Preparation of SBS Modified Emulsified Asphalt in High Cold Region

HOU Yanming

College of Civil Engineering, Nanjing Forestry University, Nanjing, Jiangsu 210037, China

Abstract. A kind of SBS modified emulsified asphalt for highly cold area was studied by experiments. The research includes two aspects: the first is preparation of SBS modified asphalt. The influence of temperature, time, shear rate and development time on asphalt modification are determined, so as to determine the process of SBS modified asphalt. On this basis, the blending ratio of SBS modified emulsified asphalt was determined by experiments. The results show that the emulsified asphalt produced by the equipment is of good quality and good ductility. 4% SBS latex content can make emulsified asphalt meet the standard requirements, but only 6% SBS latex content can obtain better road performance. Although the softening point of SBS modified emulsified asphalt prepared by this method is still low, it can meet the requirements of high cold area.

1 Introduction

SBS modified emulsified asphalt has the advantages of high and low temperature performance, strong resilience, strong cohesion, good crack resistance and wide application area, so it has a good application prospect. At present, the main factors affecting the SBS modified emulsified asphalt are as follows: ① Modification of asphalt: including the type of base asphalt, SBS modifier varieties, dosage, blending process, stabilizer varieties and SBS particle shear fineness and other factors; ② Selection of emulsifier: Including the variety and dosage of emulsifier, the variety and dosage of stabilizer and other factors; ③ Selection of emulsified asphalt production equipment and production process and so on [1-5]. In view of this, it is undoubtedly important to develop SBS modified emulsified asphalt for high-grade highway pavement in alpine region by optimizing material compatibility and fine quality control.

Based on the above considerations, the SBS modified emulsified asphalt suitable for climatic environment in alpine region was developed through a large number of experiments in this study [6-10].

2 Preparation technology of SBS modified asphalt

In this experiment, the softening point and ductility index at 5 ℃ of SK90 matrix asphalt after modification were taken as the evaluation indexes. The technological conditions such as shear temperature, shear time, shear rate and development time were analyzed, and the reasonable and optimized technological conditions were finally determined.

Modified asphalt was prepared from L4RT colloid mill produced by Silveson company.

2.1 Effect of shear temperature

The effect of shear temperature on the performance of modified asphalt is shown in Table 1. The experimental conditions are as follows: the shear time is 1 h, the shear rate is 3000rpm, the shear temperature is 160 ℃, and the addition of modifier and stabilizer is 3% and 0.265% (quality ratio with asphalt).

| Shear temperature / ℃ | 165 | 175 | 185 | 195 |
|-----------------------|-----|-----|-----|-----|
| 5 ℃ Ductility / cm    | 0   | 30  | 25  | 0   |
| 25 ℃ Needle penetration / 0.1mm | 42  | 50  | 44  | 40  |
| Softening point / ℃   | 61  | 60  | 58  | 57  |

Table 1 shows that the softening point of the modified asphalt changes smoothly first and then decreases slightly with the increase of shear temperature. The modified asphalt samples prepared at 165 ℃ and 195 ℃ have brittle fracture when the ductility index at 5 ℃ is measured, and their plastic deformation is very poor. By comprehensive analysis, the shear temperature is determined to be 175 ℃.

2.2 Effect of shear time
The effect of shear time on the performance of modified asphalt is shown in Table 2. The experimental conditions are as follows: the shear temperature is 175 °C, the shear rate is 3000 rpm, and the growth time is 1 h. The addition of modifier and stabilizer is 3% and 0.265% respectively.

Considering that the alpine region should be dominated by low temperature indicators, the shear time is 30 min.

Table 2: Effect of shear time on properties of modified asphalt

| Shear time /min | 50 | 60 | 90 | 120 |
|-----------------|----|----|----|-----|
| 5°C Ductility /cm | 17 | 30 | 18 | 20 |
| 25°C Needle penetration /0.1mm | 46 | 52 | 50 | 52 |
| Softening point/°C | 70 | 60 | 60 | 58 |

2.3 Effect of shear rate

The effect of shear rate on the performance of modified asphalt is shown in Table 3. The experimental conditions are as follows: the shear temperature is 175 °C, and the sample is put into 160 °C oven for 1 h after shearing for 1 h. The addition of modifier and stabilizer is 3% and 0.265% respectively.

From Table 3, it can be seen that with the increase of shear rate, the index of modified asphalt increases first and then decreases; when the shear rate is 3000 rpm, the softening point and ductility of modified asphalt are the largest, and its high and low temperature performance is better.

Based on the above analysis, the shear rate is determined to be 3000 rpm.

Table 3: Effect of shear rate on properties of modified asphalt

| Shear rate /min | 1000 | 3000 | 5000 | 7000 |
|-----------------|------|------|------|------|
| 5°C Ductility /cm | 12  | 28  | 25  | 18  |
| 25°C Needle penetration /0.1mm | 48  | 50  | 78  | 55  |
| Softening point/°C | 55  | 62  | 54  | 51  |

2.4 Development time

The effect of growth time on the performance of modified asphalt is shown in Table 4. The experimental conditions are as follows: the shear temperature is 175 °C, the shear rate is 3000 rpm, and the shear rate develops at 160 °C after 1 h. The addition of modifier and stabilizer is 3% and 0.265% respectively. Comprehensive analysis confirmed that the developmental time was 1 h.

Table 4: Effect of development time on properties of modified asphalt

| Development time /h | 1 | 2 | 3 | 4 |
|---------------------|---|---|---|---|
| 5°C Ductility /cm    | 30| 21| 21| 25|
| 25°C Needle penetration /0.1mm | 53| 51| 50| 52|
| Softening point/°C  | 62| 60| 60| 59|

Through the above investigation of the preparation process conditions of modified asphalt, and drawing lessons from the asphalt modification process proposed by other researchers [6-10]. The preparation process of modified asphalt is determined as follows: heating the base asphalt and maintaining its temperature at about 175 °C. The solid SBS modifier and stabilizer are added under the high speed shearing of 3000 rpm shearing machine. At the same time, the samples were slowly added to the hot asphalt. After shearing for about 1 h, the samples were placed in the oven at 16 °C for 1 h to develop. Then the samples were retained to determine their properties and then the samples were emulsified.

3 Preparation of SBS modified asphalt

3.1 Main raw materials

1) asphalt: in this experiment, SK90 matrix asphalt commonly used to produce emulsified asphalt was chosen. The three major indicators are shown in Table 5:

Table 5: The three major indicators of SK90# asphalt

| Project       | Unit | Index |
|---------------|------|-------|
| Softening point | °C   | 46.7  |
| Needle penetration (25°C) | mm  | 94.7  |
| Ductility (15°C) | cm  | >100  |

2) SBS: The modifier used in this test is YH-792 linear SBS produced by Yueyang baling Petrochemical Industries Company. The specific indexes are in Table 6.

Table 6: YH-792 Linear SBS performance indicators

| Project       | Nature | Unit | Index |
|---------------|--------|------|-------|
| Softening point | Linear | °C   | 46.7  |
| Molecular mass | 100000 |      |       |
| Block ratio (S/B) | 30 | 0.70 |
| Oil filling rate, % | 60 | 0.70 |
| Tensile strength /MPa | 18.0 | 600  |
| Elongation, % | 65 | >100  |
| Permanent deformation, % | 80 | >100  |

3.2 Test results

The performance of SBS modified asphalt with different SBS content is shown in Table 7.

Table 7: Test index of SBS modified asphalt

| S  | K | B | S | Softening point (°C) | 5°C | 10°C |
|----|---|---|---|----------------------|-----|------|
| 1  | 1 | 2 | 3 | 4                    | 500 | 7500 |
| 00 | 1 | 2 | 3 | 4                    | 50  | 100  |

4 Preparation and performance test of SBS modified emulsified asphalt

4.1 Main raw materials

1) asphalt: 3 kinds of SBS modified asphalt prepared above.

2) emulsifier: cationic emulsifier Peral600.
3) stabilizer: The stability of the emulsion was increased by using PC1698 and methyl compound which were imported from inorganic stabilizer and organic stabilizer.

4) pH regulator: choose 35% concentrated hydrochloric acid as pH regulator.

5) SBS latex: technical indicators are shown in Table 8.

| Nature                        | SBS latex |
|-------------------------------|-----------|
| Ion charge                    | +         |
| particle size, $\mu m$        | 1.97      |
| Particle size, %              | 40.5      |
| pH                            | 2.72      |
| viscosity, mPa·s              | 41        |
| Mechanical stability, %       | 0.38      |

Table 8 SBS Latex technical specifications

4.2 Determination of the proportioning of emulsifiers

On the basis of emulsifying formula provided by emulsifier manufacturer, taking the basic emulsifier Peral417 as the maximum value of 1.8% unchanged, changing the dosage of compound emulsifier Peral600, keeping the oil-water ratio, soap temperature, asphalt, emulsifying time and so on the same and unchanged, and the emulsifying effect of modified asphalt with 5% and 7% SBS content in different emulsifier ratios was investigated without other additives interference. The concrete test results were shown in Table 9.

Table 9 Effect of compound emulsifier on emulsifying effect

| Process                              | No. 0 | No. 1 | No. 2 | No. 3 | No. 4 | No. 5 | No. 6 | No. 7 | technical requirement |
|--------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-----------------------|
| Emulsifying effect                   |       |       |       |       |       |       |       |       |                       |
| Particle charge                       | +     | -     | +     | +     | +     | +     | +     | +     |                       |
| Residence on sieve                   |       |       |       |       |       |       |       |       |                       |
| Negra viscosity                      | 0.02  | -     | 4.0   | 3.8   | 0.09  | 0.05  | 0.08  | 0.07  | <0.1                  |
| Darkening                            | 8     | -     | 12    | 11    | 11    | 11    | 12    | 12    | 3-20                  |
| Storage stability (1d), %            | 0.8   | -     | 2.8   | 2.9   | 1.9   | 1.5   | 1.2   | 1.4   | <1.0                  |
| Storage stability (5d), %            | 4.4   | 12.7  | 11.5  | 7.8   | 4.9   | 5.1   | 4.9   | 4.9   | <5.0                  |
| Low temperature storage stability (-5℃) | qualified | - | Unqualified | Unqualified | Have a lump | qualified | Coarse-grained particles | qualified |                       |
| Mixing with cement                   |       |       |       |       |       |       |       |       |                       |
| content                              |       |       |       |       |       |       |       |       |                       |
| Softening point/℃                    |       |       |       |       |       |       |       |       |                       |
| 5℃ Ductility/cm                      |       |       |       |       |       |       |       |       |                       |

It can be seen from Table 9 that the two emulsifier mixtures can not meet the emulsification requirements of modified asphalt with 7% SBS content, although the addition of Peral600 greatly improves the emulsifying ability of the emulsified system. SBS modified asphalt with 7% content has high viscosity and is difficult to emulsify, and 5% SBS modified asphalt can be emulsified basically, but its stability is not very good, indicating that 5% content is the limit of SBS modified asphalt emulsification.

When Peral600 dosage is 1.0% of the total emulsifier dosage, SBS modified asphalt can be emulsified well, and other performance indicators can meet the requirements; when the Peral600 dosage...
continues to increase, the emulsification effect will become worse, indicating that there is an optimum proportion of multiple emulsifiers.

It can be seen from Table 9 that the emulsifying effect of modified asphalt with 5% SBS content is barely qualified when the emulsifier dosage is 1.8%; the effect is not obvious when the emulsifier dosage is increased, and the optimum emulsifier dosage is 1.8% considering the economic benefits.

### 4.3 SBS latex modified asphalt

In order to further compare the preparation methods of SBS modified emulsified asphalt, SBS modified emulsified asphalt was prepared from SBS latex and SK90# base asphalt, which were commonly used in the market[11]. The amount of latex added in the test is 3% ~ 6%, and the modified emulsified asphalt is shown in Table 10.

| Test project | JTG standard | 1# (3%) | 2# (4%) | 3# (5%) | 4# (6%) | 5% SBS |
|--------------|--------------|---------|---------|---------|---------|------|
| Ion charge   | +            | +       | +       | +       | +       | +    |
| Residue on sieve % | ≤0.1        | 0.02    | 0.01    | 0.01    | 0.02    | 0.05 |
| Negra viscosity (25℃) | 3~30        | 9.4     | 8.3     | 7.2     | 5.2     | 11   |
| storage stability (1d) % | ≤1          | 0.55    | 0.79    | 0.93    | 1.1     | 1.5  |
| Solid content (%) | ≥60         | 71.8    | 71.1    | 70.8    | 70.2    | 64.2 |
| softening point /℃ | ≥53 (60) | 57.1    | 62.4    | 64.8    | 67.9    | 71   |
| solubility (%) | ≥97.1       | 98.4    | 98.3    | 98.5    | 98.9    | 99.1 |
| Evaporation residue |              |         |         |         |         |      |
| Ductility (5℃)/cm | ≥20 (40)  | 25.5    | 32.2    | 36.5    | 40.7    | 30   |

Note: the values in brackets are recommended values in alpine regions.

### 5 The results and analysis

1. The emulsified asphalt produced by this equipment was modified by latex with good overall quality and good ductility.
2. 4% SBS latex can make the emulsified asphalt meet the standard requirements, but only 6% SBS latex can get better road performance.
3. The SBS modified emulsified asphalt prepared by this method meets the requirement of highly cold area although its softening point is still low.
