General Experimental

The photochemical reactions carried out in this study were performed using a water cooled, 125 W medium pressure mercury discharge lamp in a pyrex immersion well. All reactions were carried out at ambient temperature and under a nitrogen atmosphere unless otherwise stated. The reaction glassware was flame-dried as standard. Concentration in vacuo refers to distillation on a Buchi rotary evaporator. Flash chromatography was performed using Fluorochem silica gel 60 (0.040 – 0.063), eluting with the solvents stated. T.l.c. was performed using Merck plastic coated plates covered with a 0.2 mm layer of silica gel 60 F254. Product spots were visualised by UV irradiation at 254 nm and subsequent staining with potassium permanganate solution, followed by heating. UV spectra were recorded in the range 200-400 nm using a Shimadzu UV10 UV/VIS Recording Spectrophotometer and peaks are reported as \( \text{max(MeCN)/nm} \) which refers \( \nu_{\text{max}} \) in wavelength. IR spectra were recorded in the range 4000-600 cm\(^{-1}\) using an IR Perkin-Elmer Spectrum 1 FTIR Spectrophotometer and peaks were reported as \( \text{max(film)/cm}^{-1} \) which refers to the \( \nu_{\text{max}} \) in wavenumbers. Nuclear Magnetic Resonance spectra were recorded as solutions in the deuterated solvent stated, using tetramethylsilane as an internal standard. The spectra were recorded at 400 MHz on a Jeol Delta GX400 spectrometer, and at 300 MHz on a Jeol Lambda GX300 spectrometer. The chemical shift values were measured in parts per million (ppm) and reported as \( \delta \) for proton and carbon spectra. Coupling constants \( J \) are measured in Hz. Mass spectra were recorded on a micromass analytical machine, using either Chemical Ionisation (CI) or Electron Ionisation (EI). The mass of the fragment is given, followed by the relative intensity as a percentage in brackets. X-ray measurements were made using a Bruker SMART CCD area-detector diffractometer. The compounds in the supplementary information are numbered in the order they appear in this section, and where appropriate their relevant number in the main text is highlighted.

**General Procedure**

The sodium alkoxide component was formed in situ by the addition of sodium (1 equiv) to the desired alcohol. This solution was then added dropwise to a solution of the maleimide (1 equiv) in the alcohol. After 1 h the reaction mixture was concentrated in vacuo, then separated between EtOAc and aqueous ammonium chloride solution. The aqueous layer was washed with EtOAc, then the combined organic...
extracts washed with water, brine, and dried (MgSO₄). Concentration in vacuo, followed by purification by column chromatography [Et₂O (10-30%) in PE] gave the desired maleimides.

3,3-dimethoxy-2,5-pyrrolidinedione 7: Bromine (12.4 g, 4.0 ml, 77.3 mmol) was added dropwise to a solution of maleimide (5.0 g, 51.5 mmol) in MeOH (200 ml) at 0°C. The reaction mixture was stirred for 16 h at RT, then concentrated \textit{in vacuo}. The crude material was redissolved in MeOH (75 ml) and added dropwise to a solution of sodium metal (4.74 g, 206 mmol) in MeOH (200 ml). After a further 20 h the reaction mixture was concentrated \textit{in vacuo}, then EtOAc (100 ml) was added. The mixture was neutralised by slow addition of 7M HCl, then separated between water (100 ml) and EtOAc (100 ml). The aqueous layer was washed with EtOAc (2 × 200 ml), then the combined organic extracts washed with brine (50 ml), and dried (MgSO₄). Concentration \textit{in vacuo} gave title compound 7 (7.82 g, 96%) as a white solid, mp (EtOAc) 81-82°C (Lit\(^2\) mp 83-85°C); \textit{max}(film)/cm\(^{-1}\) 3214 (br), 1717 (s); \(^1\)H NMR (400 MHz; MeOD); 2.84 (2H, s, C\(\text{H}_2\)), 3.39 (6H, s, 2 × OC\(\text{H}_3\)), 4.86 (1 H, s, NH); \(^13\)C NMR (100 MHz; MeOD) δ 40.3 (CH\(\text{C}\)), 50.0 (2 × CH\(\text{C}\)), 99.8 (C), 173.2 (CO), 173.9 (CO); \textit{m/z} (EI) 169 (M\(^+\), 11%), 131 (33), 84 (100).

Methoxy maleimide 8: 7 (7.2 g, 45.3 mmol) and TsOH (0.75 g, 3.94 mmol) were dissolved in toluene (200 ml) and heated at reflux for 6 h. No condenser was fitted during this process, instead fresh toluene was dripped in to the reaction flask at such a rate as to maintain a constant volume of solvent. The reaction mixture was allowed to cool to RT, then purified by dry column chromatography [EtOAc (20%-80%) in PE] to give title compound 8 (4.60 g, 80%) as a white solid, mp (EtOAc) 170-171°C (Lit\(^2\) mp 169°C); \textit{max}(film)/cm\(^{-1}\) 3214 (br), 1714 (s), 1636 (s); \(^1\)H NMR (300 MHz; CDCl\(_3\)) δ 3.95 (3 H, s, OCH\(\text{C}\)), 5.44 (1 H, s, CH\(\text{C}\)), 7.24 (1 H, s, NH); \(^13\)C NMR (75 MHz; CDCl\(_3\)) δ 59.1 (CH\(\text{C}\)), 97.5 (CH), 161.1 (C), 165.2 (CO), 169.3 (CO); \textit{m/z} (EI) 127 (M\(^+\), 27%), 98 (33), 69 (100).

Concentration in vacuo, followed by removal of any traces of water by trituration with toluene (3 X 5 ml), then EtOH (3 X 5 ml) gave 31 (0.060 g, 100%), obtained as a white solid, mp (EtOAc) 89-91°C (Lit1, oil); max(film)/cm\(^{-1}\) 1611 (s), 1453 (m); \(^1\)H NMR (400 MHz; CDCl\(_3\)) \(\delta\) 1.63-1.93 (3 H, m, CH\(_2\)CH\(_2\)CH\(_2\), CHCH\(_2\)CH\(_2\)), 2.21-2.28 (1 H, m, CHCH\(_2\)CH\(_2\)), 2.50-2.65 (6 H, m, CH\(_2\)CH\(_2\)CO(N), CH\(_2\)CH\(_2\)CO, COCH\(_2\)CH\(_2\)), 3.48-3.52 (1 H, m, NCH\(_2\)CH\(_2\)), 3.60-3.65 (1 H, m, NCH\(_2\)CH\(_2\)), 3.91-3.97 (1 H, m, CH\(_3\)(N)CH\(_2\))CH\(_2\)); \(^1\)C NMR (100 MHz; CDCl\(_3\)) \(\delta\) 23.5 (CH\(_2\)), 32.8 (CH\(_2\)), 34.7 (CH\(_2\)), 39.8 (CH\(_2\)), 47.4 (CH\(_2\)), 51.2 (CH\(_2\)), 54.7 (CH), 171.7 (CO), 207.9 (CO); \(m/z\) (El) 167 (M\(^+\), 22%), 149 (15), 70 (100).
