Keywords. group A meningococcal meningitis; vaccine; epidemic; herd protection; public/private partnership.

Over the last 4 years, a remarkable public health success has unfolded in Africa. The field introduction of a new group A meningococcal conjugate vaccine, PsA-TT (MenAfriVac), has been a stunning success, with the virtual disappearance of group A meningococcal meningitis in sub-Saharan Africa. The effort began with a plea from African ministers of health to “do something” after the dreadful 1996–1997 group A meningococcal epidemic with >250 000 reported cases. The World Health Organization (WHO) convened a series of international meetings where experts recommended that a new meningococcal group A conjugate vaccine be developed for Africa.

In 2001, the Bill & Melinda Gates Foundation awarded a grant of US$70 million to create the Meningitis Vaccine Project as a partnership between PATH and WHO, with the single goal of developing, licensing, and introducing at public health scale a group A meningococcal conjugate vaccine for sub-Saharan Africa, manufactured at the Serum Institute of India, Ltd.

Using an innovative vaccine development model that paid close attention to product specifications to facilitate use of the vaccine in Africa (fewest doses required for compliance; relative stability outside cold chain) and affordability (less than US$0.50 per dose), the new vaccine, PsA-TT, was licensed by the Drug Controller General of India in December 2009 and prequalified by WHO in June 2010 [1].

The vaccine was introduced in Burkina Faso, Mali, and Niger in December 2010 and was enthusiastically accepted. By the end of that month, almost 20 million persons aged 1–29 years had been vaccinated, and the following epidemic season showed a dramatic reduction in group A meningococcal disease in all 3 countries. Vaccination campaigns have continued, and as of the end of 2014, >217 million Africans have been immunized in 15 countries. The vaccine has been shown to be safe and has generated herd protection, with control and near-elimination of group A meningococcal disease wherever it has been used [2–4].

The vaccine was further evaluated in infants and young children to prepare for its use in the Expanded Programme on Immunization (EPI), an essential step to ensure that subsequent newborn cohorts are protected and that the public health benefits continue. With study results showing safety and strong immunogenicity of a single dose at the age of 9 months and following the WHO Strategic Advisory Group of Experts on Immunization recommendations of October 2014, the vaccine is now gradually introduced as a new EPI antigen in meningitis belt countries [5].

Participants in this effort have prepared a series of manuscripts that detail the many technical, epidemiologic, and public health steps that were associated with the development, introduction, and evaluation of this vaccine. The
success of the project is a testimonial to the potential of public/private partnerships to develop needed vaccines that, when introduced, can have major impact to solve important public health problems. It is our hope that the lessons learned from this endeavor will inform similar future public health initiatives.

Notes

Disclaimers. 1) The authors and editors alone are responsible for the views expressed in this publication and they do not necessarily represent the views, decisions, or policies of the institutions with which they are affiliated; 2) The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of PATH or the World Health Organization (WHO) concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement; 3) The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by PATH or the WHO in preference to others of a similar nature that are not mentioned. Errors and omissions excepted, the names of proprietary products are distinguished by initial capital letters.

Supplement sponsorship. This article appears as part of the supplement “The Meningitis Vaccine Project: The Development, Licensure, Introduction, and Impact of a New Group A Meningococcal Conjugate Vaccine for Africa,” sponsored by the Meningitis Vaccine Project through a grant from the Bill & Melinda Gates Foundation.

Potential conflicts of interest. A. L. Lake reports that the United Nations Children’s Fund procured the stated vaccine on behalf of governments. C. J. E. previously was President and CEO of PATH, which received a grant from the Bill & Melinda Gates Foundation to support this work. S. D. has received institutional support from the Bill & Melinda Gates Foundation, the Michael and Susan Dell Foundation, Monte de Paschi Foundation, the Shefa Fund hosted by the Swiss Philanthropy Foundation, the National Philanthropic Trust, and the Global Giving Foundation; and has also received institutional funding from World Health Organization, Gavi, US Agency for International Development, US Centers for Disease Control and Prevention, US Food and Drug Administration, US National Institutes of Health, Research Council of Norway, and Fondation Mérieux. All other authors report no potential conflicts.

All authors have submitted the ICMJE Form for Disclosure of Potential Conflicts of Interest. Conflicts that the editors consider relevant to the content of the manuscript have been disclosed.
