GLOBAL WELL-POSEDNESS AND SCATTERING OF 3D DEFOCUSING, CUBIC SCHÖDINGER EQUATION

JIA SHEN AND YIFEI WU

Abstract. In this paper, we study the global well-posedness and scattering of 3D defocusing, cubic Schrödinger equation. Recently, Dodson [16] studied the global well-posedness in a critical Sobolev space $\dot{W}^{11/7, 7/6}$. In this paper, we aim to show that if the initial data belongs to $\dot{H}^{1/2}$ to guarantee the local existence, then some extra weak space which is supercritical, is sufficient to prove the global well-posedness. More precisely, we prove that if the initial data belongs to $\dot{H}^{1/2} \cap \dot{W}^{s,1}$ for $12/13 < s \leq 1$, then the corresponding solution exists globally and scatters.

1. Introduction

We study the non-linear Schrödinger equation (NLS)
\[
\begin{cases}
  i\partial_t u + \Delta u = \mu |u|^p u, \\
  u(0, x) = u_0(x),
\end{cases}
\]
where $u(t, x) : \mathbb{R} \times \mathbb{R}^d \to \mathbb{C}$, $\mu = \pm 1$ and $p > 0$. $\mu = 1$ is defocusing case, and $\mu = -1$ is focusing case. The equation (1.1) has conserved mass
\[
M(u(t)) := \int_{\mathbb{R}^d} |u(t, x)|^2 \, dx = M(u_0),
\]
and energy
\[
E(u(t)) := \int_{\mathbb{R}^d} \frac{1}{2} |\nabla u(t, x)|^2 \, dx + \mu \int_{\mathbb{R}^d} \frac{1}{p+2} |u(t, x)|^{p+2} \, dx = E(u_0).
\]
The equation (1.1) also has rescaled solution
\[
u_\lambda(t, x) = \lambda^{2/p} u(t/\lambda^2, x/\lambda).
\]
The scaling leaves $H^s_x$, $s_c = \frac{d}{2} - \frac{2}{p}$ norm invariant, that is, $\|u(0)\|_{H^s_x} = \|u_\lambda(0)\|_{H^s_x}$. In this sense, it has critical Sobolev space $\dot{H}^{s_c}_x$. Therefore, according to the conservation law, the equation is called mass critical when $p = \frac{4}{d}$, and energy critical when $p = \frac{4}{d-2}$.

The local well-posedness for (1.1) is well-understood, which can be found in Cazenave and Weissler [6]. Moreover, there are extensive studies on the large data global well-posedness and scattering for (1.1). Let us first mention the results in energy space when $\mu = 1$. In energy subcritical and mass supercritical case, Ginibre and Velo [20] proved the large data global well-posedness and scattering in energy space for $d \geq 3$. Bourgain [4] introduced the induction on energy method to study the 3D quintic energy critical NLS and proved global well-posedness and scattering in $H^1(\mathbb{R}^3)$ for radial data. Nakanishi [31] used this method and introduced a new
kind of modified Morawetz estimate to obtain the energy scattering for \( p > 4/d \) when \( d = 1 \) and \( d = 2 \). Bourgain’s result was extended to the non-radial case by Colliander, Keel, Staffilani, Takaoka and Tao [9], for which a key ingredient is the interaction Morawetz estimate introduced in [8]. Energy critical case in higher dimensions was solved by [33, 39]. Secondly, focusing equations has special solutions constructed from ground state, which does not scatter. Kenig and Merle [25] introduced the concentration compactness method to study the radial focusing energy critical NLS in \( H^1 \) when \( d = 3, 4, 5 \). They proved the “ground state theorem”, namely below the energy of ground state, the solution with positive virial is global well-posed and scatters, and the solution with negative virial blows up. Killip and Visan [28] obtained the scattering below the ground state for non-radial energy critical NLS in dimensions five and higher, and dimension \( d = 4 \) case was solved by Dodson [15]. In mass critical case, authors further studied the global well-posedness and scattering purely in \( L^2 \). In radial case, it was solved by Killip, Tao and Visan [27] for \( d = 2 \), and by Tao, Visan, Zhang [37], and Killip, Visan and Zhang [29] for \( d \geq 3 \). The defocusing non-radial case for all dimensions were proved by Dodson [10, 12, 13]. Furthermore, Dodson [11] studied the focusing case with initial data below the mass of the ground state in all dimensions.

Next, we review some of the results for the energy subcritical and mass supercritical case. As the typical model, we consider the 3D cubic NLS as follows,

\[
\begin{align*}
\begin{cases}
i \partial_t u + \Delta u &= \mu |u|^2 u, \\
u(0, x) &= u_0(x),
\end{cases}
\end{align*}
\tag{1.5}
\]

In the defocusing case, as described above, global and scattering in energy space was proved by Ginibre and Velo in [20]. In the focusing case, global well-posedness and scattering in energy space below the ground state was proved by Duyckaerts, Holmer and Roudenko in [18, 22]. For negative virial data, blowing-up solution in energy space was established in [17, 21, 23, 32]. Below the energy space, Bourgain [3] obtained global well-posedness and scattering in \( H^s \) with \( s > 11/13 \) in the defocusing case. The result was further extended to \( s > 5/6 \) in [7], \( s > 4/5 \) in [8] and \( s > 5/7 \) in [34]. With radial assumption, Dodson [14] obtained the result almost in critical space \( s > 1/2 \). In critical space, Kenig and Merle [26] proved global well-posedness and scattering for defocusing case with assumption that the solution is uniformly bounded in critical space. More recently, Dodson [16] studied the global well-posedness for defocusing equation in a critical Sobolev space \( \dot{W}^{11/7, 7/6} \).

In this paper, we intend to study the global well-posedness and scattering for defocusing 3D cubic NLS in critical \( \dot{H}^{1/2} \) space intersected with a supercritical space. The main result is

**Theorem 1.1.** Let \( \mu = 1 \) and \( 1 \geq s > 12/13 \). Suppose that \( u_0 \in \dot{H}^{1/2}_x \cap \dot{W}^{s, 1}_x \), then the solution \( u \) of equation (1.5) exists globally and scatters.

**Remark 1.2.** The followings are some remarks related to the theorem.

1. Our main purpose is to show that if the initial data belongs to \( \dot{H}^{1/2}_x \) to guarantee the local existence, then some extra weak space, likes \( \dot{W}^{s, 1}_x \) which is supercritical space under the scaling, is sufficient to prove the global well-posedness.
2. We mainly concern the rough data case when the derivative index \( s < 1 \). In this case, the main obstruction is the lack of any \( \nabla \)-estimate for the linear
solution. Then, the two key ingredients are as follows. First, we invoke the bilinear Strichartz estimate suitably to lower down the derivative of the linear solution, but it costs the increase of the energy bound. To overcome the difficulty, we also derive a global space-time estimate $L^q_t L^r_x$ with $r > 6$, see (4.31). These tools allow us to control the growth of the energy under the rough data assumption.

(3) The scattering statement is also included. Indeed, by the uniform boundedness in $\dot{H}^{1/2}_x$ obtained below, it is an immediate consequence of the result of Kenig and Merle [26].

(4) Lastly, we remark that the lower bound $12/13$ for the regularity $s$ of the space $W_s^{s,1}$ is not optimal, which can be improved by more delicate analysis, see (4.32) below. In particular, we can further lower down the required regularity by $I$-method in [8]. However, in this paper we are not going to pursue this optimality. We conjecture that if $u_0 \in \dot{H}^{1/2} \cap L^1$, then the corresponding solution of equation (1.5) with $\mu = 1$ exists globally and scatters.

Let us explain the main idea of the proof in this paper. We use the argument in [1], in which a strategy of “time-cutoff” equation’s decomposition was given. More precisely, we split the solution $u = v + w$ with $v$ satisfying

$$i\partial_t v + \Delta v = \chi_{<1}(t)|v|^2v.$$ 

Then we can prove that $v$ keeps the properties as the linear flow. Furthermore, $w$ satisfies

$$i\partial_t w + \Delta w = \chi_{\geq 1}(t)|v|^2v + O(wu^2).$$

As the heart of the whole analysis, benefiting from that $v$ is more regular in $t \gtrsim 1$, we can transfer the additional regularity from $v$ to $w$ by bootstrap. However, the implementation of such ideas is quite challenging because of the rough data.

The first main obstruction is to improve the regularity of the solution $w$ when it transits from $t = 0$ to $t = 1$, we choose various appropriate function spaces to bootstrap. This is analogue to the works that studied the NLS at critical regularity, in which the Gronwall’s inequalities were employed suitably to gain the regularity of the solution, see, e.g., [27, 29]. To do this, the analysis is subtle and the estimates should be critical. More precisely, to establish the $H^1$-estimate of $w$ in local time for $H^k_\frac{1}{2}$ data, there is a half of derivative loss, and we use the bi-linear Strichartz estimate to save the regularity. In particular, a multi-scale bi-linear Strichartz estimate established very recently by Candy [5] shall be applied to overcome the difficulties.

More precisely, the bi-linear Strichartz estimate in the form of

$$\| [e^{it\Delta} \phi] [e^{it\Delta} \psi] \|_{L^q_t L^r_x(\mathbb{R} \times \mathbb{R}^d)}$$

(1.6)
with particular frequency restrictions on $\phi, \psi$ plays a crucial role in this paper. $L^2_{t,x}$ bi-linear estimate for Schrödinger equation was first introduced by Bourgain [2] in 2D case, and was further extended in [9] and [39]. This kind of estimates was widely used in the theory of critical non-linear Schrödinger equations, see for examples [9–13, 27, 29, 39]. For $q, r \leq 2$, (1.6) has close relation with bi-linear restriction estimate for paraboloid, which was extensively studied before. Wolff proved bi-linear restriction estimate for cone in [40] with $q = r > \frac{4+5}{d+1}$, and then Tao [35] extended the result to paraboloid case. Moreover, bi-linear restriction estimate is an important technique towards the linear restriction problems, see [36]. We refer the reader to Mattila’s book [30] for more references of bi-linear restriction theory.

In this paper, we are going to use the multi-scale version of bi-linear restriction estimate by Candy [5]. To be more precise, in the proof of local result, in order to close the bootstrap argument, we combine $L^1_tL^2_x$ and the classical $L^2_t$ estimates to obtain additional regularity for the low frequency summation.

The second main ingredient of this paper is that the energy of $w$ part is almost conserved for any long time. This is achieved by controlling the energy increment of the perturbed solution $w$. More precisely, the energy increment contains at least one $v$ that has subcritical estimate, which allows us to control the remaining $w$ parts with supercritical norms. Since $v$ is lack of $\dot{W}^{1,\infty}$-estimate (especially when we assume $s < 1$), we need to use the bi-linear Strichartz estimate to lower down the regularity of $v$. However, as described in Remark 1.2 (b), in the view of (4.32) and (4.33), the use of bi-linear Strichartz estimate will increase the energy bound dramatically for long time. To close the bootstrap argument, we interpolate the bi-linear estimate and the interaction Morawetz estimate to control the energy increment properly, see (4.51) below.

**Organization of the paper.** In Section 2, we give some preliminaries. This includes notations and some useful lemmas. In Section 3, we give the subcritical estimate of $v$. In Section 4, we give the energy estimate of $w$, and finish the proof of Theorem 1.1.

## 2. Preliminary

### 2.1. Notations.** The followings are some notations.

- $\hat{f}$ or $\mathcal{F}f$ denotes the Fourier transform of $f$.
- For any $a \in \mathbb{R}$, $a \pm := a \pm \varepsilon$ for some small $\varepsilon > 0$.
- $C > 0$ denotes some constant, and $C(a) > 0$ denotes some constant depending on coefficient $a$.
- If $f \leq Cg$, we write $f \lesssim g$. If $f \lesssim Cg$ and $g \leq Cf$, we write $f \sim g$. Suppose further that $C = C(a)$ depends on $a$, then we write $f \lesssim a g$ and $f \sim a g$, respectively.
- If $f \leq 2^{-5} g$, we denote $f \ll g$. The notation $f \gg g$ is defined similarly.
- $|\nabla| := \mathcal{F}^{-1}|\xi|\mathcal{F}$ and $|\nabla|^* := \mathcal{F}^{-1}|\xi|^*\mathcal{F}$.
- Take a cut-off function $\chi \in C_c^\infty(0, \infty)$ such that $\chi(r) = 1$ if $r \leq 1$ and $\chi(r) = 0$ if $r > 2$. For $N \in 2\mathbb{Z}$, let $\chi_N(r) = \chi(N^{-1}r)$ and $\phi_N(r) = \chi_N(r) - \chi_{N/2}(r)$. We define the Littlewood-Paley dyadic operator $f_{\leq N} = P_{\leq N}f := \mathcal{F}^{-1}(\chi_N(|\xi|)\hat{f}(\xi))$ and $f_N = P_Nf := \mathcal{F}^{-1}(\phi_N(|\xi|)\hat{f}(\xi))$. We also define that $f_{\geq N} = P_{\geq N}f := f - P_{\leq N}f$, $f_{\ll N} = P_{\ll N}f := P_{\ll 2^{-5}N}f$, $f_{\gg N} = P_{\gg N}f := P_{\gg 2^{-5}N}f$, $f_{\leq N} = P_{\leq N}f := P_{\leq 2^{-5}N}f$, $f_{\gg N} = P_{\gg N}f := P_{\gg 2^{-5}N}f$, and $f_{\sim N} = P_{\sim N}f := P_{\ll 2^{5}N}f - P_{\leq 2^{-5}N}f$.**
• Let $S(\mathbb{R}^d)$ be the Schwartz space and $S'(\mathbb{R}^d)$ be the tempered distribution space. $L^p(\mathbb{R}^d)$ denotes the usual Lebesgue space. We define the homogeneous Sobolev and Besov spaces

$$W^{s,p}(\mathbb{R}^d) := \{ f \in S'(\mathbb{R}^d) : \sum_{N \in \mathbb{Z}^d} N^s P_N f \text{ converges in } S' \text{ to a } L^p\text{-function} \},$$

$$\dot{B}^s_{p,q}(\mathbb{R}^d) := \{ f \in S'(\mathbb{R}^d) : \| f \|_{\dot{B}^s_{p,q}} := \| N^s f \|_{L^p(\mathbb{R}^d)} \|_{L^q(\mathbb{R}^d)} \}. $$

Moreover, the Sobolev norm is defined by $\| f \|_{W^{s,p}(\mathbb{R}^d)} := \| \sum_{N \in \mathbb{Z}^d} N^s P_N f \|_{L^p(\mathbb{R}^d)}$. We know from the Littlewood-Paley theory that for $1 < p < \infty$, $\| f \|_{W^{s,p}(\mathbb{R}^d)} \sim \| \nabla^s f \|_{L^p(\mathbb{R}^d)}$. We denote that $\dot{H}^s(\mathbb{R}^d) := W^{s,2}(\mathbb{R}^d)$. We also define $\langle \cdot, \cdot \rangle$ as real $L^2$ inner product:

$$\langle f, g \rangle = \Re \int f(x) \overline{g}(x) \, dx.$$

• For any time interval $I \subset \mathbb{R}$, we denote $L^q_t \dot{W}^{s,r}_x(I) := L^q_t \dot{W}^{s,r}(I \times \mathbb{R}^3)$ for short.

• For any $0 \leq \gamma \leq 1$, we call that the exponent pair $(q, r) \in \mathbb{R}^2$ is $\dot{H}^\gamma$-admissible, if $\frac{2}{q} + \frac{2}{r} = \frac{2}{\gamma}$, $2 \leq q \leq \infty$, and $2 \leq r < \infty$. If $\gamma = 0$, we say that $(q, r)$ is $L^2$-admissible.

• For functions $f, g, h$, we use the notation $O(fg) := c_1 f g + c_2 f \overline{g} + c_3 f g + c_4 \overline{f} \overline{g}$, for some $c_i \in \mathbb{C}$, $i = 1, 2, 3, 4$. We also set $O(fgh) := O((fg)h)$, and $O(f + g) := O(f) + O(g)$.

2.2. Useful lemmas. In this subsection, we gather some useful results.

**Lemma 2.1** (Strichartz estimate, [24]). Suppose that $(q, r)$ and $(\overline{q}, \overline{r})$ are $L^2$-admissible. Then, we have

$$\| e^{it \Delta} \varphi \|_{L^q_t L^r_x(\mathbb{R})} \lesssim \| \varphi \|_{L^2_x}, \quad (2.1)$$

and

$$\left\| \int_0^t e^{i(t-s) \Delta} F(s) \, ds \right\|_{L^q_t L^r_x(\mathbb{R})} \lesssim \| F \|_{L^q_t L^r_x(\mathbb{R})}. \quad (2.2)$$

Furthermore, by the Bernstein inequality and (2.1), for any $0 < \varepsilon < \frac{1}{10}$,

$$\left( \sum_{N \in \mathbb{Z}^d} \| P_N e^{it \Delta} \varphi \|_{L^q_t L^r_x(\mathbb{R})} + N^{4\varepsilon - 1} \| P_N e^{it \Delta} \varphi \|_{L^q_t L^r_x(\mathbb{R})} \right)^\frac{1}{2} \lesssim \| \varphi \|_{\dot{H}^\frac{1}{2}_x}. \quad (2.3)$$

**Lemma 2.2** (Schur’s test). For any $a > 0$, sequences $\{a_N\}$, $\{b_N\} \subset L^2_{N \in 2^\mathbb{Z}}$, we have

$$\sum_{N_1, N_2 \in 2^\mathbb{Z}; N_1 \leq N} \left( \frac{N_1}{N} \right)^a a_N b_{N_1} \lesssim \| a_N \|_{\dot{B}^\frac{a}{2}_\infty} \| b_N \|_{\dot{B}^\frac{a}{2}_\infty}. \quad (2.4)$$

In this paper, we need the following multi-scale bi-linear Strichartz estimate for Schrödinger equation, which is a particular case of Theorem 1.2 in [5]:

**Lemma 2.3.** Let $1 \leq q, r \leq 2$, $\frac{1}{q} + \frac{2}{r} < 2$, and suppose that $M, N \in 2^\mathbb{Z}$ satisfy $M \ll N$. Then for any $\phi, \psi \in L^q_2(\mathbb{R}^3)$,

$$\left\| [e^{it \Delta} P_N \phi][e^{it \Delta} P_M \psi] \right\|_{L^q_t L^r_x(\mathbb{R})} \lesssim \frac{M^{4 - \frac{2}{q} - \frac{2}{r}}}{N^{1 - \frac{2}{r}}} \| P_N \phi \|_{L^q_x} \| P_M \psi \|_{L^r_x}. \quad (2.5)$$
Using the same argument as in [39], we can transfer the bi-linear estimate in Lemma 2.3 from linear solutions into general functions:

**Lemma 2.4.** Let \( I \subset \mathbb{R}, 1 \leq q, r \leq 2, \frac{1}{q} + \frac{2}{r} < 2, \) and suppose that \( M, N \in 2^\mathbb{Z} \) satisfy \( M \ll N \). Let \((\tilde{q}, \tilde{r})\) be \( L^2\)-admissible with \( \tilde{q} < q \). Moreover, for any \( t \in I \)
\( \tilde{u}(t, \cdot) \) is supported on \( \{\xi : |\xi| \sim N\} \), and \( \tilde{v}(t, \cdot) \) is supported on \( \{\xi : |\xi| \sim M\} \). Then,
\[
\|O(uv)\|_{L^q_t L^r_x(I)} \lesssim \frac{M^{\frac{4}{q} - \frac{2}{r}}}{N^{1 - \frac{2}{r}}} \|u\|_{S^0(I)} \|v\|_{S^0(I)},
\]
where \( a \in I \), and
\[
\|u\|_{S^0(I)} := \|u(a)\|_{L^q_x} + \|(i\partial_t + \Delta)u\|_{L^q_t L^r_x(I)},
\]

**Lemma 2.5** (Inhomogeneous Strichartz, [19, 38]). Let \( I \subset \mathbb{R} \). Suppose that \((q, r)\) satisfy
\[
\frac{5}{4} < q < \infty, 2 \leq r \leq 15, \frac{1}{q} + \frac{3}{r} < \frac{3}{2}, \text{ and } \frac{2}{q} + \frac{3}{r} = 2.
\]
Then, for \( a \in I \), we have
\[
\left\| \int_a^t e^{it(s-x)} F(s, x) \, ds \right\|_{L^q_t L^r_x(I)} \lesssim \|F\|_{L^q_t L^r_x(I)}.
\]

Particularly, \((q, r) = (3/2, 9/2)\) satisfies the above conditions.

**Lemma 2.6** (Interaction Morawetz inequality, [8]). Let \( u \in C([0, T] : H^{1/2}) \) be the solution of (1.5) with \( \mu = 1 \) for some \( T > 0 \). Then, we have
\[
\int_0^T \int_{\mathbb{R}^3} |u(t, x)|^4 \, dx \, dt \lesssim \|u_0\|_{L^2_x}^2 \sup_{t \in [0, T]} \|u(t)\|_{H^{1/2}}^2.
\]

2.3. Rescaling. From now on, we assume that \( \mu = 1 \) in (1.5), and for convenience we denote the initial data as \( \tilde{u}_0 \). Fix \( \tilde{u}_0 \in H^{1/2}_x \cap \dot{W}^{s, 1}_x \) with \( \frac{12}{13} < s \leq 1 \). Then, for any \( \delta > 0 \), there exists \( t_0 = t_0(\delta, \tilde{u}_0) < 1 \) such that
\[
\|e^{it\Delta} \tilde{u}_0\|_{L^r_t L^q_x([0, t_0]; H^{1/2}_x)} \lesssim \delta.
\]

Let \( \delta = \delta(\|\tilde{u}_0\|_{H^{1/2}_x \cap \dot{W}^{s, 1}_x}) > 0 \) be a small constant determined later. By standard local theory, the equation (1.5) admits a unique solution \( \tilde{u} \in C([0, t_0]; H^{1/2}_x) \) with initial data \( \tilde{u}_0 \), satisfying
\[
\|\tilde{u}\|_{L^r_t H^\frac{1}{2}_x([0, t_0]; L^q_x)} \lesssim 2 \|\tilde{u}_0\|_{H^\frac{1}{2}_x}, \text{ and } \|\tilde{u}\|_{L^r_t L^q_x([0, t_0]; L^q_x)} \lesssim 2\delta.
\]

Then, we make the scaling transform
\[
u_0 := t_0^{\frac{1}{r}} \tilde{u}_0(t_0^{\frac{1}{r}} x), \text{ and } u(t, x) := t_0^{\frac{1}{r}} \tilde{u}(t_0 t, t_0^{\frac{1}{r}} x).
\]

Now, we have
\[
\|\nu_0\|_{H^{1/2}_x} := \|\tilde{u}_0\|_{H^{1/2}_x}, \text{ and } \|\nu_0\|_{\dot{W}^{s, 1}_x} := t_0^{\frac{1}{r} - 1} \|\tilde{u}_0\|_{\dot{W}^{s, 1}_x}.
\]

Moreover, the local solution \( u \) of (1.5) is defined on \([0, 3]\) with
\[
\|u\|_{L^r_t H^\frac{1}{2}_x([0, 3]; L^q_x)} \lesssim 2 \|\nu_0\|_{H^\frac{1}{2}_x}, \text{ and } \|u\|_{L^r_t L^q_x([0, 3]; L^q_x)} \lesssim 2\delta.
\]
2.4. Decomposition of the solution. For the above $\delta$, we can find sufficiently large dyadic $N_0 = N_0(\delta, t_0, \tilde{u}_0) \in 2^\mathbb{N}$ such that
\[
\|P_{\geq N_0}u_0\|_{H^{1/2}_t} + \|P_{\geq N_0}u_0\|_{\dot{W}^{s,1}_x} \lesssim t_0^{10}\delta. \tag{2.12}
\]
We define that $v_0 = P_{\geq N_0}u_0$ and $w_0 = u_0 - v_0$. Then, we decompose the solution $u$ of (1.5) as $u(t, x) = v(t, x) + w(t, x)$, where $v$ and $w$ satisfy
\[
\begin{cases}
    i\partial_t v + \Delta v = \chi(t)|v|^2v, \\
v(0, x) = v_0(x),
\end{cases}
\tag{2.13}
\]
and
\[
\begin{cases}
    i\partial_t w + \Delta w = |u|^2u - \chi(t)|v|^2v, \\
w(0, x) = w_0(x),
\end{cases}
\tag{2.14}
\]
respectively. In the following, we regard $\|\tilde{u}_0\|_{\dot{H}^{1/2}_{t} \cap \dot{W}_{x}^{s,1}}$ as a constant and omit its dependence for short. We consider the $L^p_x$-norm of $u_0$:
\[
\|u_0\|_{L^2_x} \lesssim \|P_{\leq 1}u_0\|_{L^2_x} + \|P_{>1}u_0\|_{L^2_x}.
\]
Note that
\[
\|P_{>1}u_0\|_{L^2_x} \lesssim \|P_{\geq 1}u_0\|_{\dot{H}^{1/2}_t} \lesssim 1.
\]
By Bernstein’s inequality, $s < \frac{3}{2}$, $\dot{W}^{s,1}_x \hookrightarrow \dot{B}^s_{1,\infty}$, and (2.10),
\[
\|P_{\leq 1}u_0\|_{L^2_x} \lesssim \sum_{N \leq 1} \|P_N u_0\|_{L^2_x} \lesssim \sum_{N \leq 1} N^{3/2} \|P_N u_0\|_{L^1_t} \lesssim \|u_0\|_{\dot{W}^{s,1}_x} \lesssim t_0^{s-1}.
\]
Therefore,
\[
\|u_0\|_{L^2_x} \lesssim t_0^{s-1}. \tag{2.15}
\]
By the above argument and (2.12),
\[
\|v_0\|_{L^2_x} \lesssim t_0^{10}\delta, \tag{2.16}
\]
and
\[
\|w_0\|_{\dot{H}^1_t} \lesssim N_0^{1/2} \|u_0\|_{\dot{H}^{1/2}_t} \lesssim N_0^{1/2}. \tag{2.17}
\]
Using the equation, for any $0 \leq \gamma \leq 1/2$ and $\dot{H}^{\frac{1}{2} - \gamma}_x$-admissible $(q, r)$, we have
\[
\|\nabla \gamma u\|_{L^q_t L^r_x(\mathbb{R}^3)} \lesssim \left( \sum_{N \in 2^\mathbb{Z}} N^{2\gamma} \|P_N u\|_{L^q_t L^r_x(\mathbb{R}^3)}^2 \right)^{1/2} \lesssim \|u_0\|_{\dot{H}^{1/2}_x} \lesssim 1. \tag{2.18}
\]
3. Subcritical estimate of $v$

We define $v(t, x) := e^{it\Delta}v_0$ and
\[
v_{\text{nl}}(t, x) := -i \int_0^t e^{i(t-s)\Delta}\chi(s)|v(s, x)|^2v(s, x) \, ds.
\]
By (2.13), we have $v = v_+ + v_{\text{nl}}$. Using the Strichartz estimate in Lemma 2.1,
\[
\|v\|_{L^\infty_t H^{1/2}_x \cap L^2_x L^2_r(\mathbb{R})} \lesssim \|v_0\|_{H^{1/2}_t} + \|v\|_{L^\infty_t H^{1/2}_x \cap L^2_x L^2_r(\mathbb{R})} \|v\|_{L^2_t L^2_r(\mathbb{R})}^2.
\]
Therefore, by (2.12), (2.16), and the standard fixed point argument, we have that $v$ is global defined, and satisfies
\[
\|v\|_{L^\infty_t H^{1/2}_x \cap L^2_x L^2_r(\mathbb{R})} \lesssim t_0^{10}\delta, \tag{3.1}
\]
and thus by (2.2) in Lemma 2.1,  
\[ \|v_0\|_{L_t^\infty H_x^{1/2} \cap L_t^1 L_x^2(\mathbb{R})} \lesssim t_0^{30} \delta^3. \]  
(3.2)

Using the equation again, by the Bernstein inequality, the Strichartz estimate (2.2) in Lemma 2.1, and the Littlewood-Paley theory, we have the following $\dot{H}^{\frac{5}{2}}_x$ estimate: for any $0 \leq \gamma \leq 1/2$, and $\dot{H}^{\frac{5}{2} - \gamma}_x$-admissible exponent pair $(q, r)$, we have  
\[ \|\nabla |\nabla|^\gamma v\|_{L_t^q L_x^r(\mathbb{R})} \lesssim \left( \sum_{N \in 2^\mathbb{Z}} N^{2\gamma} \|P_N v\|_{L_t^q L_x^r(\mathbb{R})}^2 \right)^{1/2} \lesssim t_0^{10} \delta. \]  
(3.3)

Combining (2.18), (2.11) and (3.3), we also have  
\[ \|\nabla |\nabla|^\gamma w\|_{L_t^q L_x^r((0,3])} \lesssim \left( \sum_{N \in 2^\mathbb{Z}} N^{2\gamma} \|P_N w\|_{L_t^q L_x^r((0,3])}^2 \right)^{1/2} \lesssim \|u_0\|_{\dot{H}^{1/2}_x} \lesssim 1, \]  
(3.4)

and  
\[ \|w\|_{L_t^r L_x^r((0,3])} \lesssim \delta. \]  
(3.5)

Moreover, by Lemma 2.1 and Lemma 2.4, we have the following $L^1$ nonlinear estimate (see [16] for its proof),  
\[ \sum_N N^{\frac{1}{4}} \|P_N (|v|^2 v)\|_{L_t^1 L_x^2(\mathbb{R})} \lesssim t_0^{30} \delta^3. \]  
(3.6)

We denote  
\[ A(N) := \|P_N v_0\|_{L_x^2} + \|P_N (|v|^2 v)\|_{L_t^1 L_x^2(\mathbb{R})}, \]  
(3.7)

and  
\[ B(N) := \|P_N w_0\|_{L_x^2} + \|P_N (|w|^2 w)\|_{L_t^1 L_x^2((0,3])}. \]  
(3.8)

Similarly, we denote $\tilde{A}(N)$ and $\tilde{B}(N)$ with projector $P_N$ replaced by $P_{\gamma}N$. Then, by (2.11), (3.3) and (3.4), we have $t_N^3$-bound:  
\[ \left( \sum_N N(A(N)^2 + \tilde{A}(N)^2) \right)^{\frac{1}{2}} \lesssim t_0^{10} \delta, \text{ and } \left( \sum_N N(B(N)^2 + \tilde{B}(N)^2) \right)^{\frac{1}{2}} \lesssim 1. \]  
(3.9)

The first main result in this section is that on local time interval $[0, 3]$, $v$ belongs to some subcritical space away from the origin, which is inspired by Proposition 4.4 in [1].

**Lemma 3.1.** Suppose that $\frac{1}{2} < s < 1$ and $\|v_0\|_{\dot{H}_x^{1/2} \cap W_{s,1}} \lesssim t_0^{10} \delta$. Let $v$ be the solution of (2.13). Then, for any $0 < \varepsilon < \frac{1}{10}(s - \frac{1}{2})$,  
\[ \|v\|_{X([0,3])} := \sup_{N \geq 1} \left\| t_N^{\frac{s}{2}} N^{\frac{s}{2} + \varepsilon} v_N \right\|_{L_t^r L_x^r((0,3])} \lesssim t_0^{10} \delta. \]  
(3.10)

**Proof.** We bound the linear part using the dispersive estimate:  
\[ \left\| t_N^{\frac{s}{2}} N^{\frac{s}{2} + \varepsilon} P_N v_0 \right\|_{L_t^r L_x^r((0,3])} \lesssim \left\| \nabla \right\|^{\frac{s}{2} + \varepsilon} \|v_0\|_{L_x^r}. \]
Note that \( v_0 = P_{\geq 1} v_0 \), then by interpolation, \( \frac{1}{2} + \frac{10}{3} \varepsilon < s \), and \( W^{s,1} \to \tilde{B}^s_{1,\infty} \),

\[
\| |\nabla|^{\frac{1}{2}+\varepsilon} v_0 \|_{L^2_t} \lesssim \sum_{N \geq 1} N^{\frac{1}{2}+\varepsilon} \| P_N v_0 \|_{L^2_t} \\
\lesssim \sum_{N \geq 1} N^{-\varepsilon} \left( N^{\frac{1}{2}+\frac{10}{3}\varepsilon} \| P_N v_0 \|_{L^1_t} \right)^{\frac{3}{2}} \left( N^{\frac{1}{2}} \| P_N v_0 \|_{L^2_t} \right)^{\frac{1}{2}} \\
\lesssim \| v_0 \|_{W^{s,1}} \| v_0 \|_{H^{1/2}_{t,x}} \lesssim t_0^{10} \delta.
\]

Then, we have

\[
\| t^{\frac{2}{5}} N^{\frac{1}{2}+\varepsilon} P_N v_0 \|_{L^2_{t,x}([0,3])} \lesssim t_0^{10} \delta. \tag{3.11}
\]

For the non-linear part, \( \| t^{9/10} \nabla^{1/2+\varepsilon} P_N v_{nl} \|_{L^2_{t,x}([0,3])} \) can be bounded by

\[
\| t^{\frac{2}{5}} N^{\frac{1}{2}+\varepsilon} \int_0^{t/2} e^{i(t-s)\Delta} \chi(s) P_N (|v|^2 v) \, ds \|_{L^2_{t,x}([0,3])} \tag{3.12} \\
+ \| t^{\frac{2}{5}} N^{\frac{1}{2}+\varepsilon} \int_{t/2}^t e^{i(t-s)\Delta} \chi(s) P_N (|v|^2 v) \, ds \|_{L^2_{t,x}([0,3])}. \tag{3.13}
\]

We bound the term (3.12) by the dispersive estimate, noting that \( t \sim |t - s| \) when \( s \leq t/2 \),

\[
\| N^{\frac{1}{2}+\varepsilon} \int_0^{t/2} \| P_N (|v|^2 v) \|_{L^{1/4}_{t,x}} \, ds \|_{L^2_t([0,3])} \lesssim \| N^{\frac{1}{2}+\varepsilon} P_N (|v|^2 v) \|_{L^1_t L^{1/4}_{t,x}([0,2])} \tag{3.14} \\
\lesssim \| N^{\frac{1}{2}+\varepsilon} P_N (v_2 v_{\geq N} + v_{\sim N} v_{\sim N}^2) \|_{L^1_t L^{1/4}_{t,x}([0,2])},
\]

where we have used the frequency support property

\[
P_N (|v|^2 v) = P_N (v_2 v_{\geq N} + v_{\sim N} v_{\sim N}^2) = P_N (v_2 v_{\geq N} + v_{\sim N} v_{\sim N}^2).
\]

Then by \( N \geq 1 \), Hölder’s inequality and (3.3),

\[
\| N^{\frac{1}{2}+\varepsilon} P_N (v_2 v_{\geq N} + v_{\sim N} v_{\sim N}^2) \|_{L^1_t L^{1/4}_{t,x}([0,2])} \lesssim \| v_{\geq N} \|_{L^\infty_t L^2_x([0,2])} \| v_{\geq N} \|_{L^2_t L^{20/3}_{x}([0,2])} \| v \|_{L^2_t L^{20/3}_{x}([0,2])} \lesssim \| v \|_{L^\infty_t H^{1/2}_{t,x}([-\infty,\infty])} \| v \|_{L^2_t W^{20/3}_{x}([-\infty,\infty])} \| v \|_{L^{40/11}_{t,x} L^{20/3}_{x}([-\infty,\infty])} \lesssim t_0^{10} \delta. \tag{3.15}
\]

Note that for \( N \geq 1 \), by (2.12), we have

\[
N^\varepsilon \tilde{A}(N) \lesssim \| v_0 \|_{H^{1/2}} + \| |\nabla|^\frac{1}{2} (|v|^2 v) \|_{L^1_t L^2_x([-\infty,\infty])} \lesssim t_0^{10} \delta. \tag{3.16}
\]
then combining Lemma 2.4, Lemma 2.2, (3.3) and (3.9), we have
\[
\left\| N^{\frac{1}{2} + \epsilon} P_N \left( v_{\geq N} v_{\leq N}^2 \right) \right\|_{L_t^1 L_x^{5/4} ((0, 2))} \\
\lesssim N^{\frac{1}{2} + \epsilon} \sum_{N_1, N_2 : N_1 \leq N_2 \leq N} \left\| O \left( \sum_{\chi} (\cdot) \right) \right\|_{L_t^2 L_x^1 ((0, 2))} \left\| v_{N_2} \right\|_{L_t^4 L_x^{10/3} ((0, 2))}
\]
\[
\lesssim \sum_{N_1, N_2 : N_1 \leq N_2 \leq N} N^s N_1 A(N_1) \left\| v_{N_2} \right\|_{L_t^{10/3} L_x^{10/3} ((0, 2))}
\]
\[
\lesssim \delta \sum_{N_1, N_2 : N_1 \leq N_2 \leq N} N^{1/2} N_1^2 A(N_1) \left\| \nabla v_{N_2} \right\|_{L_t^{10/3} L_x^{10/3} ((0, 2))} \lesssim t_0^{30} \delta^3.
\]  
Next, we estimate (3.13). Note that we have \( P_N (|v|^2 v) = P_N O (v_{\geq N} v^2) \). Using dyadic decomposition in time, Lemma 2.5 and \( t^3 \subset l^5 \), we have
\[
(3.13) \lesssim \left( \sum_{M \leq 1, M \in 2^\mathbb{Z}} \left\| MN^{\frac{1}{2} + \epsilon} \int_{t/2}^t e^{i(t-s)\Delta} \chi(t) P_N \left( v_{\geq N} v^2 \right) \, ds \right\|_{L_t^5 L_x^5 (([3M/2, 3M]))} \right)^{\frac{1}{5}}
\]
\[
\lesssim \left( \sum_{M \leq 1, M \in 2^\mathbb{Z}} \left\| MN^{\frac{1}{2} + \epsilon} \varphi_{M/4} v_{\geq N} v^2 \right\|_{L_t^5 L_x^5 (([3M/2, 3M]))} \right)^{\frac{1}{5}}
\]
\[
\lesssim \left\| t^{\frac{9}{10}} N^{\frac{1}{2} + \epsilon} P_N \left( v_{\geq N} v^2 \right) \right\|_{L_t^5 L_x^5 (([0, 3]))}
\]
\[
\lesssim N^{\frac{1}{2} + \epsilon} \sum_{N_1 : N_1 \geq N} \left\| t^{\frac{9}{10}} v_{N_1} \right\|_{L_t^5 L_x^5 (([0, 3]))} \left\| v \right\|_{L_t^5 L_x^5 (\mathbb{R})}
\]
\[
\lesssim t_0^{20} \delta^2 \sum_{N_1 : N_1 \geq N} N^{\frac{1}{4} + \epsilon} \left\| MN^{\frac{1}{2} + \epsilon} v_{N_1} \right\|_{L_t^5 L_x^5 (([0, 3]))} \lesssim t_0^{20} \delta^2 \left\| v \right\|_{X([0, 3])}.
\]  
Combining the estimates (3.11), (3.15), (3.17), and (3.18), we have
\[
\left\| v \right\|_{X([0, 3])} \lesssim t_0^{10} \delta + t_0^{20} \delta^2 \left\| v \right\|_{X([0, 3])}.
\]
Noting that \( t_0 < 1 \) and \( \delta \) is sufficiently small, this implies (3.10). \( \square \)

An immediate consequence of Lemma 3.1 is

**Corollary 3.2.** Suppose that \( \frac{1}{2} < s \leq 1 \) and \( \left\| v_0 \right\|_{H_s^{1/2} \cap W_s^{-1}} \leq t_0^{10} \delta \), then
\[
\sum_{N \in 2^\mathbb{Z}} \left\| \left\| \nabla v_N \right\|_{L_t^1 L_x^1 ([1, 3])} \right\|_{L_t^1 L_x^1 ([1, 3])} \lesssim t_0^{10} \delta.
\]  
Next, we derive the global bound for \( v \) when \( t \geq 3 \), for which the estimate is even better. This lemma is one of the key ingredients in our argument, which gives subcritical estimates for long time and will be frequently used in the following.

**Lemma 3.3.** Suppose that \( \frac{1}{2} < s \leq 1 \) and \( \left\| v_0 \right\|_{H_s^{1/2} \cap W_s^{-1}} \leq t_0^{10} \delta \), and let \( v \) be the solution of (2.13). Then, for any \( t \geq 3 \), we have
\[
\left\| v(t) \right\|_{B_{s, \infty}} \lesssim t^{-\frac{3}{2}} t_0^{10} \delta,
\]
and
\[
\left\| v(t) \right\|_{L_x^\infty} \lesssim t^{-\frac{3}{2}} t_0^{10} \delta, \quad \text{and} \quad \left\| v(t) \right\|_{L_x^4} \lesssim t^{-\frac{3}{2}} t_0^{10} \delta.
\]
Proof. First, we prove (3.20). For any \( t > 0 \), by the dispersive estimate
\[
\|v_0\|_{\dot{B}^{2/3}_x,\infty} \lesssim t^{-3/2} \|v_0\|_{\dot{B}^2_x,1} \lesssim t^{-3/2} \|v_0\|_{W^{1,1}} \lesssim t^{-3/2} t_0^{1/2} \delta. \tag{3.22}
\]

For the non-linear part, we have
\[
\|v_n\|_{\dot{B}^{2/3}_x,\infty} \lesssim \int_0^t |t-s|^{-3/2} \sup_{N \leq 2^{s-2}} \|NP_N (|v|^2 v)\|_{L_x^1} \, ds
\lesssim \int_0^t |t-s|^{-3/2} \sup_{N \leq 2^{s-2}} \|P_N \nabla (|v|^2 v)\|_{L_x^1} \, ds 
\lesssim t^{-3/2} \|O (\nabla v^2)\|_{L_t^1([0,2])}
\lesssim t^{-3/2} \sum_N \|O (\nabla v_N v_{\geq N}) + O (\nabla v_N v_{\ll N})\|_{L_x^1([0,2])}. \tag{3.23}
\]

By Hölder’s inequality, Lemma 2.2, and (3.3),
\[
\|\sum_N O (\nabla v_N v_{\geq N})\|_{L_x^1([0,2])} \lesssim \sum_{N_1 \geq N} \|O (\nabla v_N v_{N_1})\|_{L_x^1([0,2])}
\lesssim \sum_{N_1 \geq N} \frac{N_1^{1/2} \|v_N\|_{L_x^2([0,2])} \|v_{N_1}\|_{L_x^2([0,2])} \|v\|_{L_x^2([0,2])}}{N_1^{1/2}} \lesssim t_0^{30} \delta. \tag{3.24}
\]

Changing order of summation and using Hölder’s inequality,
\[
\|\sum_N O (\nabla v_N v_{\ll N})\|_{L_x^1([0,2])} \lesssim \sum_{N_1 \leq N} \sum_{N_2 \leq N} O (\nabla v_{N_1} v_{N_2})\|L_x^1([0,2])
\lesssim \sum_{N_2} \sum_{N_1 \leq N} \|O (\nabla v_{N_1} v_{N_2})\|_{L_x^1([0,2])}
\lesssim \sum_{N_2} \|O (\nabla v_{N_1} v_{N_2})\|_{L_x^2([0,2])} \|v_{N_2}\|_{L_x^2([0,2])}. \tag{3.25}
\]

By the frequency support property, we can update the \( L^1_N \)-summation for \( N \) to \( L^2_N \):
\[
\|\sum_{N_1 \leq N} O (\nabla v_{N_1} v_{N_2})\|_{L_x^2([0,2])} \lesssim \|O (\nabla v_{N_1} v_{N_2})\|_{L_x^2([0,2])} \|v_{N_1}\|_{L_x^2([0,2])}
\lesssim \sum_{N_1 \leq N} \|O (\nabla v_{N_1} v_{N_2})\|_{L_x^2([0,2])}. \tag{3.26}
\]

Note also that by (3.1),
\[
(\sum_{N_2} N_2 \|v_{N_2}\|_{L_x^2([0,2])}^2)^{1/2} \lesssim \|v\|_{L_x^2 H_x^{1/2}([0,2])} \lesssim t_0^{10} \delta. \tag{3.27}
\]
Then using Lemma 2.4, Lemma 2.2, (3.9), and (3.27),
\[
\| \sum_N O(\nabla v_N, v_{N; N}^2, 0) \|_{L^1_T(0,2)} \\
\lesssim \sum_{N_1, N_2: N_1 \leq N_2} \| O(\nabla v_{N_1}) \|_{L^2_T(0,2)} \| v_{N_2} \|_{L^2_T(0,2)} \\
\lesssim \sum_{N_1, N_2: N_1 \leq N_2} (\sum_{N > N_2} N N_1^2 A(N)^2 A(N_1)^2)^{1/2} \| v_{N_2} \|_{L^2_T(0,2)} \\
\lesssim t_0^{20} \delta \sum_{N_1, N_2: N_1 \leq N_2} \frac{N_1^{1/2} N_2^{1/2} A(N_1) A(N_2)^{1/2}}{N_2} \| v_{N_2} \|_{L^2_T(0,2)} \lesssim t_0^{30} \delta. \tag{3.28}
\]

Therefore, by (3.23), (3.24), and (3.28), we obtain \( \| v_{n1} \|_{B^3_{\infty, \infty}} \lesssim t^{-3} t_0^{10} \delta. \) By dispersive estimate and \( H_x^1 \subseteq L^3, \) \( \| v_{n1} \|_{B^0_{\infty, \infty}} \lesssim \| v_{n1} \|_{L^\infty_T} \lesssim t^{-3} \int_0^t \| v(s) \|_{L^3}^2 \ ds \lesssim t^{-3} t_0^{30} \delta. \)

Then, by interpolation, \( \| v_{n1} \|_{B^3_{\infty, \infty}} \lesssim t^{-3} t_0^{30} \delta, \) which completes the proof of (3.20).

By (3.22), we have
\[
\| v(t) \|_{L^\infty_T} \lesssim \sum_{N \geq 1} \| P_N v_0 \|_{L^\infty_T} + \| v_{n1} \|_{L^\infty_T} \\
\lesssim t^{-\frac{s}{2}} \sum_{N \geq 1} \| P_N v_0 \|_{L^1_T} + t^{-\frac{s}{2}} t_0^{30} \delta \tag{3.29}
\]
\[
\lesssim t^{-\frac{s}{2}} \| v_0 \|_{W^{s,1}_x} + t^{-\frac{s}{2}} t_0^{30} \delta \\
\lesssim t^{-\frac{s}{2}} t_0^{10} \delta.
\]

Moreover, \( L^4 \)-estimate follows from (3.21) and the interpolation
\[
\| v(t) \|_{L^4_T} \lesssim \| v(t) \|_{L^\infty_T}^{1/4} \| v(t) \|_{L^2_T}^{3/4}. \tag{3.30}
\]

This finishes the proof of this lemma.

\[\square\]

4. Energy estimate

First, we have the following local estimate of \( w. \) Note that \( w \) satisfies
\[
w(t) = e^{i \Delta} w_0 - i \int_0^t e^{i(t-s) \Delta} (|u|^2 u - \chi(s) |v|^2 v) \ ds. \tag{4.1}
\]

**Proposition 4.1.** Suppose that \( \frac{1}{2} < s \leq 1, \) \( \tilde{u}_0 \in \dot{H}_x^{1/2} \cap \dot{W}^{s,1}_x, \) \( u_0(x) = t_0^{1/2} \tilde{u}_0(t_0^{1/2} x), \) and let \( v \) and \( w \) be the solutions of equations (2.13) and (2.14), respectively. Then,
\[
\sup_{0 \leq t \leq 3} \| w(t) \|_{\dot{H}^1_x} \lesssim N_0^{1/2} \| u_0 \|_{\dot{H}^{1/2}_x}^s. \tag{4.2}
\]

**Proof.** We define \( \tilde{X}([0,3]) \) norm as
\[
\| w \|_{\tilde{X}([0,3])} := \| w \|_{L^\infty_T \dot{H}^1_x([0,3])} + \left( \sum_{N \in 2^Z} N^2 \| P_N w \|_{L^2_T([0,3])} \right)^{1/2} + N \| P_N w \|_{L^\infty_T([0,3])}^{1/2}
\]
\[
+ \left( \sum_{N \in 2^Z} N \| P_N w \|_{L^2_T([0,3])}^{2} + N^{4s-1} \| P_N w \|_{L^\infty_T([0,3])}^{2} \right)^{1/2}. \tag{4.3}
\]
Here $\varepsilon \ll 1$ is a fixed positive small number. By (2.1) and (2.3) in Lemma 2.1 and (2.17), we have
\[
\| e^{it\Delta} w_0 \|_{X([0,3])} \lesssim N_0^{1/2} \| w_0 \|_{H^{1/2}}. \tag{4.4}
\]

For the non-linear part, by the Sobolev inequality and (2.2) in Lemma 2.1, we have
\[
\| \int_0^t e^{i(t-s)\Delta} \left( |u|^2 u - \chi(s) |v|^2 v \right) \, ds \|_{X([0,3])} \\
\lesssim \left( \sum_N N^2 \left\| P_N \left( |u|^2 u - \chi(s) |v|^2 v \right) \right\|_{L^2_t L^2_x([0,3])}^{1/2} \right)^2 \\
\lesssim \left( \sum_N N^2 \left\| (1 - \chi(t)) P_N \left( |v|^2 v \right) \right\|_{L^2_t L^2_x([0,3])}^{1/2} \right)^2 \\
+ \left( \sum_N N^2 \left\| P_N \left( |u|^2 u - |v|^2 v \right) \right\|_{L^2_t L^2_x([0,3])}^{1/2} \right)^2. \tag{4.5}
\]

For the first term (4.5), by Minkowski’s inequality and the Littlewood-Paley theory, it suffices to estimate
\[
\| \nabla (|v|^2 v) \|_{L^{10/7}_{t,x}([1,3])}. \tag{4.7}
\]
To this end, we use the similar method in the proof of (3.20) in Lemma 3.3 and write
\[
\nabla (|v|^2 v) = \sum_N O (\nabla v_N v \geq N \, v) + O (\nabla v_N v \leq N \, v). \tag{4.8}
\]
By Hölder’s inequality, Lemma 2.2, (3.3), and (3.19), we have
\[
\left\| \sum_N O (\nabla v_N v \geq N \, v) \right\|_{L^{10/7}_{t,x}([1,3])} \lesssim \sum_{N_1 \geq N} \left\| O (\nabla v_N v_{N_1} \, v) \right\|_{L^{10/7}_{t,x}([1,3])} \\
\lesssim \sum_{N_1 \geq N} N^{1/2} N_{1/2} \left\| v_N \right\|_{L^{10}_{t,x}([1,3])} \left\| v_{N_1} \right\|_{L^{10}_{t,x}(\mathbb{R})} \left\| v \right\|_{L^{10}_{t,x}(\mathbb{R})} \lesssim t_0^{30} \delta^3. \tag{4.9}
\]
Using the similar argument in (3.26), and then using Lemma 2.4, Lemma 2.2, (3.9), and (3.19), we have
\[
\left\| \sum_N O (\nabla v_N v \leq N \, v) \right\|_{L^{10/7}_{t,x}([1,3])} \lesssim \sum_{N_1 \geq N_2; N_1 \leq N_2} \left\| O (\nabla v_N v_{N_1}) \right\|_{L^{10}_{t,x}([0,3])} \left\| v_{N_2} \right\|_{L^{10}_{t,x}([1,3])} \lesssim t_0^{30} \delta^3. \tag{4.10}
\]
Combining (4.8) and (4.9), we have
\[
\| \nabla (|v|^2 v) \|_{L^{10/7}_{t,x}([1,3])} \lesssim t_0^{30} \delta^3. \tag{4.11}
\]
For the term (4.6), we have
\[
\left( \sum_N N^2 \left\| P_N \left( |u|^2 u - |v|^2 v \right) \right\|_{L^2_t L^2_x([0,3])}^{1/2} \right)^2 \\
\lesssim \left( \sum_N N^2 \left\| P_N \left( w_N \left( w^2 + w v + v^2 \right) \right) \right\|_{L^2_t L^2_x([0,3])}^{1/2} \right)^2 \tag{4.12}
\]
}\]

3D NLS
\[
\left( \sum_N N^2 \left\| P_N O \left( v_{\geq N} \left( w^2 + wv \right) \right) \right\|_{L_t^1 L_x^2 \cap L_t^2 L_x^\infty([0,3])}^2 \right)^{1/2}.
\] (4.12)

We first estimate the term (4.11). We only consider the term \( O \left( w_{\geq N} w^2 \right) \), since other terms can be treated similarly. Since
\[
P_N O \left( w_{\geq N} w^2 \right) = P_N O \left( w_{\geq N} w_{\geq N} w \right) + P_N O \left( w_{\sim N} w_{\leq N} \right),
\]
by Hölder’s inequality, (3.4), (3.5), and Lemma 2.2, we have
\[
(\sum_N N^2 \left\| P_N O \left( w_{\geq N} w_{\geq N} w \right) \right\|_{L_t^1 L_x^\infty([0,3])}^2)^{1/2} \leq \delta \left( \sum_N (\sum_{N_1, N_2: N_1, N_2 \geq N} N \left\| w_{N_1} \right\|_{L_t^1 L_x^\infty([0,3])} \left\| w_{N_2} \right\|_{L_t^1 L_x^\infty([0,3])} )^2 \right)^{1/2}
\]
\[
\leq \delta \left( \sum_N \left( \sum_{N_1, N_2: N_1, N_2 \geq N} N \left( \frac{1}{N_1^{1/2}} \frac{1}{N_2^{1/2}} \right) \left\| w_{N_1} \right\|_{L_t^1 L_x^\infty([0,3])} \left\| w_{N_2} \right\|_{L_t^1 L_x^\infty([0,3])} \right)^{1/2} \right)^{1/2}
\]
\[
\leq \delta \sum_{N_1, N_2} \left( \sum_{N_1, N_2: N_1, N_2 \geq N} N \left( \frac{1}{N_1^{1/2}} \frac{1}{N_2^{1/2}} \right) \left\| w_{N_1} \right\|_{L_t^1 L_x^\infty([0,3])} \left\| w_{N_2} \right\|_{L_t^1 L_x^\infty([0,3])} \right) \leq \delta \left\| w \right\|_{\tilde{X}([0,3])}.
\] (4.13)

Similarly using only Hölder’s inequality and (3.5), we also have
\[
(\sum_N N^2 \left\| P_N O \left( w_{\sim N} w_{\leq N} \right) \right\|_{L_t^1 L_x^\infty([0,3])}^2)^{1/2} \leq \delta \left( \sum_N N^2 \left\| w_{\sim N} \right\|_{L_t^1 L_x^\infty([0,3])}^2 \right)^{1/2}
\]
\[
\leq \delta \left\| w \right\|_{\tilde{X}([0,3])}.
\] (4.14)

Therefore, by (4.13) and (4.14), we get
\[
(4.11) \lesssim \delta \left\| w \right\|_{\tilde{X}([0,3])}.
\] (4.15)

For the second term (4.12), we write
\[
P_N O \left( v_{\geq N} \left( w^2 + wv \right) \right) = P_N O \left( v_{\geq N} \left( w_{\leq N} + w_{\leq N} w_{\geq N} \right) \right)
+ P_N O \left( v_{\geq N} w_{\geq N} + v_{\geq N} w_{\geq N} + v_{\geq N} v_{\geq N} w \right).
\]
Treated similarly as (4.13), we have
\[
(\sum_N N^2 \left\| P_N O \left( v_{\geq N} w_{\geq N} + v_{\geq N} w_{\geq N} + v_{\geq N} v_{\geq N} w \right) \right\|_{L_t^1 L_x^2 \cap L_t^2 L_x^\infty([0,3])}^2)^{1/2} \lesssim \delta \left\| w \right\|_{\tilde{X}([0,3])}.
\] (4.16)

Therefore, it suffices to estimate
\[
(\sum_N N^2 \left\| O \left( v_{\sim N} \left( w_{\leq N} + w_{\leq N} w_{\geq N} \right) \right) \right\|_{L_t^1 L_x^2 \cap L_t^2 L_x^\infty([0,3])}^2)^{1/2}.
\] (4.17)

By Minkowski’s inequality,
\[
(4.17) \lesssim \sum_{N_1, N_2} \left( \sum_{N: N \gg N_1, N_2} N^2 \left\| O \left( v_{N_2} w_{N_1} \right) \right\|_{L_t^1 L_x^2 \cap L_t^2 L_x^\infty([0,3])}^2 \right)^{1/2}.
\] (4.18)
For \( N_1, N_2 \ll N, 1 < q_0 \leq 2 \), by Lemma 2.4, we have the following tri-linear estimate:

\[
\begin{align*}
N \|O (v_N (v_{N_2} + w_{N_2}) w_{N_1})\|_{L^1_t L^2_x ([0, 3])} & \\
\lesssim N \|O (v_N (v_{N_2} + w_{N_2}))\|_{L^6_t L^2_x ([0, 3])} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} & \\
\lesssim N^{\frac{1}{2}} N_2^{-\frac{2}{30}} \lesssim_A N (A(N_2) + B(N_2)) N_1^\frac{\delta}{3} N_1^{-\frac{2}{3}} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} & \quad (4.19)
\end{align*}
\]

Therefore, by (4.18), (4.19) and (3.9), we have

\[
(4.17) \lesssim t_0^\delta \sum_{N_1 \leq N_2} \left( N_2 \right)^{\frac{\delta}{30}} N_2^\frac{1}{2} (A(N_2) + B(N_2)) N_1^{\frac{\delta}{3}} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} \quad (4.20)
\]

Note that for both choices \( q_0 = 2 \) and \( q_0 = 1/(1 - \varepsilon) \) for \( \varepsilon \ll 1 \), we have

\[
\| N_1^{\frac{\delta}{30}} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} \|_{L^2_{N_1}} \lesssim \| w \|_{\tilde{X}([0, 3])}. \quad (4.21)
\]

Therefore, we can choose \( q_0 = 1/(1 - \varepsilon) \) when \( N_1 \leq N_2 \), and \( q_0 = 2 \) when \( N_1 \geq N_2 \). Using Lemma 2.2, (3.9) and (4.21), we have

\[
(4.17) \lesssim t_0^\delta \sum_{N_1 \leq N_2} \left( N_2 \right)^{\frac{\delta}{30}} N_2^\frac{1}{2} (A(N_2) + B(N_2)) N_1^{\frac{\delta}{3}} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} + t_0^\delta \sum_{N_1 \geq N_2} \left( N_2 \right)^{\frac{\delta}{30}} N_2^\frac{1}{2} (A(N_2) + B(N_2)) N_1^{\frac{\delta}{3}} \| w_{N_1} \|_{L^6_t L^\infty_x ([0, 3])} \quad (4.22)
\]

Together with (4.4), (4.10), (4.15), (4.16), and (4.22), we have

\[
\| w \|_{\tilde{X}([0, 3])} \lesssim N_0^{1/2} \| u_0 \|_{H^{1/2}} + t_0^\delta + t_0^\delta \| w \|_{\tilde{X}([0, 3])}, \quad (4.23)
\]

then by choosing \( \delta \) small enough, we have

\[
\| w \|_{\tilde{X}([0, 3])} \lesssim N_0^{1/2} \| u_0 \|_{H^{1/2}},
\]

which completes the proof of (4.2). \( \square \)

Define that

\[
E(w(t)) = \frac{1}{2} \int_{\mathbb{R}^3} |\nabla w(t, x)|^2 \, dx + \frac{1}{4} \int_{\mathbb{R}^3} |w(t, x)|^4 \, dx.
\]

By (4.2), (2.10), (2.12), Sobolev’s inequality, and the interpolation,

\[
\sup_{0 \leq t < 3} \| w(t) \|_{L^6_t} \lesssim \sup_{0 \leq t < 3} \| w(t) \|_{L^\frac{6}{5}_t} \| w(t) \|_{L^\frac{6}{5}_x} \lesssim N_0^{1/4}.
\]

Then, there exists a constant \( C_0 = C_0(\| \tilde{u}_0 \|_{H^{1/2}}) > 0 \) such that

\[
\sup_{0 \leq t < 3} E(w(t)) \leq C_0 N_0. \quad (4.24)
\]

Next, we turn to the energy bound of \( w \) when \( t \geq 3 \). For all \( t \geq 0 \), by conservation law \( \| u(t) \|_{L^2_t}^2 = \| u_0 \|_{L^2_x}^2 \), and (3.1), we have

\[
\| w(t) \|_{L^2_t} \lesssim t_0^{\frac{1}{2} - 1}. \quad (4.25)
\]
We take $3 < T_0 < \infty$ such that $u$ is well-posed on $[0, T_0)$. We are going to prove that

**Proposition 4.2.** Suppose that $12/13 < s \leq 1$, $\tilde{a}_0 \in \dot{H}_x^{1/2} \cap \dot{\dot{W}}_x^{s, 1}$, and $u_0(x) = t_0^{1/2}\tilde{u}_0(t_0^{1/2} x)$. Let $v$ and $w$ be the solution of equations (2.13) and (2.14), respectively. Then,

$$
\sup_{3 \leq t < T_0} E(w(t)) < 2C_0N_0.
$$

\hspace{1cm} (4.26)

**Proof.** Suppose that (4.26) did fail, then we could define

$$
T := \inf \{ 3 < T_1 < T_0 : \sup_{3 \leq t < T_1} E(w(t)) \geq 2C_0N_0. \}
$$

In the following, we denote $\lesssim_{C_0}$ as $\lesssim$ for short.

We first collect some useful estimates. By definition of $T$, for $0 \leq t \leq T$, we have that

$$
\|w(t)\|_{H_x^{1/2}} \lesssim N_0^{1/2}, \quad \|w(t)\|_{L_t^1} \lesssim N_0^{1/4}.
$$

Combining (4.25), for any $0 \leq l \leq 1$,

$$
\|w\|_{L_t^l H_x^l(0, T)} + \|u\|_{L_t^l H_x^l(0, T)} \lesssim N_0^{1/4}t_0^{-1/2}.
$$

Using the interaction Morawetz inequality in Lemma 2.6, (4.28) and (3.1), we have

$$
\|v\|_{L_t^4 H_x^3(0, T)} \lesssim t_0^{-\delta}, \quad \text{and} \quad \|w\|_{L_t^4 H_x^3(0, T)} \lesssim N_0^{-1/8}t_0^{3(s-2)}.
$$

Interpolating with $\|w\|_{L_t^3 L_x^2(0, T)} \lesssim N_0^{1/2}$,

$$
\|w\|_{L_t^4 L_x^{5/2}(0, T)} \lesssim N_0^{1/4}t_0^{-\delta/2}.
$$

Using the equation (2.14) and (4.30), we have

$$
\begin{align*}
\|w\|_{L_t^1 L_x^2(0, T)} &\lesssim N_0^{1/4} + \|\nabla \frac{1}{2}(|u|^2w)\|_{L_t^1 L_x^2(0, T)} \\
&\lesssim N_0^{1/4} + \|\nabla \frac{1}{2}u\|_{L_t^1 L_x^2(0, T)} \|u\|_{L_t^1 L_x^2(0, T)} \lesssim N_0^{3/4}t_0^{3(s-2)}.
\end{align*}
$$

Then, by (4.27), (4.25), (4.30), and (4.31), for any $0 \leq \alpha \leq 1$ and $N \in 2\mathbb{Z}$, we have

$$
\begin{align*}
N^\alpha \|P_Nw_0\|_{L_t^2} + N^\alpha \|P_N(|u|^2u)\|_{L_t^1 L_x^2(0, T)} \\
\lesssim N_0^{\frac{\delta}{2}} + \|u\|_{L_t^\infty H_x^2(0, T)} \|u\|_{L_t^4 L_x^2(0, T)} \|u\|_{L_t^4 L_x^2(0, T)} \lesssim N_0^{\frac{\delta}{2} + 1}t_0^{(\frac{13}{4} - \frac{3}{4}\alpha)(s-2)}.
\end{align*}
$$

Moreover, for $0 \leq \alpha \leq \frac{1}{2}$, we can improve the bound by (4.27), (4.25), and (4.29),

$$
\begin{align*}
N^\alpha \|P_Nw_0\|_{L_t^2} + N^\alpha \|P_N(|u|^2u)\|_{L_t^1 L_x^2(0, T)} \\
\lesssim N_0^{\frac{\delta}{2}} + \|\nabla \|u\|_{L_t^4 L_x^2(0, T)} \|u\|_{L_t^4 L_x^2(0, T)} \lesssim N_0^{\frac{\delta}{2} + 1}t_0^{(\frac{13}{4} - \frac{3}{4}\alpha)(s-2)}.
\end{align*}
$$

Inspired by [16], we define the modified energy by

$$
\mathcal{E}(w(t)) = E(w(t)) + \langle |w|^2w, v \rangle.
$$

\hspace{1cm} (4.34)

Then, we have

$$
\frac{d}{dt}\mathcal{E}(w(t)) = \langle |w|^2w, v_t \rangle - \langle w_t, |v|^2v \rangle - \langle w_t, 2|v|^2w + v^2w \rangle.
$$

\hspace{1cm} (4.35)
Therefore, noting that $C_0N_0 \geq 1$,

$$
sup_{3 \leq t \leq T} |\mathcal{E}(w(t)) - E(w(t))| \leq \frac{1}{100} C_0N_0.
$$

(4.36)

Note that for $t \geq 3$, $v_t = i\Delta v$. After integrating by parts in $x$, we have

$$
\int_3^T \left| \langle |w|^2 w, v_t \rangle \right| \, dt \lesssim \int_3^T \left| \int O(\nabla w \cdot \nabla vw^2) \, dx \right| \, dt.
$$

(4.37)

Therefore, for any $3 \leq t \leq T$, by (4.24), (4.36), and (4.35), it follows that

$$
\mathcal{E}(w(t)) \leq \mathcal{E}(w(3)) + \int_3^t \left| \frac{d}{ds} \mathcal{E}(w(s)) \right| \, ds
$$

\begin{align*}
&\leq C_0N_0 + \frac{1}{100} C_0N_0 + \int_3^T \left| \langle |w|^2 w, v_t \rangle \right| \, dt + C \int_3^T \int (|w|^4 + |v|^4)|v|^2 \, dx \, dt \\
&\quad + C \int_3^T \int |\nabla vw|^2 \, dx \, dt + C \int_3^T \left| \int O(\nabla w \cdot \nabla vv(w + v)) \, dx \right| \, dt \\
&\leq \frac{101}{100} C_0N_0 + \int_3^T \int (|w|^4 + |v|^4)|v|^2 \, dx \, dt \\
&\quad + C \int_3^T \int |\nabla vw|^2 \, dx \, dt + C \int_3^T \left| \int O(\nabla w \cdot \nabla (w^2 + vv + v^2)) \, dx \right| \, dt.
\end{align*}

(4.38)

By (4.29) and (3.21), we have

$$
\int_3^T \int (|w|^4 + |v|^4)|v|^2 \, dx \, dt \lesssim \left( \|w\|^4_{L^4_x(\mathbb{R}^3)} + \|v\|^4_{L^4_x(\mathbb{R}^3)} \right) \|v\|^2_{L^2_xL^\infty_T(\mathbb{R}^3)}
$$

\begin{align*}
&\lesssim N_0^{1/2} t_0 (s-2) \delta (t_0^2 \delta)^2 \lesssim \delta^2 N_0^{1/2}.
\end{align*}

(4.39)

By (4.27) and (3.21), we also have

$$
\int_3^T \int |\nabla vw|^2 \, dx \, dt \lesssim \|w\|^2_{L^\infty_tH^1_x(\mathbb{R}^3)} \|v\|^2_{L^2_xL^\infty_T(\mathbb{R}^3)} \lesssim \delta^2 N_0.
$$

(4.40)

By (4.29) and (3.21), we have

$$
\int_3^T \left| \int O(\nabla w \cdot \nabla v_{\leq 1}(w^2 + vv + v^2)) \, dx \right| \, dt
$$

\begin{align*}
&\lesssim \|\nabla w\|_{L^\infty_tL^2_x(\mathbb{R}^3)} \|v\|_{L^2_tL^\infty_x(\mathbb{R}^3)} \left( \|w\|^2_{L^4_tL^2_x(\mathbb{R}^3)} + \|v\|^2_{L^4_tL^2_x(\mathbb{R}^3)} \right) \\
&\lesssim N_0^{1/2} t_0^2 \delta \cdot N_0^{1/4} t_0^3 (s-2) \lesssim \delta N_0^{3/4}.
\end{align*}

(4.41)

Then, it suffices to consider the term

$$
\int_3^T \left| \int O(\nabla w \cdot \nabla v_{> 1}(w^2 + vv + v^2)) \, dx \right| \, dt.
$$

(4.42)

By the frequency support property, we can divide it into three terms,

$$
(4.42) \lesssim \sum_{N \geq 1} \int_3^T \int |\nabla v_N \cdot \nabla vw_{\geq N} (v + w)| \, dx \, dt
$$

(4.43)

$$
+ \sum_{N \geq 1} \int_3^T \int |\nabla v_N \cdot \nabla vw_{\geq N} (v + w)| \, dx \, dt
$$

(4.44)
\[ + \sum_{N \geq 1} \int_0^T \int |\nabla v_N \cdot \nabla w_N (w_{\leq N}^2 + v_{\leq N} w_{\leq N} + v_{\leq N}^2)| \, dx \, dt. \tag{4.45} \]

For (4.43), from (4.27), (4.29), and the Sobolev inequality, we have for any \( 1 \geq s > \frac{5}{6}, \)
\[ \int_0^T \int |\nabla v_N \cdot \nabla w_{\leq N}(v + w)| \, dx \, dt \]
\[ \lesssim \|\nabla v_N\|_{L_t^2 L_x^\infty([3,T])} \|\nabla w\|_{L_t^\infty L_x^2([3,T])} \|w_{\leq N}\|_{L_t^\infty L_x^\infty([3,T])} \|w_{\leq N}\|_{L_t^\infty L_x^2([3,T])} \]
\[ \cdot \left( \| v \|_{L_t^{12} L_x^1([3,T])} + \| w \|_{L_t^{12} L_x^1([3,T])} \right) \]
\[ \lesssim N_0^{\frac{25}{48}} t_0^{2(s-2)} \|\nabla v_N\|_{L_t^2 L_x^\infty([3,T])} \|w_{\leq N}\|_{L_t^2 L_x^\infty([3,T])} \lesssim N_0^{\frac{25}{48}} t_0^{2(s-2)} \|\nabla v_N\|_{L_t^2 L_x^\infty([3,T])}. \tag{4.46} \]

Hence, applying Lemma 3.3, we have
\[ (4.43) \lesssim N_0 \sum_{N \geq 1} N^{\frac{s}{2} - \frac{25}{48}} t_0^{2(s-2)} \cdot t_0^0 \delta \lesssim \delta N_0. \tag{4.47} \]

For (4.44), by Hölder’s inequality, (4.27), (3.1), and (4.25),
\[ \int_0^T \int |\nabla v_N \cdot \nabla w_{\leq N}(v + w)| \, dx \, dt \]
\[ \lesssim \|\nabla v_N\|_{L_t^\infty L_x^2([3,T])} \|\nabla w\|_{L_t^\infty L_x^2([3,T])} \left( \| v \|_{L_t^\infty L_x^2([3,T])} + \| w \|_{L_t^\infty L_x^2([3,T])} \right) \]
\[ \lesssim N_0^{1/2} N^{1-2s} t_0^{s-2} \|\nabla v_N\|_{L_t^2 L_x^\infty([3,T])} \|\nabla w\|_{L_t^\infty L_x^2([3,T])} \|w_{\leq N}\|_{L_t^2 L_x^\infty([3,T])}. \tag{4.48} \]

Therefore, using (3.20) and (3.21), we have for any \( 1 \geq s > \frac{1}{2}, \)
\[ (4.44) \lesssim \sum_{N \geq 1} N_0^{1/2} N^{1-2s} t_0^{s-2} \cdot (t_0^0 \delta)^2 \lesssim \delta^2 N_0^{1/2}. \tag{4.49} \]

Finally, we deal with the term (4.45). Since the estimate of \( v \) will not increase the bound of \( N_0 \), the worst case is as follows, and the others can be treated similarly:
\[ \sum_{N \geq 1} \int_0^T \int |\nabla v_N \cdot \nabla w_{\leq N} w_{\leq N} w_{\leq N}| \, dx \, dt. \tag{4.50} \]

By Hölder’s inequality and (4.29),
\[ \int_0^T \int |\nabla v_N \cdot \nabla w_{\leq N} w_{\leq N} w_{\leq N}| \, dx \, dt \]
\[ \lesssim \|\nabla v_N\|_{L_t^{12} L_x^1([3,T])} \|\nabla w_{\leq N} w_{\leq N}\|_{L_t^{12} L_x^1([0,T])} \|\nabla w\|_{L_t^\infty L_x^2([3,T])} \|w_{\leq N}\|_{L_t^\infty L_x^\infty([3,T])} \|w_{\leq N}\|_{L_t^{12} L_x^2([3,T])}. \tag{4.51} \]

Interpolating (4.25) with (4.29), we have
\[ \|w_{\leq N}\|_{L_t^{12} L_x^2([3,T])} \lesssim \|w\|_{L_t^\infty L_x^2([3,T])} \|w\|_{L_t^{12} L_x^2([3,T])} \lesssim N_0^{\frac{25}{48}} t_0^{2(s-2)}. \tag{4.52} \]
By Lemma 2.4, (4.32), and (4.33), we have
\[
\left\| \nabla \tilde w_{N} w_{N, w_{N, N}} \right\|_{L_{t}^{a} L_{x}^{r}([0, T])} \lesssim \sum_{N_{1}, N_{2} \ll N} N^{\frac{1}{2}} N \left( \left\| P_{N} w_{0} \right\|_{L_{t}^{2}} + \left\| P_{N} \left( |u|^{2} u \right) \right\|_{L_{t}^{2} L_{x}^{s}([0, T])} \right) \\
\cdot N^{\frac{1}{12}} \left( \left\| P_{N_{1}} w_{0} \right\|_{L_{t}^{2}} + \left\| P_{N_{1}} \left( |u|^{2} u \right) \right\|_{L_{t}^{2} L_{x}^{s}([0, T])} \right)
\lesssim N^{\frac{7}{2}} N_{0}^{\frac{9}{2}} t^{7(s-2)-}.
\]
(4.53)

By (4.27), (4.51), (4.52), (4.53), and (3.20), we have for any $1 \geq s > \frac{12}{13}$,
\[
\left(4.50\right) \lesssim N_{0}^{-1} \sum_{N \geq 1} N^{\frac{12}{13} - s} t_{0}^{\frac{48}{25} - (s-2)-} \left\| |\nabla|^{s} \tilde v_{N} \right\|_{L_{t}^{25} L_{x}^{\infty}([0, T])} \\
\lesssim N_{0}^{-1} \sum_{N \geq 1} N^{\frac{12}{13} - s} t_{0}^{\frac{48}{25} - (s-2)-} t_{0}^{10} \delta \lesssim \delta N_{0}.
\]
(4.54)

Then, by (4.47), (4.49) and (4.54), we have
\[
\left(4.42\right) \lesssim \delta N_{0}.
\]
(4.55)

Therefore, (4.39), (4.40), (4.41), and (4.55) imply
\[
\sup_{t \in [3, T]} E(w(t)) \leq \frac{101}{100} C_{0} N_{0} + C(C_{0}) \delta N_{0} \leq \frac{3}{2} C_{0} N_{0},
\]
(4.56)

which contradicts to the definition of $T$. Then, we obtain (4.26). \qed

**Proof of Theorem 1.1.** Note that by (3.1), (4.25) and Proposition 4.2, we obtain that for some $C(N_{0}, \| \tilde u_{0} \|_{H_{x}^{1} \cap W_{x}^{s, 1}} > 0$, such that
\[
\| u \|_{L_{t}^{\infty} H_{x}^{s}(I)} \leq C(N_{0}, \| \tilde u_{0} \|_{H_{x}^{1} \cap W_{x}^{s, 1}}).
\]
Here $I$ is the maximal lifespan. Then the global well-posedness and scattering follows directly from the conclusion in [26]. This finishes the proof of Theorem 1.1. \qed
