A COUNTER EXAMPLE ON NONTANGENTIAL CONVERGENCE FOR OSCILLATORY INTEGRALS

KAROLINE JOHANSSON

Abstract. Consider the solution of the time-dependent Schrödinger equation with initial data $f$. It is shown in [3] that there exists $f$ in the Sobolev space $H^s(\mathbb{R}^n)$, $s = n/2$ such that tangential convergence can not be widened to convergence regions. In this paper we show that the corresponding result holds when $-\Delta_x$ is replaced by an operator $\varphi(D)$, with special conditions on $\varphi$.

1. Introduction

In this paper we generalize previous work by Sjögren and Sjölin [3] about non-existence of non-tangential convergence for the solution $u = S^\varphi f$ to the generalized time-dependent Schrödinger equation

\[(\varphi(D) + i\partial_t)u = 0,\]  \tag{1.1}

with the initial condition $u(x,0) = f(x)$. Here $\varphi$ should be real-valued and its radial derivatives of first and second order ($\varphi' = \varphi'_r$ and $\varphi'' = \varphi''_r$) should be continuous, outside a compact set containing origin. Furthermore, we will require some appropriate conditions on the growth $\varphi'$ and $\varphi''$. (See (1.5) and (1.6) for exact conditions on $\varphi$.) In particular the function $\varphi(\xi) = |\xi|^a$ will satisfy these conditions, for $a > 1$.

For $\varphi(\xi) = |\xi|^2$ it was shown in [3] that there exists a function $f$ such that near the vertical line $t \mapsto (x,t)$ through an arbitrary point $(x,0)$ there are points accumulating at $(x,0)$ such that the solution of equation (1.1) takes values far from $f$. This means that the solution of the time-dependent Schrödinger equation with initial condition $u(x,0) = f(x)$ does not converge non-tangentially to $f$. Therefore we can not consider regions of convergence.

In this paper, we prove that this property holds for more general functions $\varphi(\xi)$ of the type described above. In the proof we use some ideas by Sjögren and Sjölin in [3] in combination with new estimates, to construct a counter example. Some ideas can also be found in Sjölin [5, 6] and Walther [9, 10], and some related results are given in Bourgain [1], Kenig, Ponce and Vega [2], and Sjölin [4, 7].

Key words and phrases. Generalized time-dependent Schrödinger equation, non-tangential convergence.
Existence of regions of convergence has been studied before for other equations. For example, Stein and Weiss consider in [8, Theorem 3.16] Poisson integrals acting on Lebesgue spaces. These operators are related to the operator $S^\varphi$.

For an appropriate function $\varphi$ on $\mathbb{R}^n$, let $S^\varphi$ be the operator acting on functions $f$ defined by

$$f \mapsto \mathcal{F}^{-1}(\exp(it\varphi(\xi))\mathcal{F}f),$$

where $\mathcal{F}f$ is the Fourier transform of $f$, which takes the form

$$\hat{f}(\xi) = \mathcal{F}f(\xi) \equiv \int_{\mathbb{R}^n} e^{-ix\cdot\xi}f(x)\,dx,$$

when $f \in L^1(\mathbb{R}^n)$. This means that, if $\hat{f}$ is an integrable function, then $S^\varphi$ in (1.2) takes the form

$$S^\varphi f(x, t) = \frac{1}{(2\pi)^n} \int_{\mathbb{R}^n} e^{ix\cdot\xi}e^{it\varphi(\xi)}\hat{f}(\xi)\,d\xi, \quad x \in \mathbb{R}^n, \quad t \in \mathbb{R}. \quad (1.4)$$

If $\varphi(\xi) = |\xi|^2$ and $f$ belongs to the Schwartz class $\mathcal{S}(\mathbb{R}^n)$, then $S^\varphi f$ is the solution to the time-dependent Schrödinger equation $(-\Delta_x + iT)u = 0$ with the initial condition $u(x, 0) = f(x)$.

For more general appropriate $\varphi$, for which the equation (1.1) is well-defined, the expression $S^\varphi f$ is the solution to the generalized time-dependent Schrödinger equation (1.1) with the initial condition $u(x, 0) = f(x)$. Note here that $S^\varphi f$ is well-defined for any real-valued measurable $\varphi$ and $f \in \mathcal{S}$. On the other hand, it might be difficult to interpret (1.1) if for example $\varphi \notin L^1_{\text{loc}}$.

In order to state the main result we need to specify the conditions on $\varphi$ and give some definitions. The function $\varphi$ should satisfy the conditions

$$\liminf_{r \to \infty} \inf_{|\omega| = 1} |\varphi'(r, \omega)| = \infty, \quad (1.5)$$

and

$$\sup_{r \geq R} \left( \sup_{|\omega| = 1} \frac{r|\varphi''(r, \omega)|}{|\varphi'(r, \omega)|^2(\log r)^{3/4}} \right) < C. \quad (1.6)$$

Here $\varphi'(r\omega) = \varphi'(r, \omega)$ denotes the derivative of $\varphi(r, \omega)$ with respect to $r$, and similarly for higher orders of derivatives.

We let $H^s(\mathbb{R}^n)$ be the Sobolev space of distributions with $s \in \mathbb{R}$ derivatives in $L^2$. That is $H^s(\mathbb{R}^n)$ consists of all $f \in \mathcal{S}'(\mathbb{R}^n)$ such that

$$\|f\|_{H^s(\mathbb{R}^n)} \equiv \left( \int_{\mathbb{R}^n} (1 + |\xi|^2)^s|\hat{f}(\xi)|^2\,d\xi \right)^{1/2} < \infty. \quad (1.7)$$
Theorem 1.1. Assume that the function $\gamma : \mathbb{R}_+ \to \mathbb{R}_+$ is strictly increasing and continuous such that $\gamma(0) = 0$. Let $R > 0$, and let $\varphi$ be real-valued functions on $\mathbb{R}^n$ such that $\varphi'(r, \omega)$ and $\varphi''(r, \omega)$ are continuous and satisfy (1.5) and (1.6) when $r > R$. Then there exists a function $f \in H^{n/2}(\mathbb{R}^n)$ such that $S^\varphi f$ is continuous in $\{(x, t); t > 0\}$ and

$$\limsup_{(y,t) \to (x,0)} |S^\varphi f(y, t)| = +\infty$$

for all $x \in \mathbb{R}^n$, where the limit superior is taken over those $(y, t)$ for which $|y - x| < \gamma(t)$ and $t > 0$.

Here we recall that $\varphi' = \varphi'_r$ and $\varphi'' = \varphi''_{rr}$ are the first and second orders radial derivatives of $\varphi$. When $s > n/2$ no counter example of the form in Theorem 1.1 can be provided, since $S^\varphi f(y, t)$ converges to $f(x)$ as $(y, t)$ approaches $(x, 0)$ non-tangentially when $f \in H^s(\mathbb{R}^n)$. In fact, Hölder’s inequality gives

$$(2\pi)^n |S^\varphi f(x, t)| \leq \int_{\mathbb{R}^n} |\hat{f}(\xi)| d\xi \leq \left( \int_{\mathbb{R}^n} (1 + |\xi|^2)^{-s} d\xi \right) \|f\|_{H^s(\mathbb{R}^n)},$$

which is finite when $f \in H^s(\mathbb{R}^n)$, $s > n/2$. Therefore convergence along vertical lines can be extended to convergence regions when $s > n/2$ and $f$ belongs to $H^s(\mathbb{R}^n)$.

For functions $\varphi$ satisfying

$$\inf_{r > R} \inf_{|\omega| = 1} |\varphi'(r, \omega)| = h > 0$$

(1.9)

and one of the conditions (1.6) or

$$\sup_{r \geq R} \left( \sup_{|\omega| = 1} \frac{r^{\beta} |\varphi''(r, \omega)|}{(\log r)^{3/4}} \right) < C,$$

(1.10)

for some $\beta > 0$, we can prove a weaker form of Theorem 1.1.

Theorem 1.2. Assume that the function $\gamma : \mathbb{R}_+ \to \mathbb{R}_+$ is strictly increasing and continuous such that $\gamma(0) = 0$. Let $R > 0$, and let $\varphi$ be real-valued functions on $\mathbb{R}^n$ such that $\varphi'(r, \omega)$ and $\varphi''(r, \omega)$ are continuous and satisfy (1.9), and (1.6) or (1.10) when $r > R$. Then for fixed $x \in \mathbb{R}^n$ there exists a function $f \in H^{n/2}(\mathbb{R}^n)$ such that $S^\varphi f$ is continuous in $\{(x, t); t > 0\}$ and

$$\limsup_{(y,t) \to (x,0)} |S^\varphi f(y, t)| = +\infty,$$

(1.11)

where the limit superior is taken over those $(y, t)$ for which $|y - x| < \gamma(t)$ and $t > 0$. 

3
2. Examples and remarks

In this section we give some examples of functions $\varphi$ for which Theorem 1.1 holds. In the first example we let $\varphi$ be a positively homogeneous function of order $a > 1$.

**Example 2.1.** Let $a > 1$ and $\varphi(\xi) = |\xi|^a$, then $S^a f(x, t)$ is the solution to the generalized time-dependent Schrödinger equation $((-\Delta_x)^{a/2} + i\partial_t)u = 0$. By change of variables to polar coordinates and derivate with respect to $r$ we see that $\varphi(r, \omega) = r^a$, $\varphi'(r, \omega) = ar^{a-1}$ and $\varphi''(r, \omega) = a(a-1)r^{a-2}$. We can see that these derivatives satisfy (1.5) and (1.6). In particular for $a = 2$ this is the solution to the time-dependent Schrödinger equation $(-\Delta_x + i\partial_t)u = 0$ and this case is treated in Sjögren and Sjölin [3].

In the following example we let $\varphi$ be a sum of positively homogeneous functions where $a > 1$ denote the term of highest order.

**Example 2.2.** For $a > 1$, let

$$\varphi(\xi) = \sum_{i=1}^{d} |\xi|^{a_i} \varphi_{a,i}(1, \omega), \quad a_1 < \cdots < a_d = a,$$

where

$$\inf_{\omega} |\varphi_{a,d}(1, \omega)| = h > 0 \quad \text{and} \quad \|\varphi_{a,i}(1, \cdot)\|_{L^\infty(S^{n-1})} < \infty$$

for each $i \in \{1, 2, \ldots, d\}$. Here $S^{n-1}$ is the $n-1$-dimensional unit sphere. By rewriting this into polar coordinates and differentiate with respect to $r$, we see that in the first derivative the term $\varphi_{a,i}(1, \omega)r^{a-1}$ dominates the sum and that the second derivative can be estimated by $Cr^{a-2}$, for some constant $C$. These derivatives satisfy (1.5) and (1.6).

In the examples at the above we have used functions $\varphi$ such that the modulus of the radial derivative is bounded from below by a positive homogeneous function of order $a - 1$ for some $a > 1$. This condition is not necessary. The hypothesis in the theorem permit a broader class of functions $\varphi$. The following example shows that there are functions, which do not grow as fast as a positive homogeneous function of order $a - 1$ for any $a > 1$, but satisfy the conditions (1.5) and (1.6).

**Example 2.3.** Let $\varphi(\xi) = |\xi| \log |\xi|$, then $\varphi'(r, \omega) = \log r + 1$ and $\varphi''(r, \omega) = r^{-1}$ and (1.5) and (1.6) are satisfied.

We also allow the dominant part of the derivative to grow faster than any positively homogeneous function as long as we have some restrictions on the second derivative. The conditions are given explicitly in (1.5) and (1.6). The following example contains such functions.

**Example 2.4.** Let $\varphi(\xi) = \varphi(r, \omega) = e^{\mu(\omega)r^\beta}$, where $\beta > 0$ and $\inf_{|\omega|=1} \mu(\omega) = c > 0$. These functions grow faster than $r^a$ for all $a$ and...
the same is true for the absolute value of the first and second derivative with respect to \( r \). This can be used to show that (1.5) and (1.6) are satisfied.

3. Notations for the proofs

In order to prove Theorems 1.1 and 1.2 we introduce some notations. Let \( B_r(x) \) be the open ball in \( \mathbb{R}^n \) with center at \( x \) and radius \( r \). Numbers denoted by \( C, c \) or \( C' \) may be different at each occurrence. We let

\[
\delta_k = \delta_{k,n} \equiv \frac{\gamma(1/(k + 1))}{\sqrt{n}}, \quad k \in \mathbb{N},
\]

(3.1)

where \( \gamma \) is the same as in Theorem 1.1 and Theorem 1.2. Since \( \gamma \) is strictly increasing it is clear that \( (\delta_k)_{k \in \mathbb{N}} \) is strictly decreasing. We also let \( (x_j)_{j=1}^{\infty} \subset \mathbb{R}^n \) be chosen such that \( x_1, x_2, \ldots, x_m \) denotes all points in \( B_1(0) \cap \delta_1 \mathbb{Z}^n \), \( x_{m_1} + 1, \ldots, x_{m_2} \) denotes all points in \( B_2(0) \cap \delta_2 \mathbb{Z}^n \) and generally

\[
\{x_{m_k + 1}, \ldots, x_{m_{k+1}}\} = B_{k+1}(0) \cap \delta_{k+1} \mathbb{Z}^n, \quad \text{for } k \geq 1.
\]

(3.2)

Furthermore we choose a strictly decreasing sequence \( (t_j)_{j=1}^{\infty} \) such that \( 1 > t_1 > t_2 > \cdots > 0 \) and

\[
\frac{1}{k + 2} < t_j < \frac{1}{k + 1}, \quad k \in \mathbb{N},
\]

(3.3)

for \( m_k + 1 \leq j \leq m_{k+1} \).

In the proof of Theorem 1.1 we consider the function \( f_\varphi \), which is defined by the formula

\[
\hat{f}_\varphi(\xi) = |\xi|^{-n/2} \sum_{j=1}^{\infty} \chi_j(\xi)e^{-i(x_j \cdot \xi + t_j \varphi(\xi))},
\]

(3.4)

where \( \chi_j \) is the characteristic function of

\[
\Omega_j = \{\xi \in \mathbb{R}^n; R_j < |\xi| < R'_j\}.
\]

(3.5)

Here \( (R_j)_{j=1}^{\infty} \) and \( (R'_j)_{j=1}^{\infty} \) are sequences in \( \mathbb{R} \) which fulfill the following conditions:

1. \( R_1 \geq 2 + R, R'_1 \geq R_1 + 1 \), with \( R \) given by Theorem 1.1 or Theorem 1.2

2. \( R'_j = R_j^N \) when \( j \geq 2 \), where \( N \) is a large positive number and independent of \( j \), which is specified later on;

3. \( R_j < R'_j < R_{j+1} \), when \( j \geq 1 \);
(4) \(|\varphi'(r, \omega)| > 1\) when \(r \geq R\); \(3.6\)

(5) for \(j \geq 2\)

\[ R_j > \max_{l<j} \frac{2^j}{t_l - t_j}, \quad (3.7) \]

and

\[ \inf_{R_j \leq r \leq R_j'} \left( \inf_{|\omega|=1} |\varphi'(r, \omega)| \right) > \max_{l<j} \frac{2|x_l - x_j|}{t_l - t_j}; \quad (3.8) \]

**Remark 3.1.** The sequences \((R_j)_{1}^{\infty}\) and \((R_j')_{1}^{\infty}\) can be chosen since \(\varphi\) satisfies condition (1.5).

Furthermore, in order to get convenient approximations of the operator \(S^\varphi\), we let

\[ S_m^\varphi f(x, t) = \frac{1}{(2\pi)^n} \int_{|\xi|<R_m} e^{ix \cdot \xi} e^{it\varphi(\xi)} \hat{f}(\xi) d\xi. \quad (3.9) \]

Then

\[ S_m^\varphi f_\varphi(x, t) = \sum_{j=1}^{m} A_j^\varphi(x, t), \quad (3.10) \]

where

\[ A_j^\varphi(x, t) = \frac{1}{(2\pi)^n} \int_{|\omega|=1} \left\{ \int_{R_j}^{R_j'} \frac{1}{r(log r)^{3/4}} e^{iF_\varphi(r, \omega)} dr \right\} d\sigma(\omega), \quad (3.11) \]

By using polar coordinates we get

\[ A_j^\varphi(x_k, t_k) = \frac{1}{(2\pi)^n} \int_{|\omega|=1} \left\{ \int_{R_j}^{R_j'} \frac{1}{r(log r)^{3/4}} e^{iF_\varphi(r, \omega)} dr \right\} d\sigma(\omega), \quad (3.12) \]

where

\[ F_\varphi(r, \omega) = r(x_k - x_j) \cdot \omega + (t_k - t_j)\varphi(r, \omega), \quad (3.13) \]

and \(d\sigma(\omega)\) is the euclidean surface measure on the \(n-1\)-dimensional unit sphere. By differentiation we get

\[ F'_\varphi(r, \omega) = (x_k - x_j) \cdot \omega + (t_k - t_j)\varphi'(r, \omega) \quad (3.14) \]

and

\[ F''_\varphi(r, \omega) = (t_k - t_j)\varphi''(r, \omega). \quad (3.15) \]

Here recall that \(F'_\varphi(r, \omega) = F'_\varphi(r, \omega)\) and \(F''_\varphi(r, \omega)\) denote the first and second orders of derivatives of \(F_\varphi(r, \omega)\) with respect to the \(r\)-variable.
By integration by parts in the inner integral of (3.12) we get

\[ \int_{R_j} \frac{1}{r(\log r)^{3/4}} e^{iF_\varphi(r, \omega)} \, dr = A_\varphi - B_\varphi, \tag{3.16} \]

where

\[ A_\varphi = \left[ \frac{e^{iF_\varphi(r, \omega)}}{r(\log r)^{3/4} iF_\varphi'(r, \omega)} \right]_{R_j} \tag{3.17} \]

and

\[ B_\varphi = \int_{R_j} \frac{d}{dr} \left( \frac{1}{r(\log r)^{3/4} iF_\varphi'(r, \omega)} \right) e^{iF_\varphi(r, \omega)} \, dr \tag{3.18} \]

4. Proofs

In this section we prove Theorems 1.1 and 1.2. We need some preparing lemmas for the proof. In the following lemma we prove that for fixed \( x \in B_k(0) \) there exists sequences \((x_n^j)_j\) and \((t_n^j)_j\) such that

\[ x_n^j \in \{x_{m_k^j+1}, \ldots, x_{m_k^j+1}\}, \quad \text{and} \quad t_n^j \in \{t_{m_k^j+1}, \ldots, t_{m_k^j+1}\} \]

and \( |x_n^j - x| < \gamma(t_n^j) \).

**Lemma 4.1.** Let \( x \in \mathbb{R}^n \) be fixed. Then for each \( k \geq |x| \) there exists \( x_n^j \in \{x_{m_k^j+1}, \ldots, x_{m_k^j+1}\} \) and \( t_n^j \in \{t_{m_k^j+1}, \ldots, t_{m_k^j+1}\} \) such that \( |x_n^j - x| < \gamma(t_n^j) \). In particular \((x_n^j, t_n^j) \to (x, 0)\) as \( j \) turns to infinity.

**Proof.** For each \( k \geq |x| \), \( x \) belongs to a cube with vertices in \( T_k = B_{k+1}(0) \cap \delta_{k+1} \mathbb{Z}^n \) and side lengths \( \gamma(1/(k+2))/\sqrt{n} \). Take a vertex \( x' \) in the cube and its diagonal \( \gamma(1/(k+2)) \) as center and radius of a ball respectively. This ball \( B_{\gamma(1/(k+2))}(x') \) contains the whole cube and hence also \( x \). Therefore there exists \( x_n^j \) for every \( k \geq |x| \) such that \( x \in B_{\gamma(1/(k+2))}(x_n^j) \subset B_{\gamma(t_n^j)}(x_n^j) \). This proves the first part of the assertion, and the second statement follows from the fact that \( \gamma(0) = 0 \) and \( \gamma \) is continuous and strictly increasing. \( \square \)

We want to prove that \( f_\varphi \) in (3.4) belongs to \( H^{n/2}(\mathbb{R}^n) \) and fulfill (1.8). The former relation is a consequence of Lemma 4.2 below, which concerns Sobolev space properties for functions of the form

\[ \widehat{g}(\xi) = |\xi|^{-n} (\log |\xi|)^{-\rho/2} \sum_{j=1}^\infty \chi_j(\xi) b_j(\xi), \tag{4.1} \]

where \( \chi_j \) is the characteristic function on disjoint sets \( \Omega_j \).

**Lemma 4.2.** Assume that \( \rho > 1 \), \( \Omega_j \) for \( j \in \mathbb{N} \) are disjoint open subsets of \( \mathbb{R}^n \setminus B_\rho(0) \), \( b_j \in L^1_{\text{loc}}(\mathbb{R}^n) \) for \( j \in \mathbb{N} \) satisfies

\[ \sup_{j \in \mathbb{N}} \|b_j\|_{L^\infty(\Omega_j)} < \infty, \tag{4.2} \]
and let \( \chi_j \) be the characteristic function for \( \Omega_j \). If \( g \) is given by (4.1), then \( g \in H^{n/2}(\mathbb{R}^n) \).

**Proof.** By estimating (1.7) for the function \( g \) we get that

\[
\int_{\mathbb{R}^n} |\hat{g}(\xi)|^2 (1 + |\xi|^2)^{n/2} \, d\xi \leq C \int_{\mathbb{R}^n \setminus B_\rho(0)} |\xi|^{-2n} (\log |\xi|)^{-\rho} (1 + |\xi|^2)^{n/2} \, d\xi \leq 2^{n/2} C \int_\rho^{\infty} \frac{1}{r(\log r)^{\rho}} \, dr < \infty.
\]

The second inequality holds since \((1 + r^2)^{n/2} < (r^2 + r^2)^{n/2} = 2^{n/2} r^n\) for \( r > 1 \).

\[ \square \]

In the following lemma we give estimates of the expression \( A^\varphi_j \).

**Lemma 4.3.** Let \( A^\varphi_j(x, t) \) be given by (3.11). Then the following is true:

1. \[ \sum_{j=1}^{k-1} |A^\varphi_j(x, t)| \leq C (\log R'_{k-1})^{1/4}, \text{ with } C \text{ independent of } k; \]
2. \( A^\varphi_k(x_k, t_k) > c (\log R'_k)^{1/4}, \) with \( c > 0 \) independent of \( k \).

**Proof.** (1) By triangle inequality and the fact that \(|\xi| > 2\), when \( \xi \in \Omega_j \), we get

\[
\sum_{j=1}^{k-1} |A^\varphi_j(x, t)| \leq \frac{1}{(2\pi)^n} \int_{2 \leq |\xi| \leq R'_{k-1}} |\xi|^{-n} (\log |\xi|)^{-3/4} \, d\xi
\]

\[
= C \int_{2}^{R'_{k-1}} \frac{1}{r(\log r)^{3/4}} \, dr \leq C (\log R'_{k-1})^{1/4},
\]

where \( C \) is independent of \( k \). In the last equality we have taken polar coordinates as new variables of integration.

(2) Since \( R^N_j = R'_j \) for sufficiently large \( N \), we get

\[
A^\varphi_k(x_k, t_k) = C \int_{R_k}^{R'_k} \frac{1}{r(\log r)^{3/4}} \, dr
\]

\[
= C \left( (\log R'_k)^{1/4} - (\log(R'_k)^{1/4})^{1/4} \right)
\]

\[
= C \left( 1 - \frac{1}{N^{1/4}} \right) (\log R'_k)^{1/4} > c (\log R'_k)^{1/4},
\]

for some constant \( c > 0 \), which is independent of \( k \).

\[ \square \]

**Lemma 4.4.** Assume that \( S^\varphi_m f_\varphi \) is given by (3.9). Then \( S^\varphi_m f_\varphi \) is continuous on \( \{(x, t); t > 0, x \in \mathbb{R}^n\} \).
Proof. The continuity for each $S_m f$ follows from the facts, that for almost every $\xi \in \mathbb{R}^n$, the map

$$(x, t) \mapsto e^{ix \cdot \xi} e^{it \varphi(\xi)} \hat{f}_\varphi(\xi)$$

is continuous, and that

$$\int_{|\xi| < R_m} |e^{ix \cdot \xi} e^{it \varphi(\xi)} \hat{f}_\varphi(\xi)| d\xi = \int_{|\xi| < R_m} |\hat{f}_\varphi(\xi)| d\xi < C.$$

□

When proving Theorem 1.1 we first prove that the modulus of $S_m f$ turns to infinity as $k$ goes to infinity. For this reason we note that the triangle inequality and (3.10) implies that

$$|S_m f(x_k, t_k)| \geq |A_\varphi^k(x_k, t_k)| - \left| \sum_{j=1}^{k-1} A_\varphi^j(x_k, t_k) \right| - \left| \sum_{j=k+1}^{m} A_\varphi^j(x_k, t_k) \right|. \quad (4.3)$$

We want to estimate the terms in (4.3). From Lemma 4.3 we get estimates for the first two terms. It remains to estimate the last term.

Proof of Theorem 1.1

Step 1. For $j > k \geq 2$ we shall estimate $|A_\varphi^j(x_k, t_k)|$ in (3.12). We have to find appropriate estimates for $A_\varphi$ and $B_\varphi$ in (3.16)-(3.18). By using $t_k - t_j > 0$ and $R_j < r < R_j'$ it follows from (3.8), (3.15), triangle inequality and Cauchy-Schwarz inequality that

$$|F'_\varphi(r, \omega)| \geq (t_k - t_j)|\varphi'(r, \omega)| - |x_k - x_j|$$

$$> (t_k - t_j)|\varphi'(r, \omega)| - (t_k - t_j) \frac{|\varphi'(r, \omega)|}{2}$$

$$= \frac{|\varphi'(r, \omega)|}{2}(t_k - t_j). \quad (4.4)$$

From (3.6), (3.7) and (4.4) it follows that

$$|A_\varphi| = \left| \left[ \frac{1}{r(\log r)^{3/4} F'_\varphi(r, \omega)} e^{i F'_\varphi(r, \omega)} \right] R_j \right|$$

$$\leq \frac{C}{R_j} \left( \frac{1}{|F'_\varphi(R_j, \omega)|} + \frac{1}{|F'_\varphi(R_j', \omega)|} \right) \leq \frac{C}{(t_k - t_j) R_j} \leq C 2^{-j}.$$
In order to estimate $B_\varphi$, using (1.6), (3.15) and (4.4), we have
\[
\left| \frac{d}{dr} \left( \frac{1}{r} (\log r)^{3/4} i F_\varphi'(r, \omega) \right) e^{i F_\varphi(r, \omega)} \right|
\leq \frac{C}{r^2 |F_\varphi'(r, \omega)|} + \frac{C |F_\varphi''(r, \omega)|}{r |F_\varphi'(r, \omega)|^2 (\log r)^{3/4}} < \frac{C}{r^2 (t_0 - t_j)}.
\]
This together with (3.7) gives us
\[
|B_\varphi| = \left| \int_{R_j}^{R_j'} \frac{d}{dr} \left( \frac{1}{r} (\log r)^{3/4} i F_\varphi'(r, \omega) \right) e^{i F_\varphi(r, \omega)} dr \right|
\leq \int_{R_j}^{R_j'} \frac{C}{r^2 (t_0 - t_j)} dr \leq \frac{C}{R_j(t_0 - t_j)} \leq C 2^{-j}.
\]
From the estimates above and the triangle inequality we get
\[
|A_j^\varphi(x_k, t_k)| \leq C (|A_\varphi| + |B_\varphi|) < C 2^{-j}, \quad j > k \geq 2. \quad (4.5)
\]
Here $C$ is independent of $j$ and $k$.

Using the results from (4.3), (4.5), in combination with Lemma 4.3 and recalling that $R'_j = R_j^N$, gives us
\[
|S_{m, j}^\varphi f_\varphi(x_k, t_k)| \geq c (\log R'_k)^{1/4} - C' (\log R_k)^{1/4} - C \sum_{k+1}^{m} 2^{-j}
\geq c (\log(R'_k))^{1/4} - \frac{C'}{N^{1/4}} (\log(R'_k))^{1/4} - C \geq c (\log R'_k)^{1/4}, \quad (4.6)
\]
when $m > k$ and $N$ is chosen sufficiently large. Here $c > 0$ is independent of $k$.

**Step 2.** Now it remains to show that $S_{m}^\varphi f_\varphi$ is continuous when $t > 0$, and then it suffices to prove this continuity on a compact subset $L$ of
\[
\{(x, t); \ t > 0, \ x \in \mathbb{R}^n \}.
\]
We want to replace $(x_l, t_l)$ with $(x, t) \in L$ in (3.7) and (3.8). Since we have maximum over all $l$ less than $j$, we can choose $j_0 < \infty$ large enough such that for all $j > l > j_0$ we have that $t_j < t_l < t$. Hence we may replace $(x_l, t_l)$ with $(x, t) \in L$ on the right-hand sides in (3.7) and (3.8) for all $j > j_0$. This in turn implies that (4.5) holds when $(x_k, t_k)$
is replaced by \((x, t) \in L\) and \(j > j_0\). We use (4.5) to conclude that

\[
|S_m^\varphi f_\varphi(x, t) - S^\varphi f_\varphi(x, t)|
= \left| (2\pi)^{-n} \int_{|\xi| < R_m} e^{ix \cdot \xi} e^{it\varphi(\xi)} \hat{f}_\varphi(\xi) d\xi - (2\pi)^{-n} \int_{\mathbb{R}^n} e^{ix \cdot \xi} e^{it\varphi(\xi)} \hat{f}_\varphi(\xi) d\xi \right|
= (2\pi)^{-n} \left| \int_{|\xi| > R_m} e^{ix \cdot \xi} e^{it\varphi(\xi)} \hat{f}_\varphi(\xi) d\xi \right| 
\leq C \sum_{i=m+1}^\infty 2^{-i} = C2^{-m},
\]
when \(m > j_0\). Hence \(S_m^\varphi f_\varphi\) converge uniformly to \(S^\varphi f_\varphi\) on every compact set.

We have now showed that \(S_m^\varphi f_\varphi\) converge uniformly to \(S^\varphi f_\varphi\) on every compact set and from Lemma 4.4 it follows that each \(S_m^\varphi f_\varphi\) is a continuous function. Therefore it follows that \(S^\varphi f_\varphi\) is continuous on \(\{(x, t); t > 0\}\). In particular there is an \(N \in \mathbb{N}\) such that

\[
|S_m^\varphi f_\varphi(x, t_k) - S^\varphi f_\varphi(x, t_k)| < 1,
\]
when \(m > N\). Using (4.6) and the triangle inequality we get

\[
c(\log R_k)^{1/4} \leq |S_m^\varphi f_\varphi(x, t_k)|
\leq |S_m^\varphi f_\varphi(x, t_k) - S^\varphi f_\varphi(x, t_k)| + |S^\varphi f_\varphi(x, t_k)| < 1 + |S^\varphi f_\varphi(x, t_k)|.
\]

This gives us

\[
|S^\varphi f_\varphi(x, t_k)| > c(\log R_k)^{1/4} - 1 \rightarrow +\infty \quad \text{as} \quad k \rightarrow +\infty.
\]

For any fixed \(x \in \mathbb{R}^n\) we can by Lemma 4.1 choose a subsequence \((x_{n_j}, t_{n_j})\) of \((x, t_k)\) that goes to \((x, 0)\) as \(j\) turns to infinity. This gives the result. \(\square\)

In order to prove Theorem 1.2 we first let \(x \in \mathbb{R}^n\) be fixed, and consider a modified sequence of \(\gamma(t_j)\). More precisely, let

\[
\eta(t) = \min(h/4, 1) \min(\gamma(t), t), \quad (4.7)
\]

where \(h\) is given by (1.9). Then \(\eta\) is continuous, strictly increasing and \(\eta(0) = 0\). By Lemma 4.1 there exist subsequences \((x_{n_j})^\infty_{j=1}\) and \((t_{n_j})^\infty_{j=1}\) of \((x_j)^\infty_{j=1}\) and \((t_j)^\infty_{j=1}\) respectively such that

\[
|x_{n_j} - x| < \eta(t_{n_j}) < \gamma(t_{n_j}).
\]

Since \(t_{n_j}\) goes to 0 as \(j\) turns to infinity, it follows from (4.7) that

\[
t_{p_j} - t_{p_{j+1}} \geq (3/h)\eta(t_{p_j}),
\]

for some subsequence \((t_{p_j})^\infty_{j=1}\) of \((t_{n_j})^\infty_{j=1}\). In the proof of Theorem 1.2 we modify \(f_\varphi\) in (3.4) into

\[
\hat{f}_{\varphi, 1}(\xi) \equiv |\xi|^{-n}(\log |\xi|)^{-3/4} \sum_{j=1}^\infty \chi_j(\xi) e^{-i(x_{p_j} \cdot \xi + t_{p_j} \varphi(\xi))}, \quad (4.8)
\]
where $\chi_j$ is the characteristic function of
\[ \Omega_j = \{ \xi \in \mathbb{R}^n; R_j < |\xi| < R'_j \} . \]
For $\varphi$ satisfying (1.6) and (1.9) and $j > 2$, we replace (3.7) and (3.8) by
\[ R_j > \max_{l<j} \frac{2^j}{t_{p_l} - t_{p_j}} . \] (4.9)
If instead $\varphi$ satisfies (1.9) and (1.10), then for $j > 2$, we replace (3.7) and (3.8) by
\[ R_j > \left( 2^{j+2} \max \left( \frac{1}{t_{p_j}}, \frac{1}{\gamma(t_{p_j})} \right) \right)^{1/\beta} . \] (4.10)

We give the proof of Theorem 1.2 separately depending on which of the conditions (1.6) and (1.10), the function $\varphi$ satisfies.

Proof of Theorem 1.2 in the case where $\varphi$ satisfies (1.6).

Step 1. For $j > k \geq 2$ we shall estimate $|A_{\varphi}^j(x_{p_j}, t_{p_j})|$ in (3.12), where $F_{\varphi}(r, \omega)$ in (3.13) is replaced by
\[ F_{\varphi,1}(r, \omega) = r(x_{p_k} - x_{p_j}) \cdot \omega + (t_{p_k} - t_{p_j}) \varphi(r, \omega) . \] (4.11)
We have to find appropriate estimates for $A_{\varphi}$ and $B_{\varphi}$ in (3.17) and (3.18), with $F_{\varphi,1}(r, \omega)$ instead of $F_{\varphi}(r, \omega)$. Since
\[ t_1 > t_2 > \cdots > 0 \]
and
\[ t_{p_j} - t_{p_{j+1}} \geq (3/h) \eta(t_{p_j}) , \]
we have that
\[ t_{p_k} - t_{p_j} \geq (3/h) \eta(t_{p_k}) . \]
Using this together with
\[ |x_{p_k} - x_{p_j}| \leq |x_{p_k} - x| + |x - x_{p_j}| \leq 2 \eta(t_{p_k}) , \]
it follows by the triangle inequality and Cauchy-Schwarz inequality that
\[ |F_{\varphi,1}'(r, \omega)| \geq (t_{p_k} - t_{p_j}) |\varphi'(r, \omega)| - |x_{p_k} - x_{p_j}| \]
\[ > (t_{p_k} - t_{p_j}) |\varphi'(r, \omega)| - 2 \eta(t_{p_k}) \geq (t_{p_k} - t_{p_j}) \left( |\varphi'(r, \omega)| - \frac{2h}{3} \right) \]
\[ \geq (t_{p_k} - t_{p_j}) \frac{|\varphi'(r, \omega)|}{3} . \] (4.12)
From (1.6), (4.9) and (4.12) it follows that
\[ |A_{\varphi}| = \left| \left[ \frac{1}{r (\log r)^{3/4} F_{\varphi,1}'(r, \omega)} e^{i F_{\varphi,1}(r, \omega)} \right]_{R_j}^{R'_j} \right| \]
\[ \leq \frac{C}{R_j} \left( \frac{1}{|F_{\varphi,1}(R_j, \omega)|} + \frac{1}{|F_{\varphi,1}(R'_j, \omega)|} \right) \leq \frac{C}{(t_{p_k} - t_{p_j}) h R_j} \leq C 2^{-j} . \]

In order to estimate $B_\varphi$, we have
\[
\left| \frac{d}{dr} \left( \frac{1}{r (\log r)^{3/4} iF'_\varphi(r, \omega)} \right) e^{iF_\varphi(r, \omega)} \right|
\leq \frac{C}{r^2 |F'_\varphi(r, \omega)|} + \frac{C |F''_\varphi(r, \omega)|}{r |F'_\varphi(r, \omega)|^2 (\log r)^{3/4}}
\leq \frac{C}{r^2 (t_p - t_j)} \varphi'(r, \omega) \left\| F'_\varphi(r, \omega) \right\|_1 + \frac{C |\varphi''(r, \omega)|}{r (t_p - t_j)} \left\| F''_\varphi(r, \omega) \right\|_1
\leq \frac{C}{r^2 (t_p - t_j)}.
\]
This together with (4.9) gives us
\[
|B_\varphi| = \left| \int_{R_j}^{R_j'} \frac{d}{dr} \left( \frac{1}{r (\log r)^{3/4} iF'_\varphi(r, \omega)} \right) e^{iF_\varphi(r, \omega)} \, dr \right|
\leq \int_{R_j}^{R_j'} \frac{C}{r^2 (t_p - t_j)} \, dr \leq \frac{C}{R_j (t_p - t_j)} \leq C 2^{-j}.
\]
From the estimates above and the triangle inequality we get
\[
|A_j^\varphi(x_{p_k}, t_{p_k})| \leq C (|A_\varphi| + |B_\varphi|) < C 2^{-j}, \quad j > k \geq 2. \tag{4.13}
\]
Here $C$ is independent of $j$ and $k$.

Using the results from (4.3), (4.13), in combination with Lemma 4.3, and recalling that $R'_j = R''_j$, gives
\[
|S_m^\varphi f_\varphi,1(x_{p_k}, t_{p_k})| \geq c (\log R'_k)^{1/4} - C' (\log R'_k)^{1/4} - C \sum_{k+1}^{m} 2^{-j}
\geq c (\log R'_k)^{1/4}, \tag{4.14}
\]
when $m > k$ and $N$ is sufficiently large. Here $c > 0$ is independent of $k$.

**Step 2.** By similar arguments as in the last part of the proof of Theorem 1.1 it follows that $S^\varphi f_\varphi,1$ is continuous on each compact subset of
\[
L = \{(x, t); \ t > 0\}
\]
and
\[
|S^\varphi f_\varphi,1(x_{p_k}, t_{p_k})| \to +\infty \quad \text{as} \quad k \to +\infty.
\]
This gives the result for $\varphi$ satisfying (4.6).

**Proof of Theorem 1.2 in the case where $\varphi$ satisfies (1.10).**
Step 1. For \( j > k \geq 2 \) we estimate \( A_j^r(x_{p_k}, t_{p_k}) \). Let \( \eta, f_{\varphi,1} \) and \( F_{\varphi,1}(r, \omega) \) be defined by (4.7), (4.8) and (4.11) respectively. Since 

\[ t_1 > t_2 > \cdots > 0 \]

and 

\[ t_{p_j} - t_{p_{j+1}} \geq (3/h)\eta(t_{p_j}), \]

we have that 

\[ t_{p_k} - t_{p_j} \geq (3/h)\eta(t_{p_k}). \]

Using this together with 

\[ |x_{p_k} - x_{p_j}| \leq |x_{p_k} - x| + |x - x_{p_j}| \leq 2\eta(t_{p_k}), \]

it follows by the triangle inequality and Cauchy-Schwarz inequality that 

\[ |F'_{\varphi,1}(r, \omega)| = |(x_{p_k} - x_{p_j}) \cdot \omega + \varphi'(r, \omega)(t_{p_k} - t_{p_j})| \leq h(t_{p_k} - t_{p_j}) - |x_{p_k} - x_{p_j}| \geq \eta(t_{p_k}) \geq \eta(t_{p_j}). \]  

Then we estimate each part of equation (3.16) by using (1.10), (4.10) and (4.15) and see that 

\[ |A_{\varphi}| = \left| \frac{1}{r(\log r)^{3/4}iF_{\varphi,1}''(r, \omega)} e^{iF_{\varphi,1}(r, \omega)} \right|_{R_j} \]

\[ \leq \frac{C}{R_j(\inf_{|\omega|=1}(|F'_{\varphi,1}(R_j, \omega)|, |F'_{\varphi,1}(R'_j, \omega)|))) < \frac{C}{R_j \eta(t_{p_j})} < C2^{-j}. \]

In order to estimate \( B_{\varphi} \), we have 

\[ \left| \frac{d}{dr} \left( \frac{1}{r(\log r)^{3/4}iF_{\varphi,1}(r, \omega)} \right) e^{iF_{\varphi,1}(r, \omega)} \right| \]

\[ \leq \frac{C}{r^2 |F'_{\varphi,1}(r, \omega)|} + \frac{C|F''_{\varphi,1}(r, \omega)|}{r|F'_{\varphi,1}(r, \omega)|^2(\log r)^{3/4}} \]

\[ \leq \frac{C}{r^2 \eta(t_{p_j})} + \frac{C|\varphi''(r, \omega)|}{r(\log r)^{3/4} \eta(t_{p_j})} \leq \frac{C}{r^{1+\beta} \eta(t_{p_j})}. \]

This together with (4.10) gives us 

\[ |B_{\varphi}| = \left| \int_{R_j}^{R'_j} \frac{d}{dr} \left( \frac{1}{r(\log r)^{3/4}iF_{\varphi,1}(r, \omega)} \right) e^{iF_{\varphi,1}(r, \omega)} dr \right| \]

\[ \leq \int_{R_j}^{R'_j} \frac{C}{r^{\beta+1} \eta(t_{p_j})} dr \leq \frac{C}{R_j^\beta \eta(t_{p_j})} < C2^{-j}. \]

From the estimates above and the triangle inequality we get 

\[ |A_j^r(x_{p_k}, t_{p_k})| = C(|A_{\varphi}| + |B_{\varphi}|) < C2^{-j} \]  

(4.16) 

for \( j > k \geq 2 \). Here \( C \) is independent of \( j \) and \( k \).
Using the result from (4.16) in combination with Lemma 4.3, and recalling that \( R_j' = R_j^N \), now gives

\[
|S_{m,1}^\varphi f_{\varphi,1}(x_{p_k}, t_{p_k})| \geq c (\log R'_k)^{1/4} - C' (\log R_k)^{1/4} - C \sum_{k+1}^m 2^{-j} \geq c (\log R'_k)^{1/4} \tag{4.17}
\]

when \( m > k \) and \( N \) is sufficiently large. Here \( c > 0 \) is independent of \( k \).

**Step 2.** By similar arguments as in the last part of the proof of Theorem 1.1, it follows that \( S_{\varphi}^\varphi f_{\varphi,1} \) is continuous on each compact subset of

\[ L = \{(x, t); t > 0\} \]

and

\[ |S_{\varphi}^\varphi f_{\varphi,1}(x_{p_k}, t_{p_k})| \to +\infty \quad \text{as} \quad k \to +\infty. \]

This gives the result for \( \varphi \) satisfying (1.10). \( \square \)
