Abstract
The present study was aimed at assessing the effect of supplementing wheat flour with guava powder on physico-chemical and sensory characteristic of biscuits. Guava fruit was prepared as dehydrated powder and used at different levels (0, 2.5, 5, 7.5 and 10%) of wheat flour substitution for biscuit formulation. The effects of guava powder supplementation on physicochemical and sensory characteristics of biscuits were evaluated. Diameter of guava flour supplemented biscuits increased (from 4.72 cm to 4.86 cm) while spread ratio decreased (from 9.44 to 9.00), significantly. Protein (6.54% to 9.03%) and fiber (0.24% to 1.8%) also increased significantly by increasing the concentration of guava flour while moisture, fat and ash remain unchanged and NFE decreased. Sensory evaluation of biscuits showed that supplementation of guava flour improve color, texture, taste, aroma and over all acceptability. The supplementation seems to be suited for wheat flour substitution and it is possible to obtain biscuits of better quality within the standard for biscuits.

Introduction
Fruits are gift of nature which provides a number of essential vitamins and minerals that are deficient in other foods or present in small quantities. Seasonal supply of fruits results in economic loss and spoilage of large quantities of fruits. To avoid the spoilage of large quantities of fruits, they can be processed into various products like syrups, squashes, candy, jelly, jams etc. Another option is to dehydrate these fruits into powder and use in development of value added products which contribute significantly to the therapeutic as well as nutritive value. Development of value added products based on fruit powders have excellent sensory characteristics, reduce the post-harvest losses and contribute in improving the health status of people [1].

Pakistan is one of the largest guava producing countries in the world with two harvesting seasons, winter and summer. To prevent post-harvest losses, it is important to market it immediately after harvesting. Other option is to process and preserve in different forms. Drying of the fruit can be an alternate to increase shelf-life by converting perishable commodity into a stable product by lowering water activity. It also improves the quality by preventing microbial growth and biochemical reactions. Drying also facilitate handling, storage and transportation of fruits which is important in the globalized world [2].

Biscuits are common bakery item due to their nutritional quality, ease of use, availability of different types and also affordability by people. Nutritional diversification of biscuits is common and easy by adding different ingredients. Such ingredients improve nutritional value of biscuits making them healthier for customers and also modify/enhance the sensory characteristics of the product [3-5]. Fruit residues are important source of nutrients which fulfill the consumer demand for healthier food [6].

It was stated that the incorporation of wheat flour with unconventional powders improves the nutritional quality and palatability of cookies making them more accepted by consumers [7]. So, bakery products especially biscuits and cookies can be manufactured using different flours due to economic and nutritional reasons [8-10].

This study was aimed at processing guava into powder, develop a biscuit formulation from supplementing guava powder with wheat flour with good acceptability and evaluate its effect on the physicochemical and sensory characteristics of biscuits produced.

Materials and methods
Preparation of guava powder
Guava fruit, the surahi variety was purchased from local market, Sargodha, Pakistan. After removing the unwanted residues, fruits were cut into slices (1.0 cm thickness) and dried at
60-65°C. During drying, slices were turned occasionally to enhance even drying. The process of drying was continued until the moisture content remains 4.0%. Dried slices were ground and into sieved into particle size of 100 μm. The guava powder was packed in low density polyethylene bags and stored in airtight container for further analysis and use.

**Preparation of biscuits**
The biscuits were made according to the method described by [11] with some modification. Guava powder was replaced with wheat flour at a concentration of 0, 2.5, 5, 7.5 and 10%. Shortening and sugar were mixed until a light and fluffy cream formed. Eggs were added while mixing. Then wheat flour, guava powder, baking soda and salt were slowly introduced into the mixture. The batter was shaped into biscuits and then baked in oven at temperature of 150°C for 15-20 min. After cooling, biscuits were stored in airtight container for further analysis. Different formulations used for the preparation of biscuits are shown in (Table 1).

**Physical analysis of biscuits**
Biscuits were evaluated for diameter (cm), thickness (cm) and spread ratio (diameter/thickness) according to the standard method [12]. Diameter and thickness were determined using vernier caliper and weight was measured using an electronic weighing balance. Spread ratio was calculated as diameter/thickness.

**Chemical composition of biscuits**
Moisture, protein, fat, ash, fiber and NFE contents were determined according to the official methods of the AOAC [13].

**Sensory evaluation of biscuits**
Sensory evaluation was conducted using a semi-trained panel of twenty judges. Coded samples of biscuits were presented to each of the judges and they were asked to assess the biscuits for color, texture, taste, aroma and overall acceptability according to the described procedure [14].

**Statistical analysis**
All analytical determinations were conducted in triplicates. The means were calculated and data obtained were subjected to analysis of variance (ANOVA) and the significance was compared using LSD [15].

**Results and discussion**

**Physical characteristics of biscuits**
Biscuits prepared from wheat flour substituted with guava powder at 0, 2.5, 5, 7.5 and 10% were evaluated for various physical characteristics. The mean values are presented in (Table 2). The data recorded a gradual increase in width of guava powder substituted biscuits from 4.72 cm to 4.86 cm without larger changes in thickness. The values for spread ratio decreases with addition of guava powder in biscuits significantly. The obtained results are in complete agreement with those of Chinma and Gernah [16]. Several researches showed the reduction of spread ratio of cookies and biscuits when wheat flour is supplemented with non-wheat flour [7, 17, 18].

**Chemical composition of biscuits**
In (Figure 1) showed the chemical composition of biscuits prepared without and with different concentrations of guava powder. There were no significant difference in moisture, fat and ash content of all the treatments. Uchoa et al., [1] reported 11.47% of proteins and 24.29% fibre in guava fruit powder. Hence, addition of guava powder increased the protein content from 6.54 to 9.03% and fibre from 0.24 to 1.8% in biscuits

**Sensory characteristics**
The sensory characteristics of the studied wheat biscuits as influenced by the incorporation of guava powder are outlined in (Table 3). There was significant difference in relation to the sensorial attributes in biscuits when the level of the guava powder supplementation increased. The biscuits with 5% had the highest hedonic scale rating and with 10% showed the lowest scores. In a study [1] sensory analysis in cookies with cashew apple and guava powder demonstrated that replacement of wheat flour upto 20% guava flour improve all sensorial parameters while 20% cashew apple flour showed lower scores. In another study [19] enrichment of cookies with passion fruit powder improves the nutritional quality without affecting sensory quality. The results of different research showed that higher the level of substitution the lower the overall acceptability [20-22].

| Ingredients               | Level of substitutions | T0  | T1  | T2  | T3  | T4  |
|---------------------------|------------------------|-----|-----|-----|-----|-----|
| Wheat flour (g)           |                        | 100 | 97.5| 95  | 92.5| 90  |
| Guava powder (g)          |                        | 0   | 2.5 | 5   | 7.5 | 10  |
| Shortening (g)            |                        | 60  | 60  | 60  | 60  | 60  |
| Sugar (g)                 |                        | 40  | 40  | 40  | 40  | 40  |
| Salt (g)                  |                        | 0.8 | 0.8 | 0.8 | 0.8 | 0.8 |
| Leavening agent (g)       |                        | 1.6 | 1.6 | 1.6 | 1.6 | 1.6 |
| Eggs (medium)             |                        | 2   | 2   | 2   | 2   | 2   |

| T₃         | 5.8<sup>c</sup>  | 5.9<sup>c</sup> | 8.4<sup>c</sup> | 5.7<sup>c</sup> | 6.3<sup>c</sup>        |
| T₄         | 6.3<sup>c</sup>  | 6.1<sup>c</sup> | 7.6<sup>c</sup> | 6.2<sup>c</sup> | 5.7<sup>c</sup>        |

Conclusion
Preparations of biscuits using guava powder in partial replacement of wheat flour improve the nutritional quality by increasing protein and fibre content. With regard to sensory evaluation, biscuits with 5% guava powder were very well accepted. So, it could be concluded that dehydrated guava powder could be used as a suitable source of protein and dietary fiber in biscuits.
