RESEARCH AND THEORY

Combining Integration of Care and a Population Health Approach: A Scoping Review of Redesign Strategies and Interventions, and their Impact

Elina Farmanova*, G. Ross Baker* and Deborah Cohen†,‡

Background and aim: Many health systems attempt to develop integrated and population health-oriented systems of care, but knowledge of strategies and interventions to support this effort is lacking. We aimed to identify specific redesign strategies and interventions, and to present evidence of their effectiveness.

Method: A modified scoping review process was carried out. Fifteen relevant examples of integrated care organizations that incorporated a broad population health approach in countries of the Organization for Economic Cooperation and Development described in 57 articles and reports were included in analysis.

Results: Seven key redesign strategies and multiple redesign interventions have been identified and are described. Most commonly used redesign strategies included focusing on health and wellness, embracing intersectoral action and partnerships, addressing health in vulnerable groups, and addressing a wide range of determinants of health, including making improvements in health services. Redesign interventions included creative and innovative ways of addressing clinical and non-clinical issues such as establishing housing surgeries in primary care, establishing vast social and provider networks to support patients with complex needs and also broadening of the scope of services, workforce redesign and other. Potential reductions in the utilization of care and costs could be derived by the wider adoption of these strategies and interventions.

Conclusion: Development of integrated and population health-oriented systems of care requires the redesign of how services are organized and delivered, and how organizations and care systems operate. Combining integration of care with the population health approach can be supported by a set of cohesive strategies and interventions aimed at preventing disease, addressing social determinants of health and improving health equity at both population- and individual-level.

Keywords: integrated care; population health; redesign interventions; determinants of health

Introduction

Health systems worldwide face increasing challenges from growing numbers of complex multimorbid patients, the rising costs of care and an increasing recognition of the impact that results from a failure to address the social determinants of health [1–4]. Collaborative or integrated health care delivery has proven to be effective for patients with complex medical needs [5–8] and is now seen as a necessary innovation [9] to address these challenges. Extending the benefits of integrated care to the general population, requires combining the scope of integrated care with a population health approach [2, 10–13]. This approach to care considers a wide range of factors and interrelated conditions that influence the health of populations over the life course, identifies systematic variations in their patterns of occurrence, and applies the resulting knowledge to improve the health and well-being of those populations [11]. This approach also commonly shifts the focus to prevention, multiple determinants of health, equity in health, intersectoral action and partnerships, and understanding the needs and solutions through community outreach [14].

Neither the integration of care and nor the population health approach are novel concepts; although some general strategies and design principles have been proposed for both the integration of health services [3, 15–18] and the population health approach [2, 19–23] the linkage of these concepts remains challenging. Moreover, the concrete operationalization of these strategies is still missing in many settings. For example, it is often unclear how to expand the scope of integrated care beyond traditional
health services and how to address the social determinants of health in the processes of care [24]. Some integrated healthcare organizations such as Kaiser Permanente in the U.S [25], and Gesundes Kinzigtal in Germany [26], have successfully adapted a broad population health approach to the organization and delivery of care. These and other examples demonstrate that integrated health care systems can be successfully redesigned to incorporate the population health approach to care [2]. But such examples need to be studied systematically to inform and facilitate the broader adoption of the integrated care combined with the population health approach.

This paper presents the results of a scoping review of selected examples from countries of the Organization for Economic Cooperation and Development (OECD) of initiatives that have taken on the broad population health approach in the context of the integration of care. The review sought to answer the following key question: How can the population health approach and its elements be embedded in the context of integrated care delivery? The aim was to investigate: 1) redesign interventions that can facilitate combining integration of care with elements of the population health approach, and 2) evidence of the effectiveness of these interventions. For the purpose of this paper, we define interventions as either changes in or redesign of processes and structures in healthcare organizations or innovations with an overall objective of establishing integrated population health-based systems of care. This definition is deliberately broad so as to cover as many interventions as possible. This article also discusses real-life challenges reported in literature with regard to implementation of integrated population health-based care delivery and recommendations for its scalability.

Methods

We modified Arksey and O'Malley's [27] five stage scoping review process (identifying the research questions (stage one), identifying relevant studies (stage two), selecting studies (stage three), charting the data (stage four), collating, summarizing and reporting results (stage five) by adding two additional steps between stages 2 and 3. Specifically, after identifying relevant studies, we looked for the description of initiatives in these reports and searched for additional information on each identified initiative before commencing stage 4 (charting the data). We identified 27 relevant initiatives and after applying the inclusion criteria, 15 initiatives were selected for the review.

To identify relevant reports, one reviewer (EF) with the support of a librarian searched OVID-medline, Pubmed, Mendeley and EMBASE databases and screened articles based on titles and abstracts. The detailed search strategy is presented in Table 1. A hand search of bibliographies in selected articles and grey literature was also performed. Another team member (JPN) reviewed selected reports to validate their inclusion using agreed upon criteria. Inclusion criteria specified that all initial research must be drawn from the OECD countries, published between the years 2000 and 2015. In 2017, new reports were included to update the content of this review to December 2017. Relevant studies were required to describe examples of either established or new initiatives or programs for which descriptive information was available, and that were evaluated (internally or externally). Specifically, we looked for the presence of at least one interface (e.g., referral, co-location) between healthcare and non-healthcare services that addressed multiple determinants of health as evidence of the integration of medical and non-medical sectors beyond individual tiers of public health, primary care, acute care/hospitals, mental health, community care, and long-term care services. These inclusion criteria helped us identify examples of initiatives and programs designed with consideration of concepts of integrated care [15, 28] and tenets of the population health approach [21]. The selected initiatives included a number of upstream interventions across sectors and levels of care that address the challenge of moving beyond the individual to the community.

For each selected initiative we carried out an additional search of published and grey literature to collect details about interventions and results. Two team members (EF, JPN) independently reviewed each report and abstracted data using inductive reasoning and open coding to identify themes. Abstraction and analysis of data were conducted in parallel. Two team members (RB, DC) reviewed a subset of reports to validate findings and their accuracy. Disagreements associated with data abstraction and analyses were resolved in a discussion between the reviewers who abstracted data or all team members together.

We used the 7 population health elements identified by the Canadian Institute for Health Information (CIHI) (14) and the 12 determinants of health described by the Public Health Agency of Canada (PHAC) [29] to categorize population health strategies and redesign interventions, respectively. Together these population health elements and the determinants of health help identify specific foci for the population health efforts and how they have been linked to integrated care.

In assessing each initiative, we identified the level and the type of integration among medical and non-medical care and services using Leutz's [30] continuum of integration (linkages, coordination, full integration) and the Fulop et al.'s [31] integration typologies (organizational, functional, service, clinical, normative, and systemic). Contracting arrangements that supported the level and type of integration were reviewed following the typology of Billings & de Weger [32]. Analyses of integration strategies included aspects of governance, management, funding, organization and delivery of care as proposed by Kodner and Spreeuwenberg [28]. The effectiveness of redesign interventions was assessed using results of reported evaluations for each selected initiative.

Results

Fifteen initiatives from 9 OECD countries described in 57 articles and reports published between 2001–2017 were included in analysis. The characteristics of these initiatives are presented in Table 2. They represent a broad array of
examples from short-term pilot projects, randomized controlled trials, small-scale programs in one neighbourhood or city, through to larger initiatives at regional levels. The initiatives reviewed here included both newly established care systems that adopted the population health approach from the start and established acute care systems that have developed elements of integrated population health-based systems in more recent times. Many of these initiatives were established in response to increasing rates of chronic diseases and multimorbidity thus addressed the needs of high-need/high-cost populations [9, 12, 33–35], and some have begun to combine these efforts with population health management [12, 36, 37].

Population health strategies and determinants of health
As noted, each initiative was assessed for the 7 population health strategies [14] and the 12 determinants of health [29] to identify what startegies have been used and for which determinants of health. Commonly, initiatives used multiple population health strategies at the same time, including focusing on health and wellness, embracing intersectoral action and partnerships, addressing health in vulnerable groups, and addressing a wide range of determinants of health, including making improvements in health services (Table 3). Specific interventions used to implement these strategies are described in Table 4. All
Table 2: General characteristics of projects and programs (projects 1–4).

| Initiative                  | Embrace (The Netherlands) | Liverpool City Council's Healthy Homes Programme (UK) | New Zealand Healthy Housing Programme (also known as Counties Manukau Health) | Hennepin Health Accountable Care Organization (ACO) (USA) |

| **Country**                 |                           |                                                     | New Zealand                                                                 | USA                                                      |
| **Objective**               |                           |                                                     | To improve tenant access to health-care services in order to improve health outcomes. | To treat each person holistically through the coordination of medical and social services to improve health outcomes and reduce cost; |
|                             |                           |                                                     | To reduce the risk of housing related health issues, such as an extension to the house, a transfer to a larger home, housing design improvements or creation of healthy environments, including insulation and ventilation. | To increase use of preventive care and reduce preventable hospital admissions and emergency visits in high-risk population it serves. |
|                             |                           |                                                     | To identify social or welfare issues and provide a link to the appropriate social service agencies. |                                                                 |
| **Intervention period**     | 2012 – present (pilot phase 2012–2013) | 2009 – present                                     | 2001 – present                                                              | 2011 – present                                           |
| **Population size**         | 755 community-living adults in three municipalities | 40000 properties eligible; 33000 assessments and 25000 referrals done in year one | 9736 residents of 3410 homes in 2001–2007 | 9054                                                     |
| **Target population**       | Older adults living in community stratified into robust, frail and complex care needs risk profiles (profiles correspond to care intensity levels) | Population living in eligible housing (neighbourhoods with high level of deprivation) | Families at high risk of infectious diseases, living in neighbourhoods with high levels of deprivation and high concentrations of public and other low-income housing. | Population is stratified based on risk and high cost; Patients with high risk/cost have highest priority for intervention. |
| **Sectors integrated or otherwise involved** | Primary care physicians (15 practices) and local health and community organizations (welfare service, preventive and medical care) | Public health, primary care, community-level care that includes a range of services, e.g., social care agencies, specialized care (mental health), hospitals, etc. | Joint initiative between Housing New Zealand Corporation (provider of government-funded housing) and District Health Boards that includes other tiers of care (primary care, hospitals) and social service agencies via referral | Hennepin County Human Services and Public Health Department; Hennepin County Medical Center, Level I trauma center and medium-size public hospital and safety net medical system; NorthPoint Health and Wellness Center, and Metropolitan Health Plan |
| **Model of integration and/or theoretical framework** | Chronic Care Model elements (self-management, delivery system design, decision support, clinical information system), Kaiser Permanent Triangle | Initiative is rooted into councils’ understanding how quality of housing affects health and wellbeing of their residents | Socio-ecological model | Shared risk model of integrated delivery of medical, behavioral, and social services for an expanded population of Medicaid beneficiaries | (Contd.)
| Initiative | Objective | Intervention period | Population size | Target population | Sectors integrated or otherwise involved | Model of integration and/or theoretical framework |
|------------|-----------|---------------------|-----------------|------------------|----------------------------------------|-----------------------------------------------|
| Spokane and Clark counties Maternal and Child Health Inequities | To reduce chronic disease in marginalized communities by improving outcomes and opportunities in early life; To transition Maternal and Child Health services from an individual-focused (mother–child dyads/family) home visiting model to a population-focused, place-based model. | 2008–2010 | NR | Mothers and children, pregnant women | Spokane Regional Health District and Clark County Public Health led pilots and involved a great number of partners among businesses, schools, clinics. | Socio-ecological model Life-course approach |
| North West London Integrated Care Pilot | To become a “beacon” for delivering integrated care; To significantly improve patient experience; To decrease emergency admissions by 30% and nursing home admissions by 10% for people with diabetes and the frail elderly through better, more proactive and coordinated care; To reduce cost of care for these groups by 24% over next 5 years. | 2013–2017 | 38000 | Older adults age 75+ with diabetes | 100 general practices, 2 acute care trusts, 5 primary care trusts, 2 mental health care trusts, 5 community health trusts, 5 local authorities, and 2 voluntary sector organizations (Age UK and Diabetes UK) | NR |
| Integrated Social Care and Health Districts in Hartberg | To offer patients in need of care the possibility to stay at home; To improve and guarantee offer of health and social care in a district; To help patients and their families to find suitable care for their needs; To start and develop care programmes for relatives. | Established in 1989, the program changed and cooperation with a district hospital was added in 2000 | 941 | Community-dwelling older adults | Social support, preventative and primary medical services and hospital care | NR |
| Open Care Centres for the Elderly (KAPI) | To provide older adults with primary medical, pharmaceutical and nursing care, and social and domestic assistance while they remain at their homes. | Established in 1979, it changed throughout 1980s–90s and doubled in size in 2000s to support aging at home; (pilot phase 1979–1981) | 17000 | Older adults age 65+, community-dwelling | Social support and preventative and primary medical services | Innovative programmes aiming at socialisation of elderly, keeping them active, fit and healthy and creating awareness in their social environment. | (Contd.) |
| Initiative | Zorgvoorziening Zijloever (Care friendly district) | Integrated services for frail elders (SIPA) | Torbay Integrated Care Pilot | Gesundes Kinzigtal |
|------------|-----------------------------------------------|----------------------------------------|-----------------------------|-------------------|
| **Country** | The Netherlands                               | Canada                                 | UK                          | Germany           |
| **Objective** | • To deliver primary medical, pharmaceutical, nursing care, social and domestic assistance to eligible persons with disabilities living in community. | • To respond appropriately to needs of older persons with disabilities; • To maintain and promote independence of older persons; • To optimize use of community-, hospital- and institutional-based resources | • To establish integrated health and social care teams within a single organization to better meet the needs of older people. | • To establish more efficient and better-organized health care in cooperation with patients, health professionals and health insurers; • To provide best practice health care to all patients. |
| **Intervention period** | Established in 1990, program undergone changes and expansion to comprehensive services in 2000s | 1999–2001                              | 2005 – present               | 2006 – present    |
| **Population size** | NR                                            | 1230                                   | 145000                      | 69000             |
| **Target population** | Older adults age 65+ eligible on medical grounds for place in residential home. | Older adults age 64+, community-dwelling, with at least moderate disability | Older adults           | All residents     |
| **Sectors integrated or otherwise involved** | Long term care and welfare services            | Two community-based multidisciplinary teams with full clinical responsibility for delivering integrated care through provision of community health and social services and coordination of hospital and long term care. | Primary and secondary care (primary care trust that also took over hospital care and adult social care services, Torbay Council and Torbay Care Trust) | Physicians’ network and health care management company with background in medical sociology and integrated care management. |
| **Model of integration and/or theoretical framework** | Concept of ‘care-friendly districts’ supported by national policies. | Integrated Services for Frail Elderly delivering integrated social and health services, acute and long term care, community-based and institutional services. | “Bottom up” approach; departed from the creation of integrated health and social care team established in Brixham in 2004. | Triple Aim approach, chronic care model, innovative model of integration in its combination of logistical re-engineering of care processes, IT integration, public health and prevention measures. |

| **Determinants of health**  |                                                               |                                                   |                                                 |                                                 |                                                 |                                                 |                                                 |
| **Physical Environments**   | Primary care centre used as a community hub was designed and built using traditional materials and exhibiting local arts to foster pride and confidence in local communities (Nuka) | Housing options advice, home improvements (Healthy Homes, Healthy Housing) | House modifications due to disability (Healthy Housing) | Co-location and “open concept” – all providers in one open space (Nuka) | Enhancing residents’ sense of identity, security and inclusion by involving householders in home renovations (Healthy Housing) | • Enhancing patients’ sense of identity, security and inclusion by involving householders in home renovations (Healthy Housing) | Primary care centre used as a community hub was designed and built using traditional materials and exhibiting local arts to foster pride and confidence in local communities (Nuka) |
|                            | Health promotion workshops (Healthy Homes, Healthy Housing)   | Health risks education (Healthy Housing)          | Safe opportunities for physical activity (Spokane, Kaiser Permanente) | Referral pathways supported by teams of referral, health, and social care coordinators and IT (Torbay) | Integrated medical care complimented by dental, behavioural, after-care, youth, elders; Family Wellness Warriors; Tribal and Traditional Services; Chiro, massage, acupuncture (Nuka) | Self-management support and prevention for frail and complex care needs via community meetings and case manager (Embrace, Nuka) | Patients (customers) and providers are encouraged to use phone, email and text for routine monitoring and some preventative screening (Nuka) |
|                            | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) | “Patient university” (health education and patient counselling by medical experts) (Gesundes Kinzigtal) |
|                            | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) | “Healthy body weight” combining prevention with regular blood sugar level check ups (Gesundes Kinzigtal) |

(Contd.)
| Population health elements | Determinants of health | Interventions |
|----------------------------|-----------------------|---------------|
| Focusing on health and wellness, prevention rather than illness | Addressing the social/multiple determinants of health | Taking a population rather than an individual orientation | Embracing intersectoral action and partnerships | Addressing equity/health disparities/health in vulnerable groups | Understanding needs and solutions through community outreach | Adopting a long-term approach in care planning and delivery |
| Healthy Child Development | Child immunisations (Healthy Housing, Nuka) | Pre- and post-natal care, including advising on birthing options and carrying out six-weekly check-ups as part of primary care services (Nuka) | Increasing access to healthy foods via community kitchens (Spokane, Kaiser Permanente) | No interventions noted |
| Biology and Genetic Endowment | Healthy Homes on Prescription in primary care (Healthy Homes) | Stratification into (A) no complex care needs and with low frailty level; (B) frail at risk of complex care needs; and (C) complex care needs (Embrace) | Informal/formal multidisciplinary teams coordinate & provide care (Torbay, Embrace) | Increasing access to first trimester prenatal care for marginalized women (Spokane) |
| Health Services | Individual treatment plans and goal-setting agreements between doctor and patient (Gesundes Kinzigtal, Nuka, Kaiser Permanente) | Healthy housing surgeries in primary care (Healthy Homes) | Community-based multidisciplinary teams responsible for health and social services and coordinating hospital and nursing home care (SIPA, Hartberg) | Outreach conducted centrally at region and at medical centers via telephone, secure messaging, mail (Kaiser Permanente) | Established regional organization, Social Care and Health District, for co-ordination and co-operation of health and social care organizations (Hartberg) |
| | Follow-up care and case management (Gesundes Kinzigtal, Nuka, Kaiser Permanente) | Multidisciplinary team working with all family members to enable behavioural change (Nuka) | | Social worker goes on rounds with a local nonprofit’s street outreach team to find homeless members (Hennepin Health) | (Contd.)
Population health elements

| Determinants of health                                                                 |
|----------------------------------------------------------------------------------------|
| Focusing on health and wellness, prevention rather than illness                        |
| Addressing the social/multiple determinants of health                                  |
| Taking a population rather than an individual orientation                              |
| Embracing intersectoral action and partnerships                                        |
| Addressing equity/health disparities/health in vulnerable groups                      |
| Understanding needs and solutions through community outreach                          |
| Adopting a long-term approach in care planning and delivery                            |

Interventions

- System-wide electronic patient records (Gesundes Kinzigtal, Nuka, Kaiser Permanente)
- Intervention programme for patients with chronic heart failure (Gesundes Kinzigtal)
- ‘Healthy body weight’ combining prevention with regular blood sugar level check-ups (Gesundes Kinzigtal, Kaiser Permanente)
- Referrals to paediatric and women’s clinics with coordination from primary care team (Nuka)
- General practitioner and nurse-led case management aim to address the emotional, psychological and social determinants of health (Nuka)
- Health and self-management education for patients and families/carers (Jönköping, Kaiser Permanente)
- Supplementing medical records with data from the corrections department, foster care system, housing providers, and other local agencies to identify those whose health may be at risk because of nonmedical issues (Hennepin Health)
- Stratification into 1) children and young people, 2) people with mental health conditions, 3) people with drug and alcohol addiction, 4) older people (Jönköping)
- Population risk stratification based on Kaiser’s Know your population model (Torbay) or simple assessment scales (NWL; Hennepin)
- Patient panel from registered list of patients (Nuka, Kaiser Permanente)
- “Esther model” and “Mrs Smith” provided basis for designing care pathways for all older people (Jönköping, Torbay)
- Inter- and multi-disciplinary group meetings to develop unified view of patients’ care and system navigation (NWL, Embrace, Nuka, Kaiser Permanente, Jönköping)
- Case managers for medical and social issues, liaising with physicians, and following patients throughout care trajectory, assuring continuity and easing transitions between hospital and community (SIPA, Nuka)
- Integrated system of community-based care, offering front and second-line health and social services, incl. short- and long-term care in community (SIPA)
- Whole-system approach, with hospitals, primary health care and other community services in partnership with zones (Torbay)
- Mental health services integrated using a ‘hub and spoke’ model (Torbay)
- Integrated medical services (primary care, women’s health, paediatrics, optometry, urgent care) complimented by dental, behavioural health, family wellness, tribal and traditional services, chiro, massage, acupuncture
- Monitoring of interdisciplinary protocols (nutrition, falls, congestive heart failure, dementia, depression, medication, vaccination) (SIPA)
- Established primary care trust to commission community health and social care services (Torbay)
- Developed integrated management structure for primary care trust and adult social services (Torbay)
- Established single management system (Torbay)
- Established IT tool to bring together medical and social care records from different provider organizations in one location (NWL)
- Making and sustaining large-scale changes to create an integrated care system capable of improvement (Jönköping)

(Contd.)
| Population health elements | Determinants of health | Interventions                                                                                                                                 |
|----------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| **Focusing on health and wellness, prevention rather than illness** | **Addressing the social/multiple determinants of health** | • “The Esther model” – network of health and social care organizations; redesign of intake and care transfer process across the continuum of care; team-based telephone consultation (Jönköping) |
| **Taking a population rather than an individual orientation** | **Embracing intersectoral action and partnerships** | • Complete care with panel management and regional safety nets to identify and respond to the needs of patients (Kaiser Permanente) |
| **Addressing equity/health disparities/health in vulnerable groups** | **Understanding needs and solutions through community outreach** | • Providers acknowledge and incorporate importance of culture to well-being (Healthy Housing) • Engagement of tribal elders and the Alaska Native community in design and delivery of care (Nuka) • Traditional healing provided by tribal doctors whose skills are culturally relevant (Nuka) • Governance from Alaska Native community (Nuka) |

**Gender**

No gender-specific interventions noted with the exception of interventions for marginalized expectant mothers as part of the Spokane and Clark counties Maternal and Child Health Inequities initiative.

**Culture**

• Providers acknowledge and incorporate importance of culture to well-being (Healthy Housing) • Engagement of tribal elders and the Alaska Native community in design and delivery of care (Nuka) • Traditional healing provided by tribal doctors whose skills are culturally relevant (Nuka) • Governance from Alaska Native community (Nuka)
15 initiatives aimed to improve population health by targeting more than one determinant of health and applying more than one intervention.

**Focusing on health and wellness**

Health promotion was embedded in practice-level interventions and also in broader system changes that promoted wellness-oriented health and social care services. At the practice level, many initiatives focused on traditional behavioural modification approaches for high-risk groups as a key strategy for preventing diseases. At the broad system level, creation of new supportive environments to promote better personal and population health practices for broader populations [36, 38, 39] was observed. For example, Kaiser Permanente’s Total Health program [40] employed health promotion as a philosophy of care and used a multipronged strategy to address healthy eating and active living by fostering strong supportive environments across local communities.

Relationships between clinical staff and community partners were used widely to create supportive programs and environments addressing the needs of local populations (e.g., early childhood education opportunities [41], violence prevention programs [36], safe opportunities for physical activity [46], community kitchens [41] and farmer’s markets [42]). In these programs, health promotion and prevention efforts were often blended with traditional self-management supports [9, 12, 43, 44]. A major focus centered on physical activity and nutrition, and attention to other determinants of health was less visible.

**Embracing intersectoral action and partnerships**

A variety of ways were used to organize intersectoral work. At an organizational level, many initiatives created an alliance of partners, defined as a strategic collaboration and cooperation among the parties who deliver services [32]. In some cases, organizations developed an elaborate system of committees and other structures to reinforce intersectoral action. At the care delivery level, multidisciplinary teams were used commonly to address the clinical and non-clinical needs of their patients. Application and monitoring of interdisciplinary protocols was used frequently in organizing and coordinating care along with more informal exchanges among the providers from different sectors. In the majority of initiatives reviewed, health sector organizations played the lead role in planning and implementing the intersectoral work. However, when the focus was on the broader determinants of health (e.g., housing), the social sector tended to take leadership. For example, in New Zealand, the Healthy Housing Program created a successful partnership between the housing and the health sectors [45]. A culture of partnership and collaboration was present from the beginning in this program and facilitated its success.

**Addressing health in vulnerable groups**

Care for vulnerable populations (e.g., frail older adults with complex needs, individuals with mental health and addictions issues, and others with limited access to health care and services) was delivered by multispecialty medical and multidisciplinary team-based care with intensive disease and case management, and an emphasis on prevention and self-management. Both professional care networks and informal (social) networks were used to provide support to patients and families whose complex needs impacted their health. The “Esther Network” in Jönköping, Sweden, for example, is a network of caregivers, clinicians, patients, and families working together to improve care for patients with complex needs who require coordination of hospital, primary, home, and community care [46].

**Redesigning and building capacity to address the determinants of health**

Health services redesign received significant attention in all reviewed initiatives. Adoption of the population health approach in health care requires system redesign to develop capacity to carry out both population-based and individual-level initiatives aimed at preventing disease, addressing social determinants of health and improving health equity [4]. In our sample of initiatives, this redesign effort commonly included the development of comprehensive, coordinated systems of community-based care, offering public health services, primary and secondary health, and social services [9, 39, 41, 47–52] and also redesign of the delivery system to support these services [9, 36, 40, 47, 50, 53, 54]. For many organizations such transformations required substantial reconfiguration of services, including investments in home and community care, and strengthening of primary care [9, 12, 33, 35, 36, 44, 55]. Redesigning care delivery often included efforts to segment and stratify populations based on risk/needs profiles. These profiles were formulated based on complexity of medical conditions [33, 34, 54], diseases and population demographics [33, 34, 56], costs [25, 27] or their combination [25, 50, 53, 57]. The types of care offered to population segments were transformed and included elements such as mechanisms for the coordination of care [9, 33, 50, 51, 54, 58], referrals [36, 45, 48, 54, 59], case management [33, 34, 36, 43, 53], follow-ups [36, 43, 60, 61] and team-based care [33, 34, 36, 43, 50, 50] to help address specific needs of the population segments.

All initiatives reviewed featured the use of interdisciplinary or multidisciplinary teams as a substantive component of the interventions. We observed that efforts to address the social determinants of health were supported by two specific health human resources strategies: 1) introduction of new roles to complement membership on traditional interdisciplinary or multidisciplinary teams [50, 62], and/or 2) expansion of mandates for existing roles (e.g., nurse care managers) [36]. New roles included care coordinators, housing or social service navigators [43, 63], healthy home advocates [48], health visitors and family assistants [39], health care managers and multidisciplinary group coordinators [9, 50]. In addition to new and expanded roles, some initiatives introduced protocols for delegation of care which allowed team members to practice at the top of their scope of practice. [36, 43].

Taken together, the experience of these initiatives points to the importance of building and using social capital effectively [64] as a strategy to improve population health outcomes. Socializing clients with other clients...
was used both as prevention and rehabilitation strategy in elder care to prevent social isolation and overutilization of services [39, 52], and to leverage health promotion efforts in school-aged children and adults [40]. Networking among different care providers from different (health and non-health) sectors was used often to facilitate social networking among patients and their families. In Hartberg, Austria, for example, a network of several organizations, including religious and political groups, and a district hospital coordinated the provision of health and social care as one care package [51]. The blending of health and social services supported viable social connections in this community and resulted in improved quality of care [51]. In another example, medical facilities of the Nuka System of Care in Alaska were used as a meeting place and a community hub to foster relationships and to strengthen social capital in the community [36].

**Integration and redesign of care systems**

Combining integration of care with the population health approach requires changes to the way services are organized and delivered, and to the way organizations and care systems operate. As part of the analyses, we examined the degree and the type of integration [30] and the contracting models [32] used to support integration of care and embedded population health elements (Box 1). Details of these analyses are presented in Table 5. A range of levels of integration were supported by a variety of contracting arrangements and partnership(s) (Table 5). Alliances were used in more than half of reviewed initiatives to co-ordinate complex care between service sectors, settings, types of organisations, types of care and between different providers.

**Box 1: Definitions of the levels and types of integrated care, and types of contracting models.**

**Levels of integration:**
- **Linkage** refers to lose organisational ties (linkages) among teams and organisations that form an informal network of providers either within a single-care or across the continuum of care between community and hospital or specialist services. Service delivery is supported by referrals and provision of information.
- **Coordination** describes explicit infrastructure installed to coordinate care across acute and other systems. Coordination is a more structured form of integration than linkage, but it operates through the separate structures of current systems. Coordination focuses on persons receiving services simultaneously or sequentially from two or more systems of care on either a short- or a long-term basis.
- **Full integration** creates new programs or units where resources from multiple systems are pooled. Fully integrated programs gain control of resources to define new benefits and services that they control.

**Typologies of integrated care:**
- **Organisational integration** refers to structures that bring organisations together, for example, by mergers and/or structural change or virtually through contracts between separate organisations
- **Functional integration** describes how non-clinical support and back-office functions are integrated, such as by using electronic patient records.
- **Service integration** describes how different services provided are integrated at an organisational level, such as through multidisciplinary teams.
- **Clinical integration** refers to medical services integrated into a single or coherent process within and/or across professions, such as through use of shared guidelines and protocols.
- **Normative integration** refers to shared values and commitment to coordinating work that enable trust and collaboration in delivering healthcare.
- **Systemic integration** describes the coherence of rules and policies at all organisational levels.

**Types of contracting models:**
- **Alliance Contracting Model** – a contract between the owner, financier, or commissioner and an alliance of parties who deliver the project or service.
- **Lead provider/Prime contractor model** – a model where one provider is given the responsibility through a contract for subcontracting to other providers for the various aspects of care to both deliver care and also to ensure all different aspects of care are fully integrated, bringing together the previously episodic providers of care into a single pathway.
- **Accountable Care Organisations** – groups of health care providers from primary and secondary care levels who work together to coordinate and streamline clinical care and a range of non-clinical interventions at an individual and population level in a cost-effective way.
- **Outcome-based Contracting and Commissioning** – is a “performance-based” contracting focusing on results rather than activities, defining clear performance expectations and measures, providing incentives and monitoring performance.

**Table 5**

| Type of Integration | Description |
|---------------------|-------------|
| Linkage             | Lose organisational ties |
| Coordination        | Explicit infrastructure |
| Full integration    | New programs or units |

**Note:**
- **Box 1** defines the levels and types of integrated care, and types of contracting models.
Table 5: Level and type of integration, contracting and partnership arrangements.

| Initiative, Country | Level of integration | Type of integration | Contracting model |
|---------------------|----------------------|---------------------|-------------------|
| Torbay, UK          | Full                 | • Organizational    | Alliance Contracting Model |
|                     |                      | • Functional        | Contract between Torbay Care Trust (now Torbay and Southern Devon Health and Care NHS Trust) and alliance of parties who deliver integrated care and services. |
|                     |                      | • Service           | All parties share risk and collectively own opportunities and responsibilities to deliver care and services. |
|                     |                      | • Clinical          | |
|                     |                      | • System            | |
| SIPA, Canada        | Full                 | • Organizational    | Lead provider/Prime contractor model |
|                     |                      | • Service           | Two community-based multidisciplinary teams in two areas in Montreal took full clinical responsibility for delivering integrated care through provision of community health and social services and coordination of hospital and long term care. |
|                     |                      | • Clinical          | |
| Nuka, USA           | Full                 | • Organizational    | Alliance Contracting Model |
|                     |                      | • Service           | Co-ownership and co-management agreement between Southcentral Foundation and the Alaska Native Tribal Health Consortium (ANTHC); Provision of care is based on integration among the providers and types of care/services and inter-provider and -agency referrals. |
|                     |                      | • Clinical          | Financial risk and benefits from efficiencies, better coordination or better population management are shared across the system. |
|                     |                      | • Normative         | |
|                     |                      | • System            | |
| NW London ICP, UK   | Coordination         | • Organizational    | Alliance Contracting Model |
|                     |                      | • Service           | Alliance partnership of commissioners (clinical groups and local authorities), voluntary sector and providers from social care and other sectors governed by the Integrated Management Board. |
|                     |                      | • Clinical          | Funding surplus from efficiencies is shared across the partnership and a flexible resource envelope is made available to each multidisciplinary group for care planning, case conferences, and performance reviews. |
|                     |                      | • System            | |
| Embrace, the Netherlands | Coordination     | • Organizational    | University of Groningen in partnership with health insurance company Menzis and health care organization Meander initiated Embrace (public-private partnership); |
|                     |                      | • Service           | Formal cooperation agreement was struck between community organisations (welfare organizations and municipalities) and health care organisations (general practitioner practices), home health care organisations, homes for the elderly, nursing homes and hospitals, and elderly associations to leverage the unique skills and expertise of each organization. |
|                     |                      | • Clinical          | |
| Healthy Housing, NZ | Coordination         | • Organizational    | Alliance Contracting Model |
|                     |                      | • Service           | Joint initiative between Housing New Zealand Corporation (provider of government-funded housing) and District Health Boards that includes other tiers of care (primary care, hospitals) and social service agencies. |
|                     |                      | • Clinical          | Alliance agreements are used to share responsibility between partners and Healthy Housing program. |
|                     |                      | • System            | |
| Hennepin, USA       | Coordination         | • Organizational    | Accountable Care Organisations |
|                     |                      | • Functional        | Four partner affiliates of the Hennepin County government (Hennepin County Medical Center, North-Point Health and Wellness Center, Hennepin County Human Services and Public Health Department) created Hennepin Health ACO by signing a business agreement to share full financial risk for newly enrolled Medicaid beneficiaries. |
|                     |                      | • Service           | |
|                     |                      | • Clinical          | |
|                     |                      | • Normative         | |
| Hartberg, Austria   | Coordination         | • Organizational    | Alliance Contracting Model |
|                     |                      | • Service           | Initially established as a network of social care and health organizations, including Red Cross, Caritas and Volkshilfe; district hospital added later to assure a full continuum of care for patients within the network. |
|                     |                      | • Clinical          | Principal task is to coordinate the network between the different social and health care providers in a district. |
|                     |                      | • Normative         | |

(Contd.)
| Initiative, Country | Level of integration | Type of integration | Contracting model |
|---------------------|----------------------|---------------------|-------------------|
| KAPI, Greece        | Coordination         | • Organizational    | Alliance Contracting Model |
|                     |                      | • Service           | • Ministry of Health and Welfare and Association of Volunteer Workers set up a pilot KAPI; |
|                     |                      | • Clinical          | • Since their institutionalisation, state transferred the responsibility of their management and operation to local municipalities and KAPI have been operating with the contribution of volunteer organisations, the Greek Red Cross and the Christian Youth Organisation. |

Given the diversity of partners, and the need for collaboration, governance arrangements were crucial and appeared to be largely determined by local circumstances. Many initiatives noted the important role of an “integrator” in the governance structures [67, 68] and a collaborative approach that allows for joint action and consideration of interests and concerns of all parties.

A mix of public, private and grant funding was commonly used to support transformation to an integrated population health-based system of care. To overcome difficulties with separately funded sectors, types of care, settings and professions, many initiatives attempted to align and “pool” funding by using a mixture of per capita funding [25, 36, 50, 63, 69], service reimbursement [44, 50] and payment-for-performance incentives [44, 50]. Several initiatives used innovative shared-savings contracts and incentives that provided flexibility, rewards for efficiency and improved quality, and also allowed reinvesting savings into less expensive primary and community-based care [50, 63, 68].

**Effectiveness of interventions supporting integration of care and population health**

Combining integration of care with the population health approach requires multifaceted interventions (i.e., an intervention with two or more components). The type and the level of evidence on the effectiveness of these interventions are limited and uneven across this sample of initiatives. Evaluations concentrated on the impact of integrated care on utilization outcomes such as admissions to hospitals, visits to emergency rooms, hospital length of stay and outpatient visits [9, 12, 33, 46, 48, 53, 63, 70]. The majority of initiatives that reported before and after comparisons of utilization impacts of the interventions reported statistically significant benefits for the access to care and services, including same day appointments [34, 41, 49, 70, 71]; reductions in wait time for referrals [35, 70]; reductions in emergency room use, hospital admissions and 30-day readmissions, and length of stay [9, 47, 48, 53, 57]; increased uptake of screening and immunizations [47, 48, 61]; reductions in overall morbidity and mortality rates [47, 53, 59], and overall quality of care [9, 51]. Two randomized controlled trials (RCT) were included [12, 33]. The Embrace RCT measured and reported a higher level of perceived quality of care in the intervention than in the control group [12]. The SIPA RCT measured differences in utilization and costs of care between the intervention and control groups, and reported no significant differences in utilization and costs of emergency room, hospital acute care, and nursing home stays between the groups [33]. With regard to costs, some initiatives demonstrated the potential for cost-containment [47, 56, 72], cost-savings [12, 40] and reduction of cost of care [44].

Some initiatives reported descriptive evaluations of organizational changes and outcomes [36–38, 40, 45, 58, 72, 76] to intersectoral interventions that can support broad populations in a community [48, 77] and empower vulnerable groups [9, 50, 54, 72, 78] and address the needs of the community [35, 61], innovative patient education approaches [37] and other. Addressing non-clinical issues is an emerging area of practice in integrated care that requires broadening the scope of interventions and the services provided in order to influence health of communities [77]. A continuum of strategies from health promotion [36–38, 40, 45, 58, 72, 76] to intersectoral interventions that can support broad populations in a community [36, 43, 47, 69], promote nurturing relationships [9, 50, 54, 72, 78] and empower vulnerable groups [9, 12, 44, 49, 57, 72, 79] is necessary.

Efforts to embed the population health approach within integrated care face a number of challenges. Initiatives reviewed here reported difficulties with population segmentation and the planning of needs-based services [33, 34, 39], difficulties with funding mechanisms and models of care that can accommodate the interactions...
of multidisciplinary teams [33, 57], challenges with hierarchical management, governance and accountability of integrated care systems [9, 53], and with adapting traditional evaluation strategies to assess the complexities of integrated population health-based type of care [9, 41, 44]. The crucial role of the “integrator” as well as the need for creativity and innovation with the use of funding and programming [39, 41, 60, 68, 71, 80] are often key to shifting traditional care to integrated and population health-based systems of care. Although evidence on the effectiveness of multifaceted redesign interventions on the integration of care or the population health approach is limited, some of the reviewed initiatives have demonstrated that integration of health and non-health sectors can provide benefits in the utilization of care [9, 47, 48, 53, 57] and costs [9, 36, 48]. There is a need for expanded assessments to evaluate the clients’ needs for both social and medical care to better understand the effectiveness of multifaceted interventions [33, 81]. Few measures of population health were reported although some reports suggested improvement in outcomes. Integrated, population focused care may benefit from more flexible teamwork to address care challenges, and from broader sharing of knowledge and experiences [36, 43, 50, 69], as well as better metrics and innovative evaluation approaches [2, 82, 83]. More broadly, there is a need for continued learning about the selection of implementation strategies in different contexts, both at program and system level to facilitate transition toward integrated population health-based systems of care [2, 4, 19].

Several of the initiatives reviewed here, including the Nuka System of Care, Jönköping County Council, Kaiser Permanente’s programs and Gesundes Kinzigtal, have been spread and scaled up elsewhere. These efforts have had varied degrees of success due to a combination of political, economic, societal, cultural and organizational factors [35, 55, 68, 69, 78]. These experiences underline the challenges of replicating entire integrated care systems; but they also suggest that specific strategies, techniques, and innovations may be transferable to other sectors, settings, types of organizations, types of care and multidisciplinary groups [55, 69]. For example, the introduction of features of the Nuka system into three primary care practices in Scotland has had positive effects in improving access to care, and patient and staff experience [55]. But establishing Nuka-style systems in Scotland required careful planning and nimbleness to adapt this model to local settings and context [55]. Developers of Gesundes Kinzigtal argue that models, interventions and evaluation frameworks that are rooted in the scientific literature and have shown to be effective are widely replicable despite context-specific features [68]. But successful replication depends on a number of conditions [68]. First, these efforts require a shared vision to go beyond traditional institutional boundaries in the planning of health interventions that address improving population health [68]. Second, a local organization needs to plan and deliver interventions while involving and communicating with key stakeholders [68]. Third, the population served needs to be defined and perhaps limited in size to enable effective use of resources and to facilitate networking among providers who develop local solutions to issues. Fourth, an innovative culture and fostering of collaborative efforts is required to derive value from new relationships for all stakeholders [68]. Such prerequisites may assist in the spread and scale up of programs that integrate population health and social care interventions with health services to address the increasing burdens of multi-morbidity and the determinants of health.

**Limitations**

There are several limitations to this study. As a scoping review this study is not a comprehensive synthesis of the literature to cover the entire field of population health and integrated care. Data was limited to information included in published reports. There are likely other examples of integrated population health-based systems of care that have not yet been reported in the literature. Future studies might augment published data with interviews with studies’ authors to validate interpretations and extend the findings.

**Conclusions**

We reviewed evidence from 15 integrated and population health-based initiatives from 9 OECD countries and identified specific implementation interventions and strategies, and their impact. This review suggests that improving population health requires co-ordinated efforts of many organizations, and new program elements and partnerships that extend beyond integration of health services. Combining integration of care with the population health approach requires a set of cohesive strategies to design comprehensive medical and non-medical care for defined population groups, and to redesign service organization and delivery. Further study is needed on how population health thinking and efforts support integrated care and vice versa, and the need for continued learning about redesign interventions at a program and a system level.

**Notes**

1. Based on published recommendations for key determinants of health from the Public Health Agency of Canada: [https://www.canada.ca/en/public-health/services/health-promotion/population-health/what-determines-health.html#key_determinants](https://www.canada.ca/en/public-health/services/health-promotion/population-health/what-determines-health.html#key_determinants).

2. Targets general population of older adults.

3. The level of integration is defined according to Leutz W. Five Laws for Integrating Medical and Social Services: Lessons from the United States and the United Kingdom. *Milbank Q* 1999; 77(1): 77–110.

4. The typologies of integration are described according to Fulop N, Mowlam A, Edwards N. Building integrated care: Lessons from the UK and Elsewhere. *NHS Confed London*. 2005: 3–15.

5. The models are consistent with Billings J, de Weger E. Contracting for integrated health and social care: a critical review of four models. *J Integr Care*. 2015; 23(3): 153–175. DOI: [https://doi.org/10.1108/JICA-03-2015-0015](https://doi.org/10.1108/JICA-03-2015-0015).
