Introduction

The heterogeneous relief of Kosovo with the diversity of soil types, are responsible for the heterogeneousness of the Kosovo flora [1]. The secondary metabolism of the plants which are responsible for the biological activities are terpenes, phenolics and nitrogen-containing compounds. The antibiotics drugs obtained from plants are of greater interest in comparison to synthetic ones. The use of natural antibiotics from plants does not induce the secondary health effects (abdominal pain, diarrhea, cramping, headache, nausea and vomiting etc). Plant products may be used as antibiotic alternatives and do not cause resistance in bacteria [2].

The genus Salvia, commonly called sage, is the largest member of Lamiaceae or mint family containing over 900 species throughout the world [3]. Salvia officinalis L., probably the most known species of the Salvia genus and commonly known as garden or red sage, is a perennial hardly sub-shrub native to Mediterranean regions and is one of the most popular medicinal and culinary herbs used in the world [4,5]. Sage water extracts has been traditionally used for the treatment of digestive and circulation disturbances, bronchitis, cough, asthma, angina, mouth and throat inflammations, depression, excessive sweating, skin diseases, and many other diseases. In addition, they possess a number of biological activities including antiseptic, antibacterial, antioxidant, antiviral and antimycobacterial activities [6-19]. The antibacterial effect of the ethanol extracts, obtained from the medicinal plants, has been studied by a number of researchers in different parts of the world. Our research group was interested to analyze the biological activities of different medicinal plants extracts growing in different region of Kosovo. The aim of this study was to investigate the antibacterial activity of ethanol extracts of Salvia officinalis L. growing wild in Kosovo.

Experimental

Plant Material

The S. officinalis L. plant was collected in 2015 in Kosovo. Voucher specimens were deposited in the herbarium of the Department of Plant Protection, University of Prishtina. The aerial part of this medicinal plant were air dried at room temperature within three weeks.
Preparation of Plant Organic Extracts

The aerial part of *S. officinalis* (L.) was air-dried and then milled with a mixer. A piece of finely powdered material (200 g) was extracted with 70% ethanol (CH₂CH₂OH, 4 L) during a 24 h period (three times). After removing the solvent by vacuum rotary evaporator (EYELA N-1000, Japan) the crude product was dissolved in DMSO to prepare the solution with the concentration 1, 3 and 5 mg/mL. The solutions are used in subsequent experiments for testing their antibacterial. Etanol (analytical grade) for extraction were obtained from Sigma–Aldrich.

Antibacterial Activity

The antibacterial activity of the *S. officinalis* (L.) extracts obtained by using the ethanol organic solvents are determined applying the Kirby-Bayer [19] method or disk method (d = 5.5 mm, maximum capacity 10 mg). *S. officinalis* (L.) extracts were tested in an *in vitro* experiment against bacterial strains; *S. aureus* (clinical isolate with code 3319), *L. monocytogenes* (clinical isolate with code 2653) and *E. coli* (clinical isolate with code 2813). For the research we used three different concentration of ethanol extract, 1, 3 and 5 mg/mL in DMSO as solvent and then placed in a Petri dishes (d=15 cm). The disks were incubated at 37°C for 48 h; the control was also maintained with penicillin G dissolved in DMSO in a similar manner.

Results and Discussion

During the antibacterial activity, we have tested the extracts from the plant *S. officinalis* (L.) against bacteria: *S. aureus* (positive Gram bacteria), *L. monocytogenes* (positive Gram bacteria) and *E. coli* (negative Gram bacteria-clinical isolate). Antibacterial activity of the ethanol extracts were compared with Penicillin G–a substance, which can be found in the market and have been used with concentration 1, 3 and 5 mg/ mL as a standard. The comparison is done in accordance to the measurements of the diameter of the inhibition zone that is formed. These results are shown in Table 1.

Extracts of ethanol (1, 3 and 5 mg/ mL) shows antibacterial activities against *S. aureus*, *L. monocytogenes* and *E. coli* (Table 1 and Figure 1). The extracts of ethanol resulted in a lower activity than the penicillin G of the same concentration against *E. coli* (Table 1 and Figure 1). The extract of ethanol with concentration of 3 mg/mL and 5 mg/mL has higher inhibition zone (7 mm) as the standard (6 mm) against *L. monocytogenes*. The extract with concentration 1 mg/mL resulted in lower activity than the penicillin G with the same concentration against *L. monocytogenes* (Table 1 and Figure 1). The extracts of ethanol with concentration of 5 mg/mL have the same inhibition zone as the standard (inhibition zone 6 mm) against *S. aureus* (Table 1 and Figure 1).

![Figure 1: Antibacterial activity of ethanol extracts from *S. officinalis* (L.).](image)

**Table 1:** Inhibition zones diameters of *S. officinalis* (L.) ethanol extracts.

| Extracts     | Concentration (mg/mL) | *E. coli* (c. i.) | *L. monocytogenes* (c. i.) | *S. aureus* (c. i.) |
|--------------|-----------------------|------------------|---------------------------|--------------------|
| Ethanol      | 1                     | 5                | 2                         | 4                  |
|              | 3                     | 6                | 7                         | 6                  |
|              | 5                     | 6                | 7                         | 9                  |
| Penicillin   | 1                     | 7                | 3                         | 6                  |
|              | 3                     | 7                | 5                         | 7                  |
|              | 5                     | 8                | 6                         | 9                  |
Conclusion

*S. officinalis* (L.) is a medicinal plant used in folk medicine for different health illnesses. The aim of this research was to analyze the antibacterial activities of ethanol extracts from *S. officinalis* (L.) plant growing wild in Kosovo. Based on the results, the three concentrations of the extract showed a very good activity by inhibiting the growth of all the tested bacteria. Ethanol extract of the plant with concentration 5 mg/mL showed a stronger antibacterial activity towards bacteria *S. aureus*, *E. coli* and *L. monocytogenes* (clinical isolate). Extract with concentration 5 mg/mL showed a higher antibacterial activity against bacteria *L. monocytogenes*. Results obtained from ethanol extracts of *S. officinalis* (L.) for antibacterial activity are logical, based on numerous studies where these extracts were analyzed in the content of flavonoids, phenols, terpenes, alkaloids, etc., and these components are responsible for the biological activity.
