Introduction
Since the first years of independence of the Republic of Uzbekistan pressing problems associated with reforming the education system, improving society, the future of young people began to be seen as a promising sector, has been a special emphasis on education and upbringing of young people. Article 3 of the Law "On Education" of the Republic of Uzbekistan states: "Education is declared paramount in the sphere of social development". [7]. It is well known that taking into account the evolutionary development of social life in the content of education is not allowed to make radical changes, the content of education is modernized in close connection with the development of science, culture, technology and production. As a consequence, the need to achieve the content of learning requirements of science and production, which, in turn, creates the possibility of effective development of science and production. The content of learning is enriched, differentiated in close connection with the spiritual and cultural, economic life of society, the development of the labor market. In particular, in order to prepare the public labor market specializes the content of technological learning.

As you know, one facet of didactics is the timely modernization of the content of training. Analysis of the literature confirms that the first works on industrial pedagogy refers to its applied forms. Thus, the first dissertation research is devoted to the study of the problem of using folk applied art in aesthetic education of elementary school students [8]. In the 80s of the twentieth century, research in this area becomes more and more [1; 3; 4], in the 90s there are works that cover the theoretical aspects of this problem [2; 3; 6]. The use of illustrative materials on fine arts in the lessons, classes in circles in schools with the Uzbek language of instruction was studied by A. Sulaimanov, R. Khasanov, S. Bulatov and K. Kosimov in their studies also address issues of teaching fine art. It should be noted that in the above-mentioned studies the technological basis for the modernization of fine arts education has not been studied. At the same time, the technological basis for modernization of the content of fine arts education in the schools of the Republic of Karakalpakstan has not been specifically studied either.

As it was underlined in the "National Training Program", the art education is based on the peculiarities of art and culture as well as on the artistic
The educational process in general education schools require modernization of the various levels of general education, because the dictates of the time are the new experiences. When the selected learning content takes into account the physiological, age, individual and psychological characteristics of students, the learning process is effective, students are not overworked, tired and bored. As a result, students can fully apply the acquired knowledge in their activities and strive to master new knowledge in a deeper way. Consequently, each learning content parameter should be set with a focus on students’ implementation of the acquired knowledge in their activities, formation of creative abilities of an individual.

The subject “Fine Art” provides the elementary knowledge and skills of artistic culture necessary for each person. For no matter in which industry in the future each graduate of a secondary school will work, at his or her leisure time he or she should rest, restore the strength spent during working hours. At the same time, this does not mean that schools need to give extensive and deep knowledge of art and applied art.

Ensuring the uniqueness and continuity of the subjects taught in general education schools, their mutual coordination is aimed at improving the knowledge of students in a number of areas of education. In particular, the knowledge obtained at the lessons of fine art, which includes elements related to the circle of knowledge, intellectual level, abilities, features of thinking is undoubtedly a technological tool that increases the effectiveness of knowledge of such subjects as mathematics, physics, geography, history, biology, chemistry, etc., which should be obtained in secondary general education schools on the basis of illustrative material.

It is important to develop pedagogical requirements for the technology of modernization of the content of education taking into account the interdisciplinary connection, obtaining and consolidation of the skills obtained in the process of teaching the fine arts, increasing the efficiency of mastering the subjects that contain illustrative material, increasing the interdisciplinary connection of teaching material, as well as student literacy.

One of the main objectives of the fine arts subject is to study centuries-old national traditions and rituals, the history of the people, its ethnogenesis, which equally applies to the content of a number of other school subjects, such as geography, zoology, biology, natural history, art history. This means that the visual arts materials are quite extensive. We are talking about historical monuments, archaeological, ethnographic, toponymic, archival documents, samples of national and artistic craftsmanship, folk applied art, works of fine arts. Consequently, the methods of modernization of the content of fine arts education represent one of the main factors in strengthening the national basis of the pedagogical system, increasing the level of artistic and aesthetic
knowledge of students. The use of visual art materials at different stages of education due to its pedagogical impact is an effective means of consolidating knowledge of the history of the people, enriching the mental world of students.

Based on the above, we can conclude that the modernization of the content of the subject "Fine Arts" is aimed at the formation of the spiritual culture of students.
