The determinants of liquidity of Indian listed commercial banks: A panel data approach

Eissa A. Al-Homaidi, Mosab I. Tabash*, Najib H. Farhan and Faozi A. Almaqtari

Abstract: The objective of this study is to examine the liquidity (LQD) determinants of Indian listed commercial banks. The study has applied both GMM and pooled, fixed and random effect models to a panel of 37 commercial banks listed on the Bombay Stock Exchange (BSE) in India for the period from 2008 to 2017. The banks' LQD was taken as a dependent variable which functioned against both bank-specific and macroeconomic determinants. The results indicated that among the bank-specific factors, bank size, capital adequacy ratio, deposits ratio, operation efficiency ratio, and return on assets ratio are found to have a significant positive impact on LQD, while assets quality ratio, assets management ratio, return on equity ratio, and net interest margin ratio are found to have a significant negative impact on LQD. With respect to macroeconomic factors, the results indicated that interest rate and exchange rate are found to have a significant effect on LQD. The Reserve Bank of India (RBI) should give benchmarks for the above mentioned ratios to achieve smooth LQD of commercial banks in India. The study recommended that bankers should consider assets quality in such a way that improves banks' performance. Finally, the current study provides useful insights for bankers, analysts, regulators, investors, and other interested parties on the LQD of listed commercial banks.

ABOUT THE AUTHORS

Eissa A. Al-Homaidi is a Ph.D. scholar in Aligarh Muslim University, India. His research interests include financial reporting, financial performance, disclosure, corporate governance, goods & service tax (GST), and demonetization.

Mosab I. Tabash is currently working as an Assistant Professor of Finance and Banking at the College of Business, Al Ain University of Science and Technology, UAE. He obtained his Ph.D. from FMS Delhi, University of Delhi. His research interests include Islamic banking and finance, monetary policies, governance, financial performance, investments, and corporate government.

Najib H. Farhan is a Ph.D. scholar at Aligarh Muslim University, India. His areas of interests are in the field of financial reporting quality, financial performance, working capital, and corporate governance.

Faozi A. Almaqtari is a Ph.D. scholar at Aligarh Muslim University. His research interests include disclosure, corporate governance, demonetization, value relevance of BV and EPS, financial reporting quality and financial performance.

PUBLIC INTEREST STATEMENT

This study investigates the factors that are affecting the liquidity (LQD) of Indian listed banks. The LQD of banks is very important for everybody in any society. The study uses secondary data that were collected from the ProwessIQ database. Different analytical models are used to test the impact of internal and external determinants on the LQD of Indian listed banks. The results indicated that bank size, capital adequacy ratio, deposits ratio, operation efficiency ratio, and return on assets ratio are found to have a significant positive impact on LQD. The results also indicated that interest rate, and exchange rate, are found to have a significant effect on LQD. The study recommended that bankers should consider assets quality in such a way that improves banks' performance.
1. Introduction

As banks have become one of the most vital components of any financial system, ensuring stability of the banking sector has gained significant importance as a policy initiative worldwide. Banking stability as an economic indicator can be used to determine whether an economy is robust enough to withstand both internal and external shocks. Banking stability in itself is a function of several health parameters of individual banks. For example, asset quality, LQD risk, capital adequacy, performance, etc. (Reserve Bank of India, 2013).

LQD in the context of banking may be explained as the capacity of a bank to fund asset growth and meet both expected and unforeseen cash and collateral obligations at sensible cost and without incurring unacceptable losses (Settlements, B. for I, 2008). “Liquidity risk is the bank’s inability to meet such obligations as they become due, without adversely affecting the bank’s financial condition” (RBI, 2012). According to the guidelines of the Reserve Bank of India (2012), “liquidity is a bank’s capacity to fund an increase in assets and meet both expected and unexpected cash and collateral obligations as they become due”. “Although Indian banks have largely been able to adhere to the guidelines of the Reserve Bank of India for managing liquidity, factors affecting liquidity in Indian banks remain relatively unidentified owing to a scarcity of studies on management of liquidity in Indian banks” (Bhati & Zoysa, 2012).

Many investigators, such as Ratnovski (2013), report that the primary role of banks as creators of LQD makes them vulnerable to LQD risks. Arif and Nauman Anees (2012) noted that the LQD risk is at a rate of inability of the bank to meet its financial obligations without loss of incurring undesirable expenditure. Such a situation would depend on financial stability. It is better for banks to maintain adequate liquid storage. After putting off the financial reason, assume that bank solvency is the root cause. Basel Committee on Banking Supervision (2010) suggested solvency, LQD formation by banks, and new capital rules such a situation in the future. Mandatory Seals. Matz and Neu (2007) found that LQD management was often considered a secondary risk in banking literature before the global financial crisis. However, after performance, the attention of policymakers and researchers has been drawn. However, it should be noted that subsurface literature on banks’ inadequate risk management practices. So, inadequate LQD has gained considerable attention and a major concern for banks (Jenkinson, 2008).

The present study aims to examine the determinants of LQD of Indian listed commercial banks. In the process, it will empirically investigate both internal (bank-specific) and external (macroeconomic) determinants that affect the listed banks’ LQD in India. The present study seeks to fill the existing gap by empirically analyzing bank specific variables such as assets size (LOGA), capital adequacy (CA), deposits (DEP), assets quality (AQ), assets management (AM), profitability (ROA, ROE, NIM), operation efficiency (OPEF), and non-interest income (NII)), and macroeconomic determinants such as economic activity (GDP), inflation rate (IFR), exchange rate (EXCH), and interest rate (INTRT).

The study is organized in the following manner. Section 2 presents an overview of Indian banking and LQD trends of Indian listed banks. Section 3 discusses the relevant literature of the study. Section 4 explains data and methodology used in the study. Section 5 shows the results of our empirical analysis, and Section 6 conclusion, recommendations, and directions for future research.
2. Overview of Indian banking

India has an extensive and large financial system distinguished by diversified financial institutions including both banks and non-banks (Ghosh, 2016). Since the 1990s, the Indian economy had undergone substantial liberalization and policy shifts with the objectives of improving efficiency, profitability, and productivity, thus enhancing businesses to be more competitive (Ghosh, 2016; Rina, 2009). However, due to information asymmetry, the product markets of Indian banks are moderately competitive and less opaque (Sinha & Sharma, 2016). A salient feature of the liberalization reforms was the concentration on enhancing the banking sector competition by expanding the financial system to include entrance of private and foreign banks (Ghosh, 2016). Currently, the Indian banking system comprises of 27 public banks, 26 private banks, 46 foreign banks, 56 regional rural banks, 1,574 urban cooperative banks and 93,913 rural cooperative banks, in addition to cooperative credit institutions, according to information provided by the annual database of the Reserve Bank of India (RBI). 70–73% of the total assets of the Indian banks are reported by the public sector banks (Ghosh, 2016; Shrivastava, Sahu, & Siddiqui, 2018).

2.1. LQD trend of Indian listed banks

Figure 1 shows the LQD trend of Indian listed commercial banks for the period time from 2008 to 2017. It highlights patterns of LQD holdings of nationalized, private and SBI group banks and its associates. It can be revealed that since 2009 SBI group banks have maintained high LQD as compared to public and private sector banks. Further, LQD during (2010 to 2017) was kept high by nationalized banks. Whereas private Banks showed low level of LQD as compared to other groups of banks.

3. Literature review

Spacious studies in different countries of the world have been conducted to investigate the factors that impact a bank’s LQD. Previous studies of a bank’s LQD can be categorized into three categories. First, empirical studies related to banks’ LQD determinants that were investigated in different countries around the world. For example, Trenca, Petria, and Corovei (2015) who studied 6 countries, Roman and Camelia (2015) who studied 27 EU countries and Delechat, Henao, Muthoora, and Vtyurina (2012) who studied 7 Central American countries, Parameswar (2012) who studied 6 countries. Second, studies that compare banks LQD factors among different banks in the same region (e.g. Trenca et al. (2015) who studied country of origin, Parameswar (2012) who studied GCC, Ghenimi, Chaibi, and Omri (2017) who studied MENA region, Roman and Camelia (2015) who studied 27 EU countries, and Delechat et al. (2012) who studied Central America. Finally, studies that investigated banks’ LQD determinants and focused only on a single country. For example, Singh and Sharma (2016) and Sopan and Dutta (2018) who studied India, Rashid and Jabeen (2016) and Awais and Khursheed (2016) who studied Pakistan, Munteanu (2012) who studied Romania, Horváth, Seidler, and Weill (2014) who studied Czech Republic, Moussa (2015) who studied Tunisia, Vodová and Republic (2011) who studied Czech Republic, Thi, Diep, and Nguyen (2017) who studied Vietnam, Trabelsi (2015) who studied Kingdom of Bahrain, Cucinelli (2014) who studied Eurozone, Marozva (2015) who studied South Africa) (see Table 1 below).
| NO. | Study by | Variables/Models | Tools and methods of analysis | Sample | Time limit | Data | Country |
|-----|----------|------------------|-------------------------------|--------|------------|------|---------|
| 1   | Rashid and Jabeen (2016) | “Operating efficiency, reserves, bank size, deposit ratio, operating efficiency, gross domestic product (GDP), real interest rate (RI), market capitalization market, and market concentration ratio”. | Regression analysis | 22 | 2006 to 2012 | Secondary | Pakistan |
| 2   | Munteanu (2012) | “Liquidity, capital adequacy, assets quality, interbank funding, funding cost, cost to income ratio, interest rate robor, credit risk rate, inflation rate, GDP real growth rate, and unemployment”. | Regression Analysis | 27 | 2002 to 2010 | Secondary | Romania |
| 3   | Ghenimi et al. (2017) | “Liquidity risk, credit risk, capital to asset, credit risk, return on equity, net interest income to earning assets, liquidity gaps, return on asset, size of the bank, liquid assets to total assets ratio, loan growth, crisis dummy, loan assets, efficiency, income diversity, inflation rate, and GDP relative real growth GDP”. | Robustness and GMM technical analysis | 49 | 2006 to 2013 | Secondary | MENA region |
| 4   | Singh and Sharma (2016) | “Liquidity, bank size, profitability, cost of funding, capital adequacy, deposits, GDP, inflation and unemployment”. | Regression analysis | 59 | 2000 to 2013 | Secondary | India |
| 5   | Trenca et al. (2015) | “The share of common shareholders’ equity on total assets, the logarithm of total bank assets, return on equity, revisions for loan losses/net loans, gross domestic product growth rate, inflation rate, unemployment rate, and public deficit/surplus”. | GMM technical analysis | 40 | 2005q1-2011q4 | Secondary | Country of origin: Greece, Portugal, Spain, Italy, Croatia and Cyprus |

| 17  | Parameswar (2012) | “Liquid assets to customer and short-term funding, total capital adequacy ratio, return on average equity, return on average assets, net interest margin, non-performing assets, dummy variable for Oman, dummy variable for Saudi Arabia, dummy variable for Bahrain, dummy variable for United Arab Emirates, Qatar and Kuwait respectively” | Regressions analysis | 2000 to 2009 | Secondary | Gulf Cooperation Council (GCC) |
Majority of previous studies measure banks’ LQD by liquid assets to total assets (Almaqtari, Al-Homaidi, Tabash, & Farhan, 2018; Delechat et al., 2012; Singh & Sharma, 2016; Sopan & Dutta, 2018). However, banks’ LQD studies by previous research examined as a function of both internal and external factors. Internal factors are associated with the direct outcomes of managerial decisions of a bank (e.g. Moussa, 2015; Munteanu, 2012; Roman & Camelia, 2015; Singh & Sharma, 2016; Sopan & Dutta, 2018; Trabelsi, 2015). Several studies which have examined bank specific factors include variables such as bank size, profitability (For example, Moussa, 2015; Munteanu, 2012; Roman & Camelia, 2015; Singh & Sharma, 2016; Sopan & Dutta, 2018; Thi et al., 2017; Trabelsi, 2015; Trenca et al., 2015; Yahya, Akhtar, & Tabash, 2017), capital adequacy ratio (For example, Ghenimi et al., 2017; Munteanu, 2012; Roman & Camelia, 2015; Singh & Sharma, 2016; Trabelsi, 2015), deposits ratio (For example, Rashid & Jabeen, 2016; Singh & Sharma, 2016; Sopan & Dutta, 2018; Thi et al., 2017; Trabelsi, 2015), assets quality ratio (e.g. Cucinelli, 2014; Munteanu, 2012; Sopan & Dutta, 2018), assets management ratio, operation efficiency ratio (Rashid & Jabeen, 2016), while macroeconomic factors are economic activity (GDP), inflation rate (For example, Cucinelli, 2014; Ghenimi et al., 2017; Moussa, 2015; Munteanu, 2012; Rashid & Jabeen, 2016; Singh & Sharma, 2016; Sopan & Dutta, 2018; Trenca et al., 2015), exchange rate, and interest rate (e.g. Delechat et al., 2012; Vodová & Republic, 2011).

Although overall studies have been done on banks’ LQD factors in different countries, comprehensive empirical evidence from emerging and developing countries are either still yielding ambiguous evidence or mixed results (Singh & Sharma, 2016). With respect to banks’ LQD factors studies in the Indian context, there is a lack of studies that examine this issue.

Singh and Sharma (2016) investigated internal and external determinants that determined the Indian commercial banks’ LQD. They revealed that bank ownership impacts LQD of commercial banks. They suggested that all bank-specific factors except (cost of funding) and macroeconomic determinants except (unemployment) have a significant impact on commercial banks’ LQD. Further, Almaqtari et al. (2018) studied internal and external factors that influence of commercial banks’ profitability in India. Sopan and Dutta (2018) investigated the bank-specific factors and macroeconomic factors that influence the banks’ LQD in India. Bank-specific determinants contain bank-size, deposit rate, profitability, asset quality, funding cost and the rate of capitalization in a bank. While the macroeconomic factors include GDP and inflation rate. The results indicated that among internal (bank-specific) determinants, the size, profitability level, funding cost, and the quality of assets negatively impact the LQD risk of Indian commercial banks. Whereas, the rate of deposits and the capitalization rate have a positive influence. Amongst the macroeconomic determinants, inflation rate and GDP growth rate have a positive and negative association with bank LQD respectively.

4. Data and methodology

4.1. Data collection and sampling

To conduct this study, data of 37 listed commercial banks have been collected from India. The present study focuses only on listed commercial banks listed on the Bombay Stock Market in India. The sample of this research is based on panel data that consists of 37 listed commercial banks from the population of 42 listed banks for a period from 2008 to 2017. The bank-specific variables such as, assets size, capital adequacy, deposits, assets quality, assets management, profitability, operation efficiency, non-interest income are collected from ProwessIQ database. While the macroeconomic variables such as GDP, exchange rate, interest rate, and inflation rate are collected from World Bank. The criteria for selection of these listed banks are based on the availability of data for the period covered by this research.
In this study, banks’ LQD has been used as the dependent variable, while independent variables are classified into two sections as internal and external factors. The internal determinants include: assets size, capital adequacy, assets quality, deposits, assets management, profitability, operation efficiency, non-interest income, while external factors are GDP economic activity, inflation rate, interest rate, and exchange rate.

4.2. Econometric models specification

In this study, a model is developed to identify the association between the LQD of listed commercial banks in India as a dependent variable measured by (liquid assets/total assets) and fourteen independent variables have been categorized into bank-specific factors (Assets size, capital adequacy, deposits, assets quality, assets management, profitability, operation efficiency, non-interest income) and external factors (economic activity (GDP), inflation rate, exchange rate, and interest rate) as shown in Figure 2.

This study uses the panel data structure model that has been adopted by Chowdhury and Rasid (2017) and Masood and Ashraf (2012) which is defined as follows:

$$\gamma_{nt} = \alpha + \beta x_{nt} + \epsilon_{nt}$$  \hspace{1cm} (1)

Where $\gamma_{nt}$ indicates the dependent variable (LQD), $\alpha$ is the intercept term on the independent variables, $\beta$ is a $k \times 1$ vector of parameter to be predestined, and vector of observations is $x_{nt}$ which is $1 \times k$, $t=1,\ldots,T$; $n=1,\ldots,N$. The workable and operational form, the aforesaid model can be expressed as follows:

Liquidity = $f$(Bank – specific; Macroeconomic variables)  \hspace{1cm} (2)

Where LQD is defined by liquid assets/total assets and bank-specific determinants comprise: assets size, capital adequacy, deposits, assets quality, assets management, profitability, operation efficiency, non-interest income, and macroeconomic factors comprise: economic activity, inflation rate, interest rate, and exchange rate.

Expanding the indicators adopted in model 2 will give us the following model:

$$LQD_{it} = \alpha_i + \beta_1 \text{LOGAS}_{it} + \beta_2 \text{CAD}_{it} + \beta_3 \text{DP}_{it} + \beta_4 \text{AQ}_{it} + \beta_5 \text{AM}_{it} + \beta_6 \text{ROA}_{it} + \beta_7 \text{ROE}_{it} + \beta_8 \text{OPEF}_{it} + \beta_9 \text{NII}_{it} + \beta_{10} \text{NIM}_{it} + \beta_{11} \text{GDP}_{it} + \beta_{12} \text{IFR}_{it} + \beta_{13} \text{INTR}_{it} + \beta_{14} \text{EXCH}_{it} + \epsilon_{it}$$  \hspace{1cm} (3)

Where LQD = Liquidity ratio; $\alpha$ is a constant term; $i=1,\ldots,N$ and $t=1,\ldots,T$. all other determinants are as explained in Table 2.
| Variables | Measure | Notation | Prior studies |
|-----------|---------|----------|---------------|
| **Dependent variables** | | | |
| Liquidity | QD<sub>i</sub> = Liquid assets<sub>i</sub> / Total assets<sub>i</sub> | LQD | Munteanu (2012), Horváth et al. (2014), Cucinelli (2014), Roman and Camelio (2015), Moussa (2015), Singh and Sharma (2016), and Ghenimi et al. (2017), Tabash (2018). |
| **Independent variables (bank-specific)** | | | |
| Bank size | Natural Logarithm of total assets | LOGA | Delechat et al. (2012), Cucinelli (2014), Roman and Camelio (2015), Moussa (2015), Ghenimi et al. (2017), and Sopan and Dutta (2018). |
| Capital adequacy | CAD<sub>i</sub> = Equity<sub>i</sub> / Total assets<sub>i</sub> | CAD | Munteanu (2012), Parameswar (2012), Munteanu (2012), Roman and Camelio (2015), Trabelsi (2015), Singh and Sharma (2016), and Ghenimi et al. (2017). |
| Deposits | DEP<sub>i</sub> = Deposit<sub>i</sub> / Total assets<sub>i</sub> | DP | Singh and Sharma (2016), Moussa (2015), Rashid and Jabeen (2016), Sopan and Dutta (2018), Thi et al. (2017), Trabelsi (2015). |
| Assets quality | AQ<sub>i</sub> = Loan<sub>i</sub> / Total assets<sub>i</sub> | AQ | Cucinelli (2014), Munteanu (2012), and Sopan and Dutta (2018). |
| Assets management | AM<sub>i</sub> = Operating Income<sub>i</sub> / Total assets<sub>i</sub> | AM | Rashid and Jabeen (2016). |
| Profitability | ROA<sub>i</sub> = Net prof<sub>i</sub> / Total assets<sub>i</sub> ROE<sub>i</sub> = Net prof<sub>i</sub> / Total equity<sub>i</sub> NIM<sub>i</sub> = Net interest income / Total assets<sub>i</sub> | ROA ROE NIM | Marozva (2015), Moussa (2015), Roman and Camelio (2015), Treca et al. (2015), Trabelsi (2015), Singh and Sharma (2016), Awais and Khursheed (2016), Tabash and Hassan (2017), Ghenimi et al. (2017), Thi et al. (2017), and Sopan and Dutta (2018). |
| Operation efficiency | OPEF | | Rashid and Jabeen (2016). |
| Non-Interest income | NII<sub>i</sub> = Non-interest income<sub>i</sub> / Total assets<sub>i</sub> | NII | Tan and Floras (2012), Wu, Chen and Shiu (2007), and Ahamed (2017). |
| **Independent variables (macroeconomic)** | | | |
| Economic activity | Annual real GDP growth rate | GDP | Aspachs, Nier, and Tiesset (2005), Dinger (2009), Vodová (2011), Munteanu (2012), Choong, Hoi, Murthi, Yi, and Shven (2013), and Ghenimi et al. (2017). |
| Variables   | Measure               | Notation | Prior studies                                                                 |
|------------|-----------------------|----------|-------------------------------------------------------------------------------|
| Inflation rate | Annual inflation rate | IFR      | Vodová and Republic (2011), Cucinelli (2014), Trenca et al. (2015), Ghenimi et al. (2017), and Sopan and Dutta (2018). |
| Exchange rate | Average in a year     | EXCH     | Delechat et al. (2012), Vodová and Republic (2011), Perera and Wickramanayake (2016), Issah and Antwi (2017), Almaqtari et al. (2018). |
| Interest rate | Lending interest      | INTRT    | Ongore and Kusa (2013), Perera and Wickramanayake (2016), Almaqtari et al. (2018), and Aspachs et al. (2005). |
Then, following Saona (2016) who used a dynamic model which takes the following form:

\[ \text{liquidity}_t = \beta_0 + \beta_1 \text{liquidity}_{t-1} + \sum_{i=1}^{10} \delta_i \text{LOGAS}_i + \sum_{j=1}^{4} \theta_j \text{Y}_j + \eta_t + \mu_t + \epsilon_t \] (4)

Where \( \text{LOGAS}_i \) represents the vector of the internal factors of LQD, \( \text{Y}_j \) is the vector of the external factors of banks \( \eta_t, \mu_t \), and \( \epsilon_t \) measure the individual impact, the temporal impact, and the stochastic error, respectively. Specifically

\[ \sum_{i=1}^{10} \delta_i \text{LOGAS}_i = \delta_1 \text{LOGAS}_1 + \delta_2 \text{CA}_1 + \delta_3 \text{DP}_1 + \delta_4 \text{AQ}_1 + \delta_5 \text{AM}_1 + \delta_6 \text{ROA} + \delta_7 \text{ROE} + \delta_8 \text{OPEF}_1 + \delta_9 \text{NII}_1 + \delta_{10} \text{NIM}_1 \] (5)

And

\[ \sum_{j=1}^{4} \theta_j \text{Y}_j = \theta_1 \text{GDP}_1 + \theta_2 \text{INF}_1 + \theta_3 \text{INTRT}_1 + \theta_4 \text{EXCH}_1 \] (6)

Hausman test has been used to choose the convenient estimation method (fixed or random effects) model. The results indicate that fixed effect is more suitable than the random effect model because the (p-value < 0.05%) is less than 0.05% in this study (see Table 6).

4.3. Measurement of independent variables

With respect to bank specifics, the ones that have been analyzed such as assets size, capital adequacy, deposits, assets quality, assets management, profitability, operation efficiency, and non-interest income have been taken as important attributes and measures of bank specifics. Table 2 summarizes the operational definition and measurement of the independent variables of the study.

5. Data analysis and results

5.1. Descriptive statistics

Table 3 shows the results of descriptive analysis of the current study for the period from 2008 to 2017. Banks’ LQD is taken as a dependent variable, while the independent variables are bank-specific and macroeconomic determinants. The bank-specific determinants include: assets size, capital adequacy, deposits, assets quality, assets management, profitability, operation efficiency, non-interest income, economic activity, inflation rate, exchange rate, and interest rate, while macroeconomic variables are economic activity, inflation rate, exchange rate, and interest rate. The maximum value of LQD is 0.33, and the minimum value is 0.00, while the average value of LQD ratio is 8%, and the standard deviation is 0.03. For bank-specific variables, the results show that LOGA is 17.12, the ratio of CA, DP, AQ, AM, ROA, ROE, OPEF, NII, and NIM have maximum values which are 0.07, 0.92, 0.70, 0.11, 2.02, 31.56, 0.14, 1.16, and 261.00, respectively. The minimum values are 9.60, 0.00, 0.52, 0.40, 0.05, −2.04, −38.60, 0.06, 0.00, and 0.00, respectively, the mean values of all bank-specific variables of LOGA, CA, DP, AQ, AM, ROA, ROE, OPEF, NII, and NIM are 13.89, 1.82, 61, 10.93, 8, 4, and 3.66%, respectively, while the standard deviation values are 1.28, 1.8, 4, 1, 70, 12.09, 1, 11, and 13.44%, respectively. In the term of macromacroeconomics, variables reveal that GDP, IFR, INTRT, and EXCH have maximum and minimum values of 10.26, 12.00, 7.78, 66.25 and 3.89, 4.90, 1.06, 42.02, respectively. While the mean value of macroeconomic variables is 7.33, 8.39, 4.63, and 55.77%, while the standard deviation is 1.81, 2.31, 2.25, and 8.81%, respectively.

5.2. Unit root test

Table 4 provides unit root analysis of the variables of the study. Stationarity of the data as an essential step for panel data analysis is confirmed using unit root test. Levin, Lin & Chu t, I’m, Pesaran and Shin W-stat, ADF—Fisher Chi-square and PP—Fisher Chi-square tests are applied to test the stationarity of the variables. The null hypothesis that the variables have unit root problems at the level is accepted leading to replicate the unit root test for all variables at the first difference. The outcome results in rejection of the null hypothesis at the 1st difference, leading to the confirmation that all variables don’t have unit root problems at the 1st difference.
5.3. Correlation matrix and multicollinearity diagnostics

Table 5 reveals the association between the dependent and independent variables of the current study from 2008 to 2017. In terms of bank-specific determinants, LQD has a positive association with CA, DP, NIM, and has a negative relationship with LOGA, AQ, AM, ROA, ROE, OPEF, and NII. While in the term of macroeconomic determinants, the result shows that LQD has a positive correlation with GDP, INTRT, and has a negative relationship with IFR and EXCH. The study further investigates the correlation between the independent variables by using the variance inflation factor (VIF). The findings of the VIF suggests that there is no multicollinearity problem among the independent variables. All values of the VIF are below 6 which indicate that multicollinearity problem between the independent variables is not present in this study. The VIF is depicted in Table 5 (see below).

5.4. Regression analysis

As explained in the fixed effect model in Table 6 for LQD, the results of fixed effect model illustrate that the value of Adjusted R-square is 0.57, which reveals that both internal determinants and external variables contribute about 57% to the LQD.

Among internal determinants, LOGA, AQ ratio, ROE ratio, OPEF ratio, and DP ratio have a significant effect on LQD. AQ ratio, ROE ratio, OPEF ratio, and DP ratio have significant effect at the level of 1% (p value = 0.00 < 0.01) while LOGA has significant effect on LQD at the level of 10% (p value = 0.00 < 0.10). The coefficient of LOGA, CA ratio, AM ratio, LNAS, and OPEF have a negative effect on LQD, while CA ratio, ROA ratio, ROE ratio, NII ratio, NIM ratio, and DP ratio are found to be
a negative impact on LQD. The results supported the findings of Singh and Sharma (2016) who found that LOGA and DP ratio have a significant effect on LQD.

The above results consistent with Choon et al. (2013) who suggested that there is a significant association between bank size and LQD. However, the findings of the current study are inconsistent with that of Aspachs et al. (2005) who has suggested that bank size has an insignificant influence on LQD. The findings are inconsistent also with those of Moussa (2015) who has revealed that there is significant effect among capital adequacy and bank LQD.

In the term of macroeconomics determinants, the findings reveal that only GDP has a significant effect on LQD, while IFR rate, INTRT rate, and EXCH rate have an insignificant impact on LQD. The coefficient of GDP, IFR rate, and INTRT rate have a positive impact on LQD, while EXCH rate has a statistically negative influence on LQD.

The findings supported by Singh and Sharma (2016) who indicated that GDP has a significant effect on LQD. It also supported by Choon et al. (2013), Moussa (2015), and Bunda and Desquilbet (2008) who have indicated that GDP has a positive impact on banks’ LQD. It is inconsistent with Valla, Saes-Escorbiac, and Tiesset (2006), Aspachs et al. (2005), and Vodová (2011) who indicated that GDP has a negative association with bank LQD. The findings are consistent with Tseganesh (2012) who revealed that inflation rate has a positive influence on the LQD. It also supports the findings of Horváth et al. (2014) who reported that there is an

Note: The dependent variable LQD is defined as liquid assets to total assets, while independent variables classified into bank-specific factors and macroeconomic determinants. The bank-specific as: LOGA is the natural logarithm of total assets, CAD is the capital adequacy ratio (%), ROA is ratio of bank net profit to total assets, ROE is ratio of net profit to shareholders’ equity, AM is the asset quality (%), DEP is the deposits to total assets, NII is non-interest income ratio, NIM is calculated as net interest income/total assets (%), AM is the asset management ratio (%), OPEF is the operating efficiency ratio (%). The macroeconomic factor as: “GDP is the real Gross domestic product, INF is annual inflation rate (%), INTR is the lending Interest rate (%), EXCH is the exchange rate (%).”
Table 5. Correlation analysis

Note: The dependent variable LQD is defined as liquid assets to total assets, while independent variables classified into bank-specific factors and macroeconomic determinants. The bank-specific as: LOGA is the natural logarithm of total assets, CAD is the capital adequacy ratio (%), ROA is ratio of bank net profit to total assets, ROE is ratio of net profit to shareholders’ equity, AQ is the asset quality (%), DEP is the deposits to total assets, NII is the non-interest income ratio, OPEF is calculated as net interest income/total assets (%), AM is the asset management ratio (%), GDP is the real Gross domestic product, IFR is annual inflation rate (%), INTR is the lending Interest rate (%), EXCH is the exchange rate (%).
insignificant influence on the banks’ liquid assets. It is inconsistent with the findings of Moussa (2015) and Shyam Bhati et al. (2015) who have revealed that inflation rate has a negative effect on LQD. Supported with Almaqtari et al. (2018) who suggested that LQD ratio has an insignifi- cant effect on banks’ profitability measured by ROA. The findings also supported with Al-Homaidi, Tabash, Farhan, and Almaqtari (2018) reported insignificant effect between LQD and banks’ profitability measured by ROA and ROE.

The study has used the Hausman test to choose the convenient estimation method (fixed or random effects). The fixed effect regression model is more suitable than the random effects according to the Hausman test because the (p-value<0.05%) is less than 0.05% in this study.

5.5. GMM model estimation
Generalized methods of moments (GMM) is conducted to verify the results of the estimated models above. A two-step system GMM models are applied to control the problems of correlation between the lagged dependent variable and the error term. Chowdhury and Rasid (2017) stated that GMM can solve only the “fixed effect” problems by fixing the problem of correlation between the lagged of the dependent variable and the error term and the indigeneity of some of the explanatory variables. Further, the system GMM tries to deal with weak instrument problems by augmenting instruments.

| Variables          | Coeff. | t-   | Prob. | Coeff. | t-   | Prob. | Coeff. | t-   | Prob. |
|--------------------|--------|------|-------|--------|------|-------|--------|------|-------|
| **Pooled**         |        |      |       |        |      |       |        |      |       |
| C                  | -0.12  | -1.38| 0.17  | 0.29   | 1.93 | 0.05**| -0.04  | -0.50| 0.61  |
| **Fixed**          |        |      |       |        |      |       |        |      |       |
| ROA                | 0.01   | 2.89 | 0.00***| 0.01   | 1.44 | 0.15  | 0.01   | 2.49 | 0.01***|
| ROE                | 0.00   | -5.87| 0.00***| 0.00   | -3.55| 0.00***| 0.00   | -5.38| 0.00***|
| **Random**         |        |      |       |        |      |       |        |      |       |
| GDP                | 0.00   | -2.60| 0.01***| 0.00   | -1.95| 0.05**| 0.00   | -2.19| 0.03***|
| INTRT              | 0.00   | 0.14 | 0.88  | 0.00   | -0.05| 0.96  | 0.00   | -0.12| 0.90  |
| EXCH               | -0.05  | -2.82| 0.01***| -0.01 | -0.59| 0.56  | -0.05  | -3.24| 0.00***|
| **Note**: significance at *1*, **5, *10 percent levels.
The results of GMM in Table 7 confirm that there is no order correlation within the error. The p-value of the Arrellano and Bond test of second-order correlation suggests that there is no significant order correlation in both cases, ROA and ROE. Further, the Sargent test is conducted, which shows that the value of this test is more than 0.05 (LQD = 0.41), which confirms the usage of the dynamic panel data model. The results from the bank-specific determinants indicate that LOGA, CA ratio, AQ ratio, DP ratio, AM ratio, OPEF ratio, ROA ratio, ROE ratio, and NIM ratio have statistically significant impact on LQD, except NII has an insignificant impact on banks’ LQD. AQ ratio, AM ratio, ROE ratio, and NIM ratio have a statistically significant impact on LQD at the level of 1% (p-value < 0.01), while LOGA, CA ratio, DP ratio, and ROA ratio have statistically significant impact on LQD at the level of 5% (p-value<0.05). Only NIM has a statistically significant effect on LQD at the level of 10% (p-value<0.10). The coefficient value of LOGA, CA ratio, DP ratio, OPEF ratio, ROA ratio, and NII ratio have a positive effect on LQD, while AQ ratio, AM ratio, ROE ratio, and NIM ratio have a negative influence on LQD.

The findings are supported by Choon et al. (2013) who revealed that bank size has a significant association with banks’ LQD. It is not supported by the findings of Aspachs et al. (2005) who suggested that bank size has an insignificant influence on banks’ LQD. It is also inconsistent with

Note: significance at *1**, **5, *10 percent levels. Generalized Method of Moments (GMM) procedure following Manuel Arellano and Olympia Bover (1995).
the findings of Aspachs et al. (2005) who indicated that banks’ profitability has an insignificant association with bank’s LQD. This argument is also inconsistent with that of Moussa (2015) who found that deposits ratio has an insignificant effect on banks’ LQD. Finally, the findings inconsistent with Choon et al. (2013), Delechat et al. (2012), and Bhati and Zoysa (2012) who suggested that capital adequacy ratio has a significant effect on banks’ LQD.

In terms of macroeconomic determinants, only INTRT rate and EXCH rate have a statistically significant effect on banks’ LQD at the level of 1% (p-value < 0.01), while GDP and IFR have an insignificant impact on LQD. The coefficient of macroeconomic variables reveals that GDP and INTRT rate have a statistically negative impact on LQD, while IFR rate and EXCH rate have positive effects on LQD.

The results are consistent with Bunda and Desquilbet (2008), Dinger (2009), Vodová (2011) and Aspachs et al. (2005) who agreed that GDP has a negative association with banks’ LQD. This argument is inconsistent with Moussa (2015) and Choon et al. (2013) who indicated a positive influence of GDP on banks’ LQD. It is supported by Tseganesh (2012) who found that inflation ratio has a positive effect on banks’ LQD. It is inconsistent with that of Moussa (2015) and Shyam Bhati et al. (2015) who suggested that inflation rate has a statistically negative impact on banks’ LQD.

6. Conclusion and recommendations
This study has examined the LQD determinants of Indian listed banks for the period from 2008 to 2017. The research study has used both technical analysis (pooled, fixed, and random effects) and the Generalized Method of Moments (GMM). The sample size of the current study consists of 37 listed banks which were selected among the 42 banks listed on Bombay stock exchange in India. Banks’ LQD was used as a dependent variable, while the independent variables were bank-specific determinants and macroeconomic variables. The bank-specific variables included: assets size, capital adequacy ratio, deposits ratio, assets quality ratio, assets management ratio, profitability ratios, operation efficiency ratio, non-interest income ratio, while macroeconomic determinants are an economic activity (GDP), inflation rate, exchange rate, and interest rate.

The findings indicate that among the bank-specific determinants; bank size, capital adequacy ratio, assets quality ratio, deposits ratio, assets management ratio, operation efficiency ratio, return on assets ratio, net interest margin ratio, and return on equity ratio have a significant effect on banks’ LQD, except non-interest income which has an insignificant impact on the banks’ LQD. Assets quality ratio, assets management ratio, operation efficiency ratio, and return on equity ratio have a statistically significant influence on banks’ LQD, while bank size, capital adequacy ratio, deposits ratio, and return on assets ratio have a significant impact on LQD, only net interest margin ratio has a statistically significant impact on LQD. The coefficient value of bank size, capital adequacy ratio, deposits ratio, operation efficiency ratio, return on assets ratio, and non-interest income ratio has a statistically positive effect on LQD, while assets quality ratio, assets management ratio, net interest margin ratio, and return on equity ratio have a statistically negative impact on LQD.

With respect to macroeconomic factors, only interest rate and exchange rate have a statistically significant effect on LQD, while annual real GDP growth rate and inflation rate have an insignificant effect on LQD. The coefficient of macroeconomic variables shown that annual real GDP growth rate and interest rate have a statistically negative effect on LQD, while inflation rate and exchange rate have a positive effect on LQD.

Furthermore, the current research seeks to fill an existing gap in the literature of listed commercial banks’ LQD, and provides new empirical evidence using different statistical tools as a methodological contribution, and brings useful insights and empirical evidence on the internal variables and external factors of listed banks’ LQD working in India. The results will be very beneficial for bankers, analysts, regulators, investors, and other interested parties to improve their consideration for LQD management of Indian listed banks. The current study also provides new insights into the internal variables
and external determinants of banks’ LQD listed on Bombay Stock Exchange in India. Few investigations have investigated this issue in India and to the best of the authors' knowledge, this study is the first attempt to examine this issue using various statistical tools of analysis and panel data of the listed commercial banks in India. Therefore, this research seeks to bridge a present gap in the body of literature on listed commercial banks’ LQD in India.
