hbar(-\psi_0 - \tilde{\psi}_0)}e^{2\hbar \frac{\partial}{\partial z}(\gamma - \tilde{\gamma})} \frac{1 + G\psi_-(\gamma, \partial_z \gamma, \ldots) - G\psi_-(\tilde{\gamma}, \partial_z \tilde{\gamma}, \ldots)}{1 + G\psi_+(\gamma, \partial_z \gamma, \ldots) - G\psi_+(\tilde{\gamma}, \partial_z \tilde{\gamma}, \ldots)} = 1,
\]
which amounts to the statement (3.17) of [10].

\section*{Proposition 3.5.}
The
\[
e[\epsilon_{i_1}]^{\alpha_1} \cdots e[\epsilon_{i_p}]^{\alpha_p} h[\epsilon_{k_1}]^{\gamma_1} \cdots h[\epsilon_{k_r}]^{\gamma_r} D^d K^t f[\epsilon_{j_1}]^{\beta_1} \cdots f[\epsilon_{j_q}]^{\beta_q}
\]
with $i_1 < \ldots < i_p$, $\alpha_i \geq 1$, $j_1 < \ldots < j_q$, $\beta_i \geq 1$, $k_1 < \ldots < k_r$, $\gamma_i \geq 1$, $d, t \geq 0$, form a topological basis of $U_h\mathfrak{g}$.

\textbf{Proof.} This follows from Lemmas \ref{lem:3.2} \ref{lem:3.3} and the fact that $h'[\epsilon_{k_1}]^{\gamma_1} \cdots h'[\epsilon_{k_r}]^{\gamma_r} D^d K^t$, $k_1 < \ldots < k_r$, $\gamma_i \geq 1$, $d, t \geq 0$, forms a basis of $\mathcal{B}^0$. \hfill \Box

\textbf{Remark 8.} It is straightforward to repeat the reasoning above to obtain topological bases of the $U_h\mathfrak{g} \hat{\otimes} \mathbb{K}$, as tensor powers of the base obtained in Prop. \ref{prop:3.5}.

\textbf{Remark 9.} It would be interesting to explicitly compute, in the case of the algebras $\mathcal{B}^\pm$, the $\kappa_0$ provided by Prop. \ref{prop:3.3}.

\section{Subalgebra $U_h\mathfrak{g}_R$ of $U_h\mathfrak{g}$}

\subsection*{4.1. Presentation of $U_h\mathfrak{g}_R$.} Recall that $\mathfrak{g}$ contains as a Lie subalgebra $\mathfrak{g}_R$. In this section, we define a subalgebra $U_h\mathfrak{g}_R$ of $U_h\mathfrak{g}$, such that the inclusion $U_h\mathfrak{g}_R \subset U_h\mathfrak{g}$ is a deformation of $U\mathfrak{g}_R \subset U\mathfrak{g}$.

Let $U_h\mathfrak{g}_R$ be the algebra with generators $\tilde{D}, \tilde{e}[r], \tilde{f}[r], \tilde{h}[r], R, r \in R$ and relations
\begin{align}
\tilde{x}[\alpha_1 r_1 + \alpha_2 r_2] &= \alpha_1 \tilde{x}[r_1] + \alpha_2 \tilde{x}[r_2], \quad x = e, f, h, \quad (49) \\
[\tilde{h}[r], \tilde{h}[r']] &= 0, \quad \forall r, r' \in R, \quad (50) \\
[\tilde{h}[r], \tilde{e}[r']] &= 2\tilde{e}[rr'], \quad [\tilde{h}[r], \tilde{f}[r']] = -2\tilde{f}[rr'], \quad \forall r, r' \in R, \quad (51)
\end{align}
\begin{align}
\tilde{e}[r_1 \alpha_1 \tilde{e}[r_2] - \tilde{e}[r_1] \tilde{e}[\alpha_2 r_2] + \tilde{e}[r_1] \psi_-(\gamma\alpha)^{(1)} \tilde{e}[r_2] \psi_+(\gamma\alpha)^{(2)}] &= \tilde{e}[r_2 (q^{2(\tau - \phi)})^{(2)}] \tilde{e}[\alpha_1 (q^{2(\tau - \phi)})^{(1)}] - \tilde{e}[r_2 (q^{2(\tau - \phi)})^{(2)}] \tilde{e}[\alpha_1 (q^{2(\tau - \phi)})^{(1)}] \\
&+ \tilde{e}[r_2 (\psi_+^{(1)} q^{2(\tau - \phi)})^{(2)} \gamma(\alpha)^{(2)}] \tilde{e}[r_1 (\psi_+^{(1)} q^{2(\tau - \phi)})^{(1)} \gamma(\alpha)^{(1)}], \quad (52)
\end{align}
\begin{align}
\tilde{f}[r_2] \tilde{f}[\alpha r_1] &= \tilde{f}[r_2] \alpha \tilde{f}[r_1] + \tilde{f}[r_2 (\psi_+^{(1)} q^{2(\tau - \phi)})^{(2)}] \tilde{f}[r_1 (\psi_+^{(1)} q^{2(\tau - \phi)})^{(1)} \gamma(\alpha)^{(1)}] = \tilde{f}[r_2 (q^{2(\tau - \phi)})^{(1)}] \tilde{f}[r_1 (q^{2(\tau - \phi)})^{(2)} \alpha r_2] \\
+ \tilde{f}[r_2 (q^{2(\tau - \phi)})^{(1)} \gamma(\alpha)^{(1)}] \tilde{f}[r_2 (q^{2(\tau - \phi)})^{(2)} \gamma(\alpha)^{(2)}], \quad (53)
\end{align}
\[
[e[r_1], f[r_2]] = \sum_{s \in S} \text{res}_s \left\{ \frac{1}{\hbar} (r_1 r_2)(z) q^{(z^2 + U)\hbar(z)} \omega_z \right\}
\]  \hspace{1cm} (54)

\[
[\tilde{D}, \hbar[r]] = \hbar[\partial r],
\]  \hspace{1cm} (55)

\[
[\tilde{D}, \tilde{x}^\pm[r]] = \tilde{x}^\pm[\partial r] + \frac{\hbar}{2} \sum_{i \in \mathbb{N}} \hbar[e^i] \tilde{x}^\pm[(Ae_i)r]
\]  \hspace{1cm} (56)

for \( x = e, f, h; \) \( x^\pm = e, f; \) \( \alpha, r_i \in R, \) \( \alpha_i \) scalars, \( i = 1, 2; \) \( \hbar(z) = \sum_{i \in \mathbb{N}} \hbar[e^i] e_i(z); \)

\[
\gamma(\alpha) = (\alpha \otimes 1 - 1 \otimes \alpha) a_0 \in R \otimes R
\]

for \( \alpha \in R. \)

**Notation.** For \( \xi \in R \otimes R, \) \( \xi = \sum_i \xi_i \otimes \xi'_i, \) and \( a, b \in R, \) we denote \( \sum_i \tilde{x}[a\xi_i] \tilde{x}[b\xi'_i] \) as \( \tilde{x}[a^1] \tilde{x}[b^2]. \) The operator \( A \) arising in (16) has been defined in (15). Note that the sums arising in (56) have only finite non-zero terms, since \( U \) has the property that for any sequence \( (\xi_i) \) with \( \xi_i \to 0, \) \( U \xi_i \) is zero for \( i \) large enough, and both sequences \( e_i, \partial e_i \) tend to zero; and on the other hand, \( (\partial e_i)_R = 0 \) for \( i \) large enough.

**Remark 10.** On relations (52) and (53). The complicated-looking formulas (52) and (53) are simply obtained by pairing the vertex relations (25) and (26), for \( \alpha \in R, \) with an element of \( R \otimes R. \)

**Remark 11.** Generating series for relations (52), (53) and (54). Let us introduce the generating series

\[
\tilde{e}(z) = \sum_{i \in \mathbb{N}} \tilde{e}[e^i] e_i(z), \quad \tilde{f}(z) = \sum_{i \in \mathbb{N}} \tilde{f}[e^i] e_i(z).
\]

Relations (52) and (53) can then be obtained as Fourier modes of

\[
( [\alpha(z) - \alpha(w) + \psi_- (z, w) \gamma(\alpha)(z, w)] \tilde{e}(z) \tilde{e}(w) )_{\Lambda, \Lambda}
\]  \hspace{1cm} (57)

\[
= \left( q^{2(\gamma(z, w) - \gamma(w, z))} [\alpha(z) - \alpha(w) + \psi_+ (z, w) \gamma(\alpha)(z, w)] \tilde{e}(z) \tilde{e}(w) \right)_{\Lambda, \Lambda}, \quad \forall \alpha \in R,
\]

and

\[
\left( q^{2(\gamma(z, w) - \gamma(w, z))} [\alpha(z) - \alpha(w) + \psi_+ (z, w) \gamma(\alpha)(z, w)] \tilde{f}(z) \tilde{f}(w) \right)_{\Lambda, \Lambda}
\]  \hspace{1cm} (58)

\[
= \left( [\alpha(z) - \alpha(w) + \psi_- (z, w) \gamma(\alpha)(z, w)] \tilde{f}(z) \tilde{f}(w) \right)_{\Lambda, \Lambda}, \quad \forall \alpha \in R,
\]

where the index \( \Lambda, \Lambda \) has the following meaning: for any vector space \( V \) and \( \xi \in V \otimes (k \otimes k) \) (with \( k \otimes k = \lim_N k/k_N \otimes k/k_N), \) \( \xi_{\Lambda, \Lambda} = (id_V \otimes pr_\Lambda \otimes pr_\Lambda) \xi, \) where
pr_{\Lambda} denote the projection on the second summand of \( k = R \oplus \Lambda \). In terms of these generating series, the relations (54) take the form

\[
[\tilde{e}(z), \tilde{f}(w)] = \left( \frac{1}{\hbar} q^{((T+U)\tilde{h})(z)} \delta(z, w) \right)_{\Lambda, \Lambda},
\]  

which can be rewritten as

\[
[\tilde{e}(z), \tilde{f}(w)] = \sum_{i \in \mathbb{N}} \left( \frac{1}{\hbar} q^{((T+U)\tilde{h})(z)} e^{i}(z) \right)_i e_i(w) = \sum_{i \in \mathbb{N}} \left( \frac{1}{\hbar} q^{((T+U)\tilde{h})(w)} e^{i}(w) \right)_i e_i(z)
\]

or in “mixed” form

\[
[\tilde{e}(z), \tilde{f}[r]] = [\tilde{e}[r], \tilde{f}(z)] = \left( \frac{1}{\hbar} q^{((T+U)\tilde{h})(z)} r(z) \right)_r,
\]

for any \( r \in R \). \( \square \)

4.2. PBW result for \( \mathfrak{u}_h \mathfrak{g}_R \) and inclusion in \( \mathfrak{u}_h \mathfrak{g} \). Let \( \mathcal{B}^+_R \) be the algebra with generators \( e''[r], r \in R \), and relations (49), with \( \tilde{e} \) replaced by \( e'' \), and (52), with \( \tilde{e} \) replaced by \( e'' \); let \( \mathcal{B}^-_R \) be the algebra with generators \( f''[r], r \in R \), and relations (49), with \( \tilde{x} \) replaced by \( f'' \), and (53), with \( \tilde{f} \) replaced by \( f'' \); and let \( \mathcal{B}^0_R \) be the algebra with generators \( D'', h''[r], r \in R \), and relations (50), (55), with \( \tilde{D}, \tilde{h} \) replaced by \( D'', h'' \).

**Lemma 4.1.** 1) There are injective algebra morphisms \( i^{\pm}, i^0 \) from \( \mathcal{B}^+_R, \mathcal{B}^-_R, \mathcal{B}^0_R \) to \( \mathcal{B}^+_R, \mathcal{B}^0_R \) respectively, sending each \( e''[r] \) to \( e''[r] \), and \( D'' \) to \( D'' \), \( x = e, f, h, r \in R \).

2) Topological bases of \( \mathcal{B}^+_R, \mathcal{B}^0_R \) are given by the

\[
(e''[e^{i_1}]^{\alpha_1} \ldots e''[e^{i_p}]^{\alpha_p})_{i_1 < \ldots < i_p, \alpha \geq 1}, \quad (f''[e^{i_1}]^{\alpha_1} \ldots f''[e^{i_p}]^{\alpha_p})_{i_1 < \ldots < i_p, \alpha \geq 1},
\]

and \( (h''[e^{i_1}]^{\alpha_1} \ldots h''[e^{i_p}]^{\alpha_p} D^{s})_{i_1 < \ldots < i_p, \alpha \geq 1, s \geq 0} \).

**Proof.** 1) (25) [resp. (26)] with \( e \) (resp. \( f \)) replaced by \( e' \) (resp. \( f' \)), are relations of \( \mathcal{B}^+ \) (resp. of \( \mathcal{B}^- \)). Pair them with \( r_1(z) r_2(w) \). We obtain relations (52), (53), with \( e', f' \) instead of \( \tilde{e}, \tilde{f} \). This shows that the maps \( x''[r] \mapsto x'[r], x = e, f \) extend to morphisms from \( \mathcal{B}^+_R \) to \( \mathcal{B}^+ \). The statement on the map \( h''[r] \mapsto h'[r], D'' \mapsto D' \) is evident.

2) The case of \( \mathcal{B}^0_R \) is obvious. Let us treat \( \mathcal{B}^+_R \). From relations (52) follows

\[
[e''[r_0 \alpha], e''[r_1 \alpha]] - [e''[r_0], e''[\alpha r_1]] \in h \mathcal{B}^+_R,
\]  

for any \( r_0, r_1, \alpha \in R \). We then get, setting \( r_0 = 1 \) in (60),

\[
[e''[\alpha], e''[\beta]] \in [e''[1], e''[\alpha \beta]] + h \mathcal{B}^+_R,
\]

on the other hand, setting \( r_0 = r_1 = 1 \) in (60), we find that

\[
2[e''[\alpha], e''[1]] \in h \mathcal{B}^+_R
\]
so that any commutator \([e''[\alpha], e''[\beta]]\) is in \(hB_+^\perp\). This shows that any monomial can be transformed into a combination of the \(e''[e_{i_1}]^{\alpha_1} \ldots e''[e_{i_p}]^{\alpha_p}\), with \(i_1 < \ldots < i_p\), and \(\alpha_i \geq 1\).

Suppose now that some combination \(\sum_{i \geq 0} h^i \sum_{i_1 < \ldots < i_p, \alpha_i \geq 1} a_{i_j, \alpha_j} e''[e^{i_1}]^{\alpha_1} \ldots e''[e^{i_p}]^{\alpha_p}\) is zero (where for each \(i\), the second sum is a finite one). Applying \(i^+\) to this identity, we obtain the identity in \(B^+\)

\[
\sum_{i \geq 0} h^i \sum_{i_1 < \ldots < i_p, \alpha_i \geq 1} a_{i_j, \alpha_j} e''[e^{i_1}]^{\alpha_1} \ldots e''[e^{i_p}]^{\alpha_p} = 0,
\]

which implies that all \(a_{i_j, \alpha_j}\) are zero due to Lemma 3.3. This shows that \(e''[e^{i_1}]^{\alpha_1} \ldots e''[e^{i_p}]^{\alpha_p}\) is topologically free in \(B^+_R\). Part 2 of the lemma follows for \(B^-_R\). The case of \(B^-_R\) is similar.

**Lemma 4.2.** There are injective algebra morphisms from \(B^+_R\) and \(B^0_R\) to \(U_{\hbar}\mathcal{G}_R\), sending each \(x''[r]\) to \(\bar{x}[r]\), and \(D''\) to \(\bar{D}\), \(x = e, f, h, r \in R\). The composition of the tensor product of these morphisms, with the multiplication of \(U_{\hbar}\mathcal{G}_R\), induces a linear isomorphism \(i_{\mathcal{G}R} : B^+_R \otimes B^0_R \otimes B^-_R \to U_{\hbar}\mathcal{G}_R\).

**Proof.** Let \(U_{\hbar}\mathcal{G}'_R\) be the algebra with the same generators (without \(\bar{D}\)) and relations as \(U_{\hbar}\mathcal{G}_R\). We can prove by direct computation that the r.h.s. of relations (55), (56) define derivations of this algebra.

The proof of the lemma is then identical to that of Lemma 3.2. \(\square\)

**Proposition 4.1.** The map sending each \(\bar{x}[r]\) to \(x[r]\), \(x = e, f, h, r \in R\), and \(\bar{D}\) to \(D\), extends to an injective algebra morphism from \(U_{\hbar}\mathcal{G}_R\) to \(U_{\hbar}\mathcal{G}\).

**Proof.** Let us first show that this map extends to an algebra morphism for \(U_{\hbar}\mathcal{G}_R\) to \(U_{\hbar}\mathcal{G}\). For any \(\alpha \in R\), (25) and (26) are relations of \(U_{\hbar}\mathcal{G}\). Pairing them with \(r_1(z)r_2(w)\), \((r_1, r_2 \in R)\), we obtain relations (52), (53), with \(\bar{e}, \bar{f}\) replaced by \(e, f\). Moreover, (3) is a relation of \(U_{\hbar}\mathcal{G}\); pairing it with \(r_1(z)r_2(w)\), we obtain (50) with \(\bar{x}\) replaced by \(x\) for \(x = e, f, h\). Finally, pairing relations (14), (13) with \(r(z), r \in R\), we obtain relations (50), (53), with \(\bar{x}\) replaced by \(x\). This shows that the map \(\bar{x}[r] \mapsto x[r]\), \(\bar{D} \mapsto D\) extends to an algebra morphism from \(U_{\hbar}\mathcal{G}_R\) to \(U_{\hbar}\mathcal{G}\), that we will denote by \(i\).

We easily check that the diagram

\[
\begin{array}{ccc}
B^+_R \otimes B^0_R \otimes B^-_R & \xrightarrow{i_{\mathcal{G}R}} & U_{\hbar}\mathcal{G}_R \\
\downarrow{i^+ \otimes \mathcal{I}^0 \otimes \mathcal{I}^-} & & \downarrow{i} \\
B^+ \otimes B^0 \otimes B^- & \xrightarrow{i_{\mathcal{G}}} & U_{\hbar}\mathcal{G}
\end{array}
\]

(61)
commutes. By Lemmas (1.2) and (4.2), the horizontal arrows are vector spaces isomorphisms. From Lemma (1.1) follows that the left vertical arrow is injective. It follows that \( \iota \) is also injective.

\[ \square \]

4.3. Dependence of \( U_{h\mathfrak{g}_R} \) in \( \tau \) and \( \Lambda \). In [10] we showed that the various algebras \( U_{h\mathfrak{g}} \), associated to different choices of \( \Lambda \) and \( \tau \), are all isomorphic. We are now going to show that the same is true for their subalgebras \( U_{h\mathfrak{g}_R} \). We will denote with a superscript \((\Lambda, \tau)\) the objects associated with a choice \((\Lambda, \tau)\).

We will study two families of changes of the pair \((\Lambda, \tau)\), that will generate all possible changes. The first is to change \((\Lambda, \tau)\) into \((\Lambda', \tau')\), where \( v = \tau' - \tau \) is an arbitrary antisymmetric element in \( R^2[[\hbar]] \). To it is associated the map 
\[ u : \Lambda[[\hbar]] \to R[[\hbar]] \]
defined by 
\[ u(\lambda) = \langle v, 1 \otimes \lambda \rangle_k. \]

The second family of changes is parametrized by some continuous anti-self-adjoint linear map \( r : \Lambda \to R \) (or equivalently, by some antisymmetric \( r_0 \) in \( R^2 \)). We then define a new pair \((\bar{\Lambda}, \bar{\tau})\) by the formulas 
\[ \bar{\Lambda} = (1 + r)\Lambda \text{ and } \bar{\tau} = \tau - \sum_{i \in \mathbb{N}} T(r(e_i)) \otimes e^i. \]
Recall now the results of [10].

**Proposition 4.2.** (see [10] 1) There is an isomorphism \( \iota^{\tau,\tau'} \) from \( U_{h\mathfrak{g}}^{(\Lambda,\tau')} \) to \( U_{h\mathfrak{g}}^{(\Lambda,\tau)} \), such that 
\[ \iota^{\tau,\tau'}(e^{(\Lambda,\tau)}(z)) = e^{\frac{\hbar}{2}(uh^{+(\Lambda,\tau)})(z)}e^{(\Lambda,\tau)}(z), \]
\[ \iota^{\tau,\tau'}(e^{(\Lambda,\tau')}(z)) = f^{(\Lambda,\tau)}(z)e^{\frac{\hbar}{2}(uh^{+(\Lambda,\tau')})(z)}, \]
\[ \iota^{\tau,\tau'}(h^{+(\Lambda,\tau)}(z)) = h^{+(\Lambda,\tau)}(z), \quad \iota^{\tau,\tau'}(D^{(\Lambda,\tau')}) = D^{(\Lambda,\tau)}. \]

2) There is an isomorphism \( \iota^{\Lambda,\bar{\Lambda}} \) from \( U_{h\mathfrak{g}}^{(\Lambda,\tau)} \) to \( U_{h\mathfrak{g}}^{(\bar{\Lambda},\bar{\tau})} \) such that 
\[ \iota^{\Lambda,\bar{\Lambda}}(x^{(\Lambda,\tau)}(z)) = x^{(\bar{\Lambda},\bar{\tau})}(z), \quad \iota^{\Lambda,\bar{\Lambda}}(D^{(\Lambda,\tau)}) = D^{(\bar{\Lambda},\bar{\tau})}, \]
\[ x = e, f, h^+. \]

**Proposition 4.3.** Both maps \( \iota^{\tau,\tau'} \) and \( \iota^{\Lambda,\bar{\Lambda}} \) restrict to isomorphisms of \( U_{h\mathfrak{g}_R}^{(\Lambda,\tau)} \) with \( U_{h\mathfrak{g}_R}^{(\Lambda',\tau')} \) and \( U_{h\mathfrak{g}_R}^{(\Lambda',\tau)} \). Therefore the algebras \( U_{h\mathfrak{g}_R}^{(\Lambda,\tau)} \) are isomorphic for all choices of \((\Lambda, \tau)\).

**Proof.** For \( r \in R \)
\[ \iota^{\tau,\tau'}(e^{(\Lambda,\tau)}[r]) = \sum_{s \in S} \text{res}_s \left( re^{\frac{h}{2}(uh^{+(\Lambda,\tau)})}e^{(\Lambda,\tau)} \right) \omega. \]

\[ = \sum_{s \in S} \text{res}_s \sum_{n \geq 0} \frac{1}{n!} \sum_{i_1, \ldots, i_n \in \mathbb{N}} \left( \frac{h}{2} \right)^n h^{+(\Lambda,\tau)}[e^{i_1}] \ldots h^{+(\Lambda,\tau)}[e^{i_n}](ru(e_{i_1}) \ldots u(e_{i_n})e^{(\Lambda,\tau)}(z))\omega. \]

\[ = \sum_{s \in S} \text{res}_s \sum_{n \geq 0} \frac{1}{n!} \sum_{i_1, \ldots, i_n \in \mathbb{N}} \left( \frac{h}{2} \right)^n h^{+(\Lambda,\tau)}[e^{i_1}] \ldots h^{+(\Lambda,\tau)}[e^{i_n}]e^{(\Lambda,\tau)}[r \cdot u(e_{i_1}) \ldots u(e_{i_n})] \]
so \( \iota^{\tau,\tau'}(e^{(\Lambda,\tau)}[r]) \in U_{h\mathfrak{g}_R}^{(\Lambda,\tau')} \). The proof that \( \iota^{\tau,\tau'}(f^{(\Lambda,\tau')}[r]) \in U_{h\mathfrak{g}_R}^{(\Lambda,\tau)} \) is similar and in the case of \( \iota^{\tau,\tau'}(h^{+(\Lambda,\tau')}[r]) \) the analogous statement is obvious. The inverse
of \( i^{r,r'} \) is \( i^{r',r} \); in particular, \( i^{r,r'} \) is bijective. It is also an algebra morphism by Prop. [4.2]. This shows 1). The proof of 2) is obvious. \( \square \)

**Remark 12.** There is another isomorphism \( \bar{i}^{r,r'} \) from \( U_{h\mathfrak{g}}^{(\Lambda,\tau)} \) to \( U_{h\mathfrak{g}}^{(\Lambda,r')} \), such that

\[
\bar{i}^{r,r'}(e^{(\Lambda,\tau)}(z)) = e^{(uh^+)}(z)e^{(\Lambda,\tau)}(z), \quad \bar{i}^{r,r'}(\hat{e}^{(\Lambda,\tau)}(z)) = \tilde{f}^{(\Lambda,\tau)}(z)e^{(uh^+)}(z),
\]

\[
\bar{i}^{r,r'}(h^{+(\Lambda,\tau)}(z)) = h^{+(\Lambda,\tau)}(z), \quad \bar{i}^{r,r'}(D^{(\Lambda,\tau)}) = D^{(\Lambda,\tau)}.
\]

It is easy to see that it also yields an isomorphism from \( U_{h\mathfrak{g}}^{(\Lambda,\tau)} \) to \( U_{h\mathfrak{g}}^{(\Lambda,r')} \).

**4.4.** \( U_{h\mathfrak{g}_{\bar{R}}} \) and \( \Delta, \bar{\Delta} \). Let us define \( U_{h\mathfrak{g}_{\bar{R}}} \otimes U_{h\mathfrak{g}} \), resp. \( U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}_{\bar{R}}} \), as the quotients of \( T(\bar{\mathfrak{g}}_{\bar{R}} \oplus \mathfrak{g})[[h]] \), resp. \( T(\mathfrak{g} \oplus \mathfrak{g}_{\bar{R}})[[h]] \) by the usual relations. These are complete subalgebras of \( U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}} \).

**Proposition 4.4.**

\[
\Delta(U_{h\mathfrak{g}_{\bar{R}}}) \subset U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}_{\bar{R}}}, \quad \bar{\Delta}(U_{h\mathfrak{g}_{\bar{R}}}) \subset U_{h\mathfrak{g}_{\bar{R}}} \hat{\otimes} U_{h\mathfrak{g}}.
\]

**Proof.** It is enough to check these statements for the generators of \( U_{h\mathfrak{g}_{\bar{R}}} \). They are obvious for \( D \) and \( h^{+[r]} \). Moreover,

\[
\Delta(e[r]) = \sum_{s \in S} \text{res}_s \left( e(z) \otimes q^{(T+U)h^+(z)}r(z)\omega_z \right) + 1 \otimes e[r];
\]

the first term of the r.h.s. of this equality can be decomposed as a sum of terms, the second factors of which all lie in the algebra generated by the \( h^{+[r']}, r' \in R \).

We also have

\[
\Delta(f[r]) = f[r] \otimes 1 + \sum_{s \in S} \text{res}_s \left( q^{-h^-(z)} \otimes (q^{-K_1 \partial} f)(z) \right) r(z)\omega_z
\]

\[
= f[r] \otimes 1 + \sum_{s \in S} \sum_{p \geq 0} \sum_{i_1, \ldots, i_p \in \mathbb{N}} \frac{(-h)^p}{p!} h^{-[e_{i_1}]} \ldots h^{-[e_{i_p}]} e^{i_1}(z) \ldots e^{i_p}(z)
\]

\[
\otimes (q^{-K_1 \partial} f)(z) \right) r(z)\omega_z
\]

\[
= f[r] \otimes 1 + \sum_{p \geq 0} \sum_{i_1, \ldots, i_p \in \mathbb{N}} \frac{(-h)^p}{p!} h^{-[e_{i_1}]} \ldots h^{-[e_{i_p}]} \hat{f}[q^{K_1 \partial} (e^{i_1} \ldots e^{i_p})].
\]

All \( f[\partial^p(e^{i_1} \ldots e^{i_p})] \) belong to \( U_{h\mathfrak{g}_{\bar{R}}} \). This ends the proof of the proposition in the case of \( \Delta \).

In the case of \( \bar{\Delta} \), the proof is similar. \( \square \)
5. \( F \), universal \( R \)-matrices and Hopf algebra pairings

In what follows, we will denote by \( U_n \) the algebras \( B^\pm \).

Recall that the Hopf algebras \((U_n^+, \Delta)\) and \((U_n^-, \Delta')\), as well as \((U_n^+, \bar{\Delta})\) and \((U_n^-, \bar{\Delta}')\), are dual. Denote by \( \langle \cdot, \cdot \rangle_U \) and \( \langle \cdot, \cdot \rangle_{U^\Delta} \) the corresponding bilinear forms. They are defined by the formulas

\[
\langle h^+[r], h^-[\lambda] \rangle_U = \frac{2}{\hbar} \langle r, \lambda \rangle_k, \quad \langle e[\epsilon], f[\eta] \rangle_U = \frac{1}{\hbar} \langle \epsilon, \eta \rangle_k, \tag{62}
\]

for \( \epsilon, \eta \in k, r \in R, \lambda \in \Lambda \),

\[
\langle D, K \rangle_U = 1, \quad \langle D, a(k) \rangle_U = \langle a(k), K \rangle_U = 0,
\]

and

\[
\langle h^+[r], h^-[\lambda] \rangle_U = \frac{2}{\hbar} \langle r, \lambda \rangle_k, \quad \langle f[\epsilon], e[\eta] \rangle_{U^\Delta} = \frac{1}{\hbar} \langle \epsilon, \eta \rangle_k, \tag{63}
\]

for \( \epsilon, \eta \in k, r \in R, \lambda \in \Lambda \),

\[
\langle D, K \rangle_{U^\Delta} = 1, \quad \langle D, a(k) \rangle_{U^\Delta} = \langle a(k), K \rangle_{U^\Delta} = 0.
\]

From the Hopf algebra pairing rules follows immediately

**Lemma 5.1.** Let \( U_n^R \) be the subalgebra of \( U_n \) generated by \( D \) and the \( h^+[r], r \) in \( R \), and let \( U_n^\Lambda \) be the subalgebra of \( U_n \) generated by \( K \) and the \( h^+[\lambda], \lambda \) in \( \Lambda \).

For any \( x^\pm \) in \( U_n^\pm \) and \( t_R, t_\Lambda \) in \( U_n^R \) and \( U_n^\Lambda \), we have

\[
\langle t_R x^+, t_\Lambda x^- \rangle_{U_n^\Delta} = \varepsilon(t_R) \varepsilon(t_\Lambda) \langle x^+, x^- \rangle_{U_n^\Delta}, \tag{64}
\]

and

\[
\langle x^- t_R, x^+ t_\Lambda \rangle_{U_n^\Delta} = \varepsilon(t_R) \varepsilon(t_\Lambda) \langle x^-, x^+ \rangle_{U_n^\Delta}. \tag{65}
\]

Then:

**Proposition 5.1.** The restrictions to \( U_n^+ \times U_n^- \) and \( U_n^- \times U_n^+ \) of the pairings \( \langle \cdot, \cdot \rangle_U \) and \( \langle \cdot, \cdot \rangle_{U^\Delta} \) coincide up to permutation.

**Proof.** Fix \( \epsilon_i, \eta_j \) in \( k, i = 1, \ldots, n, j = 1, \ldots, m \). Let us compute

\[
\langle \prod_{i=1}^n e[\epsilon_i], \prod_{j=1}^m f[\eta_j] \rangle_{U_n^\Delta}
\]

(we denote by \( \prod_{i \in I} x_i \) the product \( x_{i_1} \cdots x_{i_p} \), where \( I \) is a set of integers \( \{i_0\} \) with \( i_1 < i_2 < \ldots \)). It is clear that this is zero if \( n \) is not equal to \( m \). Assume that \( n = m \), then let us compute the generating series \( \langle \prod_{i=1}^n e[\epsilon_i], \prod_{j=1}^m f[\eta_j] \rangle_{U_n^\Delta} \).
By the Hopf algebra pairing rules, it is equal to
\[
\sum_{\sigma \in S_n} \langle \otimes_{i=1}^n e[\epsilon_i], \otimes_{i=1}^n \{ \prod_{l=1}^{\sigma^{-1}(i)} q^{-h-(z_l)} \} \rangle_{U_{\mathfrak{g}} \otimes^n}.
\]
(66)

Set
\[
q(z, w) = q^{2 \sum_i ((T+U)e_i)(z)e_i(w)}.
\]
(67)

We have \(q^{-h(w)} f(z) q^{-h(w)} = q(z, w)^{-1} f(z)\). Using this equality and (64), we identify (66) with
\[
\sum_{\sigma \in S_n} \langle \otimes_{i=1}^n e[\epsilon_i], \otimes_{i=1}^n f(z_{\sigma^{-1}(i)}) \rangle_{U_{\mathfrak{g}} \otimes^n} \prod_{l<\sigma(l)>} q(z_l, z_l)^{-1}
\]
\[
= \sum_{\sigma \in S_n} \prod_{i=1}^n \epsilon_{\sigma(i)}(z_i) \prod_{l<\sigma(l)>} q(z_l, z_l)^{-1};
\]
each term of this sum belongs to \(\mathbb{C}((z_1))((z_2)) \cdots ((z_n))\). Therefore
\[
\langle \prod_{i=1}^n e[\epsilon_i], \prod_{i=1}^n f[\eta_i] \rangle_{U_{\mathfrak{g}} \otimes^n}
\]
(68)
\[
= \sum_{\sigma \in S_n} \text{res}_{z_{\alpha}} \cdots \text{res}_{z_{\alpha_1}} \sum_{\sigma \in S_n} \prod_{i=1}^n \epsilon_{\sigma(i)}(z_i) \prod_{i=1}^n \eta_i(z_i) \prod_{l<\sigma(l)>} q(z_l, z_l)^{-1} \omega_{z_1} \cdots \omega_{z_n},
\]
where \(\text{res}_{z_{\alpha}} \cdots \text{res}_{z_{\alpha_1}}\) means \(\sum_{s \in S} \text{res}_{s, \alpha_1} \cdots \text{res}_{s, \alpha_1} \).

In the case of \(U_{\mathfrak{h}} \otimes U_{\mathfrak{g}}\), one can lead the similar computation for
\[
\langle \prod_{i=1}^n f[\eta_i], \prod_{i=1}^n e[\epsilon_i] \rangle_{U_{\mathfrak{h}} \otimes U_{\mathfrak{g}}}.
\]
In that case one uses the identity \((K^+(z), f(w)) = q(z, w)^{-1}\), with \(q(z, w)\) defined by (67); the result is the r.h.s. of (68). \(\square\)

Let us define the completion \(U_{\mathfrak{h}} \otimes U_{\mathfrak{g}}\) as follows. Let \(I_N \subset U_{\mathfrak{g}}\) be the left ideal generated by the \(x[e], e \in \prod_{s \in S} z_s^N \mathbb{C}[[z_s]]\). Define \(U_{\mathfrak{h}} \otimes U_{\mathfrak{g}}\) as the inverse limit of the \(U_{\mathfrak{g}} \otimes I_N \otimes U_{\mathfrak{g}} + U_{\mathfrak{h}} \otimes I_N\) (where the tensor products are \(h\)-adically completed). \(U_{\mathfrak{h}} \otimes U_{\mathfrak{g}}\) is clearly a completion of \(U_{\mathfrak{g}} \otimes^n\). One defines similarly \(U_{\mathfrak{h}} \otimes^n\).

**Definition 5.1.** Let \((\alpha_i), (\alpha_i)\) be dual bases of \(U_{\mathfrak{h}} \mathfrak{n}_+\) and \(U_{\mathfrak{h}} \mathfrak{n}_-\). We set
\[
F = \sum_i \alpha_i \otimes \alpha_i.
\]
(69)
From (68) follows that $F$ belongs to $U_h\mathfrak{g} \otimes U_h\mathfrak{g}$.

By (62), we also have
\[
F \in 1 + \hbar \sum_i e[\epsilon^i] \otimes f[\epsilon_i] + \sum_{j \geq 2} U_h n^{[j]}_+ \otimes U_h n^{[j]}_-, \tag{70}
\]
where $U_h n^{[j]}_\pm$ are the degree $j$ homogeneous components of $U_h n_\pm$ (where the $e[\epsilon]$ and $f[\epsilon]$ are given homogeneous degree 1).

**Proposition 5.2.** Set $q = e^\hbar$ and
\[
\mathcal{R} = q^{D \otimes K} \exp \left( \frac{\hbar}{2} \sum_i h^+[\epsilon^i] \otimes h^-[\epsilon_i] \right) F,
\]
and
\[
\bar{\mathcal{R}} = F^{(21)} q^{D \otimes K} \exp \left( \frac{\hbar}{2} \sum_i h^+[\epsilon^i] \otimes h^-[\epsilon_i] \right);
\]
then $\mathcal{R}$ and $\bar{\mathcal{R}}$ are the universal $R$-matrices of $(U_h\mathfrak{g}, \Delta)$ and $(U_h\mathfrak{g}_-, \bar{\Delta})$ (viewed as the doubles of $(U_h\mathfrak{g}_+, \Delta)$ and $(U_h\mathfrak{g}^+_+, \bar{\Delta})$), respectively.

**Proof.** These statements are equivalent to the following ones:
\[
\langle id \otimes b_+, \mathcal{R} \rangle_{U_h\mathfrak{g}} = b_+, \quad \langle \mathcal{R}, b_- \otimes id \rangle_{U_h\mathfrak{g}} = b_-,
\]
for $b_\pm \in U_h\mathfrak{g}_\pm$, and
\[
\langle id \otimes \bar{b}_+, \bar{\mathcal{R}} \rangle_{U_h\mathfrak{g}} = \bar{b}_+, \quad \langle \bar{\mathcal{R}}, \bar{b}_- \otimes id \rangle_{U_h\mathfrak{g}} = \bar{b}_-,
\]
for $\bar{b}_\pm \in U_h\mathfrak{g}_\pm$. (Here and later, we will set $\langle id \otimes a, b \otimes c \rangle = \langle a, c \rangle b$, $\langle a \otimes id, b \otimes c \rangle = \langle a, b \rangle c$, etc.) Let us show the first statement.

Assume that $b_\pm$ has the form $t_R x_+$, with $t_R \in U_h \mathfrak{h}_R$ and $x_+ \in U_h n_+$. Set $K = q^{D \otimes K} \exp \left( \frac{\hbar}{2} \sum_i h^+[\epsilon^i] \otimes h^-[\epsilon_i] \right)$; and set $K = \sum_j K_j \otimes K'_j$. Then
\[
\langle id \otimes b_+, \mathcal{R} \rangle_{U_h\mathfrak{g}} = \sum_{j,i} K_j \alpha^i \langle b_+, K'_j \alpha_i \rangle_{U_h\mathfrak{g}}.
\]

Now set $\Delta(b_+) = \sum b_+^{[1]} \otimes b_+^{(2)}$; we have $\langle b_+, K'_j \alpha_i \rangle_{U_h\mathfrak{g}} = \sum \langle b_+^{[1]}, K'_j \rangle_{U_h\mathfrak{g}} \langle b_+^{(2)}, \alpha_i \rangle_{U_h\mathfrak{g}}$. Only the part of $\Delta(b_+)$ whose first factors are of degree zero contribute to this sum. This part is equal to $\Delta(t_R)(1 \otimes x_+)$. Therefore, if $\Delta(t_R) = \sum t_R^{(1)} \otimes t_R^{(2)}$, we have
\[
\langle id \otimes b_+, \mathcal{R} \rangle_{U_h\mathfrak{g}} = \sum_{j,i} K_j \alpha^i \sum \langle t_R^{(1)}, K'_j \rangle_{U_h\mathfrak{g}} \langle t_R^{(2)}, x_+, \alpha_i \rangle_{U_h\mathfrak{g}};
\]
by (74), this is equal to
\[
\sum_{j,i} K_j \alpha^i \sum \langle t_R, K'_j \rangle_{U_h\mathfrak{g}} \langle x_+, \alpha_i \rangle_{U_h\mathfrak{g}} = \sum_j K_j \langle t_R, K'_j \rangle_{U_h\mathfrak{g}}.
\]

One easily checks that $\sum_j K_j \langle t_R, K'_j \rangle_{U_h\mathfrak{g}} = t_R$. Therefore, the last sum is equal to $b_+$. 

\[\]
The proof of the other statements is similar.

**Lemma 5.2.** $\mathcal{K}$ satisfies the cocycle identity
\[
\mathcal{K}^{12}(\bar{\Delta} \otimes 1)(\mathcal{K}) = \mathcal{K}^{23}(1 \otimes \bar{\Delta})(\mathcal{K}).
\]

*Proof.* $(B^0, \bar{\Delta})$ is a Hopf subalgebra of $(U_\hbar g, \bar{\Delta})$. It is easy to check that $(U_\hbar h_R, \Delta)$ and $(U_\hbar h_A, \Delta')$ are dual Hopf algebra, and that the double of $(U_\hbar h_R, \Delta)$ is $(B^0, \bar{\Delta})$. Moreover, $\mathcal{K}$ represents the identity pairing between these algebras. The identities of the Lemma are then consequences of the quasi-triangular identities.

**Lemma 5.3.** $\mathcal{K}$ conjugates the coproducts $\bar{\Delta}$ and $\Delta'$, that is
\[
\Delta'(x) = \mathcal{K}\Delta(x)\mathcal{K}^{-1}
\]
for any $x$ in $U_\hbar g$.

*Proof.* Let us first prove this identity for $x$ in $B^0$. The $R$-matrix identity for $(B^0, \bar{\Delta})$ says that $\bar{\Delta}'(x) = \mathcal{K}\bar{\Delta}(x)\mathcal{K}^{-1}$ for $x$ in $B^0$. On the other hand, the restrictions of $\Delta$ and $\bar{\Delta}$ to $B^0$ coincide. This proves (71) in this case.

Let us now treat the case where $x = e(z)$. Set $\mathcal{K}_0 = \exp(h \sum_i h^+[e^i] \otimes h^-[e_i])$ and $\mathcal{K}_D = q^{D \otimes \mathcal{K}}$. Then $\mathcal{K} = \mathcal{K}_D\mathcal{K}_0$.

We have $\bar{\Delta}(z) = (e \otimes q^{-h^-})(q^{K_{2\partial}z}) + 1 \otimes e(z)$. Then we have
\[
\sum_i h^+[e^i] \otimes h^-[e_i], 1 \otimes e(z) = (T + U)(h^+(q^{K_{2\partial}z}))_\Lambda \otimes e(z),
\]
so that
\[
\mathcal{K}_0(1 \otimes e(z))\mathcal{K}_0^{-1} = \exp(h \sum_i h^+[e^i]((T + U)(q^{K_{2\partial}e_i}))_\Lambda(z)) \otimes e(z),
\]
and
\[
\mathcal{K}_D\mathcal{K}_0(1 \otimes e(z))\mathcal{K}_0^{-1}\mathcal{K}_D^{-1} = \exp(h \sum_i h^+[e^i]((T + U)(q^{K_{2\partial}e_i}))_\Lambda(z)) \otimes e(z)
\]
\[
= \exp(h \sum_i h^+[e^i](T + U)e_i(z)) \otimes e(z)
\]
\[
= q^{(T+U)h^+}(z) \otimes e(z).
\]

On the other hand,
\[
\mathcal{K}_0(e(z) \otimes 1)\mathcal{K}_0^{-1} = e(z) \otimes q^{h^-}(z),
\]
and
\[
[h^-[e_i], h^-(z)] = \frac{2}{h} ((q^{-K_{2\partial}}(T(q^{K_{2\partial}e_i})_R))(z) + Ue_i(z) - (q^{-K_{2\partial}}U((q^{K_{2\partial}e_i}))_\Lambda(z))).
\]
where \( \alpha \) and \( \beta \)

Finally, the product of (73) and (74) gives

On the other hand, we have

\[
\text{Lemma 5.4.} \quad \text{Enlarge the Lie algebra by adjoining to it an element } F, \text{ such that } [L, F] = f. \text{ We have in the associated formal group}
\]

\[
\alpha^{L+f} = \alpha^L \exp \left( \frac{1 - \alpha^{-\text{ad}L}}{\text{ad}L} (f) \right),
\]

where \( \alpha = e^{\hbar k} \), \( k \) scalar and \( \hbar \) a formal parameter.

\[
\text{Proof.} \quad \text{Set in (76), } \alpha = q^{K_2}, \ L = D + \partial_z \text{ and } f = -Ah^+ (z). \text{ Then we need to compute}
\]

\[
\frac{1 - q^{K_2 \text{ad}(D + \partial_z)}}{\text{ad}(D + \partial_z)} (-Ah^+ (z)).
\]
For this, we show:

**Lemma 5.5.** Let $B$ be some linear operator from $\Lambda[[h]]$ to $R[[h]]$, such that $Be_i \to 0$ when $i \to \infty$, then

1) $\text{ad}(D + \partial_z)(Bh^+(z)) = Ch^+(z)$, where $C = \partial \circ B - B \circ \text{pr}_\Lambda \circ \partial$,

2) $\text{Ad}(\alpha^{D+\partial_z})(Bh^+(z)) = Gh^+(z)$, where $G = \alpha^{\partial} \circ B \circ \text{pr}_\Lambda \circ \alpha^{-\partial}$, and $\alpha = e^{\text{hk}}$, $k$ scalar.

3) assume that $B = \partial \circ E - E \circ \text{pr}_\Lambda \circ \partial$, with $E$ a linear operator from $\Lambda[[h]]$ to $k[[h]]$, then

$$\frac{\alpha^{\text{ad}(D+\partial_z)}-1}{\text{ad}(D+\partial_z)}(Bh^+(z)) = Fh^+(z),$$

where $F = \alpha^{\partial} \circ E \circ \text{pr}_\Lambda \circ \alpha^{\partial} - E$.

**Proof.** 1) is obvious. 2) is obtained by first computing

$$\text{ad}^k(D + \partial_z)(Bh^+(z)[e^i]),$$

using 1). We again use this expression to obtain 3). \qed

Applying Lemma 5.5 with $B = A$, $E = h(T + U)$, $\alpha = q^{-K_2}$, we get

$$1 - q^{-K_2\text{ad}(D+\partial_z)} (-Ah^+)(z). = \frac{q^{-K_2\text{ad}(D+\partial_z)} - 1}{\text{ad}(D+\partial_z)}(Ah^+)(z). = Fh^+(z),$$

with $F = h(q^{-K_2\partial} \circ (T + U) \circ \text{pr}_\Lambda - (T + U))$. Therefore Lemma 5.4 gives

$$q^{K_2(D+\partial_z-Ah^+(z))} = q^{K_2(D+\partial_z)} \exp\left(1 - q^{-K_2\text{ad}(D+\partial_z)} (-Ah^+)(z)\right)$$

$$= q^{K_2(D+\partial_z)} \exp([q^{-K_2\partial} \circ h(T + U) \circ \text{pr}_\Lambda - h(T + U)]h^+(z)).$$

Finally, (76) gives

$$q^{K_2(D+\partial_z)} \exp([q^{-K_2\partial} \circ h(T + U) \circ \text{pr}_\Lambda - h(T + U)]h^+(z))e(z) = e(z)q^{K_2(D+\partial_z)},$$

so that

$$q^{-K_2D}e(z)q^{K_2D} = q^{K_2\partial_z}\{\exp([q^{-K_2\partial} \circ h(T + U) \circ \text{pr}_\Lambda - h(T + U)]h^+(z))e(z)\},$$

which coincides with the r.h.s. of (75). Therefore

$$\mathcal{K}_D\mathcal{K}_0((e \otimes q^{-h^-})(q^{K_2\partial}z))(\mathcal{K}_D\mathcal{K}_0)^{-1} = e(z) \otimes 1. \quad (77)$$

Adding up (72) and (77), we get

$$\Delta'(e(z)) = \mathcal{K}\Delta(e(z))\mathcal{K}^{-1}.$$

The proof is similar when $e(z)$ is replaced by the case of $f(z)$. \qed

**Proposition 5.3.** $F$ satisfies the cocycle identity

$$F^{12}(\Delta \otimes 1)(F) = F^{23}(1 \otimes \Delta)(F), \quad (78)$$
Proof. The quasi-triangularity identities for $\mathcal{R}$ imply that
$$\mathcal{R}^{12}(\Delta \otimes 1)(\mathcal{R}) = \mathcal{R}^{23}(1 \otimes \Delta)(\mathcal{R}).$$
Therefore, we have
$$F^{21}\mathcal{K}^{12}(\Delta \otimes 1)(F^{21})(\Delta \otimes 1)(K) = F^{32}\mathcal{K}^{23}(1 \otimes \Delta)(F^{21})(1 \otimes \Delta)(K).$$
By Lemma 5.3, it follows that
$$F^{21}(\Delta' \otimes 1)(F^{21})\mathcal{K}^{12}(\Delta \otimes 1)(K) = F^{32}(1 \otimes \Delta')(F^{21})\mathcal{K}^{23}(1 \otimes \Delta)(K).$$
Lemma 5.2 then implies that
$$F^{21}(\Delta' \otimes 1)(F^{21}) = F^{32}(1 \otimes \Delta')(F^{21}),$$
which is the same as (78), up to permutation of factors. \hfill \Box

Proposition 5.4. $\Delta$ and $\Delta$ are conjugated by $F$: we have $\Delta(z) = F\Delta(z)F^{-1}$, for any $x$ in $U_h\mathfrak{g}$.

Proof. We know that $\Delta' = \mathcal{R}\Delta\mathcal{R}^{-1}$. Since $\mathcal{R} = \mathcal{K}F$, it follows that $F\Delta F^{-1} = \mathcal{K}^{-1}\Delta'\mathcal{K}$. But by Lemma 5.3, $\mathcal{K}^{-1}\Delta'\mathcal{K}$ coincides with $\Delta$. \hfill \Box

Remark 13. It is a general principle in $R$-matrix computations (see [14]) that factors of the $R$-matrix are also twists relating quantizations of conjugated Manin triples. We see that this principle also holds in our situation. \hfill \Box

5.1. Orthogonals of $B_R^\pm$.

Proposition 5.5. 1) The orthogonal of $B_R^-$ in $B^+$ for $\langle \cdot \rangle_{U_h\mathfrak{g}}$ is the span $n_+(R)B^+$ of all $e[r]e[e_1] \ldots e[e_p]$, $p \geq 0$, $e_i \in k$, $r \in R$;

2) the orthogonal of $B_R^+$ in $B^-$ for $\langle \cdot \rangle_{U_h\mathfrak{g}}$ is the span $B^--n_-(R)$ of all
$$f[\eta_1] \ldots f[\eta_p]f[r], \quad p \geq 0, \eta_i \in k, r \in R.$$

Proof. Let us compute $\langle e[r]e[e_1] \ldots e[e_p], f[r_1] \ldots f[r_{p+1}] \rangle_{U_h\mathfrak{g}}$, $e_i \in k$, $r, r_i \in R$. Expand it as
$$\langle e[r] \otimes e[e_1] \ldots e[e_p], \Delta'(f[r_1] \ldots f[r_{p+1}]) \rangle_{U_h\mathfrak{g} \otimes 2}$$
(recall that $\Delta'$ is $\Delta$ composed with the exchange of factors). According to the proof of Prop. [14], $\Delta'(f[r_1] \ldots f[r_{p+1}])$ can be decomposed as a sum of terms, the first factors all of which are of the form $f[r'_1] \ldots f[r'_s]$, $r'_i \in R$. Since $\langle e[r], f[r'_1] \ldots f[r'_s] \rangle_{U_h\mathfrak{g}}$ is always zero (either because $s \neq 1$ of by isotropy of $R$),
$$\langle e[r]e[e_1] \ldots e[e_p], f[r_1] \ldots f[r_{p+1}] \rangle_{U_h\mathfrak{g}} = 0.$$
This shows that $n_+(R)B^+ \subset (B_R^-)^\perp$.

To show that $n_+(R)B^+ \subset (B_R^-)^\perp$, let us consider the classical limit of the situation. $B_R^\pm \subset B^\pm$ is a flat deformation of the inclusion of symmetric algebras $S^*(R) \subset S^*(k)$. On the other hand, the inclusion $n_+(R)B^+ \subset B^+$ is a flat deformation of $S^*(k)R \subset S^*(k)$. Finally, let $B_R'$ be the completion of the
span of all $x[\epsilon_1] \ldots x[\epsilon_p], \epsilon_i \in k, x = e, f$ for $i = +, -$, and multiply $\langle \cdot \rangle_{U_R\mathfrak{g}}$ by $\hbar^p$ on $B_p^+ \times B_q^-$. Then the resulting pairing is a deformation of the direct sum of the symmetric powers of the pairing $\langle \cdot \rangle_k$. Since the orthogonal of $S^*(R)$ for this pairing is $S^*(k)R$ (because $R$ is maximal isotropic, see Lemma 7.2), the orthogonal of $B_R^-$ cannot be larger than $n_+(R)B^+$. This finally shows 1).

Let us pass to the proof of 2). Let us compute

$$\langle e[r_1] \ldots e[r_{p+1}], f[\eta_1] \ldots f[\eta_p]f[r] \rangle_{U_R\mathfrak{g}}, \quad r, r_i \in R, \eta_i \in k.$$ Expand it as $\langle \Delta(e[r_1] \ldots e[r_{p+1}]), f[\eta_1] \ldots f[\eta_p] \otimes f[r] \rangle_{U_R\mathfrak{g} \otimes 2}$. From the proof of Prop. 4.4 follows that $\Delta(e[r_1] \ldots e[r_{p+1}])$ can be decomposed as a sum of terms, the second factors all of which lie in the algebra generated by the $e[r], h^+[r'], r, r' \in R$.

Further decompose each of these second factors as a sum of terms of the form

$$e[r_1'] \ldots e[r_s']h^+[\bar{r}_1] \ldots h^+[\bar{r}_t], \quad r_s', \bar{r}_i \in R.$$ The pairing of this with $f[r]$ gives

$$\langle e[r_1'] \ldots e[r_s'] \otimes h^+[\bar{r}_1] \ldots h^+[\bar{r}_t], \Delta'(f[r]) \rangle_{U_R\mathfrak{g} \otimes 2}.$$ $\Delta'(f[r])$ is equal to the sum of $1 \otimes f[r]$ and of a sum of terms, the first factors of which are either 1 or of the form $f[\rho], \rho \in R$.

Since $\langle e[r_1''] \ldots e[r_s''], f[\rho] \rangle_{U_R\mathfrak{g}} = 0$ (either by degree reasons if $s \neq 1$ or by isotropy of $R$), the only possibly non-trivial contribution is that of

$$\langle e[r_1'' \ldots e[r_s''] \otimes h^+[\bar{r}_1] \ldots h^+[\bar{r}_t], 1 \otimes f[r] \rangle_{U_R\mathfrak{g} \otimes 2};$$ but the pairing of $f[r]$ with any $h^+[\bar{r}_1] \ldots h^+[\bar{r}_t]$ is zero.

This shows that $\langle e[r_1] \ldots e[r_{p+1}], f[\eta_1] \ldots f[\eta_p]f[r] \rangle_{U_R\mathfrak{g}} = 0$, for any $r, r_i \in R, \eta_i \in k$, so that $B^+ - n_+(R) \subset (B_R^+)^\perp$.

The proof that $B^- - n_-(R)$ is actually equal to $(B_R^+)^\perp$ is similar to the argument used in the proof of 1).  

---

6. QUASI-HOPF STRUCTURES

6.1. Factorization of $F$. We now recall our aim. We would like to decompose $F$ defined in (79) as a product

$$F_2F_1, \quad \text{with} \quad F_1 \in U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}R}, \quad F_2 \in U_{h\mathfrak{g}R} \hat{\otimes} U_{h\mathfrak{g}}.$$ The interest of this decomposition lies in the following proposition.

**Proposition 6.1.** For any decomposition (79), the map $\text{Ad}(F_1) \circ \Delta$ defines an algebra morphism from $U_{h\mathfrak{g}R}$ to $U_{h\mathfrak{g}R} \hat{\otimes} U_{h\mathfrak{g}R}$ (where the tensor product is completed over $\mathbb{C}[[\hbar]]$).
Proof. Since \( \hat{\Delta} = \text{Ad}(F) \circ \Delta \), we have

\[
\text{Ad}(F_1) \circ \Delta = \text{Ad}(F_2^{-1}) \circ \hat{\Delta}.
\]

The first map sends \( U_h \mathfrak{g}_R \to U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g} \), and the second one to \( U_h \mathfrak{g}_R \hat{\otimes} U_h \mathfrak{g} \), by Prop. (4.4) and (79); so both maps send \( U_h \mathfrak{g}_R \) to \( (U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g}) = U_h \mathfrak{g}_R \hat{\otimes} U_h \mathfrak{g}_R \).

Let us now try to decompose \( F \) according to (79). Let \( (m_i) \), resp. \( (m'_i) \) be a basis of \( U_h \mathfrak{g} \) as a left, resp. right \( U_h \mathfrak{g}_R \)-module. Assume \( m_0 = m'_0 = 1 \). Due to the form of \( F_1 \) and \( F_2 \), we have decompositions

\[
F_2 = \sum_i (1 \otimes m'_j) F_2^{(j)}, \quad F_1 = \sum_i F_1^{(i)} (m_i \otimes 1), \quad F_1^{(i)}, F_2^{(j)} \in U_h \mathfrak{g}_R^{\hat{\otimes} 2}.
\]

It follows that we have

\[
F = \sum_i F_2 F_1^{(i)} (m_i \otimes 1) = \sum_j (1 \otimes m'_j) F_2^{(j)} F_1.
\]  

(80)

Let now \( \Pi \), resp. \( \Pi' \) be the left, resp. right \( U_h \mathfrak{g}_R \)-module morphisms from \( U_h \mathfrak{g} \) to \( U_h \mathfrak{g}_R \), such that \( \Pi(m_i) = 0 \) for \( i \neq 0 \), \( \Pi(1) = 1 \), and \( \Pi'(m'_i) = 0 \) for \( i \neq 0 \), \( \Pi'(1) = 1 \).

From (81) follows that we should have

\[
F_2 F_1^{(0)} = (\Pi \otimes 1) F, \quad F_2^{(0)} F_1 = (1 \otimes \Pi') F.
\]  

(81)

We may and will assume that \( m_i \), resp. \( m'_i \) contains a basis of \( \mathcal{B}^+ \) as a left \( \mathcal{B}^+_R \)-module, resp. of \( \mathcal{B}^- \) as a right \( \mathcal{B}^-_R \)-module. Then, \( \Pi \) maps \( \mathcal{B}^+ \) to \( \mathcal{B}^+_R \), and \( \Pi' \) maps \( \mathcal{B}^- \) to \( \mathcal{B}^-_R \). It follows that \( [(\Pi \otimes 1) F]^{-1} F [((1 \otimes \Pi') F]^{-1} \) belongs to \( \mathcal{B}^+ \hat{\otimes} \mathcal{B}^- \).

Equation (81) determines the possible values of \( F_1 \) and \( F_2 \), up to right, resp. left multiplication by elements of \( U_h \mathfrak{g}_R^{\hat{\otimes} 2} \).

**Proposition 6.2.** Let \( F_{11,11'} = [(\Pi \otimes 1) F]^{-1} F [(1 \otimes \Pi') F]^{-1} \); then

\[
F_{11,11'} \in U_h \mathfrak{g}_R^{\hat{\otimes} 2}.
\]  

(82)

Proof. Since \( (\Pi \otimes 1) F \in U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g} \), and \( (1 \otimes \Pi') F \in U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g}_R \), (82) is equivalent to showing that

\[
F^{-1} [(\Pi \otimes 1) F] \in \mathcal{B}^+ \hat{\otimes} \mathcal{B}^-_R, \quad [((1 \otimes \Pi') F]^{-1} \in \mathcal{B}^+_R \hat{\otimes} \mathcal{B}^-.
\]  

(83)

By Prop. (5.2) the universal \( R \)-matrices of \( U_h \mathfrak{g} \) and \( U_h \mathfrak{g} \), \( \mathcal{R} \) and \( \overline{\mathcal{R}} \) are such that \( \mathcal{R} \in (U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g}) F \), and \( \mathcal{R}^{21} \in F (U_h \mathfrak{g} \hat{\otimes} U_h \mathfrak{g}_R) \).

Since \( \Pi \), resp. \( \Pi' \) is a left, resp. right \( U_h \mathfrak{g}_R \)-module morphism, it follows that

\[
F^{-1} [(\Pi \otimes 1) F] = \mathcal{R}^{-1} [(\Pi \otimes 1) \mathcal{R}], \quad and \quad [(1 \otimes \Pi') F]^{-1} = [(1 \otimes \Pi') \overline{\mathcal{R}}^{21}] (\overline{\mathcal{R}}^{21})^{-1}.
\]  

(84)

We will need the following result.
Lemma 6.1. 1) Let $S'$ denote the skew antipode of $U_h\mathfrak{g}$, then for any $x \in \mathcal{B}^+$,
$$
\langle \mathcal{R}^{-1}, id \otimes x \rangle_{U_h\mathfrak{g}} = S'(x).
$$

2) Recall $\bar{S}$ is the antipode of $U_h\mathfrak{g}$. For any $y \in \mathcal{B}_-$, we have
$$
\langle \mathcal{R}^{-1}, id \otimes y \rangle_{U_h\mathfrak{g}} = \bar{S}(y).
$$

Proof. Since $(\Delta \otimes 1)(\mathcal{R}^{-1}) = (\mathcal{R}^{-1})(\mathcal{R}^{-1})^{13}$, $\sigma' : \mathcal{B}_+ \to U_h\mathfrak{g}_+$, $x \mapsto \langle \mathcal{R}^{-1}, id \otimes x \rangle_{U_h\mathfrak{g}}$ is an algebra morphism from $\mathcal{B}^+$ to $U_h\mathfrak{g}_+$ (that is, $U_h\mathfrak{g}_+$ with the opposite multiplication). Since $S'$ is also an algebra morphism from $\mathcal{B}^+$ to $U_h\mathfrak{g}_+$, it suffices to check that $S'$ and $\sigma'$ coincide on the generators of $\mathcal{B}^+$.

From (19) follows that
$$
\langle \mathcal{R}^{-1}, id \otimes e(z) \rangle_{U_h\mathfrak{g}} = \langle (1 - h \sum_{i \in \mathbb{Z}} e[\epsilon_i] \otimes f[\epsilon_i] + \cdots) e^{-\frac{h}{2} \sum_{j \in \mathbb{N}} h^+[\epsilon_j] \otimes h^-[\epsilon_j]} id \otimes e(z) \rangle_{U_h\mathfrak{g}}
$$
$$
= \langle (-h) \sum_{i \in \mathbb{Z}} e[\epsilon_i] \otimes f[\epsilon_i] e^{-\frac{h}{2} \sum_{j \in \mathbb{N}} h^+[\epsilon_j] \otimes h^-[\epsilon_j]} id \otimes e(z) \rangle_{U_h\mathfrak{g}}
$$
$$
= \langle (-h) \sum_{i \in \mathbb{Z}} e[\epsilon_i] f[\epsilon_i]^2 e^{-\frac{h}{2} \sum_{j \in \mathbb{N}} h^+[\epsilon_j] \otimes h^-[\epsilon_j]} id \otimes e(z) \otimes q^{((T+U)h^+)(z)} \rangle_{U_h\mathfrak{g}}
$$
$$
= -e(z) q^{-((T+U)h^+)(z)};
$$

in the r.h.s. of the first equality, the notation means that we perform the pairing of the second factors of a decomposition of $\mathcal{R}^{-1}$ with $e(z)$, so this r.h.s. belongs to $U_h\mathfrak{g}_R$; the third equality is because $e(z)$ cannot have a nontrivial pairing with a product of zero or more than two $f[\epsilon_i]$'s; in the fourth equality, we used the notation $a^{[i]}$ for $1 \oplus (i-1) \otimes a \otimes 1 \oplus (3-i)$; the last equality follows from
$$
\langle (-h) \sum_{i \in \mathbb{Z}} e[\epsilon_i] \otimes f[\epsilon_i], id \otimes e(z) \rangle_{U_h\mathfrak{g}} = -e(z),
$$

and
$$
\langle e^{-\frac{h}{2} \sum_{j \in \mathbb{N}} h^+[\epsilon_j] \otimes h^-[\epsilon_j]}, id \otimes q^{((T+U)h^+)(z)} \rangle_{U_h\mathfrak{g}} = q^{-((T+U)h^+)(z)},
$$

which follow from direct calculation. This finally shows the first part of the lemma. The proof of the second part is similar.

Let $r \in R$, $\phi \in \mathcal{B}^+$, and let us compute $\langle F^{-1}[(\Pi \otimes 1)F], id \otimes e[r] \phi \rangle_{U_h\mathfrak{g}}$. We find
$$
\langle F^{-1}[(\Pi \otimes 1)F], id \otimes e[r] \phi \rangle_{U_h\mathfrak{g}} = \langle \mathcal{R}^{-1}[(\Pi \otimes 1)\mathcal{R}], id \otimes e[r] \phi \rangle_{U_h\mathfrak{g}}
$$
$$
= \sum \langle \mathcal{R}^{-1}, id \otimes (e[r] \phi)^{(1)} \rangle_{U_h\mathfrak{g}} \Pi \langle (\mathcal{R}, id \otimes (e[r] \phi)^{(2)}) \rangle_{U_h\mathfrak{g}}
$$
$$
= S'(e[r] \phi)^{(1)} \Pi (e[r] \phi)^{(2)},
$$

where the first equality follows from (34), and the second one from the Hopf algebra pairing rules. To show the third one, we remark that $(e[r] \phi)^{(1)}$ belongs to $\mathcal{B}^+$, and apply to it Lemma 6.1. 1).
The r.h.s. of (85) is then \( \sum S'(e[r](1)\phi(1))\Pi(e[r](2)\phi(2)) \), but since \( e[r](2) \in U_\hbar\mathfrak{g}_R \) (see Prop. 4.4), and \( \Pi \) is a left \( U_\hbar\mathfrak{g}_R \)-module morphism, this is equal to

\[
\sum S'(e[r](1)\phi(1))e[r](2)\Pi(\phi(2))
\]

or

\[
\sum S'(\phi(1))S'(e[r](1))e[r](2)\Pi(\phi(2))
\]

(because \( S' \) is an algebra anti-automorphism of \( U_\hbar\mathfrak{g} \)). Since \( \sum S'(e[r](1))e[r](2) = 0 \), the r.h.s of (85) is equal to zero. By Lemma 5.1, 1), it then follows that

\[
F^{-1}[(\Pi \otimes 1)F] \in \mathcal{B}^+ \otimes \mathcal{B}^-,
\]

that is the first part of (83).

The proof of the second part of (83) is similar: let \( r \in R, \psi \in \mathcal{B}^+ \), and let us compute \( \langle [(1 \otimes \Pi')F]F^{-1}, \psi f[r] \otimes id \rangle_{U_\hbar\mathfrak{g}} \). The Hopf algebra notation employed now refers to \( U_\hbar\mathfrak{g} \).

We find

\[
\langle [(1 \otimes \Pi')F]F^{-1}, \psi f[r] \otimes id \rangle_{U_\hbar\mathfrak{g}} = \langle (1 \otimes \Pi')F \rangle F^{-1}, \psi f[r] \otimes id \rangle_{U_\hbar\mathfrak{g}} \quad (86)
\]

\[
= \langle (1 \otimes \Pi')\bar{\mathcal{R}}^{21}|(\bar{\mathcal{R}}^{21})^{-1}, \psi f[r] \otimes id \rangle_{U_\hbar\mathfrak{g}}
\]

\[
= \sum \Pi'(\langle \bar{\mathcal{R}}^{21}, (\psi f[r](1) \otimes id)_{U_\hbar\mathfrak{g}} \rangle\langle (\bar{\mathcal{R}}^{21})^{-1}, (\psi f[r](2) \otimes id)_{U_\hbar\mathfrak{g}} \rangle
\]

\[
= \sum \Pi'(\langle \psi f[r](1)S(\psi f[r](2))
\]

where the first equality follows from Prop. 5.1, the second equality follows from (84), and third one by the Hopf algebra pairing rules. To show the last one, we remark that \( (\psi f[r](2)) \) belongs to \( \mathcal{B}^- \), and apply to it Lemma 6.1, 2).

The r.h.s. of (86) is then \( \sum \Pi'(\psi(1)f[r](1)S(\psi(2)f[r](2)), \) but since \( f[r](1) \in U_\hbar \mathfrak{g}_R \) (see Lemma 4.4), and \( \Pi' \) is a right \( U_\hbar \mathfrak{g}_R \)-module morphism, this is equal to

\[
\sum \Pi'(\psi(1)f[r](1)S(\psi(2)f[r](2))
\]

or

\[
\sum \Pi'(\psi(1)f[r](1)S(\bar{f}[r](2))\bar{S}(\psi(2))
\]

(because \( \bar{S} \) is an algebra anti-automorphism of \( U_\hbar \mathfrak{g} \)). Since \( \sum f[r](1)S(\bar{f}[r](2)) = 0 \), the r.h.s of (86) is equal to zero. By Lemma 6.3, 2), it then follows that

\[
[(1 \otimes \Pi')F]F^{-1} \in \mathcal{B}_R^+ \otimes \mathcal{B}^-,
\]

that is the second part of (83).

\[ \square \]

**Proposition 6.3.** Any decomposition of \( F \) according to (79) is of the form

\[
F_2 = [(\Pi \otimes 1)F]b, \quad F_1 = a[(1 \otimes \Pi')F],
\]

with \( a, b \in U_\hbar \mathfrak{g}_R^2 \), such that \( ab = F_{\Pi,\Pi'} \).

**Proof.** Clear. \[ \square \]
Corollary 6.1. For any left $B_R^-$-module morphism $\Pi$ from $B^-$ to $B_R^-$, and any right $B_R^+$-module morphism $\Pi'$ from $B^+$ to $B_R^+$, such that $\Pi(1) = 1, \Pi'(1) = 1$, we have

$$[(\Pi \otimes 1)F]^{-1}[(\Pi \otimes 1)F] \in U_h\mathfrak{g}\mathfrak{j}_R^2,\quad [(1 \otimes \Pi')F][(1 \otimes \Pi')F]^{-1} \in U_h\mathfrak{g}\mathfrak{j}_R^2.$$

Proof. This follows from the fact that any $\Pi, \Pi'$ yield solutions to (79), and from the classification of all such solutions in Prop. 6.3.

Convention. The expansion in $h$ of $F$ is $1 + hf + o(h)$, in the notation of Lemma [1]. We may assume that $\Pi(f[e_i]) = 0, \Pi'(e[e_i]) = 0$, for all $i \in \mathbb{N}$; this implies that $(1 \otimes \Pi')F = 1 + hf_1 + o(h)$, and $(\Pi \otimes 1)F = 1 + hf_2 + o(h)$, so that $F_{\Pi,\Pi'} = 1 + o(h)$. In what follows, we will only consider solutions of (79), such that $F_1 = 1 + hf_1 + o(h)$, and $F_2 = 1 + hf_2 + o(h)$; equivalently, the $a$ and $b$ of Prop. 6.3 have the form $1 + o(h)$.

6.2. Quasi-Hopf structures on $U_h\mathfrak{g}_R$ and $U_h\mathfrak{g}$. Let us choose a solution $(F_1, F_2)$ of (79), satisfying the above requirement. Consider the algebra morphism $\Delta_R : U_h\mathfrak{g} \rightarrow U_h\mathfrak{g}\mathfrak{j}_R^2$, defined as

$$\Delta_R = \text{Ad}(F_1) \circ \Delta = \text{Ad}(F_2^{-1}) \circ \bar{\Delta};$$

define

$$\Phi = F_1^{23}(1 \otimes \Delta)(F_1)[F_1^{12}(\Delta \otimes 1)(F_1)]^{-1}.\quad (87)$$

Proposition 6.4. $\Phi$ belongs to $U_h\mathfrak{g}\mathfrak{j}_R^3$, and even to $B_R^+ \otimes U_h\mathfrak{g}_R \otimes B_R^-$.

Proof. (88) makes it clear that $\Phi$ belongs to $U_h\mathfrak{g}\mathfrak{j}_R^2 \hat{\otimes} U_h\mathfrak{g}_R$. It can be rewritten as

$$\Phi = (F_2^{-1})^{23}(1 \otimes \bar{\Delta})(F_2^{-1})[(F_2^{-1})^{12}(\bar{\Delta} \otimes 1)(F_2^{-1})]^{-1};$$

it follows that $\Phi \in U_h\mathfrak{g}\mathfrak{j}_R \hat{\otimes} U_h\mathfrak{g}\mathfrak{j}_R^2$. Finally, $\Phi$ can also be written as

$$\Phi = [(1 \otimes \Delta_R)F_1](F_2^{-1})^{23}(1 \otimes \bar{\Delta})(F^{-1})(\Delta \otimes 1)(F_2)(F_1^{-1})^{12}.$$

But $(\Delta \otimes 1)(F^{-1})$ belongs to $U_h\mathfrak{n}_+ \otimes U_h\mathfrak{g}_+ \otimes U_h\mathfrak{n}_-$, by Prop. 4.4. Therefore, $\Phi$ belongs to $U_h\mathfrak{g} \otimes (U_h\mathfrak{g}_RU_h\mathfrak{g}_+U_h\mathfrak{g}_R) \otimes U_h\mathfrak{g}$.

$\Phi$ can again be rewritten as

$$\Phi = F^{-1(23)}(1 \otimes \bar{\Delta})(F_1)(1 \otimes \bar{\Delta})(F^{-1})F^{(12)}(\Delta \otimes 1)(F_2)F_1^{-1(12)}.$$

Prop. 4.4 now implies that $(1 \otimes \bar{\Delta})(F_1)$ belongs to $U_h\mathfrak{g} \otimes U_h\mathfrak{g}_- \otimes U_h\mathfrak{g}$. Therefore, $\Phi$ belongs to $U_h\mathfrak{g} \otimes (U_h\mathfrak{g}_RU_h\mathfrak{g}_-U_h\mathfrak{g}_R) \otimes U_h\mathfrak{g}$.

By the PBW results of sect. 5.3, the intersection of $U_h\mathfrak{g}_RU_h\mathfrak{g}_+U_h\mathfrak{g}_R$ and $U_h\mathfrak{g}_RU_h\mathfrak{g}_-U_h\mathfrak{g}_R$ is reduced to $U_h\mathfrak{g}_R$. Therefore, $\Phi$ belongs to $U_h\mathfrak{g} \otimes U_h\mathfrak{g}_R \otimes U_h\mathfrak{g}$.

Let

$$u_R = m(1 \otimes S)(F_1),\quad (89)$$

with $m$ the multiplication of $U_h\mathfrak{g}$.
Theorem 6.1. The algebra $U_{h\mathfrak{g}}$, endowed with the coproduct $\Delta_R$, associator $\Phi$, counit $\varepsilon$, antipode $S_R = \text{Ad}(u_R) \circ S$, respectively defined in (87), (88), (22), (23), (24), (89), and $R$-matrix

$$\mathcal{R}_R = [a^{21}(\Pi' \otimes 1)(F^{21})]q^{D \otimes K} \frac{1}{2} \sum_{e \in \pi} h^+[e] \otimes h^-[e] ([\Pi \otimes 1](F) F_{12} a^{-1}],$$

is a quasi-triangular quasi-Hopf algebra. $U_{h\mathfrak{g}}$ is a sub-quasi-Hopf algebra of it. Moreover, $\mathcal{R}_R$ belongs to $U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}}$.

Proof. The statement on $U_{h\mathfrak{g}}$ follows directly from [4], sect. 1, rem. 5. That $U_{h\mathfrak{g}}$ is a sub-quasi-bialgebra of $U_{h\mathfrak{g}}$ follows from Prop. 6.1 and Prop. 6.4. Let us now show that $S_R$ preserves $U_{h\mathfrak{g}}$.

We have $\sum_i x_i S_R(x'_i) = \varepsilon(x)$, for $x \in U_{h\mathfrak{g}}$, where $\Delta_R(x) = \sum_i x_i \otimes x'_i$. Let $(m_\alpha)$ be a basis of $U_{h\mathfrak{g}}$ as a left $U_{h\mathfrak{g}}$-module, with $m_0 = 1$. Set $S_R = \sum_\alpha S_R^{(\alpha)} m_\alpha$, with $S_R^{(\alpha)}$ some linear map from $U_{h\mathfrak{g}}$ to itself. Then for $\alpha \neq 0$, $\sum_i x_i S_R^{(\alpha)}(x'_i) = 0$. Let us show that this implies that $S_R^{(\alpha)} = 0$.

Assume that for some $\alpha$, $S_R^{(\alpha)}$ is not 0. Dividing it by the largest possible power of $h$, we may assume that its classical limit $S_{R,cl}^{(\alpha)}$ is non-zero. $S_{R,cl}$ is then a map from $U_{\mathfrak{g}}$ to itself, such that $\sum_i y_i S_{R,cl}^{(\alpha)}(y'_i) = 0$ for any $y \in U_{\mathfrak{g}}$, where $\Delta(y) = \sum_i y_i \otimes y'_i$. We then check by induction on the degree of $y$ that $S_{R,cl}^{(\alpha)} = 0$, a contradiction.

So $S_R = S_R^{(0)}$, and $S_R$ preserves $U_{h\mathfrak{g}}$.

That $\mathcal{R}_R$ belongs to $U_{h\mathfrak{g}} \hat{\otimes} U_{h\mathfrak{g}}$ follows clearly from (90).

6.3. Adelic algebras. In [4], Drinfeld also defined an adelic version of the Manin pair $(a \otimes k, a \otimes R)$. Let $A$ be the ring of adèles of $X$ and $\mathbb{C}(X)$ be the field of meromorphic functions of $X$. Let us define on $A$ the scalar product $(f, g)_A = \sum_{x \in X} \text{res}_x(f g \omega)$. Endow $a \otimes A$ with the scalar product of the Killing form of $a$ with $(\cdot, \cdot)_A$. The Lie algebra $a \otimes \mathbb{C}(X)$ is then a Lagrangian subspace of $a \otimes A$; the pair $(a \otimes A, a \otimes \mathbb{C}(X))$ then forms a Manin pair.

It is easy to double extend it as in section 6.2. The construction of quasi-Hopf algebras presented here then can be applied to yield an “adelic” quasi-Hopf algebra quantizing this Manin pair.

6.4. Quantum Weyl group action. The Weyl group $W$ of $a$ naturally maps to the group of automorphisms of the Manin pair $(\mathfrak{g}, \mathfrak{g}_R)$. There is an algebra automorphism $w$ of $U_{h\mathfrak{g}}$, deforming the action of the nontrivial element of $W$. It is defined by the rules

$$(w \cdot e)(z) = - \left(q^{K \partial}(q^{h^-[\xi]} f)(z), \quad (w \cdot f)(z) = -\varepsilon(z)q^{-(U+T)h^+[\xi]}(z),$$

$$w(h^+[r]) = -h^+[r], \quad w(h^-[\Lambda]) = -h^-[\Lambda], \quad w(D) = D, w(K) = K,$$

where $r \in R, \Lambda \in \Lambda$ and $(w \cdot x)(z) = \sum_{i \in \mathbb{Z}} w(x[e^i]) \varepsilon_i(z), x = e, f.$
Note that \( w \) does not preserve \( U_h \mathfrak{g}_R \), and \( w^2 \neq 1 \).

### 7. Analogues and generalizations of \( U_h \mathfrak{g} \)

#### 7.1. Replacing \( q^{K \partial} \) by a general automorphism.

The algebras \( U_h \mathfrak{g} \) presented in section 2.3 admit the following generalizations. Let \( \sigma \) be a ring automorphism of \( k \), commuting with \( \partial \) and preserving \( R \) and \( (\cdot,\cdot)_k \). Then we can form an algebra \( U_{h \mathfrak{g},k,\sigma} \) with the same generators as \( U_{h \mathfrak{g}} \) (except \( K \)), replacing in all relations \( q^{K \partial} \) by \( \sigma \). For example, (6) becomes

\[
[h^+[r],h^-[\lambda]] = \frac{2}{h}((1-\sigma^{-1})r,\lambda)_k,
\]

etc. Expressing the action of \( \text{Ad}(q^{KD}) \) on \( U_{h \mathfrak{g}} \) and replacing in the resulting formulas, \( q^{K \partial} \) by \( \sigma \), we obtain an (outer) automorphism \( \Sigma \) of \( U_{h \mathfrak{g},k,\sigma} \). The formulas for \( \Sigma \) are

\[
\Sigma(q^{-((T+U)h^+)(z)x(z))} = \sigma^{-1}(q^{-((T+U)h^+)(z)x(z)}), \quad \Sigma(D) = D,
\]

\[
\Sigma(h^+[r]) = h^+[\sigma(r)], \quad \Sigma(h^-[\lambda]) = h^-[(\sigma(\lambda))_\Lambda] + h^+[\sigma((T+U)\lambda)-(T+U)((\sigma(\lambda))_\Lambda)],
\]

\( x = e,f \); in the r.h.s. of the first formula, \( \sigma^{-1} \) is applied to the function part.

Note that \( U_{h \mathfrak{g}} \) is a subalgebra of \( U_{h \mathfrak{g},k,\sigma} \), and that \( \Sigma \) restricts to an automorphism of \( U_{h \mathfrak{g}} \).

If \( \sigma \) is finite, then we can find some \( \tau \) such that the formulas defining the action of \( \Sigma \) on \( x(z) \) are simply \( \Sigma(x(z)) = \sigma^{-1}(x(z)) \), \( x = e,f \). Indeed, in that case the equation

\[
(\sigma \otimes \sigma)\tau - \tau + \sum_{i \in \mathbb{N}} [T(\sigma((\sigma^{-1}(e_i))_\Lambda)) - T(e_i)] \otimes e^i = 0
\]

can easily be solved.

If moreover \( \sigma(\Lambda) = \Lambda \), then \( \Sigma \) coincides with \( \sigma^{-1} \) also on the generating series \( h^\pm(z) \).

**Remark 14.** As in Remark [1], the algebra \( U_{h \mathfrak{g},k,\sigma} \) (without \( D \)) can be generalized with \( k, (1,\cdot)_k, R \subset k \) and \( \sigma \) replaced by an arbitrary Frobenius algebra \( (k_0,\theta) \) with a Lagrangian subalgebra and an automorphism, preserving the scalar product and the subalgebra; and the full algebra \( U_{h \mathfrak{g},k,\sigma} \) can be generalized to the case where \( k_0 \) is endowed in addition with a derivation \( \partial_0 \) commuting with the automorphism, and such that \( \theta \circ \partial_0 = 0 \).

**Remark 15.** It seems difficult to combine the above action with the quantum Weyl group action of section 6.4 to give quantizations of more general “twisted” Manin pairs of Drinfeld. In that situation, \( X \) is endowed with an involution \( \sigma \) preserving \( \omega \) and \( S \), and the Manin pair is defined in the algebra \( (\mathfrak{s}\mathfrak{l}_2 \otimes k)^{\mathbb{Z}/2\mathbb{Z}} \), where the action of \( \mathbb{Z}/2\mathbb{Z} \) is by the tensor product of the Weyl group action with \( \sigma \). The difficulty is that \( \Sigma \) has finite order whereas \( w \) has infinite order. If after
conjugation, $w$ could be brought to a “correct” form (that is, preserving $U_{h\mathfrak{g}}$), it might happen that the procedure described here applies.

7.2. **Discrete analogues.** Let us formally express the algebra relations of $U_{h\mathfrak{g}}$, using the new generating series $K^+(z) = q^{(T^+U)^h(z)}$ and $K^-(z) = q^{h^-(z)}$. Let us replace the expression $q^2\sum_{i'\in\mathbb{N}}((T^+U)e_{i'}(z)e_{i}(w))$ by $q(z, w)$. Using (91), we formally derive the equation

$$q(z, w)q(w, z) = 1;$$

let us also note $(q^{K\partial}f)(z)$ as $f(\sigma^{-1}(z))$. Then the formulas presenting $U_{h\mathfrak{g}}$ become

$$\begin{aligned}
(K^+(z), K^+(w)) = 1, & \quad (K^+(z), K^-(w)) = \frac{q(z, w)}{q(z, \sigma(w))}, \\
(K^-(z), K^-(w)) = & \quad \frac{q(\sigma(z), \sigma(w))}{q(z, w)}, \\
(K^+(z), e(w)) = q(z, w), & \quad (K^-(z), e(w)) = q(w, \sigma(z)), \\
(K^+(z), f(w)) = q(w, z), & \quad (K^-(z), f(w)) = q(z, w), \\
(e(z), e(w)) = q(z, w), & \quad (f(z), f(w)) = q(w, z), \\
[e(z), f(w)] = & \quad \delta_{z,w}K^+(z) - \delta_{z,\sigma(w)}K^-(w)^{-1};
\end{aligned}$$

we used the standard notation $(a, b)$ for the group commutator $aba^{-1}b^{-1}$; we also multiplied $f(z)$ by $\hbar$, and replaced $\delta(z, w)$ by $\delta_{z,w}$. We have also the trivial relations

$$K^\pm(z)K^\pm(z)^{-1} = K^\pm(z)^{-1}K^\pm(z) = 1. \quad (98)$$

Generators $K^\pm(z), K^\pm(z)^{-1}, e(z)$ and $f(z)$ and relations (92), (93), (94), (95), (96), (97) can be thought of as presenting a complex algebra $A(Z, \sigma, q)$ defined from the data of a discrete set $Z$, a map $\sigma : Z \to Z$, and a function $q : Z^2 \to \mathbb{C}^\times$, satisfying (91). It is easy to see that a basis for $A(Z, \sigma, q)$ is formed by the family

$$\prod_{z\in Z} e(z)^{\epsilon_z} \prod_{z\in Z} K^+(z)^{\kappa_z^+} \prod_{z\in Z} K^-(z)^{\kappa_z^-} \prod_{z\in Z} f(z)^{\eta_z}, \quad \epsilon_z, \eta_z \in \mathbb{N}, \kappa_z^\pm \in \mathbb{Z}.$$  

The quantum Weyl group action of section 6.4 then has the following discrete analogue. Assume $\sigma$ to be invertible. Then there is an automorphism $w_Z$ of $A(Z, \sigma, q)$, defined by the formulas

$$w_Z(e(z)) = -K^-(\sigma^{-1}(z))f(\sigma^{-1}(z)), \quad w_Z(f(z)) = -e(z)K^+(z)^{-1},$$

$$w_Z(K^\pm(z)) = K^\pm(z)^{-1}.$$  

In the case where $\sigma = id_Z$, the discrete analogue of the coalgebra structure of $U_{h\mathfrak{g}}$ is then given by

$$\Delta(K^\pm(z)) = K^\pm(z) \otimes K^\pm(z), \quad \Delta(e(z)) = e(z) \otimes K^+(z) + 1 \otimes e(z),$$

$$\Delta(f(z)) = f(z) \otimes 1 + K^-(z)^{-1} \otimes f(z).$$
The subalgebras $A_+(Z, id_Z, q)$ and $A_-(Z, id_Z, q)$ of $A(Z, id_Z, q)$ generated by the $e(z)$ and $K^+(z)^{\pm 1}$, respectively, by the $f(z)$ and $K^-(z)^{\pm 1}$ then form Hopf subalgebras of $A(Z, id_Z, q)$. If $A_+(Z, id_Z, q)$ is given the opposite coproduct, they are in duality, the pairing being defined by $\langle e(z), f(w) \rangle = \delta_{z,w}$, $\langle K^+(z), K^-(w) \rangle = q(z, w)e^{\epsilon'}$, $e, e' = 1$ or $-1$.

**Remark 16.** It is also natural to ask whether the formal series in $h, z$ and $w$ given by $\exp(2h \sum_i ((T + U) e^{\epsilon}) z_i (w))$ has an analytic prolongation. It could then happen that the relations defining $A(Z, \sigma, q)$ can be represented over $\mathbb{C}$ in a weak sense – as relations between analytic prolongations of matrix coefficients of operators acting on highest weight modules.

**Remark 17.** In the situation where $k$ and $R$ are replaced by a finite dimensional Frobenius algebra and a maximal isotropic subring of it, an expression for $F$ is

$$F = \exp(h \sum_i e^{\epsilon'} \otimes f[\epsilon_i]),$$

for $(\epsilon'), (\epsilon_i)$ two dual bases of $k$. As it was pointed out in [4], this result is no longer true when $k$ is infinite-dimensional. For example, such results as the commutativity of $\sum_i e^{\epsilon'} \otimes f[\epsilon_i]$ with $e(z) \otimes K^+(z) + 1 \otimes e(z)$ cease to be true in the case where $(k, R)$ are associated to a curve with marked points. This is because, by vanishing properties of $1 + a_0 \psi_+$ (see [11]), the defining relations only imply an identity

$$(z - q^{-\partial}w)(e \otimes f)(z), (e \otimes q^{(T+U)h^+})(w) = 0,$$

so that

$$[(e \otimes f)(z), (e \otimes q^{(T+U)h^+})(w)] = A(z)\delta(z, q^{-\partial}w),$$

for some field $A(z)$, so that $\sum_i e^{\epsilon'} \otimes f[\epsilon_i], (e \otimes q^{(T+U)h^+})(w) = A(q^{-\partial}w)$.

In [4], an expression for $F$, well-defined up to order 2, was proposed in the quantum affine case and checked up to that order.

It would be interesting to obtain expressions for $F$ is the framework of [13]; one could expect to check their coincidence with those of [4].

An earlier version of the present work used a (wrong) generalization of [23] to the infinite-dimensional setting; after that, the works [3, 4] were completed, relying on this work. However, after $F$ is defined by Def. 5.1, all results of that version are correct, except those involving commutation relations of $\sum_i e^{\epsilon'} \otimes f[\epsilon_i]$. This shows that the only corrections to [3, 4] are to replace the definition of $F$ based on the generalization of [23] by Def. 5.1.
Appendix: maximal isotropy of rings

Let \( \mathbb{A} \) be the adeles ring of \( X \), and \( \mathbb{C}(X) \) be the field of functions over \( X \). Define on \( \mathbb{A} \) the bilinear pairing \( \langle \cdot, \cdot \rangle_{\mathbb{A}} \) by

\[
\langle f, g \rangle_{\mathbb{A}} = \sum_{x \in X} \text{res}_x (fg\omega).
\]

In [7], Drinfeld made the following statement.

**Lemma 7.1.** \( \mathbb{C}(X) \) is maximal isotropic in \( \mathbb{A} \) w.r.t. \( \langle \cdot, \cdot \rangle_{\mathbb{A}} \).

Below we prove this and the similar statement

**Lemma 7.2.** \( R \) is maximal isotropic in \( k \) w.r.t. \( \langle \cdot, \cdot \rangle_k \).

Recall first the duality theorem ([15], II-8, thm. 2). Let \( D \) be any divisor on \( X \), and \( \Omega(D) \) be the space of all meromorphic forms \( \omega \) equal to zero or such that their divisor is \( \geq D \). Let on the other hand, \( \mathbb{A} \geq -D \) be the space of adeles with divisor \( \geq -D \). Then \( \langle \cdot, \cdot \rangle_{\mathbb{A}} \) induces a non-degenerate pairing

\[
\Omega(D) \times (\mathbb{A}/(\mathbb{A} \geq -D + \mathbb{C}(X))) \to \mathbb{C}.
\]

**Proof of Lemma 7.1.** The isotropy of \( \mathbb{C}(X) \) follows from the residue formula. Let \( \Omega \) be the space of all meromorphic forms on \( X \), and let us now show that the pairing

\[
\Omega \times (\mathbb{A}/\mathbb{C}(X)) \to \mathbb{C}
\]

is also non-degenerate. Let \( f \in \mathbb{A}/\mathbb{C}(X) \) have vanishing pairing with \( \Omega \). Then for any divisor \( D \), the pairing of its image in \( \mathbb{A}/(\mathbb{A} \geq -D + \mathbb{C}(X)) \) with any element of \( \Omega(D) \) is zero, which means that \( f \) belongs to \( \mathbb{A} \geq -D/(\mathbb{A} \geq -D \cap \mathbb{C}(X)) \) for any \( D \), and so is zero.

The lemma now follows from the non-degeneracy of (100).

**Proof of Lemma 7.2.** Let for any divisor \( \bar{D} \) with support in \( S \), \( k \geq \bar{D} \) be the space of elements of \( k \) with divisor \( \geq \bar{D} \).

**Lemma 7.3.** Let \( D_0 \) be a divisor of \( X \), supported in \( S \). Then the mappings \( \mathbb{A} \to k \) induces an isomorphism of \( \mathbb{A}/(\mathbb{A} \geq -D_0 + \mathbb{C}(X)) \) with \( k/(k \geq -D_0 + R) \).

**Proof.** Let \( D = n(\sum_{s \in \mathcal{S}} s) \). For \( n \) large enough, \( D \geq (\omega_0) \) and \( \Omega(D) = 0 \); by the duality theorem, this implies that \( \mathbb{A}/(\mathbb{A} \geq -D + \mathbb{C}(X)) = 0 \), and so \( \mathbb{A} = \mathbb{A} \geq -D + \mathbb{C}(X) \). Let \( D_0 \) be a divisor \( \leq D \), then \( \mathbb{A} \geq -D_0 \subset \mathbb{A} \geq -D \), so

\[
\mathbb{A}/(\mathbb{A} \geq -D_0 + \mathbb{C}(X)) = (\mathbb{A} \geq -D + \mathbb{C}(X))/(\mathbb{A} \geq -D_0 + \mathbb{C}(X)) = \mathbb{A} \geq -D/(\mathbb{A} \geq -D_0 + \mathbb{C}(X) \cap \mathbb{A} \geq -D)).
\]

Let for any \( n \), \( Q_n = \mathbb{A} \geq -n(\sum_{s \in \mathcal{S}} s)/((\mathbb{A} \geq -D_0 + \mathbb{C}(X) \cap \mathbb{A} \geq -n(\sum_{s \in \mathcal{S}} s))) \). For the same \( n \) as above, the natural maps \( Q_n \to Q_{n+1} \) are isomorphisms. On the other hand, we have a map \( Q_n \to k/(k \geq -D_0 + R) \); its kernel is the set of adeles.
\[ \geq -n(\sum_{s \in S} s), \geq -D_0, \text{and in } R, \text{ so is zero. So } Q_n \to k/(k_{\geq -D_0} + R) \text{ is injective; it is also surjective, as we can see by composing it with a suitable } Q_n \to Q_m, \text{ } m \text{ large enough, so it is an isomorphism.} \]

\[ \sum_{s \in S} s, \geq -D_0, \text{ and in } R, \text{ so is zero. So } Q_n \to k/(k_{\geq -D_0} + R) \text{ is injective; it is also surjective, as we can see by composing it with a suitable } Q_n \to Q_m, \text{ } m \text{ large enough, so it is an isomorphism.} \]

\[ \Omega(D_0) \times (k/(k_{\geq -D_0} + R)) \to \mathbb{C} \]

is non-degenerate. Let us specialize \( D_0 \) to \( D_{0,m} = -m(\sum_{s \in S} s) \), then the natural maps induce an inductive system \( \Omega_{0,m} \subset \Omega_{0,m'} \) and a projective system \( k/(k_{\geq -D_{0,m} + R}) \to k/(k_{\geq -D_{0,m} + R}), m \leq m' \), compatible with the duality. It follows that the induced pairing between the inductive and projective limits is non-degenerate. Since \( \bigcup_{m \geq 0} \Omega(D_{0,m}) \) is the set of forms on \( X \) regular outside \( S \), and \( \omega \) has neither zeros nor poles outside \( S \), this space is equal to \( \omega R \). On the other hand, \( \lim_{m \geq 0} k/(k_{\geq -D_{0,m} + R}) = k/R \). We conclude that the pairing

\[ \omega R \times (k/R) \to \mathbb{C} \]

induced by the residue is non-degenerate, whence the lemma.

**Remark 18.** Another proof of Lemma 7.2 can be obtained following [7], sect. 2.
