This paper reports production of nanofibers with voltage value of 20 kV, different fluid velocities (0.1 ml/h, 0.5 ml/h), different durations (2 min, 5 min), and distance of 7 cm in the electrospin assembly. The morphology of the produced nanofibers was observed before and after heat treatment by scanning electron microscope. The crystal structure of the nanofibers was examined by X-ray diffraction. In addition, thermal analysis/thermal gravimetric analysis of nanofibers was performed. X-ray diffraction measurements showed that the samples were crystalline in barium titanate. It was observed that the diameters of the nanofibers increased when the flow rate and time increased, while the diameters of the nanofibers decreased when the flow rate and time decreased. Scanning electron microscope images showed how the morphology of the samples changed by heat treatment. As a result, characterization results were found to be consistent with the literature.

1. Introduction

Nanotechnology refers to the control and reconstruction of material, which is smaller than 100 nm or at least one dimension [1]. Therefore, it causes creative changes in human life with new nanotechnological fields for the synthesis of nanomaterials [2, 3]. Nanofibers in the group of nanostructured materials have numerous distinguishing features, such as large surface area-to-volume ratios, flexibility of surface functions, and superior mechanical properties [4]. Therefore, nanofibers are efficient nanomaterials. Nanofibers created from various materials such as polymers, carbon, and semiconductors have a comprehensive area of application. Some of these applications are tissue engineering, filter media, nanocomposites reinforcement, and micro/nanoelectromechanical systems [5].

Recently, some researchers have analyzed the features of nanofibers produced by preparing a barium-doped TiO2 solution in their studies [6–8].

In this study, barium titanate nanofibers were prepared by using electrospinning process. Nanofibers were produced with 20 kV voltage value, different fluid velocities (0.1 ml/s, 0.5 ml/s), different durations (2 min, 5 min) and distance of 7 cm. Then, morphology of the produced nanofibers was examined by scanning electron microscope (SEM) before and after heat treatment. The crystal structure of the nanofibers was observed by X-ray diffraction (XRD). Additionally, thermal analysis/thermal gravimetric analysis (DTA/TGA) of nanofibers was performed.

2. Materials and method

The fabrication of the barium-titanate nanofibers was the results of the following steps: polyvinylpyrrolidone (PVP), barium acetate (Ba(C2H3O2)2), titanium isopropoxide (C12H26O4Ti), acetic acid (CH3COOH), polyethylene glycol (HO(C2H4O)nH), ethanol (C2H5OH), and diethanolamine (C6H11NO2) were supplied by Merck, Carlo Erba, and Fluka Co.

Firstly, the solution required for electrospinning process was prepared in the experimental part of the study. To obtain the first solution, a solution of TiO2 was prepared first. For this, 2.28 g titanium isopropoxide was weighed in a beaker, 1.05 g of diethanolamine were added drop by drop, and they were mixed in magnetic mixer. To this mixed solution 100 ml of ethanol was added and mixing was continued. In addition, 0.8 g of polyethylene glycol was added to the solution and mixed in a magnetic mixer for 1 h until the solution was clear.

After this, the solution was taken to a different place, and 2.61 g of barium acetate was dissolved in 25 ml of acetic acid. This solution was also dissolved in 3 g of PVP with 30 ml of ethanol after being put in a separate place. In order to produce the nanofibers, 3 ml of the stock TiO2 solution prepared in a separate beaker was taken and 3 ml of barium acetate solution was added on it.

Finally, 14 ml of PVP was added to this solution and mixed in a magnetic mixer for half an hour. To obtain the second solution, primarily 2.84 g of titanium isopropoxide was dissolved in 10 ml ethanol. Later, 2.55 g of barium acetate was dissolved in 10 ml of acetic acid in a separate place. Finally, 2 g of PVP was dissolved in 10 ml of ethanol. In the latest titanium isopropoxide solution, barium acetate solution and 10 ml of PVP solution were added and mixed in the magnetic mixer for another half hour.
Production and Characterization of Barium-Titanate Nanofibers

All samples have been produced at a constant voltage of 20 kV at constant distance of 7 cm, duration of 2 min and 5 min, and with a constant rate of 0.1 ml/s and 0.5 ml/s by electrospinning device at room temperature. Nanofibers were produced by means of the home-made electrospinning experimental setup (Fig. 1).

3. Results and conclusion

Results of experiments were examined in terms of system parameters (flow rate and applied time) and morphology. Nanofibers were heat treated for 1 h at 1100°C. As a result, the amorphous structure has been crystallized by the removal of PVP. The morphological structure of the obtained nanofibers was examined with SEM images and the diameters of the nanofibers were determined. In addition, DTA/TGA and XRD analyses were performed.

The effect of time and flow rates applied to the first solution on nanofibers is seen in Fig. 2. Figure 3 shows DTA/TGA analysis of powders obtained from BaTiO$_3$ + PVP solution.

For the red peaks, barium is orthogonal, while for the green peaks, titanium and barium are tetragonal. The results are in agreement with the literature. Table I shows effect of duration and flow rates on diameters of BaTiO$_3$ nanofibers.
TABLE I

Effect of duration and flow rates on diameters $d$ of BaTiO$_3$ nanofibers at constant distance of 7 cm and applied voltage 20 kV.

|         | Min. $d$ [nm] | Max. $d$ [nm] | Average $d$ [nm] | Flow rate [mL] | Time [min] |
|---------|---------------|---------------|------------------|----------------|------------|
| 0.1     | 38.15         | 153.6         | 95.875           | 0.1            | 2          |
| 0.1     | 29.06         | 178.1         | 103.58           | 0.1            | 5          |
| 0.5     | 43.50         | 234.3         | 138.9            | 0.5            | 2          |
| 0.5     | 75.59         | 292.0         | 183.795          | 0.5            | 5          |
