ABSTRACT

The growth of central government debt in Indonesia is the subject of endless discussion for both economists and experts in other fields. Although the government uses this debt in order to increase Indonesia's competence through infrastructure development, there are problems in the form of previous accumulated debts. This accumulative debt is known as the concept of “debt stock” which is assessed through Indonesia's fiscal resilience (APBN) to measure the repayment capacity of new debts that will be made in the future. This ability will be seen using long-term data from 1990 to 2016 which is reflected in the variables of central government debt, government spending and revenue so that it is known that Indonesia's central government debt can still be said to be sustainable and the Indonesian government should prioritize productive expenditures in order to increase government revenues.

1. Introduction

Discussion on Government Debt is again become a hot issue in Indonesia in 2017 that is since 3 years of President Jokowi’s leadership. Debate emerged triggered by the huge value of debt in this time compared to the previous presidential leadership.

supported by various studies on fiscal sustainability in Indonesia conducted by both Indonesian researchers and those from International institution that shown Indonesian fiscal condition is not sustainable (Nurmalindah & Safuan, 2013) see also (Simarmata, 2007) and also show different result that is fiscal condition in Indonesia is sustain with a note (Marks, 2004) see also (Kurniawan, 2012).

The concerns of economic experts are very rational refers to the high dependence of the Indonesian State Budget on tax revenues that increase every year and become the dominant variable for the state budget.

The tax component that serves as the main revenue source of the Indonesian State Budget does not provide “good news” where the average growth of tax revenues from 1990 to 2016 is only 0.14%. this is also one of the triggers of tax amnesty in Indonesia in 2016/2017 with one aim is to increase the number of taxpayers (Guohua & Bintoro, 2017).

On the other hand, the growth of domestic revenues is smaller than the growth in government spending that causes deficits to occur almost every year. That is, the government has two options to cover the shortfall through the printing of money (seigniorage) or by indebtedness.

The option to cover the shortfall of the state budget through indebtedness has been determined by the government of Indonesia to refer the realization of central government debt as follows.

The choice of debt doesn’t matter when the country is able to repay the debt and recorded since 2009, the ratio of central government debt to GDP is less than 3%. However, looking at the ration between the interest on debts paid by the Indonesian government each year on government expenditure, it is known that the value is greater than the realization of the social assistance budget. This become natural when many experts begin to pay more attention to debt management in Indonesia. Even with the government’s move to reduce subsidies, it is known that by 2016 the amount of interest paid (9.80%) is greater that the subsidy given in 2016 (9.35%).

Deficit state budget condition is accompanied by the reality that the government is always in debt and the amount of interest that must be paid will bring up a question about the condition of the Indonesian State Budget. This raise concerns that lead to speculation that when the government does not have sufficient fund to repay debt and/or interest on the debt, the government will create new debt to pay off the old debt. Thus, in this study will be explored more deeply about the fiscal resistance of the Indonesian State Budget from 1990 to 2016.
Various opinions that have been expressed above is not only a mere statement but also had been formulated into equation as current budget constraints (Alvarado, 2004).

\[
(D_{t+1} - D_t) + (M_{t+1} - M_t) = iD_t + G_t - REV
\]

Which \( D \) is debt stock in early period \( t \), \( M \) is monetary base, \( i \) is interest rate from government debt, \( G \) is government expenditure, \( REV \) is taxes, net. Transfer and other revenues such as royalty, revenue from natural resources. This equation shows that deficit budget can be funded by issuing bonds or seigniorage, but the consequences of seigniorage is inflation. Thus, some scholar didn’t put seigniorage as a component of budget resource. Hence, the equation:

\[
(D_{t+1} - D_t) = iD_t + G_t - REV
\]

Equation above also has negative consequences which is deficit budget will be fulfilled by new debt to pay old debt plus interest rate. So that sustainability can be achieved as required to fulfill the following intertemporal requirement

\[
D_t + \sum_{k=0}^{\infty} \frac{E_t(G_{t+k} + iD_{t+k})}{(1+i)^k} \leq \sum_{k=0}^{\infty} \frac{E_t(REV_{t+k})}{(1+i)^k}
\]

This formula emphasizes the absolute variable of debt.

Another formula expressed using the ratio of debt to GDP as Bagnai (2004).

\[
B_t = \frac{B_{t-1}}{1 + n} - s_t
\]

\( B_t \) is bonds, \( y_t \) is real GDP, \( r \) is real interest rate between \( t - 1 \) and \( t \) from government outstanding debt, \( n \) is real economic growth, and \( s_t \) is primary surplus which is include seigniorage.

Analogous to the formulation of debt in the form of absolute interest intertemporal earlier, sustainability can be achieved by an iterative approach as follows.

\[
B_t = \sum_{j=1}^{\infty} \left[ \frac{1+n}{1+r} \right] E_t[S_j] + \lim_{j \to \infty} \left[ \frac{1+n}{1+r} \right] E \left[ B_{t+j} \right]
\]

Together with the formulation of debt with the absolute value of the previous formulation of this ratio also gives the conclusion that since the value of the debt to GDP can obtain anywhere, are intrinsically intertemporal equation doesn’t limit the ratio of debt to GDP, \( B_t / y_t \) in the current year.

Both formulation from Alvarado (2004) and Bagnai (2004) requiring non-ponzi game condition, which is Alvarado states as follows.

1 Alvarado, C.D., A. Izquierdo, U. Panizza. 2004. Fiscal Sustainability in Emerging Market Countries with an Application to Ecuador, Inter-American Development Bank.
2 Mendoza, E., and P.M. Oviedo. 2003. Sustainability of the national debt under uncertainty. Washington DC, the United States: Inter-American Development Bank.
3 Calvo, G., A., Isquierdo, E. Talvi. 2003. Sudden Stops, The Real Exchange Rate, and Fiscal Sustainability: Argentina’s Lesson, NBER working papers, w9828
\[
\lim_{r \to \infty} \frac{D_{sr}}{(1+i)^r} = 0
\]

Whereas requirement for Bagnai’s shows as follow.

\[
\lim_{r \to \infty} \left( \frac{1+n}{1+r} \right)^r E \left[ B_{s,t} \left| Y_{s,t} \right. \right] = 0
\]

Both formulations known as transversality condition.

Another scholar also notes about Neo-classical stance which is stated that the government must finance its government expenditure \(G_s\), outstanding public debt \(B_s\), and interest payment on its debt \(T_s\). To do that, it can be done by raising taxes \(T_s\) or issuing public debt and it’s called by dynamic budget constraint with notation

\[
B_{s,t+1} = B_{s,t}(1+r_s) + G_s - T_s
\]

Under plausible assumptions, this implies that over an infinitely long horizon the present discounted value of public debt must be zero which is called by the transversality condition.

\[
\lim_{r \to \infty} \left( \prod_{k=1}^{r} \frac{1}{1+r_s} \right) B_{s,t} = 0
\]

Then, combination this transversality condition with the dynamic budget constraint leads to the government’s intertemporal budget constraint.

\[
B_s = \sum_{k=1}^{\infty} \left( \prod_{k=1}^{r} \frac{1}{1+r_s} \right) \beta_s \mu_t - \sum_{k=1}^{\infty} \left( \prod_{k=1}^{r} \frac{1}{1+r_s} \right) \gamma_t
\]

Study about fiscal policy also has been conducted by several researchers such as (Mahdavi, 2014)\(^4\) using model based approach by Bohn for testing fiscal sustainability. He was using data for panel with 48 contagious states started from 1961 to 2008 and found evidence of the effect of partisan equilibrium and state government through the ration of primary surpluses which results also show consistent evidence. (Potrafke & Markus, 2015)\(^5\) studying fiscal policy between states in the US and Germany is ready to pursue sustainability or not through fiscal transfers as part of the considerations made. By utilizing dynamic data panels in the two countries, an estimate is made to see primary surplus to debt. For data, they used annual data over the period 1978-2010 for U.S. states and for German states also annual data over the period 1975-2010. For the analysis, they used baseline panel data model which following form:

\[
\text{Primary Surplus}_t = \alpha + \text{Public Debt}_{t-1} + \sum_{i=1}^{k} \beta_i Z_{ti} + \eta_t + \epsilon_t + u_{t}\]

They distinguish between two measures of the primary surplus denoted by standard of the primary surplus as first measurement and OLS with standard errors robust to heteroscedasticity as second estimate baseline model also models which including the lagged dependent variable for estimate dynamic panel data models. moreover, the they found that if fiscal transfer are not included in the primary surplus, the test result do not indicate that the German and U.S. state government pursued sustainable fiscal policies. Kurniawan also examines public finances in Indonesia related to problems in fiscal policy by making a diagnosis using the evolution of the main fiscal indicators on debt, expenditure and revenues – over time. The results of the diagnosis show that fiscal policy in Indonesia has been carried out conservatively and responsibly. In addition, a fiscal sustainability test was also conducted using the intertemporal budget constraint (IBC) framework by utilizing data from 1982 to 2010. This test provides a conclusion that the fiscal policy applied in Indonesia in the sample period shows sustainable results. He also found that a bad shock to expenditure had an impact on the budget deficit which is to control and maintain it, be needed strong fiscal policy to increase revenue and control government spending (Kurniawan, 2015)\(^6\).

3. Research Method

Following (Trehan & Walsh, 1988) in term of fiscal policy then it will be known that integrated of order zero I(0) indicates fiscal policy is sustainable. Then will be established stationary or non-stationary of the individual fiscal series by applying unit root test from Augmented Dickey-Fuller (ADF) and Phillips-Perron (PP) test.

\[
\Delta X_t = \beta_1 + \beta_2 X_{t-1} + \sum_{i=1}^{k} \delta_i \Delta X_{t-1} + \epsilon_t
\]

Where is \(\Delta\) is the first-order difference operator; \(X_t\) represents the fiscal time-series encompasses: GE (government expenditures); GR (government revenues); Primary Surplus (PS); and Central Government Debt (CGD), as well as the ratio of those variables to GDP (Gross Domestic Product); \(\beta, \delta, \epsilon\) are constant parameters; and \(\epsilon_t\) is a stationary stochastic process.

---

Toda-yamamoto approach makes it possible to apply the lag option procedure to the VAR that may be integrated because the standard asymptotic theory is valid by estimating a \((k + \text{dmax})\) th-order and the previous lag length \(k\) has been determined. \(\text{dmax}\) itself is the maximum order of integration possible in the process (Yoda & Yamamoto, 1995). By generating \(n\)-vector time-series \(\{Y_t\}_{t=-\infty}^{\infty}\) then will be known.

\[
Y_t = \beta_0 + \beta_1 t + \ldots + \beta_q t^q + \eta_t
\]

4. Results and Discussion

Fiscal policy has a goal to keep budget sustainability with a simple method by Hamilton and Flavin (1986) through unit root test. It test is currently used with Augmented Dickey-Fuller (ADF) and Phillips-Perron (intercept) such table below.

Table 1 Result of ADF and PP tests

| Source: data processed |

| Unit Root Test | Test of contemporaneous budget balance | Test of intertemporal budget balance |
|-----------------|----------------------------------------|--------------------------------------|
|                | GR GE S qd | [gt+0] [gt+1] | [gt+0] [gt+1] |
| ADF            | 0.00755 | 0.001 | 0.0003 | 0.0008 | 0.0123 | 0.001 |
| PP             | 0.0039 | 0.0008 | 0.0000 | 0.011 | 0.0123 | 0.0010 |
| order          | 0 0 1 (1) 0 0 1 |

Table 2 Result of Johansen’s Test

| Hypothesized | No. of CE(s) | Eigenvalue | Trace Statistic | Critical Value | Prob.** |
|--------------|--------------|------------|----------------|---------------|---------|
| None *       | 0.975073     | 158.9557   | 47.85513       | 0.0000        |
| At most 1 *  | 0.896882     | 12.94391   | 29.78707       | 0.0000        |
| At most 2 *  | 0.508169     | 11.75957   | 15.47174       | 0.0106        |
| At most 3 *  | 0.140015     | 3.46933    | 3.841466       | 0.0625        |

| Hypothesized | Max-Eigen | Eigenvalue | Max-Eigen Statistic | Critical Value | Prob.** |
|--------------|-----------|------------|---------------------|---------------|---------|
| None *       | 0.975073 | 84.91178   | 27.58434           | 0.0000        |
| At most 1 *  | 0.896882 | 52.25518   | 21.11662           | 0.0000        |
| At most 2 *  | 0.508169 | 14.22122   | 14.24660           | 0.0223        |
| At most 3 *  | 0.140015 | 3.46933    | 3.841466           | 0.0625        |

Max-eigen value test indicates 3 cointegrating eqn(s) at the 0.05 level
* denotes rejection of the hypothesis at the 0.05 level
**MacKinnon-Haug-Nichols (1999) p-values

Long-term relationship among those variables be known from Trace Statistic and Max-Eigen value that bigger than critical value. Thus, will be known short-run relationship among those variables.

While government expenditure become dependent variable, it is known that only government revenues and seigniorage that have an influence but not with central government debt. Looking at the condition in Indonesia, that government expenditures is influenced by government revenues but to support government program, the government also create new money which is known from result of LS does not granger cause of LGE about 0.0387 which means that we can reject Ho or there is a causality between those variables.

This condition is different when variable government revenue become dependent variable where is government expenditures, seigniorage, and central government debt shows its impact to government revenues. On the other hand, central government debt gives impact when seigniorage become dependent variable but not with the reverse condition.

Granger causality gives interesting information that central government debt is affected by government spending and government revenue. This is in line with the fact that the Indonesian government will issue debt when government revenues is less than the targeted. It is intended to meet the budget for the implementation of activities that have been established by the Government.
### Table 3 Result of Granger-causality Test

| Dependent variable: LGE | Excluded | Chi-sq | df | Prob. |
|-------------------------|----------|--------|----|-------|
| LGR                     | 19.88724 | 3      | 0.0002 |
| LS                      | 8.387262 | 3      | 0.0387 |
| LCGD                    | 5.604165 | 3      | 0.1325 |
| All                     | 54.86646 | 9      | 0.0000 |

| Dependent variable: LGR | Excluded | Chi-sq | df | Prob. |
|-------------------------|----------|--------|----|-------|
| LGE                     | 34.96674 | 3      | 0.0000 |
| LS                      | 11.84707 | 3      | 0.0079 |

| All                     | 78.39294 | 9      | 0.0000 |

| Dependent variable: LS  | Excluded | Chi-sq | df | Prob. |
|-------------------------|----------|--------|----|-------|
| LGE                     | 5.296725 | 3      | 0.1513 |
| LGR                     | 5.251486 | 3      | 0.1543 |
| LCGD                    | 9.751774 | 3      | 0.0208 |
| All                     | 27.54646 | 9      | 0.0011 |

| Dependent variable: LCGD| Excluded | Chi-sq | df | Prob. |
|-------------------------|----------|--------|----|-------|
| LGE                     | 17.23624 | 3      | 0.0006 |
| LGR                     | 15.51293 | 3      | 0.0011 |
| LS                      | 1.434581 | 3      | 0.6978 |
| All                     | 33.49368 | 9      | 0.0001 |

5. Conclusion

The Indonesian government’s decision to indebted is not to worrisome. But the government needs to be careful in managing debt because the causality of central government debt is not big for government revenue. it can be seen in how the response of government expenditure and government revenue to central government debt (vice versa) which shows negative condition in the long term.
