WEIGHTED BESOV AND TRIEBEL–LIZORKIN SPACES ASSOCIATED TO OPERATORS

HUY-QUI BUI, THE ANH BUI, AND XUAN THINH DUONG

Abstract. Let $X$ be a space of homogeneous type and $L$ be a nonnegative self-adjoint operator on $L^2(X)$ satisfying Gaussian upper bounds on its heat kernels. In this paper we develop the theory of weighted Besov spaces $\dot{B}^{\alpha,L}_{p,q,w}(X)$ and weighted Triebel–Lizorkin spaces $\dot{F}^{\alpha,L}_{p,q,w}(X)$ associated to the operator $L$ for the full range $0 < p, q \leq \infty$, $\alpha \in \mathbb{R}$ and $w$ being in the Muckenhoupt weight class $A_\infty$. Similarly to the classical case in the Euclidean setting, we prove that our new spaces satisfy important features such as continuous characterizations in terms of square functions, atomic decompositions and the identifications with some well known function spaces such as Hardy type spaces and Sobolev type spaces. Moreover, with extra assumptions on the operator $L$, we prove that the new function spaces associated to $L$ coincide with the classical function spaces. Finally we apply our results to prove the boundedness of the fractional power of $L$ and the spectral multiplier of $L$ in our new function spaces.

1. Introduction

Let $X$ be a space of homogeneous type, with quasi distance $d$ and $\mu$ is a nonnegative Borel measure on $X$, which satisfies the doubling property below. In this paper, we assume that $\mu(X) = \infty$.

For $x \in X$ and $r > 0$ we set $B(x, r) = \{y \in X : d(x, y) < r\}$ to be the open ball with radius $r > 0$ and center $x \in X$, and $V(x, r) = \mu(B(x, r))$. The doubling property of $\mu$ provides a constant $C > 0$ such that

\begin{equation}
V(x, 2r) \leq CV(x, r)
\end{equation}

for all $x \in X$ and $r > 0$.

The doubling property (1) yields a constant $n > 0$ so that

\begin{equation}
V(x, \lambda r) \leq C\lambda^n V(x, r),
\end{equation}

for all $\lambda \geq 1, x \in X$ and $r > 0$; and that

\begin{equation}
V(x, r) \leq C\left(1 + \frac{d(x, y)}{r}\right)^{\tilde{n}} V(y, r),
\end{equation}

for all $x, y \in X, r > 0$ and for some $\tilde{n} \in [0, n]$.

Let $L$ be a nonnegative self-adjoint operator on $L^2(X)$ which generates a semigroup $\{e^{-tL}\}_{t > 0}$. Denote by $p_t(x, y)$ the kernel of the semigroup $e^{-tL}$. In this paper, we assume that the kernel $p_t(x, y)$ satisfies a Gaussian upper bound, i.e., there exist two positive constants $C$ and $c$ so that

\begin{equation}
|p_t(x, y)| \leq \frac{C}{\mu(B(x, \sqrt{t}))) \exp \left(- \frac{d(x, y)^2}{ct}\right). \tag{GE}
\end{equation}

The theory of classical Besov and Triebel-Lizorkin spaces has played an essential role in the theory of function approximation and partial differential equations, and has been developed by many mathematicians on Euclidean spaces $\mathbb{R}^n$. See [38, 39, 56, 60, 61, 6, 7, 8, 12, 13, 14, 15] and the references therein. Recently, this theory has been extended to several directions including the theory of these function spaces in the general setting of a metric measure space and the theory of new function spaces associated to operators. We now list some bodies of work related to these research directions.

(i) Using the existence of the approximation of identity, the authors developed the theory of Besov spaces $\dot{B}^{s}_{p, q}$ and Triebel-Lizorkin spaces $\dot{F}^{s}_{p, q}$ for a range $1 \leq p, q \leq \infty$ and $s \in (-\theta, \theta)$ for some $\theta \in (0, 1)$ on metric spaces with polynomial volume growths [47] and on spaces with doubling and reverse doubling measures [46].

(ii) In [55] the authors introduced new Besov and Triebel-Lizorkin spaces associated to the Hermite operator with a full range of indices. Similarly to the classical results, they proved the frame decompositions for these spaces by making use of estimates of eigenvectors of the Hermite operators. Similar results was also proved for the Laguerre operator in [52]. The theory of these function spaces was further developed in [17, 18] where the authors proved molecular and atomic decompositions theorems and square function characterizations for these spaces.

(iii) In [11] the authors introduced the theory of Besov spaces $\dot{B}^{s}_{p, q}$ associated to an operator $L$ satisfying Poisson estimates on metric spaces with a measure enjoying a polynomial upper bound on volume growth. However, the indices are only for $1 \leq p, q \leq \infty$ and $-1 < s < 1$. 

The restriction of indices is due to some technical reasons and the absence of a suitable space of distributions.

(iv) Recently, under the assumption that \( L \) is a nonnegative self-adjoint operator satisfying Gaussian upper bounds, Hölder continuity and Markov semigroup properties, the frame decompositions of Besov and Triebel-Lizorkin spaces associated to \( L \) with full range of indices were studied in [51, 40]. This theory has a wide range of applications from the setting of Lie groups to Riemannian manifolds.

Our main aim in this paper is to conduct the theory of weighted Besov and Triebel–Lizorkin spaces associated to a nonnegative self-adjoint operator. In contrast to [51, 40], we assume the Gaussian upper bound (GE), but do not assume Hölder continuity on the heat kernels nor the Markov properties (the conservation property). This allows our theory to cover a wider range of applications. In this article, in order to introduce the weighted Besov and Triebel–Lizorkin spaces we adapt ideas in [56, 60, 61] to make use of spectral decompositions of nonnegative self-adjoint operators. Our development on the new theory of weighted Besov and Triebel–Lizorkin spaces can be viewed as a generalization of the classical settings in \( \mathbb{R}^n \). Our techniques can be considered as a combination of classical tools such as Calderón reproducing formulas and new tools such kernel estimates for spectral decompositions of nonnegative self-adjoint operators. These techniques enable us to obtain some useful maximal function estimates which play an essential role in the proofs of our main results. Our point of view and approach are motivated and influenced by a large body of works in the classical setting, especially [56, 39, 58, 22, 13, 14, 10].

For convenience we list the main contributions of the article:

- Section 2 recalls the Fefferman–Stein maximal inequality and gives the definition of a new class of distributions. More importantly, we prove a number of Calderón reproducing formulas and some maximal function estimates which play a crucial role in the proofs of the main results.
- Section 3 gives definitions of the weighted Besov and Triebel–Lizorkin spaces. Then we prove continuous characterizations including square function characterizations via heat kernels of the new weighted Besov and Triebel–Lizorkin spaces. In particular, the characterization via non-compactly supported spectral functional calculus is a significant advance of our paper (see Theorem 3.6). Moreover, we also study the Triebel-Lizorkin space \( \dot{F}^{\alpha,L}_{p,q,w} \) with \( p = \infty \), which does not seem to be considered in this setting in the literature before.
- Section 4 establishes atomic decompositions of these new spaces where we prove similar results to the classical function spaces in the Euclidean setting.
- Section 5 derives identifications of these new spaces with well known spaces such as Hardy spaces and Sobolev Hardy spaces associated to operators.
- Section 6 compares our new spaces with classical Besov and Triebel-Lizorkin spaces.
- Section 7 proves the boundedness of singular integrals including fractional power of \( L \) and spectral multipliers \( m(L) \) on the new function spaces.

We note that, after a preliminary version of the manuscript was completed, we learned that the atomic decompositions have been obtained independently in [41] by using a different approach. It is worth noticing that in comparison with [41], our assumptions on the operator \( L \) and the underlying spaces \( X \) are weaker than those in [41]. In our paper, \( L \) is assumed to be nonnegative, self-adjoint and has a Gaussian upper bound, whereas apart from these conditions, in [41] the operator \( L \) is assumed to satisfy some additional conditions such as Hölder continuity estimate and Markov semigroup property. Moreover, the reverse doubling condition and non-collapsing condition for the underlying space are additionally required in [41]. It is worth emphasizing that our approach can be adapted to study the generalized Besov and Triebel–Lizorkin spaces as in [63] or Besov and Triebel–Lizorkin spaces with variable exponents which are associated to operators satisfying the Gaussian upper bounds of order \( m \).

Throughout the paper, we usually use \( C \) and \( c \) to denote positive constants that are independent of the main parameters involved but whose values may differ from line to line. We will write \( A \lesssim B \) if there is a universal constant \( C \) so that \( A \leq CB \) and \( A \sim B \) if \( A \lesssim B \) and \( B \lesssim A \).
2. Preliminaries, a new class of distributions and related estimates

2.1. Muckenhoupt weights, Fefferman-Stein inequality and some estimates on spaces of homogeneous type. To simplify notation, we will often use $B$ for $B(x, r; B)$. Also, given $\lambda > 0$, we will write $\lambda B$ for the $\lambda$-dilated ball, which is the ball with the same center as $B$ and with radius $r_{\lambda B} = \lambda r_B$. For each ball $B \subset X$ we set

$$S_0(B) = 4B \text{ and } S_j(B) = 2^j B \backslash 2^{j-1} B \text{ for } j \geq 3.$$ 

For $x, y \in X$ and $r > 0$, we denote $V(x \land y, r) = \min\{V(x, r), V(y, r)\}$ and $V(x \lor y, r) = \max\{V(x, r), V(y, r)\}$.

A weight $w$ is non-negative measurable and locally integrable function on $X$. Let $w$ be a weight. For any measurable set $E \subset X$, we denote $w(E) := \int_E w(x) d\mu(x)$ and $V(E) = \mu(E)$. We denote

$$\int_E h(x) d\mu(x) = \frac{1}{V(E)} \int_E h(x) d\mu(x).$$

For $1 \leq p \leq \infty$ let $p'$ be the conjugate exponent of $p$, i.e. $1/p + 1/p' = 1$.

We say that a weight $w \in A_p$, $1 < p < \infty$, if the following holds true:

$$(4) \quad [w]_{A_p} := \sup_{B: \text{balls}} \left( \int_B w(x) d\mu(x) \right)^{1/p} \left( \int_B w(x)^{-1/(p-1)} d\mu(x) \right)^{(p-1)/p} < \infty.$$ 

For $p = 1$, we say that $w \in A_1$ if there is a constant $C$ such that for every ball $B \subset X$,

$$\int_B w(y) d\mu(y) \leq Cw(x) \text{ for a.e. } x \in B.$$ 

We set $A_\infty = \bigcup_{p \geq 1} A_p$.

The reverse Hölder classes are defined in the following way: a weight $w \in RH_q$, $1 < q < \infty$, if there is a constant $C$ such that for any ball $B \subset X$,

$$\left( \int_B w(y)^q d\mu(y) \right)^{1/q} \leq C \int_B w d\mu(x).$$

The endpoint $q = \infty$ is given by the condition: $w \in RH_\infty$, if there is a constant $C$ such that for any ball $B \subset X$,

$$w(x) \leq C \int_B w(y) d\mu(y) \text{ for a.e. } x \in B.$$ 

For $w \in A_\infty$ and $0 < p < \infty$, the weighted space $L^p_w(X)$ is defined by

$$\left\{ f : \int_X |f(x)|^p w(x) d\mu(x) < \infty \right\}$$

with the norm

$$\|f\|_{p,w} = \left( \int_X |f(x)|^p w(x) d\mu(x) \right)^{1/p}.$$ 

We sum up some of the standard properties of classes of weights in [58] in the following lemma.

**Lemma 2.1.** The following properties hold:

(i) $A_1 \subset A_p \subset A_q$ for $1 < p \leq q < \infty$.

(ii) If $w \in A_p$, $1 < p < \infty$, then there exists $1 < r < p < \infty$ such that $w \in A_r$.

(iii) If $w \in A_p$, $1 < p < \infty$, then $w^{1-p'} \in A_p$.

(iv) If $w \in A_p$, $1 \leq p < \infty$, then there exists $C > 0$ so that for any ball $B$ and any measurable subset $E \subset B$ we have

$$(5) \quad \frac{w(B)}{w(E)} \leq C \left( \frac{V(B)}{V(E)} \right)^p.$$ 

(v) If $w \in RH_p$, $1 < p < \infty$, then there exists $1 < p < q < \infty$ such that $w \in RH_q$.

(vi) $\bigcup_{1 < p < \infty} A_p = \bigcup_{1 < q < \infty} RH_q$. 

For \( w \in A_\infty \) we define \( q_w = \inf\{q : w \in A_q\} \) and \( r_w = \sup\{r : w \in RH_r\}. \)

Let \( w \in A_\infty \) and \( 0 < r < \infty \). The weighted Hardy–Littlewood maximal function \( M_{r,w} \) is defined by

\[
M_{r,w}(f)(x) = \sup_{x \in B} \left( \frac{1}{w(B)} \int_B |f(y)|^r w(y) d\mu(y) \right)^{1/r},
\]

where the sup is taken over all balls \( B \) containing \( x \). We will drop the subscripts \( r \) or \( w \) when either \( r = 1 \) or \( w \equiv 1 \).

Let \( w \in A_\infty \) and \( 0 < r < \infty \). It is well-known that

\[
\|M_{r,w}f\|_{p,w} \lesssim \|f\|_{p,w}
\]

for all \( p > r \).

Moreover, let \( 0 < r < \infty \) and \( p > r \). Then we have

\[
\|M_rf\|_{p,w} \lesssim \|f\|_{p,w}
\]

for \( w \in A_{p/r} \).

The following elementary estimates will be used frequently. See for example [21].

**Lemma 2.2.** Let \( \epsilon > 0 \).

(a) For any \( p \in [1, \infty] \) we have

\[
\left( \int_X \left( \left( 1 + \frac{d(x,y)}{s} \right)^{n-\epsilon} \right)^p \right)^{1/p} \lesssim V(x,s)^{1/p},
\]

for all \( x \in X \) and \( s > 0 \).

(b) For any \( f \in L^1_{\text{loc}}(X) \) we have

\[
\int_X \frac{1}{V(x \wedge y, s)} \left( 1 + \frac{d(x,y)}{s} \right)^{-n+\epsilon} |f(y)| d\mu(y) \lesssim M_f(x),
\]

for all \( x \in X \) and \( s > 0 \).

We recall the Fefferman-Stein vector-valued maximal inequality and its variant in [43] and [51]. For \( 0 < p < \infty \), \( 0 < q \leq \infty \), \( 0 < r < \min\{p,q\} \) and \( w \in A_{p/r} \), we then have for any sequence of measurable functions \( \{f_{\nu}\} \),

\[
\left( \sum_{\nu} |M_rf_{\nu}|^q \right)^{1/q} \lesssim \left( \sum_{\nu} |f_{\nu}|^q \right)^{1/q},
\]

for all \( x \in X \) and \( s > 0 \).

For any measurable function \( F : X \times \mathbb{R}^+ \to \mathbb{C} \) with respect to the product measure \( d\mu \times du \) one has, for \( 0 < p < \infty \), \( 0 < q \leq \infty \), \( w \in A_{p/r} \) and \( 0 < r < \min\{p,q\} \),

\[
\left( \int_0^\infty \left( \int_X |M_r(F(\cdot, u))(\cdot)|^q d\mu(\cdot) \right)^{1/q} du \right)^{1/q} \lesssim \left( \int_0^\infty \left( \int_X |F(\cdot, u)(\cdot)|^q d\mu(\cdot) \right)^{1/q} du \right)^{1/q},
\]

The Young’s inequality and (8) imply the following inequality: If \( \{a_{\nu}\} \in \ell^q \cap \ell^1 \), then

\[
\left( \sum_{\nu} \left( \sum_{\nu} |a_{\nu}M_rf_{\nu}|^q \right)^{1/q} \right)^{1/q} \lesssim \left( \sum_{\nu} |f_{\nu}|^q \right)^{1/q},
\]

We will now recall an important covering lemma in [24].

**Lemma 2.3.** There exists a collection of open sets \( \{Q^k_\tau \subset X : k \in \mathbb{Z}, \tau \in I_k\} \), where \( I_k \) denotes certain (possibly finite) index set depending on \( k \), and constants \( \rho \in (0,1), a_0 \in (0,1) \) and \( \kappa_0 \in (0,\infty) \) such that

(i) \( \mu(X \setminus \bigcup_{\tau} Q^k_\tau) = 0 \) for all \( k \in \mathbb{Z} \);

(ii) if \( i \geq k \), then either \( Q^k_\tau \subset Q^i_\beta \) or \( Q^i_\beta \cap Q^k_\tau = \emptyset \);

(iii) for every \( (k,\tau) \) and each \( i < k \), there exists a unique \( \tau' \) such \( Q^k_\tau \subset Q^i_{\tau'} \);

(iv) the diameter \( \text{diam}(Q^k_\tau) \leq \kappa_0 \rho^k \).
(ν) each \( Q^k \) contains certain ball \( B(x_{Q^k}, a_0 \rho^k) \).

**Remark 2.4.** Since the constants \( \rho \) and \( a_0 \) are not essential in the paper, without loss of generality, we may assume that \( \rho = a_0 = 1/2 \). We then fix a collection of open sets in Lemma 2.3 and denote this collection by \( \mathcal{D} \). We call open sets in \( \mathcal{D} \) the dyadic cubes in \( X \) and \( x_{Q^k} \) the center of the cube \( Q^k \in \mathcal{D} \). We also denote

\[
\mathcal{D}_\nu := \{ Q^k+1 \in \mathcal{D} : \tau \in I_{\nu+1} \}
\]

for each \( \nu \in \mathbb{Z} \). Then for \( Q \in \mathcal{D}_\nu \), we have \( B(x_Q, c_0 2^{-\nu}) \subset Q \subset B(x_Q, \kappa_0 2^{-\nu}) =: B_Q \), where \( c_0 \) is a constant independent of \( Q \).

2.2. **Kernel estimates.** Denote by \( E_L(\lambda) \) a spectral decomposition of \( L \). Then by spectral theory, for any bounded Borel function \( F : [0, \infty) \to \mathbb{C} \) we can define

\[
F(L) = \int_0^\infty F(\lambda) dE_L(\lambda)
\]
as a bounded operator on \( L^2(X) \). It is well-known that the kernel \( K_{\cos(t \sqrt{L})} \) of \( \cos(t \sqrt{L}) \) satisfies

\[
supp K_{\cos(t \sqrt{L})} \subset \{(x, y) \in X \times X : d(x, y) \leq t\}. \tag{11}
\]

See for example [27]. We have the following useful lemma. See for example [49].

**Lemma 2.5.** Let \( \varphi \in \mathcal{S}(\mathbb{R}) \) be an even function with \( \text{supp} \varphi \subset (-1, 1) \) and \( \int \varphi = 2\pi \). Denote by \( \Phi \) the Fourier transform of \( \varphi \). Then for every \( k \in \mathbb{N} \), the kernel \( K_{(t^2L)^k \Phi(t \sqrt{L})} \) of \( (t^2L)^k \Phi(t \sqrt{L}) \) satisfies

\[
supp K_{(t^2L)^k \Phi(t \sqrt{L})} \subset \{(x, y) \in X \times X : d(x, y) \leq t\}, \tag{12}
\]

and

\[
|K_{(t^2L)^k \Phi(t \sqrt{L})}(x, y)| \leq \frac{C}{V(x, t)}. \tag{13}
\]

The following lemma gives some kernel estimates which play an important role in the proof of our main results.

**Lemma 2.6.** (a) Let \( \varphi \in \mathcal{S}(\mathbb{R}) \) be an even function. Then for any \( N > 0 \) there exists \( C > 0 \) such that

\[
|K_{\varphi(t \sqrt{L})}(x, y)| \leq \frac{C}{V(x \vee y, t)} \left(1 + \frac{d(x, y)}{t}\right)^{-N}, \tag{14}
\]

for all \( t > 0 \) and \( x, y \in X \).

(b) Let \( \varphi_1, \varphi_2 \in \mathcal{S}(\mathbb{R}) \) be even functions. Then for any \( N > 0 \) there exists \( C > 0 \) such that

\[
|K_{\varphi_1(t \sqrt{L}) \varphi_2(s \sqrt{L})}(x, y)| \leq \frac{C}{V(x \vee y, t)} \left(1 + \frac{d(x, y)}{t}\right)^{-N}, \tag{15}
\]

for all \( t \leq s < 2t \) and \( x, y \in X \).

(c) Let \( \varphi_1, \varphi_2 \in \mathcal{S}(\mathbb{R}) \) be even functions with \( \varphi_2^{(\nu)}(0) = 0 \) for \( \nu = 0, 1, \ldots, 2\ell \) for some \( \ell \in \mathbb{Z}^+ \). Then for any \( N > 0 \) there exists \( C > 0 \) such that

\[
|K_{\varphi_1(t \sqrt{L}) \varphi_2(s \sqrt{L})}(x, y)| \leq \frac{C}{V(x \vee y, t)} \left(1 + \frac{d(x, y)}{t}\right)^{-N}, \tag{16}
\]

for all \( t \geq s > 0 \) and \( x, y \in X \).

Note that any function in \( \mathcal{S}(\mathbb{R}) \) with compact support in \((0, \infty)\) can be extended to an even function in \( \mathcal{S}(\mathbb{R}) \) with derivatives of all orders vanish at 0. Hence the results in each part (a), (b) and (c) hold for such functions.
Proof. (a) The estimate (14) was proved in [26, Lemma 2.3] in the particular case $X = \mathbb{R}^n$ but the proof is still valid in the case of spaces of homogeneous type.

For the items (b) and (c) we refer to [21]. □

Remark 2.7. (i) From (3), the term $V(x \vee y, t)$ on the right hand side of estimates in Lemma 2.6 can be replaced by $V(x \vee y, d(x, y))$.

(ii) We will often use the following inequality
\[
(1 + d(x, y))^N \leq (1 + d(x, z))^N
\]
for all $x, y, z \in X$ and all $t, N > 0$.

We may use these in the sequel without stating any reasons.

2.3. A new class of distributions. We fix $x_0 \in X$ as a reference point in $X$. The class of test functions $S$ associated to $L$ is defined as the set of all functions $\phi \in \cap_{m \geq 1} D(L^m)$ such that
\[
P_m,\ell(\phi) = \sup_{x \in X} (1 + d(x, x_0))^m |L^\ell \phi(x)| < \infty, \quad \forall m > 0, \ell \in \mathbb{N}.
\]
It was proved in [51] that $S$ is a complete locally convex space with topology generated by the family of semi-norms $\{P_m,\ell : m > 0, \ell \in \mathbb{N}\}$. As usual, we define the space of distributions $S'$ as the set of all continuous linear functional on $S$ with the inner product defined by
\[
\langle f, \phi \rangle = f(\phi)
\]
for all $f \in S'$ and $\phi \in S$.

The space of distributions $S'$ can be used to define the inhomogeneous Besov and Triebel-Lizorkin spaces. However, in order to study the homogeneous version of these spaces we need some modifications.

Following [40] we define the space $S_\infty$ as the set of all functions $\phi \in S$ such that for each $k \in \mathbb{N}$ there exists $g_k \in S$ so that $\phi = L_k g_k$. Note that such an $g_k$, if exists, is unique. See [40].

The topology in $S_\infty$ is generated by the following family of semi-norms
\[
P_{m,\ell,k}(\phi) = P_{m,\ell}(g_k), \quad \forall m > 0, \ell, k \in \mathbb{N}
\]
where $\phi = L_k g_k$.

We then denote by $S'_{\infty}$ the set of all continuous linear functionals on $S_\infty$.

In order to have an insightful understanding about the distributions in $S'_{\infty}$, we define
\[
\mathcal{P}_m = \{g \in S' : L^m g = 0\}, \quad m \in \mathbb{N}
\]
and set $\mathcal{P} = \cup_{m \in \mathbb{N}} \mathcal{P}_m$.

From Proposition 3.7 in [40], we have:

Proposition 2.8. The following identification is valid $S' / \mathcal{P} = S'_{\infty}$.

It was proved in [40] that with $L = -\Delta$, the Laplacian on $\mathbb{R}^n$, the distributions in $S' / \mathcal{P} = S'_{\infty}$ are identical with the classical tempered distributions modulo polynomial.

From Lemma 2.6, we can see that if $\varphi \in \mathcal{F}(\mathbb{R})$ with supp $\varphi \subset (0, \infty)$, then we have $K_{\varphi(\sqrt{\Delta})}(x, \cdot) \in S_\infty$ and $K_{\varphi(\sqrt{\Delta})}(\cdot, y) \in S_\infty$. Therefore, we can define
\[
\varphi(t \sqrt{\Delta}) f(x) = \langle f, K_{\varphi(t \sqrt{\Delta})}(x, \cdot) \rangle
\]
for all $f \in S'_{\infty}$.

The support condition supp $\varphi \subset (0, \infty)$ is essential to be able to define $\varphi(t \sqrt{\Delta}) f$ with $f \in S'_{\infty}$. In general, if $\varphi \in \mathcal{F}(\mathbb{R})$, then we have $K_{\varphi(t \sqrt{\Delta})}(x, \cdot) \in S$ and $K_{\varphi(t \sqrt{\Delta})}(\cdot, y) \in S$. In this situation, it is possible to define $\varphi(t \sqrt{\Delta}) f$ when $f \in S'$, but it is not clear how to define $\varphi(t \sqrt{\Delta}) f$ when $f \in S'_{\infty}$.
Lemma 2.9. Let $f \in S'$ and $\varphi \in \mathcal{S}(\mathbb{R})$ be an even function. Then there exist $m > 0$ and $K > 0$ such that

$$|\varphi(t\sqrt{t})f(x)| \lesssim \frac{(t \vee t^{-1})^m}{V(x_0, t)} (1 + d(x, x_0))^K.$$  

The similar estimate holds true if $f \in S'_\infty$ and $\varphi \in \mathcal{S}(\mathbb{R})$ supported in $[1/2, 2]$.

Proof. Since $\varphi(t\sqrt{t})f(x, \cdot) \in \mathcal{S}$, we have

$$|\varphi(t\sqrt{t})f(x)| \lesssim P_{m', \ell}(K_{\varphi(t\sqrt{t})}(x, \cdot))$$

for some $m' \in \mathbb{N}$ and $\ell \geq 0$.

Using the kernel estimates in Lemma 2.6 and simple calculations we can find $m, K > 0$ so that

$$P_{m', \ell}(K_{\varphi(t\sqrt{t})}(x, \cdot)) \lesssim \frac{(t \vee t^{-1})^m}{V(x_0, t)} (1 + d(x, x_0))^m.$$ 

This implies (19).

The proof is similar when $f \in S'_\infty$ and $\varphi \in \mathcal{S}(\mathbb{R})$ supported in $[1/2, 2]$. We omit the details. □

2.4. Calderón reproducing formulas. In what follows, by a “partition of unity” we shall mean a function $\psi \in \mathcal{S}(\mathbb{R})$ such that $\text{supp } \psi \subset [1/2, 2]$, $\int \psi(\xi) \frac{d\xi}{\xi} \neq 0$ and

$$\sum_{j \in \mathbb{Z}} \psi_j(\lambda) = 1 \text{ on } (0, \infty),$$

where $\psi_j(\lambda) := \psi(2^{-j} \lambda)$ for each $j \in \mathbb{Z}$.

Proposition 2.10. Let $\psi$ be a partition of unity. Then for any $f \in S'_\infty$ we have

$$f = \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{t})f \text{ in } S'_\infty.$$ 

Proof. By duality it suffices to prove that for each $f \in S_\infty,$

$$f = \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{t})f \text{ in } S_\infty.$$ 

Indeed, since $f \in S_\infty$, for each $k \in \mathbb{N}$ there exists $g_k \in S$ so that $f = L^k g_k$.

For $m > 0$ and $\ell, k \in \mathbb{N}$ we have

$$\mathcal{P}_{m, \ell, k}^*(\psi_j(\sqrt{t})f) = \sup_{x \in X} (1 + d(x, x_0))^m |L^\ell \psi_j(\sqrt{t})g_k(x)|.$$ 

If $j \geq 0$, then we have

$$(1 + d(x, x_0))^m |L^\ell \psi_j(\sqrt{t})f(x)| = (1 + d(x, x_0))^m |2^{-2j} \tilde{\psi}_j(\sqrt{t})L^{\ell+1} g_k(x)|$$

where $\tilde{\psi}(\xi) = \xi^{-2} \psi(\xi)$.

This, along with Lemma 2.6 and Lemma 2.2, implies that

$$\tag{20} (1 + d(x, x_0))^m |L^\ell \psi_j(\sqrt{t})f(x)|$$

$$\lesssim 2^{-2j} (1 + d(x, x_0))^m \int_X \frac{1}{V(x, 2^{-j})} \left(1 + \frac{d(x, y)}{2^{-j}}\right)^{-N-m} |L^{\ell+1} g_k(y)| d\mu(y)$$

$$\lesssim 2^{-2j} \frac{1}{V(x, 2^{-j})} \left(1 + \frac{d(x, y)}{2^{-j}}\right)^{-N} (1 + d(y, x_0))^m |L^{\ell+1} g_k(y)| d\mu(y)$$

$$\lesssim 2^{-2j} \mathcal{P}_{m, \ell+1}(g_k) \int_X \frac{1}{V(x, 2^{-j})} \left(1 + \frac{d(x, y)}{2^{-j}}\right)^{-N} d\mu(y)$$

$$\lesssim 2^{-2j} \mathcal{P}_{m, \ell+1, k}(f)$$

as long as $N > n$. 

Hence,
\begin{equation}
P^*_{m,\ell,k}(\psi_j(\sqrt{L})f) \lesssim 2^{-2j}P^*_{m,\ell+1,k}(f), \quad \forall j \geq 0.
\end{equation}

If \( j < 0 \), then we have
\[(1 + d(x,x_0))^m |L^\ell \psi_j(\sqrt{L})f(x)| = 2^{2j(\ell+k+m+1)}(1 + d(x,x_0))^m |\varphi_j(\sqrt{L})g_{k+m+1}(x)|\]
where \( \varphi(\lambda) = \lambda^{2(\ell+k+m+1)} \psi(\lambda) \).

Arguing similarly to (20) we obtain
\begin{equation}
P^*_{m,\ell,k}(\psi_j(\sqrt{L})f) \lesssim 2^{2j}P^*_{m,0,k+m+1}(f), \quad \forall j < 0.
\end{equation}

From (21), (22) and the fact that \( \mathcal{S}_\infty \) is complete, we deduce that there exists \( h \in \mathcal{S}_\infty \) so that
\[h = \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f \text{ in } \mathcal{S}_\infty.\]

On the other hand, by spectral theory we have
\[f = \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f \text{ in } L^2(X).\]

Therefore, \( f \equiv h \) and this concludes the proposition. \( \square \)

**Proposition 2.11.** Let \( \psi \in \mathcal{S}(\mathbb{R}) \) be such that \( \text{supp} \psi \subset [1/2,2] \) and \( \int \psi \frac{dt}{t} \neq 0 \). Then for any \( f \in S'_\infty \) we have
\begin{equation}
f = c_\psi \int_0^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} \text{ in } S'_\infty
\end{equation}
where \( c_\psi = \left[ \int_0^{\infty} \psi(t) \frac{dt}{t} \right]^{-1} \).

Moreover, if \( f \in S' \), then there exists \( \rho \in \mathcal{P} \) so that
\begin{equation}
f - \rho = c_\psi \int_0^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} \text{ in } S'.
\end{equation}

**Proof.** We first show that
\[f = c_\psi \int_0^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} \text{ in } S_\infty\]

Arguing similarly to the proof of Proposition 2.10, we can prove that
\[
\lim_{N \to \infty} \int_0^{1/N} \psi(t\sqrt{L})f \frac{dt}{t} = \lim_{N \to \infty} \int_N^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} = 0 \text{ in } S_\infty,
\]
and consequently, by using the completeness of \( S_\infty \) and the spectral theory as in the proof of Proposition 2.10, we obtain the representation
\[f = c_\psi \int_0^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} \text{ in } S_\infty.
\]

It follows by duality that
\[f = c_\psi \int_0^{\infty} \psi(t\sqrt{L})f \frac{dt}{t} \text{ in } S'_\infty.
\]

For the second part, we note that for \( g \in S \) we have
\[
\int_0^{\infty} \psi(s\sqrt{L})g \frac{ds}{s} = \int_0^1 \psi(s\sqrt{L})g \frac{ds}{s} + \int_1^{\infty} \psi(s\sqrt{L})g \frac{ds}{s} = \int_0^1 \psi(s\sqrt{L})g \frac{ds}{s} + \tilde{\psi}(\sqrt{L})g
\]
where \( \tilde{\psi}(x) = \int_0^{|x|} \psi(s) \frac{ds}{s} = \int_1^{\infty} \psi(sx) \frac{ds}{s}. \)
Hence, for any $\ell \in \mathbb{N}$, $k > 0$ and $x \in X$ we have
\[
(1 + d(x, x_0))^k \left| L^\ell \left( \int_0^\infty \psi(s\sqrt{L})g(x) \frac{ds}{s} \right) \right|
\leq (1 + d(x, x_0))^k \int_0^1 |\psi(s\sqrt{L})L^\ell g(x)| \frac{ds}{s} + (1 + d(x, x_0))^k |\tilde{\psi}(\sqrt{L})L^\ell g(x)|
\leq (1 + d(x, x_0))^k \int_0^1 s^N |(s\sqrt{L})^{-2N}\psi(s\sqrt{L})L^\ell+N g(x)| \frac{ds}{s} + (1 + d(x, x_0))^k |\tilde{\psi}(\sqrt{L})L^\ell g(x)|
= : I_1(g) + I_2(g)
\]
where $N$ is a fixed number which is greater than $k + n$.

Note that $x^{-2N}\psi(x)$ is a function in $\mathcal{S}(\mathbb{R})$ supported in $[1/2, 2]$. Using Lemma 2.6 \cite{58} and arguing similarly to the proof of Proposition 2.10 we can show that
\[I_1(g) \lesssim \mathcal{P}_{k, \ell+N}(g).\]
For the same reason, since $\tilde{\psi}$ is an even function in $\mathcal{S}(\mathbb{R})$, we also have
\[I_2(g) \lesssim \mathcal{P}_{k, \ell}(g).\]

As a consequence,
\[
(1 + d(x, x_0))^k \left| L^\ell \left( \int_0^\infty \psi(s\sqrt{L})g(x) \frac{ds}{s} \right) \right| \lesssim \mathcal{P}_{k, \ell+N}(g) + \mathcal{P}_{k, \ell}(g)
\]
for all $\ell \in \mathbb{N}$, $k > 0$ and $x \in X$.

This implies that $\int_0^\infty \psi(s\sqrt{L})g(x) \frac{ds}{s} \in \mathcal{S}$ whenever $g \in \mathcal{S}$. By duality, $\int_0^\infty \psi(s\sqrt{L})f \frac{ds}{s} \in \mathcal{S}'$ whenever $f \in \mathcal{S}'$. This, along with (23) and the fact that $S'_\infty = S'_{\mathcal{P}}$, implies that there exists $\rho \in \mathcal{P}$ so that
\[f - \rho = c_\psi \int_0^\infty \psi(s\sqrt{L})f \frac{ds}{s}\]
in $\mathcal{S}'$.

This completes our proof. \hfill \qed

**Lemma 2.12.** Let $\phi \in \mathcal{S}(\mathbb{R})$ be an even function such that $\phi(\xi) \neq 0$ on $(-2, -1/2) \cup (1/2, 2)$. Then there exist $a, b, c > 0$ and even functions $\Psi, \psi \in \mathcal{S}(\mathbb{R})$ with $\text{supp} \, \Psi \subset [-a, a]$, $\text{supp} \, \psi \subset [-c, -b] \cup [b, c]$, so that for every $f \in \mathcal{S}'$ and every $j \in \mathbb{Z}$ and $t \in [1, 2]$ we have
\[f = \Psi(2^{-j}t\sqrt{L})f + \sum_{k \geq 1} \phi(2^{-(k+j)}t\sqrt{L})\psi(2^{-(k+j)}t\sqrt{L})f \quad \text{in } \mathcal{S}'.\]

**Proof.** It is well-known that there exist an even function $\psi \in \mathcal{S}(\mathbb{R})$ with $\text{supp} \, \psi \subset [-c, -b] \cup [b, c]$ for some $c > b > 0$ so that
\[\sum_{k=\infty}^{\infty} \phi(2^{-k}\lambda)\psi(2^{-k}\lambda) = 1, \quad \forall \lambda \neq 0.
\]
See for example [58]. Define $\Psi \in \mathcal{S}(\mathbb{R})$ by $\Psi(0) = 1$, and $\Psi(\lambda) = \sum_{k \leq 0} \phi(2^{-k}\lambda)\psi(2^{-k}\lambda)$ for $\lambda \neq 0$. Then it is easy to see that $\text{supp} \, \Psi \subset [-a, a]$ for some $a > 0$, and that $\Psi(\lambda) + \sum_{k \geq 1} \phi(2^{-k}\lambda)\psi(2^{-k}\lambda) = 1, \quad \forall \lambda \in \mathbb{R}$.

Using the above identity and arguing similarly to the proof of Proposition 2.10 we conclude that
\[f = \Phi(2^{-j}t\sqrt{L})\Psi(2^{-j}t\sqrt{L})f + \sum_{k \geq 1} \phi(2^{-(k+j)}t\sqrt{L})\psi(2^{-(k+j)}t\sqrt{L})f \quad \text{in } \mathcal{S}'.\]
(A close inspection of the proof in [58] shows that we can take \( a = 2 \), and \( 1/2 < b < c/2 < 1 \).)

2.5. Maximal function estimates. We begin with some technical estimates.

**Lemma 2.13.** Let \( \psi, \varphi \in \mathcal{S}(\mathbb{R}) \) be even functions. Assume that \( 0 < a \leq b < \infty \) and \( \lambda \geq 0 \). Then there exists \( C > 0 \) such that

\[
\sup_{y \in X} |\psi(s\sqrt{L})\varphi(t\sqrt{L})f(y)| \left( 1 + \frac{d(x,y)}{t} \right)^{-\lambda} \leq C \sup_{y \in X} |\varphi(t\sqrt{L})f(y)| \left( 1 + \frac{d(x,y)}{t} \right)^{-\lambda}
\]

for all \( f \in \mathcal{S}', x \in X \) and \( s \in [at, bt] \). If both functions \( \psi \) and \( \varphi \) are supported in \([1/2, 2]\), then (25) holds for all \( f \in \mathcal{S}'_\infty \).

**Proof.** From Lemma 2.6, for \( N > n \) and \( f \in \mathcal{S}' \) we have

\[
|\psi(s\sqrt{L})\varphi(t\sqrt{L})f(y)| \left( 1 + \frac{d(x,y)}{t} \right)^{-\lambda} \leq (1 + \frac{d(x,y)}{t})^{-\lambda} \int_X \frac{1}{V(y,s)} \left( 1 + \frac{d(y,z)}{s} \right)^{-N-\lambda} |\varphi(t\sqrt{L})f(z)| d\mu(z)
\]

\[
\sim (1 + \frac{d(x,y)}{t})^{-\lambda} \int_X \frac{1}{V(y,t)} \left( 1 + \frac{d(y,z)}{t} \right)^{-N-\lambda} |\varphi(t\sqrt{L})f(z)| d\mu(z)
\]

\[
\leq \int_X \frac{1}{V(y,t)} \left( 1 + \frac{d(y,z)}{t} \right)^{-N} \left( 1 + \frac{d(x,y)}{t} \right)^{-\lambda} |\varphi(t\sqrt{L})f(z)| d\mu(z).
\]

This along with Lemma 2.2 implies the desired estimate.

Note that in the case that both functions \( \psi \) and \( \varphi \) are supported in \([1/2, 2]\), then we can define \( \psi(s\sqrt{L})\varphi(t\sqrt{L})f \) for all \( f \in \mathcal{S}'_\infty \). The above argument also gives (25) in this case.

This completes our proof.

**Lemma 2.14.** Let \( \psi \in \mathcal{S}(\mathbb{R}) \) with \( \text{supp} \psi \subset [1/2, 2] \) and \( \int \psi(t) dt \neq 0 \). Then for any \( r > 0 \) and \( N > 0 \) we have

\[
|\psi(t\sqrt{L})f(x)|^r \lesssim \int_0^\infty \int_X \frac{1}{V(y,s)} \left( 1 + \frac{d(x,y)}{s} \right)^{-N} \left( \frac{s}{t} \right)^N |\psi(s\sqrt{L})f(y)|^r d\mu(y) \frac{ds}{s}
\]

for all \( f \in \mathcal{S}'_\infty \), \( x \in X \) and \( t > 0 \).

**Proof.** By Proposition 2.11 we have

\[
\psi(u\sqrt{L})f = c_\psi \int_0^\infty \psi(u\sqrt{L})\psi(s\sqrt{L})f \frac{ds}{s}
\]

pointwise,

where \( c_\psi = \left[ \int_0^\infty \psi(\xi) \frac{d\xi}{\xi} \right]^{-1} \).

This, along with the fact that \( \text{supp} \psi \subset [1/2, 2] \), yields

\[
\psi(u\sqrt{L})f = c_\psi \int_{u/4}^{4u} \psi(u\sqrt{L})\psi(s\sqrt{L})f \frac{ds}{s}.
\]

Applying Lemma 2.6 we deduce that, for \( N > 0 \),

\[
|\psi(u\sqrt{L})f(y)| \lesssim \int_{u/4}^{4u} \int_X \frac{1}{V(y,u)} \left( 1 + \frac{d(y,z)}{u} \right)^{-N} |\psi(s\sqrt{L})f(z)| d\mu(z) \frac{ds}{s}
\]

\[
\lesssim \int_{u/4}^{4u} \int_X \frac{1}{V(y,s)} \left( 1 + \frac{d(y,z)}{s} \right)^{-N} \left( \frac{s}{u} \right)^N |\psi(s\sqrt{L})f(z)| d\mu(z) \frac{ds}{s}.
\]

If \( r \in [1, \infty) \), then using (28) for \( A + N \), where \( A > n \), together with Hölder’s inequality and Lemma 2.2 we obtain (26).
We now consider the case $r \in (0, 1)$. For each $x \in X$ and $t > 0$ we define
\[
\psi_N^*(t\sqrt{L})f(x) = \sup_{y \in X} \sup_{s > 0} \frac{|\psi(s\sqrt{L})f(y)|}{s^N} \left(1 + \frac{d(x, y)}{s}\right)^N \frac{s^N}{t^N}.
\]
Note that by Lemma 2.6 (28) holds with $V(y, s)$ replaced by $V(z, s)$. It follows that
\[
|\psi(u\sqrt{L})f(y)| \left(1 + \frac{d(x, y)}{u}\right)^{-N} \left(\frac{u^N}{t^N}\right)^N \leq \int_{u/4}^{4u} \int_X \frac{1}{V(z, s)} \left(1 + \frac{d(y, z)}{s}\right)^{-N} \left(1 + \frac{d(x, y)}{u}\right)^{-N} \left(\frac{u^N}{t^N}\right)^N |\psi(s\sqrt{L})f(z)|d\mu(z) \frac{ds}{s}.
\]
By (19), there exists $N_f > 0$ such that $\psi_N^*(t\sqrt{L})f(x) < \infty$ for all $N \geq N_f$ and $x \in X$. For any such $N$, taking the supremum over $u > 0$ and $y \in X$ in the left-hand side of (29) we obtain
\[
\psi_N^*(t\sqrt{L})f(x)^r \leq C(f, N) \int_{u/4}^{4u} \int_X \frac{1}{V(z, s)} \left(1 + \frac{d(y, z)}{s}\right)^{-N} \left(\frac{s^N}{t^N}\right)^N |\psi(s\sqrt{L})f(z)| \frac{d\mu(z)}{ds}.
\]
Consequently,
\[
|\psi(t\sqrt{L})f(x)|^r \leq C(f, N) \int_0^\infty \int_X \frac{1}{V(z, s)} \left(1 + \frac{d(y, z)}{s}\right)^{-N} \left(\frac{s^N}{t^N}\right)^N |\psi(s\sqrt{L})f(z)| \frac{d\mu(z)}{ds}.
\]
Since the integral on the right hand side of the above gets larger when $N$ gets smaller, (30) holds true for all $N > 0$ and all $x \in X$. It follows that
\[
|\psi(u\sqrt{L})f(y)|^r \leq C(f, N) \int_0^\infty \int_X \frac{1}{V(z, s)} \left(1 + \frac{d(y, z)}{s}\right)^{-2N} \left(\frac{s^N}{u^N}\right)^{2N} |\psi(s\sqrt{L})f(z)| \frac{d\mu(z)}{ds}.
\]
for all $N > 0$, $u > 0$ and $y \in X$.

Using the obvious inequalities
\[
\left(\frac{u}{t} \wedge \frac{t}{u}\right)^Ar \leq \left(\frac{s}{t} \wedge \frac{t}{s}\right)^{Ar}
\]
and
\[
\left(1 + \frac{d(y, z)}{s}\right)^{-Ar} \left(1 + \frac{d(x, y)}{u}\right)^{-Ar} \left(\frac{s}{u} \wedge \frac{u}{s}\right)^{Ar} \leq \left(1 + \frac{d(x, z)}{s}\right)^{-Ar}\),
\]
where $A = N + \bar{n}/r$, we obtain
\[
\frac{|\psi(u\sqrt{L})f(y)|^r}{\left(1 + \frac{d(x, y)}{u}\right)^{Ar}} \left(\frac{u}{t} \wedge \frac{t}{u}\right)^{Ar} \leq C(f, N, r) \int_0^\infty \int_X \frac{1}{V(z, s)} \left(1 + \frac{d(y, z)}{s}\right)^{-Ar} \left(\frac{s}{t} \wedge \frac{t}{s}\right)^{Ar} |\psi(s\sqrt{L})f(z)| \frac{d\mu(z)}{ds}.
\]
Proof. Where \( f \) for all \( (33) \) shows that we also have \( (32) \).

Remark 2.15. Actually we have proved a stronger statement:

Proposition 2.16. Let \( \psi \) and \( \lambda > 0 \) be a partition of unity. Then for any \( \lambda > 0 \) and \( j \in \mathbb{Z} \) we have

\[
\psi_{\lambda,k}(x,y) = \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad x \in X,
\]

where \( \varphi_j(\lambda) = \varphi(2^{-j}\lambda) \).

For \( \lambda > 0 \) and \( \varphi \in \mathcal{S}(\mathbb{R}) \) the Peetre’s type maximal function is defined, for \( f \in \mathcal{S}' \), by

\[
\varphi_{\lambda,j}(\sqrt{L})f(x) = \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad x \in X,
\]

where \( \varphi_j(\lambda) = \varphi(2^{-j}\lambda) \).

As we have showed that for all \( N > 0 \) and \( f \) in \( \mathcal{S}'_\infty \), the constant in the inequality depends on \( N \) and \( r \) (but independent of \( f \)). On the other hand, if this integral is infinite, then \( (26) \) holds trivially. Thus we have proved \( (26) \) for all \( N > 0 \).

\[ \square \]

\[ \text{Remark 2.15. Actually we have proved a stronger statement:} \]

\[ (32) \]

\[ \psi_{N+\frac{\alpha}{r}}(x,y) \leq C_{N,r} \int_0^\infty \int_X \frac{1}{(1 + 2^jd(x,y))^{\lambda}} \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad x \in X, \quad t > 0. \]

Moreover, a close inspection of the proof of the lemma shows that we also have

\[ (33) \]

\[ \psi_{N+\frac{\alpha}{r}}(x,y) \leq C_{N,r} \int_0^\infty \int_X \frac{1}{(1 + 2^jd(x,y))^{\lambda}} \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad x \in X, \quad t > 0. \]

For \( \lambda > 0 \) and \( \varphi \in \mathcal{S}(\mathbb{R}) \) the Peetre’s type maximal function is defined, for \( f \in \mathcal{S}' \), by

\[ (34) \]

\[ \varphi_{\lambda,j}(\sqrt{L})f(x) = \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad x \in X, \]

where \( \varphi_j(\lambda) = \varphi(2^{-j}\lambda) \).

For \( \lambda > 0 \) and \( j \in \mathbb{Z} \) we set

\[ (35) \]

\[ \varphi_{\lambda,j}(\sqrt{L})f(x) = \sup_{y \in X} \frac{|\varphi_j(\sqrt{L})f(y)|}{(1 + 2^jd(x,y))^{\lambda}}, \quad f \in \mathcal{S}'. \]

We note that in the particular case when \( \varphi \) is supported in \( (0, \infty) \), these maximal functions can be defined for \( f \in \mathcal{S}'_\infty \) via \( (18) \).

Due to \( (19) \), \( \varphi_{\lambda,j}(s\sqrt{L})f(x) \) for all \( x \in X \), provided that \( \lambda \) is sufficiently large.

Proposition 2.16. Let \( \psi \in \mathcal{S}(\mathbb{R}) \) with \( \text{supp} \psi \subset [1/2, 2] \) and \( \varphi \in \mathcal{S}(\mathbb{R}) \) be a partition of unity. Then for any \( \lambda > 0 \) and \( j \in \mathbb{Z} \) we have

\[ (36) \]

\[ \sup_{s \in [2^{-j-1},2^{-j}]} \psi_{\lambda,j}(s\sqrt{L})f(x) \leq \sum_{k=j-2}^{j+3} \varphi_{\lambda,k}(\sqrt{L})f(x), \]

for all \( f \in \mathcal{S}'_\infty \) and \( x \in X \).

Proof. Fix \( j \in \mathbb{Z} \) and \( s \in [2^{-j-1},2^{-j}] \). First note that

\[ \psi(s\sqrt{L}) = \sum_{k=j-2}^{j+3} \psi(s\sqrt{L})\varphi_k(\sqrt{L}). \]
Since $2^{-j} \sim s$, by Lemma 2.6 we have, for $y \in X$ and $N > n$,

$$\left| \psi(s\sqrt{L})f(y) \right| \leq \sum_{k=j-2}^{j+3} \left| \psi(s\sqrt{L})\varphi_k(\sqrt{L})f(y) \right|$$

(37)

$$\lesssim \sum_{k=j-2}^{j+3} \int_X \frac{1}{V(y, 2^{-j})} (1 + 2^j d(y, z))^{-N-\lambda} \left| \varphi_k(\sqrt{L})f(z) \right| d\mu(z).$$

It follows that

(38)

$$\frac{\left| \psi(s\sqrt{L})f(y) \right|}{(1 + d(x, y)/s)^{\lambda}} \lesssim \sum_{k=j-2}^{j+3} \int_X \frac{1}{V(y, 2^{-j})} (1 + 2^j d(y, z))^{-N} \left| \varphi_k(\sqrt{L})f(z) \right| (1 + 2^\lambda d(x, y))^\lambda d\mu(z)$$

$$\lesssim \sum_{k=j-2}^{j+3} \int_X \frac{1}{V(y, 2^{-j})} (1 + 2^j d(y, z))^{-N} \left| \varphi_k(\sqrt{L})f(z) \right| (1 + 2^j d(x, z))^\lambda d\mu(z).$$

Using the fact that $2^k \sim 2^j$, we obtain

(39)

$$\frac{\left| \psi(s\sqrt{L})f(y) \right|}{(1 + d(x, y)/s)^{\lambda}} \lesssim \sum_{k=j-2}^{j+3} \left( \varphi_k(\sqrt{L})f(x) \int_X \frac{1}{V(y, 2^{-j})} (1 + 2^j d(y, z))^{-N} d\mu(z) \right)$$

$$\lesssim \sum_{k=j-2}^{j+3} \varphi_k(\sqrt{L})f(x),$$

where in the last inequality we use Lemma 2.2. Taking the supremum over $y \in X$, we derive (36). \qed

\textbf{Proposition 2.17.} Let $\psi$ be a partition of unity. Then for any $\lambda, s > 0$ and $r > 0$ we have:

(40)

$$\psi^*_\lambda(s\sqrt{L})f(x) \lesssim \left[ \int_X \frac{1}{V(z, s)} (1 + d(x, z)/s)^\lambda d\mu(z) \right]^{1/r},$$

(41)

$$\psi^*_{\lambda + \tilde{n}/r}(s\sqrt{L})f(x) \lesssim \left[ \int_X \frac{1}{V(x, s)} (1 + d(x, z)/s)^\lambda d\mu(z) \right]^{1/r}$$

for all $f \in S'_{\infty}$ and $x \in X$.

\textbf{Proof.} We start with the proof of (41). Similarly to (27), we have

(42)

$$\psi(s\sqrt{L})f = c_\psi \int_{s/4}^{4s} \psi(u\sqrt{L})\psi(s\sqrt{L})f \frac{du}{u}.$$
If \( r \in (0,1) \), then using Lemma 2.6 and the fact \( u \sim s \), we see that, for \( \lambda > 0 \) and \( x, y \in X \),

\[
\frac{|\psi(s\sqrt{L})f(y)|}{(1 + d(x,y)/s)^\lambda} \lesssim \int_X \frac{1}{V(z,s)} \left( 1 + \frac{d(y,z)}{s} \right)^{-\lambda} \frac{|\psi(s\sqrt{L})f(z)|}{(1 + d(x,y)/s)^\lambda} d\mu(z)
\]

\[
\lesssim \int_X \frac{1}{V(z,s)} \frac{|\psi(s\sqrt{L})f(z)|}{(1 + d(x,z)/s)^\lambda} d\mu(z)
\]

\[
\lesssim |\psi^\ast(s\sqrt{L})f(x)|^{1-r} \int_X \frac{1}{V(z,s)} \frac{|\psi(s\sqrt{L})f(z)|^r}{(1 + d(x,z)/s)^\lambda} d\mu(z).
\]

By (19) there exists \( \lambda_f > 0 \) such that \( \psi^\ast(s\sqrt{L})f(x) < \infty \) for all \( \lambda \geq \lambda_f, s > 0 \) and \( x \in X \). Using a bootstrap argument similarly to the proof of Lemma 2.14 (see (32)), in which (29) is replaced by the above inequality, we deduce the required inequality (41) in this case. We omit the details.

On the other hand, if \( r \geq 1 \), we similarly have

\[
\frac{|\psi(s\sqrt{L})f(y)|}{(1 + d(x,y)/s)^{\lambda + \frac{n}{r}}} \lesssim \int_X \frac{1}{V(z,s)} (1 + \frac{d(y,z)}{s})^{-n - \lambda + \frac{n}{r}} \frac{|\psi(s\sqrt{L})f(z)|}{(1 + d(x,y)/s)^{\lambda + \frac{n}{r}}} d\mu(z)
\]

\[
\lesssim \int_X \frac{1}{V(z,s)} (1 + \frac{d(y,z)}{s})^{-n} \frac{|\psi(s\sqrt{L})f(z)|}{(1 + d(x,z)/s)^{\lambda + \frac{n}{r}}} d\mu(z).
\]

We now apply Hölder’s inequality, Lemma 2.2 and (3) to deduce that

\[
\frac{|\psi(s\sqrt{L})f(y)|}{(1 + d(x,y)/s)^{\lambda + \frac{n}{r}}} \lesssim \left[ \int_X \frac{1}{V(z,s)} \frac{|\psi(s\sqrt{L})f(z)|^r}{(1 + d(x,z)/s)^{\lambda r + n}} d\mu(z) \right]^{1/r}
\]

\[
\lesssim \left[ \int_X \frac{1}{V(z,s)} \frac{|\psi(s\sqrt{L})f(z)|^r}{(1 + d(x,z)/s)^{\lambda r}} d\mu(z) \right]^{1/r}.
\]

This implies the required inequality (41) when \( r > 1 \).

The proof of (40) can be done in a similar fashion, but slightly simpler, where (3) is not used. \( \square \)

**Proposition 2.18.** Let \( \psi \) be a partition of unity and \( \varphi \in \mathcal{S}^o(\mathbb{R}) \) be an even function such that \( \varphi \neq 0 \) on \([1/2, 2]\). Then for any \( \lambda > 0, j \in \mathbb{Z} \) and \( r > 0 \) we have

\[
|\psi_j(\sqrt{L})f(x)| \lesssim \left( \int_{2^{-j-2}}^{2^{-j+2}} |\varphi^\ast(s\sqrt{L})f(x)|^r \frac{ds}{s} \right)^{1/r}
\]

for every \( f \in S' \).

**Proof.** Since \( \varphi \neq 0 \) on \([1/2, 2]\), there exists \( \phi \in \mathcal{S}^o(\mathbb{R}) \) supported in \([1/2, 2]\) so that

\[
c_{\varphi,\phi} = \int_0^\infty \varphi(\xi)\phi(\xi) \frac{d\xi}{\xi} \neq 0.
\]

It follows that, for each \( j \in \mathbb{Z} \),

\[
\psi_j(\sqrt{L})f = c_{\varphi,\phi}^{-1} \int_0^\infty \varphi(t\sqrt{L})\phi(t\sqrt{L})\psi_j(\sqrt{L})f(t) \frac{dt}{t}
\]

\[
= c_{\varphi,\phi}^{-1} \int_{2^{-j-2}}^{2^{-j+2}} \varphi(t\sqrt{L})\phi(t\sqrt{L})\psi_j(\sqrt{L})f(t) \frac{dt}{t}.
\]

Hence, for any \( r > 0 \),

\[
|\psi_j(\sqrt{L})f(x)|^r \lesssim \sup_{t \in [2^{-j-2}, 2^{-j+2}]} |\varphi(t\sqrt{L})\phi(t\sqrt{L})\psi_j(\sqrt{L})f(x)|^r
\]

\[
\lesssim |\varphi(\xi)\phi(\xi)| \int_0^\infty |\varphi(t\sqrt{L})\phi(t\sqrt{L})\psi_j(\sqrt{L})f(t)| \frac{dt}{t}
\]

\[
\lesssim \left( \int_{2^{-j-2}}^{2^{-j+2}} |\varphi^\ast(s\sqrt{L})f(x)|^r \frac{ds}{s} \right)^{1/r}.
\]
Fix \( t \in [2^{-j-2}, 2^{-j+2}] \). By Lemma 2.14 and the fact that \( \text{supp } \phi \subset [1/2, 2] \), we have, for \( \lambda > 0 \),
\[
|\phi(t\sqrt{L})\varphi(t\sqrt{L})|\psi_j(\sqrt{L})f(x)|^r \leq \int_{j-2}^{j+2} \int_X \frac{1}{V(x,s)} \left( 1 + \frac{d(x,y)}{s} \right)^{-\lambda} |\phi(s\sqrt{L})\varphi(s\sqrt{L})\psi_j(\sqrt{L})f(y)|^r \, d\mu(y) \, \frac{ds}{s}
\]
\[
\leq \int_{j-2}^{j+2} \int_X \frac{1}{V(x,s)} \left( 1 + \frac{d(x,y)}{s} \right)^{-\lambda} |\phi(s\sqrt{L})\varphi(s\sqrt{L})\psi_j(\sqrt{L})f(y)|^r \, d\mu(y) \, \frac{ds}{s}.
\]

This and (44) yield (43).

3. Besov and Triebel–Lizorkin spaces associated to \( L \): Properties and Characterizations

3.1. Definitions of Besov and Triebel–Lizorkin spaces associated to \( L \).

**Definition 3.1.** Let \( \psi \) be a partition of unity. For \( 0 < p, q < \infty \), \( \alpha \in \mathbb{R} \) and \( w \in A_\infty \), we define the weighted homogeneous Besov space \( \dot{B}^{\alpha, w}_{p,q} (X) \) as follows
\[
\dot{B}^{\alpha, w}_{p,q} (X) = \{ f \in \dot{S}': \|f\|_{\dot{B}^{\alpha, w}_{p,q} (X)} < \infty \},
\]
where
\[
\|f\|_{\dot{B}^{\alpha, w}_{p,q} (X)} = \left\{ \sum_{j \in \mathbb{Z}} (2^j \|\psi_j(\sqrt{L})f\|_{p,w})^q \right\}^{1/q}.
\]

Similarly, for \( 0 < p < \infty \), \( 0 < q < \infty \), \( \alpha \in \mathbb{R} \) and \( w \in A_\infty \), the weighted homogeneous Triebel-Lizorkin space \( \dot{F}^{\alpha, w}_{p,q} (X) \) is defined by
\[
\dot{F}^{\alpha, w}_{p,q} (X) = \{ f \in \dot{S}': \|f\|_{\dot{F}^{\alpha, w}_{p,q} (X)} < \infty \},
\]
where
\[
\|f\|_{\dot{F}^{\alpha, w}_{p,q} (X)} = \left\{ \left( \sum_{j \in \mathbb{Z}} (2^j \|\psi_j(\sqrt{L})f\|)^q \right)^{1/q} \right\}^{1/q}_{p,w}.
\]

We now claim that \( \psi_j(\sqrt{L})f = 0 \) for all \( j \in \mathbb{Z} \) if and only if \( f \in \mathcal{P} \). Indeed, since \( \mathcal{P} = \cup_{m \in \mathbb{N}} \mathcal{P}_m \), it is obvious that if \( f \in \mathcal{P} \) then \( \psi_j(\sqrt{L})f = 0 \) for all \( j \).

For the reverse direction, we assume that \( \psi_j(\sqrt{L})f = 0 \) for all \( j \in \mathbb{Z} \). Since \( f \in \dot{S}' = \dot{S}'/\mathcal{P} \), we have \( f = f_{\mathcal{S}'} + f_{\mathcal{P}} \) for some \( f_{\mathcal{S}'} \in \dot{S}' \) and \( f_{\mathcal{P}} \in \mathcal{P} \). It follows that, for every \( j \in \mathbb{Z} \),
\[
\psi_j(\sqrt{L})f = \psi_j(\sqrt{L})f_{\mathcal{S}'} + \psi_j(\sqrt{L})f_{\mathcal{P}} = \psi_j(\sqrt{L})f_{\mathcal{S}'}.
\]
Therefore,
\[ \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f = \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f_{S'} \]
which implies
\[ \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f_{S'} = 0. \]
On the other hand, arguing similarly to the proof of Proposition 2.11, we can find \( \rho \in \mathcal{P} \) such that
\[ \sum_{j \in \mathbb{Z}} \psi_j(\sqrt{L})f_{S'} = f_{S'} - \rho \quad \text{in } S'. \]
From the last two identities we obtain \( f_{S'} = \rho \in \mathcal{P} \) and hence \( f \in \mathcal{P} \). The statement is proved.

Note that like the classical case, the Triebel-Lizorkin spaces for \( p = \infty \) would be defined in a different way. See Subsection 3.5.

From Proposition 2.16 we have:

**Proposition 3.2.** Let \( \psi, \varphi \) be partitions of unity and assume \( \text{supp } \psi, \text{supp } \varphi \subset [1/2, 2] \). Let \( w \in A_{\infty}, \alpha \in \mathbb{R} \) and \( \lambda > 0 \). Then the following norm equivalence holds: For all \( f \in S'_{\infty} \)
(a) \[ \left\{ \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} \| \varphi_{j,\lambda}(\sqrt{L})f \|_{p,w} \right)^q \right\}^{1/q} \sim \left\{ \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} \| \psi_{j,\lambda}(\sqrt{L})f \|_{p,w} \right)^q \right\}^{1/q}, \quad 0 < p, q \leq \infty; \]
(b) \[ \left\| \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} |\psi_{j,\lambda}(\sqrt{L})f|^q \right)^{1/q} \right\|_{p,w} \sim \left\| \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} |\varphi_{j,\lambda}(\sqrt{L})f|^q \right)^{1/q} \right\|_{p,w}, \quad 0 < p < \infty, 0 < q \leq \infty. \]

We next prove the following result.

**Proposition 3.3.** Let \( \psi \) be a partition of unity. Then we have:
(a) For \( 0 < p, q \leq \infty, \alpha \in \mathbb{R} \) and \( \lambda > nq_w/p \),
\[ \left\{ \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} \| \psi_{j,\lambda}(\sqrt{L})f \|_{p,w} \right)^q \right\}^{1/q} \sim \|f\|_{B^\alpha_{p,q,w} L(X)}. \]
(b) For \( 0 < p < \infty, \alpha \in \mathbb{R} \) and \( \lambda > \max\{n/q, nq_w/p\} \),
\[ \left\| \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} |\psi_{j,\lambda}(\sqrt{L})f|^q \right)^{1/q} \right\|_{p,w} \sim \|f\|_{F^\alpha_{p,q,w} L(X)}. \]

**Proof.** We will provide the proof for (b), since the proof of (a) is similar and even easier.

Observe that from Proposition 3.2 it suffices to prove that
\[ \left( \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} |\psi_{j,\lambda}(\sqrt{L})f|^q \right)^{1/q} \right)^{1/q} \leq \left( \sum_{j \in \mathbb{Z}} \left( 2^{j\alpha} |\psi_{j}(\sqrt{L})f|^q \right)^{1/q} \right)^{1/q}. \]
Indeed, taking \( r < \min\{p, q, p/qw\} = \min\{q, p/w\} \) so that \( \lambda > n/r \) and \( w \in A_{p/r} \), then applying (40) we have
\[ \psi_{j,\lambda}(\sqrt{L})f(x) \lesssim \left[ \int_X \frac{1}{V(z, 2^{-j})} \frac{|\psi_{j}(\sqrt{L})f(z)|^r}{(1 + 2r d(x, z))^{n/r}} d\mu(z) \right]^{1/r} \lesssim \mathcal{M}_r(|\psi_{j}(\sqrt{L})f|)(x), \]
where we use Lemma 2.2 in the last inequality. The desired inequality (45) then follows by using the weighted Fefferman-Stein maximal inequality (8). \( \square \)
As a consequence of Proposition 3.2 and Proposition 3.3, we obtain the following theorem.

**Theorem 3.4.** Let $\psi$ and $\varphi$ be partitions of unity. Then following statements hold:

(a) The spaces $\dot{B}^{\alpha,\psi,p,q}_p(X)$ and $\dot{B}^{\alpha,\varphi,p,q}_p(X)$ coincide with equivalent norms for all $0 < p, q \leq \infty$, $\alpha \in \mathbb{R}$ and $\psi \in A_\infty$.

(b) The spaces $\dot{F}^{\alpha,\psi,p,q}_p(X)$ and $\dot{F}^{\alpha,\varphi,p,q}_p(X)$ coincide with equivalent norms for all $0 < p < \infty$, $0 < q \leq \infty$, $\alpha \in \mathbb{R}$ and $\psi \in A_\infty$.

For this reason, we define the spaces $\dot{B}^{\alpha,\psi,p,q}_p(X)$ and $\dot{F}^{\alpha,\psi,p,q}_p(X)$ to be any spaces $\dot{B}^{\alpha,\psi,p,q}_p(X)$ and $\dot{F}^{\alpha,\psi,p,q}_p(X)$ with any partitions of unity $\psi$, respectively.

It is routine to show that the spaces $\dot{B}^{\alpha,\psi,p,q}_p(X)$ and $\dot{F}^{\alpha,\psi,p,q}_p(X)$ are complete, and each is continuously embedded into $\mathcal{S}_\infty'$. We omit the details.

### 3.2. Continuous characterizations by functions with compact supports.

In this section, we will prove continuous characterizations for new Besov and Triebel–Lizorkin spaces including those using Lusin functions and the Littlewood-Paley functions.

**Theorem 3.5.** Let $\psi$ be a partition of unity. Then we have:

(a) For $w \in A_\infty$, $0 < p, q \leq \infty$, $\alpha \in \mathbb{R}$ and $\lambda > \frac{nq_w}{p}$,

\[
\|f\|_{\dot{B}^{\alpha,\psi,p,q}_p} \sim \left( \int_0^\infty \left[ t^{-\alpha} \| \psi(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q} \sim \left( \int_0^\infty \left[ t^{-\alpha} \| \hat{\psi}(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q}
\]

for all $f \in \mathcal{S}_\infty'$.

(b) For $w \in A_\infty$, $0 < p < \infty$, $0 < q \leq \infty$, $\alpha \in \mathbb{R}$, and $\lambda > \max\{n/q, nq_w/p\}$,

\[
\|f\|_{\dot{F}^{\alpha,\psi,p,q}_p} \sim \left( \int_0^\infty \left[ t^{-\alpha} \| \psi(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q} \sim \left( \int_0^\infty \left[ t^{-\alpha} \| \hat{\psi}(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q}
\]

for all $f \in \mathcal{S}_\infty'$.

**Proof.** We give the proof of (b) only, since the proof of (a) can be done in the same manner.

We divide the proof of (b) into three steps.

**Step 1:** We first prove that

\[
\|f\|_{\dot{F}^{\alpha,\psi,p,q}_p} \lesssim \left( \int_0^\infty \left[ t^{-\alpha} \| \psi(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q} \lesssim \|f\|_{\dot{F}^{\alpha,\psi,p,q}_p}.
\]

Indeed, for $t \in [2^{-j-1}, 2^{-j}]$ with $j \in \mathbb{Z}$, from (36), we see that

\[
\sup_{t \in [2^{-j-1}, 2^{-j}]} |\psi(t\sqrt{L})f(x)| \lesssim \sum_{k=j-2}^{j+3} \psi_{k,\lambda}(\sqrt{L})f(x).
\]

Hence, the estimate (48) follows from the above inequality and Proposition 3.2.

**Step 2:** We next show that

\[
\|f\|_{\dot{F}^{\alpha,\psi,p,q}_p} \lesssim \left( \int_0^\infty \left[ t^{-\alpha} \| \hat{\psi}(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q} \lesssim \|f\|_{\dot{F}^{\alpha,\psi,p,q}_p}.
\]

Using Proposition 2.18 we have

\[
|\hat{\psi}_j(\sqrt{L})f(x)| \lesssim \left( \int_{2^{-j-2}}^{2^{-j+2}} |\psi_{\lambda}(s\sqrt{L})f(x)| \frac{ds}{s} \right)^{1/q}.
\]

This implies the desired inequality (49).

**Step 3:** To complete the proof of the theorem, we need to prove that

\[
\left( \int_0^\infty \left[ t^{-\alpha} \| \hat{\psi}(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q} \lesssim \left( \int_0^\infty \left[ t^{-\alpha} \| \psi(t\sqrt{L})f \|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q}.
\]

To see this, taking $r < \min\{p, q, p/w\} = \min\{q, p/w\}$ so that $\lambda > n/r$ and $w \in A_{p/r}$, then applying (40) we have, for all $x \in [1, 2]$,

$$|\psi_s^\lambda(2^{-j}t\sqrt{L})f(x)|^r \lesssim \int_X \frac{1}{V(x, 2^{-j})} |\psi(2^{-j}t\sqrt{L})f(z)|^r \frac{1}{(1 + 2^jd(x, z))^\lambda r} dm(z).$$

Since $r < q$, we use Minkowski's inequality to get the bound:

$$\left( \int_1^2 |\psi_s^\lambda(2^{-j}t\sqrt{L})f(x)|^q \frac{dt}{t} \right)^{r/q} \lesssim \int_X \frac{1}{V(z, 2^{-j})} \left( \int_1^2 |\psi(2^{-j}t\sqrt{L})f(z)|^q \frac{dt}{t} \right)^{r/q} \frac{1}{(1 + 2^jd(x, z))^\lambda r} dm(z).$$

By a change of variables,

$$\left[ \int_{2^{-j}}^{2^{-j+1}} |t^{-\alpha}(\psi(t\sqrt{L})f(x))|^q \frac{dt}{t} \right]^{r/q} \lesssim \int_X \frac{1}{V(z, 2^{-j})} \left[ \int_{2^{-j}}^{2^{-j+1}} |(t^{-\alpha}\psi(t\sqrt{L})f(z))|^q \frac{dt}{t} \right]^{r/q} \frac{1}{(1 + 2^jd(x, z))^\lambda r} dm(z).$$

Hence, applying Lemma 2.2 we obtain

$$\left( \int_{2^{-j}}^{2^{-j+1}} |\psi_s^\lambda(t\sqrt{L})f(x)|^q \frac{dt}{t} \right)^{1/q} \lesssim \mathcal{M}_r \left( \int_{2^{-j}}^{2^{-j+1}} |\psi(t\sqrt{L})f|^q \frac{dt}{t} \right)^{1/q}(x)$$

as long as $\lambda r > n$. Using (8), we deduced the required estimate (50).

The proof of our theorem is thus complete. \qed

3.3. Continuous characterizations by functions in $\mathcal{S}_m(\mathbb{R})$. For each $m \in \mathbb{N}$ we denote by $\mathcal{S}_m(\mathbb{R})$ the set of all even functions $\varphi \in \mathcal{S}(\mathbb{R})$ such that $\varphi(\xi) = \xi^{2\alpha_0} \phi(\xi)$ for some $\phi \in \mathcal{S}(\mathbb{R})$, and $\varphi(\xi) \neq 0$ on $(-2, -1/2) \cup (1/2, 2)$.

We have the following characterization for the new Besov and Triebel-Lizorkin spaces via functions in $\mathcal{S}_m(\mathbb{R})$.

**Theorem 3.6.** Let $w \in A_{\infty}$, $\alpha \in \mathbb{R}$, $m > \alpha/2$ and let $\varphi \in \mathcal{S}_m(\mathbb{R})$. Then the following statements hold:

(a) For $0 < p, q \leq \infty$, $\lambda > n\lambda w/p$, and $f \in S'$ there exists $\rho \in \mathcal{P}$ so that

$$\left( \int_0^\infty \left| t^{-\alpha} \varphi_s^\lambda(t\sqrt{L})(f - \rho) \right|^{q^*} \frac{dt}{t} \right)^{1/q^*} \lesssim \left\| f \right\|_{p, q^*, w} \lesssim \left( \int_0^\infty \left| t^{-\alpha} \varphi(t\sqrt{L})f \right|^{q^*} \frac{dt}{t} \right)^{1/q^*}. \quad (51)$$

(b) For $0 < p < \infty$, $0 < q \leq \infty$, $\lambda > \max\{n/q, n\lambda w/p\}$, and $f \in S'$ there exists $\rho \in \mathcal{P}$ so that

$$\left\| \left( \int_0^\infty \left| t^{-\alpha} \varphi_s^\lambda(t\sqrt{L})(f - \rho) \right|^{q^*} \frac{dt}{t} \right)^{1/q^*} \right\|_{p, w} \lesssim \left\| f \right\|_{p, q^*, w} \lesssim \left\| \left( \int_0^\infty \left| t^{-\alpha} \varphi(t\sqrt{L})f \right|^{q^*} \frac{dt}{t} \right)^{1/q^*} \right\|_{p, w}. \quad (52)$$

**Proof.** In comparison with the proof of Theorem 3.5, the proof of Theorem 3.6 is much more difficult, due to the lack of compact support condition for the functions in $\mathcal{S}_m(\mathbb{R})$. A significant difference with Theorem 3.5 is that the results are formulated for $f \in S'$ (as opposed to $f \in S'_{\infty}$). The reason being that, as $K_{\varphi(t\sqrt{L})}(x, \cdot)$ may not be in $S_{\infty}$ for $\varphi \in \mathcal{S}_m(\mathbb{R})$, $\varphi(t\sqrt{L})f$ may not be defined when $f \in S'_{\infty}$. Although each $f \in S'_{\infty}$ has an extension to an element in $S'$, the extension is not unique; that is, $\varphi(t\sqrt{L})f$ will depend on the chosen representative of $f$. Our theorem says that there exists a representative so that the left-hand side inequality in (51) (or in (52)) holds.

We will prove (52) only, because the proof of (51) can be done in the same manner. We divide the proof into a number of steps.

**Step 1:** Let $\psi$ be a partition of unity. From Proposition 2.11, there exists $\rho \in \mathcal{P}$ so that

$$f - \rho = c_\psi \int_0^\infty \psi(s\sqrt{L})f \frac{ds}{s} \quad \text{in } S'.$$
We will show that
\begin{equation}
\| (\int_0^\infty \left[ t^{-\alpha} \varphi(t \sqrt{L})(f - \rho) \right]^{q \frac{dt}{T}} )^{1/q} \|_{p,w} \lesssim \| f \|_{L^{p,w}}.
\end{equation}

First note that the Calderón reproducing formula above implies the pointwise representation
\begin{equation}
\varphi(t \sqrt{L})(f - \rho) = c_\psi \int_0^\infty \varphi(t \sqrt{L}) \psi(s \sqrt{L}) \frac{ds}{s}
\end{equation}
for all $t > 0$.

Let $\lambda > 0$, $t \in [2^{-\nu-1}, 2^{-\nu}]$ for some $\nu \in \mathbb{Z}$ and $M > m + \lambda/2$. For simplicity of writing we let $c_\psi = 1$. We then have
\begin{align*}
\varphi(t \sqrt{L})(f - \rho) &= \int_0^\infty \psi(s \sqrt{L}) \varphi(t \sqrt{L}) \frac{ds}{s} \\
&= \sum_{j \geq \nu} \int_{2^{-j-1}}^{2^{-j}} \psi(s \sqrt{L}) \varphi(t \sqrt{L}) \frac{ds}{s} + \sum_{j < \nu} \int_{2^{-j-1}}^{2^{-j}} \psi(s \sqrt{L}) \varphi(t \sqrt{L}) \frac{ds}{s} \\
&= \sum_{j \geq \nu} \int_{2^{-j-1}}^{2^{-j}} \left( \frac{s}{t} \right)^{2M} (s^2 L)^{-M} \psi(s \sqrt{L}) (t^2 L)^M \varphi(t \sqrt{L}) \frac{ds}{s} \\
&\quad + \sum_{j < \nu} \int_{2^{-j-1}}^{2^{-j}} \left( \frac{t}{s} \right)^{2M} (s^2 L)^{-M} \varphi(t \sqrt{L}) \frac{ds}{s}.
\end{align*}

Setting $\tilde{\psi}_{s,M}(x) = x^{-2M} \psi(x)$ and $\tilde{\varphi}_{s,M}(x) = x^{2M} \varphi(x)$, we rewrite the above as
\begin{align*}
\varphi(t \sqrt{L})(f - \rho) &= \sum_{j \geq \nu} \int_{2^{-j-1}}^{2^{-j}} \left( \frac{s}{t} \right)^{2M} (t^2 L)^M \varphi(t \sqrt{L}) \tilde{\psi}_{s,M}(\sqrt{L}) \frac{ds}{s} \\
&\quad + \sum_{j < \nu} \int_{2^{-j-1}}^{2^{-j}} \left( \frac{t}{s} \right)^{2M} (t^2 L)^M \varphi(t \sqrt{L}) \tilde{\varphi}_{s,m}(\sqrt{L}) \frac{ds}{s}.
\end{align*}

Since $\xi^{2M} \varphi(\xi)$ is an even function in $\mathcal{S}(\mathbb{R})$, we use Lemma 2.6 to deduce that
\begin{equation}
| (t^2 L)^M \varphi(t \sqrt{L}) \psi_{s,N}(\sqrt{L}) f(z) | \lesssim \int_X \frac{1}{V(y,t)} \left( 1 + \frac{d(y,z)}{t} \right)^{-\lambda - \nu} | \psi_{s,N}(\sqrt{L}) f(z) | d\mu(z),
\end{equation}
where $N > n$.

It follows that
\begin{equation}
\frac{| (t^2 L)^M \varphi(t \sqrt{L}) \psi_{s,N}(\sqrt{L}) f(y) |}{(1 + d(x,y)/t)^\lambda} \lesssim \int_X \frac{1}{V(y,t)} \left( 1 + \frac{d(y,z)}{t} \right)^{-N} | \psi_{s,N}(\sqrt{L}) f(z) | (1 + d(x,z)/t)^\lambda d\mu(z)
\end{equation}
for all $x, y \in X$.

Hence, for $j \geq \nu$, $t \in [2^{-\nu-1}, 2^{-\nu}]$ and $s \in [2^{-j-1}, 2^{-j}]$ we have
\begin{align*}
\frac{| (t^2 L)^M \varphi(t \sqrt{L}) \psi_{s,N}(\sqrt{L}) f(y) |}{(1 + d(x,y)/t)^\lambda} &\lesssim 2^{\lambda(j-\nu)} \psi_{s,N}(\sqrt{L}) f(x) \int_X \frac{1}{V(y,t)} \left( 1 + \frac{d(y,z)}{t} \right)^{-N} d\mu(y) \\
&\lesssim 2^{\lambda(j-\nu)} \psi_{s,N}(\sqrt{L}) f(x).
\end{align*}

Since $\psi \in \mathcal{S}_m(\mathbb{R})$, $x^{-2M} \psi(x) \in \mathcal{S}(\mathbb{R})$. Using Lemma 2.6 and an argument similar to the above estimate for $\psi_{s,M}$, we obtain, for $j < \nu$, $t \in [2^{-\nu-1}, 2^{-\nu}]$ and $s \in [2^{-j-1}, 2^{-j}]$,
\begin{align*}
\frac{| (t^2 L)^{-m} \varphi(t \sqrt{L}) \tilde{\psi}_{s,m}(\sqrt{L}) f(y) |}{(1 + d(x,y)/t)^\lambda} &\lesssim \tilde{\psi}_{s,m}(\sqrt{L}) f(x).
\end{align*}
Combining the above two estimates we deduce that
\[
|\varphi^*_\lambda(t\sqrt{L})(f - \rho)| \leq \sum_{j \geq \nu} 2^{-(j-\nu)(2M-\lambda)} \sup_{s \in (2^{-j-1}, 2^{-j})} \psi^*_s,\lambda(\sqrt{L})f \\
+ \sum_{j < \nu} 2^{-2m(\nu-j)} \sup_{s \in (2^{-j-1}, 2^{-j})} \tilde{\psi}^*_s,\lambda,\nu,\lambda(\sqrt{L})f.
\]
This, along with Proposition 2.16, implies that
\[
|\varphi^*_\lambda(t\sqrt{L})(f - \rho)| \lesssim \sum_{j \geq \nu} 2^{-M} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f + \sum_{j < \nu} 2^{-2m(\nu-j)} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f
\]
(55)
for all \( t \in [2^{-\nu-1}, 2^{-\nu}] \) and \( M > m + \lambda/2 \).

Therefore, if \( q \leq 1 \), we have
\[
\int_{2^{-\nu-1}}^{2^{-\nu}} (t^{-\alpha}|\varphi^*_\lambda(t\sqrt{L})(f - \rho)|^q \frac{dt}{t} \lesssim \sum_{j \in \mathbb{Z}} 2^{-q(2m-\alpha)\nu-j} (2^{j\alpha} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f)^q.
\]
It follows that
\[
\left( \int_{0}^{\infty} (t^{-\alpha}|\varphi^*_\lambda(t\sqrt{L})(f - \rho)|^q \frac{dt}{t} \right)^{1/q} \lesssim \left( \sum_{j \in \mathbb{Z}} \sum_{j \in \mathbb{Z}} 2^{-q(2m-\alpha)\nu-j} (2^{j\alpha} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f)^q \right)^{1/q}
\]
\[
\lesssim \left( \sum_{j \in \mathbb{Z}} (2^{j\alpha} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f)^q \right)^{1/q},
\]
which, along with Proposition 3.3, yields (53).

On the other hand, if \( q > 1 \), then we use Young’s inequality to get the bound:
\[
\left( \int_{0}^{\infty} (t^{-\alpha}|\varphi^*_\lambda(t\sqrt{L})(f - \rho)|^q \frac{dt}{t} \right)^{1/q} \lesssim \left( \sum_{j \in \mathbb{Z}} \left[ \sum_{j \in \mathbb{Z}} 2^{-q(2m-\alpha)\nu-j} (2^{j\alpha} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f)^q \right] \right)^{1/q}
\]
\[
\lesssim \left( \sum_{j \in \mathbb{Z}} (2^{j\alpha} \psi^*_j,\lambda,\nu,\lambda(\sqrt{L})f)^q \right)^{1/q},
\]
Hence, (53) follows from this and Proposition 3.3.

**Step 2:** We next show that
\[
\|f\|_{\mathcal{E}_{\nu,\lambda,\nu,\lambda}^{\alpha,L}_{p,w}} \lesssim \left\| \left( \int_{0}^{\infty} \left[ t^{-\alpha}\varphi^*_\lambda(t\sqrt{L})f \right]^q \frac{dt}{t} \right)^{1/q} \right\|_{p,w}.
\]
Let \( \psi \) be a partition of unity. By Proposition 2.18,
\[
|\psi_j(\sqrt{L})f(x)|^q \lesssim \int_{2^{-j-2}}^{2^{-j+2}} |\varphi^*_\lambda(t\sqrt{L})f(x)|^q \frac{ds}{s}.
\]
Hence the desired inequality follows.

**Step 3:** This is the most elaborate step in the proof, where we will prove that
\[
\left\| \left( \int_{0}^{\infty} \left[ t^{-\alpha}\varphi^*_\lambda(t\sqrt{L})f \right]^q \frac{dt}{t} \right)^{1/q} \right\|_{p,w} \lesssim \left\| \left( \int_{0}^{\infty} \left[ t^{-\alpha}\varphi(t\sqrt{L})f \right]^q \frac{dt}{t} \right)^{1/q} \right\|_{p,w}.
\]
To this end, we apply Lemma 2.12 to find \( a, b, c > 0 \) and even functions \( \phi, \eta \in \mathcal{S}(\mathbb{R}) \) with \( \text{supp} \ \phi \subset [-a, a] \), \( \text{supp} \ \eta \subset [-c, -b] \cup [b, c] \), and so that for every \( \ell \in \mathbb{Z} \), \( t \in [1, 2] \) and \( f \in \mathcal{S}' \) we have
\[
f = \phi(2^{-\ell}t\sqrt{L})f + \sum_{k \geq 1} \frac{\phi(2^{-k-\ell}t\sqrt{L})\eta(2^{-k-\ell}t\sqrt{L})f}{s}.\]
This implies that
\[
\varphi(2^{-\ell}t\sqrt{L})f = \phi(2^{-\ell}t\sqrt{L})\varphi(2^{-\ell}t\sqrt{L})f + \sum_{k \geq 1} \varphi(2^{-k-\ell}t\sqrt{L})\eta(2^{-k-\ell}t\sqrt{L})\varphi(2^{-\ell}t\sqrt{L})f
\]
pointwise.

Let \( \lambda, A > 0 \). Put \( M = \lambda + A \). Using the above pointwise representation together with Lemma 2.6, we get
\[
|\varphi(2^{-\ell}t\sqrt{L})f(y)| \lesssim \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-\ell}t\sqrt{L})f(z)|d\mu(z)
+ \sum_{k \geq 1} 2^{-kM} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
= \sum_{k \geq \ell} 2^{-kM} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
= 2^{(j-\ell)M} \sum_{k \geq \ell} 2^{(j-k)M} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
\leq 2^{(j-\ell)M} \sum_{k \geq \ell} 2^{(j-k)M} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z),
\]
where \( j, \ell \in \mathbb{Z} \) and \( \ell \geq j \). It follows that, for any \( 0 < r \leq 1 \),
\[
2^{(j-\ell)M} |\varphi(2^{-\ell}t\sqrt{L})f(y)| \lesssim \sum_{k \geq \ell} 2^{(j-k)M} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
\leq \sum_{k \geq \ell} 2^{(j-k)M} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
\leq \sum_{k \geq \ell} 2^{(j-k)M} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
\leq \varphi_{A, \lambda}^{**}(2^{-j}t\sqrt{L})f(x)^{1-r} \sum_{k \geq j} 2^{(j-k)M r} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(y, z))^{-\lambda r}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z),
\]
where, for each \( j \in \mathbb{Z} \) and \( t \in [1, 2] \), we define the Peetre-type maximal function by
\[
\varphi_{A, \lambda}^{**}(2^{-j}t\sqrt{L})f(x) = \sup \sup_{k \geq j} \frac{|\varphi(2^{-k}t\sqrt{L})f(y)|}{(1 + 2^\ell d(y, x))^{\lambda}}.
\]

By (19), \( \varphi_{A, \lambda}^{**}(2^{-j}t\sqrt{L})f(x) < \infty \), for all sufficiently large \( \lambda \) (depending on \( f \)), all \( x \in X \) and \( A > 0 \). Hence, for any such \( \lambda \), by taking the supremum of the LHS of (56) over \( \ell \geq j \) and \( y \in X \), and using the obvious inequality \( 1 + 2^\ell d(x, z) \geq 2^\ell d(x, z) \) on the RHS, we obtain
\[
\varphi_{A, \lambda}^{**}(2^{-j}t\sqrt{L})f(x) \leq \sum_{k \geq j} 2^{(j-k)(M-\lambda)r} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(x, z))^{-\lambda r}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z)
= \sum_{k \geq j} 2^{(j-k)A r} \int_X \frac{1}{V(z, 2^{-\ell})}(1 + 2^\ell d(x, z))^{-\lambda r}|\varphi(2^{-(k-\ell)}t\sqrt{L})f(z)|d\mu(z) \quad (\text{as } M - \lambda = A).
\]
Since clearly \(|\varphi(\cdots)f| \leq \varphi_{A,\lambda}^*(\cdots)f\), the above implies that

\[
|\varphi(2^{-\ell}t\sqrt{L})f(y)|^r \lesssim \sum_{k \geq \ell} 2^{(k-\ell)r} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z)
\]

for all sufficiently large \(\lambda\), \(A > 0\), \(y \in X\) and \(\ell \in \mathbb{Z}\). But the right-hand side of the above inequality increases as \(\lambda\) decreases, and hence this inequality holds for all \(\lambda > 0\) and \(A > 0\), with the inequality constant also depending on \(f\). It follows that, for \(\ell \geq j\),

\[
2^{(j-\ell)Mr} \frac{|\varphi(2^{-\ell}t\sqrt{L})f(y)|^r}{(1 + 2^j d(x,y))^{\lambda r}} \lesssim \sum_{k \geq \ell} 2^{(j-k)Ar} \int_X \frac{2^{(j-k)\lambda r}}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(y,z))^{\lambda r} (1 + 2^k d(x,y))^{\lambda r} d\mu(z)
\]

\[
= \sum_{k \geq \ell} 2^{(j-k)Ar} \int_X \frac{2^{(j-k)\lambda r}}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(y,z))^{\lambda r} (2^{-k} + 2^k d(x,y))^{\lambda r} d\mu(z)
\]

\[
\leq \sum_{k \geq j} 2^{(j-k)(A-\lambda)r} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z).
\]

(Recall that \(M = \lambda + A\).) Taking the supremum over \(\ell \geq j\) and \(y \in X\) gives

\[
\varphi_{A,\lambda}^{**}(2^{-j}t\sqrt{L})f(x)^r \lesssim \sum_{k \geq j} 2^{(j-k)(A-\lambda)r} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z).
\]

Therefore, if the right-hand side of the above is finite, then \(\varphi_{A,\lambda}^{**}(2^{-j}t\sqrt{L})f(x) < \infty\). Repeating the proof of (57), we obtain

\[
\varphi_{A,\lambda}^{*}(2^{-j}t\sqrt{L})f(x)^r \lesssim \sum_{k \geq j} 2^{(j-k)Ar} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z)
\]

\[
\leq \sum_{k \geq j} 2^{(j-k)(A-\lambda)r} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z)
\]

(with inequality constant independent of \(f\)). Since clearly \(\varphi_{A,\lambda}^{*} \lesssim \varphi_{A,\lambda}^{**}\), it follows that

\[
\varphi_{A,\lambda}^{*}(2^{-j}t\sqrt{L})f(x)^r \lesssim \sum_{k \geq j} 2^{(j-k)(A-\lambda)r} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(x,z))^{\lambda r} d\mu(z),
\]

provided the sum in the right-hand side is finite. Since (58) is obviously true when this sum is infinite, we conclude that it holds for all \(\lambda > 0\), \(A > 0\), \(j \in \mathbb{Z}\), \(t \in [1,2]\), and \(0 < r \leq 1\).

Assume now that \(r > 1\). Let \(\lambda > 0\), \(A > 0\) and \(N > n\). Using the Calderón reproducing formula and Lemma 2.6 as at the beginning of this step, we see that, for any \(j \in \mathbb{Z}\), \(t \in [1,2]\) and \(y \in X\),

\[
|\varphi(2^{-j}t \sqrt{L})f(y)| \lesssim \sum_{k \geq j} 2^{(j-k)A} \int_X \frac{1 + 2^j d(y,z)}{V(z,2^{-j})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^N (1 + 2^k d(y,z))^{\lambda} d\mu(z)
\]

\[
\leq \left( \sum_{k \geq j} 2^{(j-k)Ar} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(y,z))^{\lambda r} d\mu(z) \right)^{1/r}
\]

\[
\leq \left( \sum_{k \geq j} 2^{(j-k)Ar} \int_X \frac{1}{V(z,2^{-k})} \left| \varphi(2^{-k}t \sqrt{L})f(z) \right|^r (1 + 2^k d(y,z))^{\lambda r} d\mu(z) \right)^{1/r}.
\]
where we have also used Lemma 2.2 and Hölder’s inequality in the second last inequality in the above. It follows that
\[
\frac{\lvert \varphi(2^{-j}t\sqrt{L}) f(y) \rvert^r}{(1 + 2^j d(x, y)/t)^{\lambda r}} \lesssim \sum_{k \geq j} 2^{(j-k) Ar} \int_X \frac{1}{V(z, 2^{-k}) (1 + 2d(y, z))^{\lambda r}} \left( \frac{1}{1 + 2d(x, y)} \right)^{\lambda r} d\mu(z)
\]
(59)
\[
\lesssim \sum_{k \geq j} 2^{(j-k) Ar} \int_X \frac{1}{V(z, 2^{-k})} \frac{1}{(1 + 2d(x, z))^{\lambda r}} d\mu(z)
\]
\[
\lesssim \sum_{k \geq j} 2^{(j-k)(A-\lambda) r} \int_X \frac{1}{V(z, 2^{-k})} \frac{1}{(1 + 2^k d(x, z))^{\lambda r}} d\mu(z).
\]
Taking the supremum of the LHS over all \( y \in X \), we deduce that (58) also holds for \( r > 1 \). Hence (58) holds for all \( r > 0 \). Consequently,
\[
\left[ (2^{-j}t)^{-\alpha} \varphi^*_\lambda(2^{-j}t\sqrt{L}) f(x) \right] \lesssim \sum_{k \geq j} 2^{(j-k)(A-\lambda+\alpha)r} \int_X \frac{1}{V(z, 2^{-k})} \left( \frac{(2^{-k}t)^{-\alpha} \varphi(2^{-k}t\sqrt{L}) f(z)}{(1 + 2^k d(x, z))^{\lambda r}} \right) d\mu(z).
\]
We now choose \( r > 0 \) such that \( \max\{n/p, n/q, nq_w/p\} = \max\{n/q, nq_w/p\} < n/r < \lambda \) and then choose \( A > 0 \) such that \( A - \lambda + \alpha > 0 \). Minkowski’s inequality and the above inequality then imply that
\[
\left( \int_{1}^{2^j} \left( (2^{-j}t)^{-\alpha} \varphi^*_\lambda(2^{-j}t\sqrt{L}) f(x) \right)^q \frac{dt}{t} \right)^{r/q} \lesssim \sum_{k \geq j} \int_X \frac{2^{(j-k)(A-\lambda+\alpha)r} \left( \int_{1}^{2^j} \left( (2^{-k}t)^{-\alpha} \varphi(2^{-k}t\sqrt{L}) f(z) \right)^q \frac{dt}{t} \right)^{r/q}}{(1 + 2^k d(x, z))^{\lambda r}} d\mu(z).
\]
By a change of variables, we get that
\[
\left( \int_{2^{-j+1}}^{2^{-j}} (t^{-\alpha} \varphi^*_\lambda(t\sqrt{L}) f(x)) \frac{dt}{t} \right)^{r/q} \lesssim \sum_{k \geq j} \int_X \frac{2^{(j-k)(A-\lambda+\alpha)r} \left( \int_{2^{-k+1}}^{2^{-k}} (t^{-\alpha} \varphi(t\sqrt{L}) f(z)) \frac{dt}{t} \right)^{r/q}}{(1 + 2^k d(x, z))^{\lambda r}} d\mu(z).
\]
Setting \( F_k = \left[ \int_{2^{-k+1}}^{2^{-k}} (t^{-\alpha} \varphi(t\sqrt{L}) f(z)) \frac{dt}{t} \right]^{1/q} \) and using Lemma 2.2, we deduce that
\[
\left( \int_{2^{-j+1}}^{2^{-j}} (t^{-\alpha} \varphi^*_\lambda(t\sqrt{L}) f(x)) \frac{dt}{t} \right)^{r/q} \lesssim \sum_{k \geq j} 2^{(j-k)(A-\lambda+\alpha)r} M_r(F_k)(x)^{r/q}
\]
\[
\lesssim \left[ \int_{2^{-j+1}}^{2^{-j}} (t^{-\alpha} \varphi(t\sqrt{L}) f(x)) \frac{dt}{t} \right]^{r/q},
\]
where in the last inequality we use Hölder’s inequality and the fact that \( A - \lambda + \alpha > 0 \). Hence, by applying (10), we obtain the desired estimate
\[
\left\| \left( \int_0^\infty (t^{-\alpha} \varphi(t\sqrt{L}) f) \frac{dt}{t} \right)^{p/w} \right\|_{p,w} \lesssim \left\| \left( \int_0^\infty (t^{-\alpha} \varphi(t\sqrt{L}) f) \frac{dt}{t} \right)^{r/q} \right\|_{p,w}.
\]
Combining the results in Step 1, Step 2 and Step 3, we complete the proof of the Theorem. □

Remark 3.7. (a) It is interesting to note that when \( L = -\Delta \) the Laplacian on \( \mathbb{R}^n \), \( \mathcal{P} \) is the set of all polynomials. In this situation, Theorem 3.6 are in line with findings in [13].
(b) The presence of the polynomial ρ in (51) and (52) can be omitted if f ∈ L^2. Indeed, in this case instead of (54) we have, by the spectral theory,
\[ \varphi(t \sqrt{L}) = c_0 \int_0^\infty \varphi(s \sqrt{L}) \psi(s \sqrt{L}) \frac{ds}{s} \text{ (in } L^2 \text{ and hence in } S'). \]

Arguing similarly to the proof of the first inequalities in (51) and (52) we get the desired estimates.

We denote Ψ_{m,t}(L) = (t^2 L)^m e^{-t^2 L} for t > 0 and m ∈ N. For λ > 0 we define
\[ \Psi_{m,t,\lambda}(L) f(x) = \sup_{y \in X} \frac{\|\Psi_{m,t}(L)f(y)\|}{(1 + d(x,y)/t)^\lambda} \]
for f ∈ S'.

Applying Theorem 3.6 and Remark 3.7 for ϕ(ξ) = ξ^{2m}e^{-ξ^2}, we have the following heat kernel characterizations for the new Besov and Triebel-Lizorkin spaces:

**Corollary 3.8.** Let w ∈ A_∞, α ∈ ℝ and m > α/2. Then we the following norm equivalences hold:

(a) For 0 < p, q ≤ ∞, λ > nqw/p, and f ∈ S' there exists ρ ∈ P so that
\[ \left( \int_0^\infty \left[ t^{-\alpha} \|\Psi_{m,t,\lambda}(L)(f - \rho)\|_{p,w} \right]^{q \frac{dt}{t}} \right)^{1/q} \leq \|f\|_{B^{\alpha,L}_{p,q}} \leq \left( \int_0^\infty \left[ t^{-\alpha} \|\Psi_{m,t,\lambda}(L)f\|_{p,w} \right]^{q \frac{dt}{t}} \right)^{1/q}. \]

(b) For 0 < p < 0, 0 < q ≤ ∞, λ > max\{n/q, nqw/p\}, and f ∈ S' there exists ρ ∈ P so that
\[ \left( \int_0^\infty \left[ t^{-\alpha} \|\Psi_{m,t,\lambda}(L)(f - \rho)\|_{p,w} \right]^{q \frac{dt}{t}} \right)^{1/q} \leq \|f\|_{B^{\alpha,L}_{p,q}} \leq \left( \int_0^\infty \left[ t^{-\alpha} \|\Psi_{m,t,\lambda}(L)f\|_{p,w} \right]^{q \frac{dt}{t}} \right)^{1/q}. \]

Moreover, if f ∈ L^2, ρ can be removed in (62) and (63).

**Remark 3.9.** Note that in [51, 40], the authors proved (62) for s ∈ ℝ, 1 ≤ p ≤ ∞, 0 < q ≤ ∞, and (63) for s ∈ ℝ, 1 < p < ∞, 1 < q ≤ ∞ for inhomogeneous and homogeneous Besov and Triebel-Lizorkin spaces under additional conditions of Hölder continuity and Markov property of the heat kernel p_t(x,y). Moreover, their results are formulated for distributions in S'_∞. Hence, Corollary 3.8 can be viewed as a significant extension of those results in [51, 40].

We end this subsection by a remark on an interesting extension of Theorem 3.6.

**Remark 3.10.** The non-degeneracy condition of the function ϕ in the definition of the class \( S_m(\mathbb{R}) \), ϕ(ξ) ≠ 0 on \((-2, -1/2) ∪ (1/2, 2)\), can be weakened to ϕ(λ) ≠ 0 for some λ > 0 (as ϕ is even, this implies also ϕ(−λ) ≠ 0). Then Theorem 3.6 holds under this weaker condition on ϕ.

The proof of this stronger result can be done by modifying the proof for Theorem 3.6 and using the following two observations:

(a) There exist a > 0, c > b > 0, and even functions ϕ, η ∈ \( S(\mathbb{R}) \), such that supp ϕ ⊂ [−a, a], supp η ⊂ [−c, −b] ∪ [b, c], and
\[ \phi(\lambda) + \int_1^\infty \varphi(s\lambda)\eta(s\lambda) \frac{ds}{s} = 1 \quad \forall \lambda \in \mathbb{R}. \]

See, for example [48, 58].

(b) Part (a) and an argument similar to the proof of Proposition 2.10 imply a Calderón reproducing formula
\[ f = \phi(t \sqrt{L})f + \int_1^\infty \varphi(ts \sqrt{L})\eta(ts \sqrt{L}) \frac{ds}{s} \text{ in } S', \]
for all f ∈ S' and all t > 0.

We leave the details to the interested reader, and also refer to [13, 14] for the proof in the classical case.
3.4. Characterizations for Triebel-Lizorkin spaces via Lusin functions and the Littlewood–Paley functions. For \( \alpha \in \mathbb{R}, \lambda, a > 0 \) and \( 0 < q < \infty \) we define the Lusin function and the Littlewood–Paley function by setting

\[
G_{\lambda,q}^\alpha F(x) = \left[ \int_0^\infty \int_X (t^{-\alpha}|F(y,t)|)^q \left( 1 + \frac{d(x,y)}{t} \right)^{-\lambda a} \frac{d\mu(y)dt}{tV(x,t)} \right]^{1/q}
\]

and

\[
S_{\alpha,q}^\alpha F(x) = \left[ \int_0^\infty \int_{d(x,y)<at} (t^{-\alpha}|F(y,t)|)^q \frac{d\mu(y)dt}{tV(x,t)} \right]^{1/q},
\]

respectively.

When either \( \alpha = 0 \) or \( a = 1 \) we will drop them in the notation of \( S_{\alpha,q}^\alpha \) and \( G_{\lambda,q}^\alpha \). We now have the following result regarding the estimates on the change of the angles for the function \( S_{\alpha,q}^\alpha \).

**Proposition 3.11.** Let \( a > 1, w \in A_r, 1 \leq r < \infty, 0 < q < \infty, \alpha \in \mathbb{R} \) and \( 0 < p < \infty \). Then there exists a constant \( C \) so that

\[
\|S_{\alpha,q}^\alpha F\|_{p,w} \leq C\alpha^\alpha \|S_q^\alpha F\|_{p,w}
\]

for all \( F \).

**Proof.** It suffices to prove the proposition for \( \alpha = 0 \) and \( q = 2 \), since in the general case of \( \alpha \) and \( q \) we set \( F(y,t) = (t^{-\alpha}|F(y,t)|)^{q/2} \) and then apply the result for the case \( \alpha = 0 \) and \( q = 2 \) we will get the desired estimate. In this situation, we can adapt the proof of [2, Theorem 1] to our setting easily. Hence we omit the details.

We need to give the proof for the case \( p \geq 2 \). Indeed, for a positive function \( g \in L_w^{(p/2)'} \) we have

\[
\langle |S_{\alpha,q}^\alpha f|^2, g \rangle_w := \int_X \int_0^\infty \int_{d(x,y)<at} \frac{d\mu(y)dt}{tV(x,t)} g(x)w(x) \frac{d\mu(y)dt}{tV(x,t)} g(x)w(x) d\mu(x)
\]

\[
\sim \int_X \int_0^\infty \int_{d(x,y)<at} \frac{d\mu(y)dt}{tV(x,t)} g(x)w(x) d\mu(x)
\]

\[
= \int_X \int_0^\infty |f(y,t)|^2 M_{at,w} g(y)w(B(y,at)) \frac{d\mu(y)dt}{tV(x,t)}
\]

where

\[
M_{at,w} g(y) = \frac{1}{w(B(y,at))} \int_{B(y,at)} g(x)w(x) d\mu(x).
\]

We now observe that

\[
\chi_B(y,at)(x) \leq \frac{c_n}{w(B(y,t))} \int_{B(y,t)} \chi_B(x,at)(z)w(z) d\mu(z).
\]

It follows

\[
\frac{1}{w(B(y,at))} \int_{B(y,at)} \chi_B(y,at)(x)g(x)w(x) d\mu(x)
\]

\[
\leq \frac{c_n}{w(B(y,t))} \int_{B(y,t)} \frac{1}{w(B(y,at))} \int_{B(y,at)} \chi_B(x,at)(z)g(x)w(x) d\mu(x) w(z) d\mu(z).
\]

Note that in this situation, we have \( d(y, z) \leq 3at \), and hence \( B(y,at) \subset B(z, 3at) \) and \( w(B(y,at)) \sim w(B(z, 3at)) \). As a consequence, we have

\[
\frac{1}{w(B(y,at))} \int_{B(y,at)} \chi_B(x,at)(z)g(x)w(x) d\mu(x) \lesssim \frac{1}{w(B(z, 3at))} \int_{B(z, 3at)} g(x)w(x) d\mu(x)
\]

\[
\lesssim M_w g(z).
\]

This implies that

\[
M_{at,w} g(y) \leq c_n M_{at,w}[M_w g](y).
\]
Hence,

\[
\langle |S_{a,q}f|^2, g \rangle_w \leq c_n \int_X \int_0^\infty |f(y,t)|^2 M_{1,w}[\mathcal{M}_w g](y)w(B(y,at)) \frac{d\mu(y)dt}{tV(y,t)} \quad \sim \quad c_n \int_X \int_0^\infty \int_{d(x,y)<t} |f(y,t)|^2 w(B(y,at)) \frac{d\mu(y)dt}{tV(y,t)} M_{w,g}(x)w(x)d\mu(x) \quad \sim \quad c_n a^{nr} \int_X \int_0^\infty \int_{d(x,y)<t} |f(y,t)|^2 \frac{d\mu(y)dt}{tV(y,t)} M_{w,g}(x)w(x)d\mu(x) \quad \sim \quad c_n a^{nr} \|S_{a,q}f\|^2_{\lambda,q,w} \leq c_n a^{nr} \|S_{a,q}f\|^2_{\lambda,q,w} \leq c_n a^{nr} \|S_{a,q}f\|^2_{\lambda,q,w} \leq c_n a^{nr} \|S_{a,q}f\|^2_{\lambda,q,w}.
\]

Taking the supremum over all \( g \in L^{(p/2)'} \) with \( \|g\|_{(p/2)',w} \leq 1 \) we obtain

\[\|S_{a,q}f\|_{p,w} \leq \sqrt{c_n a^{nr/2}} \|S_q f\|_{p,w}.\]

This completes our proof. \(\square\)

We have the following corollary.

**Corollary 3.12.** Let \( a \geq 1, w \in A_r, 1 \leq r < \infty, 0 < q < \infty, \alpha \in \mathbb{R} \) and \( 0 < p < \infty \). Then there exists a constant \( C \) so that

\[C^{-1} \|G_{\lambda,q}^\alpha F\|_{p,w} \leq \|S_{a,q} F\|_{p,w} \leq C \|G_{\lambda,q}^\alpha F\|_{p,w}\]

for all \( F \) provided that \( \lambda > \frac{nr}{p\omega q} \).

**Proof.** Due to Proposition 3.11, we need only to prove the corollary for \( a = 1 \).

Since \( S_{a,q} F \leq G_{\lambda,q}^\alpha F \) for any \( \lambda > 0 \), it suffices to prove that

\[\|G_{\lambda,q}^\alpha F\|_{p,w} \lesssim \|S_q F\|_{p,w}.
\]

Indeed, it is easy to see that

\[(G_{\lambda,q}^\alpha F)^q \leq \sum_{k \geq 0} 2^{-kq\lambda} [S_{2^k,q}^\alpha F]^q .
\]

Hence,

\[(G_{\lambda,q}^\alpha F)^p \leq \left[ \sum_{k \geq 0} 2^{-kq\lambda} [S_{2^k,q}^\alpha F]^q \right]^{p/q}.
\]

If \( p/q < 1 \), we then have

\[(G_{\lambda,q}^\alpha F)^p \leq \sum_{k \geq 0} 2^{-kp\lambda} [S_{2^k,q}^\alpha F]^p .
\]

This, along with Proposition 3.11, implies that

\[
\|G_{\lambda,q}^\alpha F\|_{p,w} \leq \sum_{k \geq 0} 2^{-kp\lambda} \|S_{2^k,q}^\alpha F\|^p_{p,w} \leq c \sum_{k \geq 0} 2^{-kp\lambda} 2^{knr} \|S_q F\|^p_{p,w} \lesssim \|S_q F\|^p_{p,w}
\]

as long as \( \lambda > nr/p \).

If \( p/q \geq 1 \), then from (66) we have

\[
\|[G_{\lambda,q}^\alpha F]^q\|_{p/q,w} \leq \sum_{k \geq 0} 2^{-kq\lambda} \|[S_{2^k,q}^\alpha F]^q\|_{p/q,w}.
\]
Applying Proposition 3.11, we get
\[
\|G_{\alpha}^\ast F\|_{p,w}^q \lesssim \sum_{k \geq 0} 2^{-(k+1)q\lambda} \|S_{\alpha, q}^k F\|_{p,w}^q
\]
provided \( \lambda > nr/q \).

This completes our proof of the corollary.

We have the following characterization.

**Proposition 3.13.** Let \( \psi \) be a partition of unity. Then for \( w \in A_\infty, 0 < p, q < \infty, \) and \( \alpha \in \mathbb{R}, \) we have
\[
\|f\|_{\dot{F}_{\alpha, L}^{0, \infty}} \lesssim \|G_{\alpha, q}^\ast (\psi(t\sqrt{L}) f)\|_{p,w} \lesssim \|S_{\alpha}^\ast (\psi(t\sqrt{L}) f)\|_{p,w}
\]
for all \( f \in S'_{\infty}, \) provided that \( \lambda > \frac{nq}{p} \land q \).

**Proof.** We first prove that
\[
\|S_{\alpha}^\ast (\psi(t\sqrt{L}) f)\|_{p,w} \lesssim \|f\|_{\dot{F}_{\alpha, L}^{0, \infty}}.
\]
First observe that
\[
|\psi(t\sqrt{L}) f(y)| \leq \left[ \int_0^\infty \int_{d(x,y) < t} (t^{-\alpha} |\psi(t\sqrt{L}) f(x)|)^q \frac{d\mu(y) d\mu(x)}{tV(x,t)} \right]^{1/q}
\]
This, along with Theorem 3.5, implies that
\[
\|S_{\alpha}^\ast (\psi(t\sqrt{L}) f)\|_{p,w} \lesssim \|f\|_{\dot{F}_{\alpha, L}^{0, \infty}}.
\]
Due to the above estimate and Corollary 3.12, it remains to show that
\[
\|f\|_{\dot{F}_{\alpha, L}^{0, \infty}} \lesssim \|G_{\alpha, q}^\ast (\psi(t\sqrt{L}) f)\|_{p,w}.
\]
By Proposition 2.17 we have
\[
|\psi(t\sqrt{L}) f(x)| \lesssim \left[ \int_X \frac{1}{V(x,t)} |\psi(t\sqrt{L}) f(z)|^q \frac{d\mu(z)}{1 + d(x, z)/t} \right]^{1/q}
\]
for all \( x \in X, \lambda > 0 \) and \( t > 0. \)

This implies that
\[
\left\| \left( \int_0^\infty (t^{-\alpha} |\psi(t\sqrt{L}) f)|^q \frac{d\mu(t)}{t} \right)^{1/q} \right\|_{p,w} \lesssim \|G_{\alpha, q}^\ast (\psi(t\sqrt{L}) f)\|_{p,w}.
\]
Using Theorem 3.5 we obtain the bound:
\[
\|f\|_{\dot{F}_{\alpha, L}^{0, \infty}} \lesssim \|G_{\alpha, q}^\ast (\psi(t\sqrt{L}) f)\|_{p,w}
\]
as desired.

We also have a similar square function characterization for the new Triebel-Lizorkin spaces via functions in \( \mathcal{S}_m(\mathbb{R}). \)
Proposition 3.14. Let \( w \in A_\infty \), 0 < \( p < \infty \), 0 < \( q < \infty \), \( \alpha \in \mathbb{R} \), \( \lambda > \frac{mq}{p+q} \) and \( \varphi \in \mathcal{S}_m(\mathbb{R}) \) with \( m > \alpha/2 \). Then for each \( f \in \mathcal{S}' \) there exists \( \rho \in \mathcal{P} \) such that
\[
\| \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})(f - \rho)) \|_{p,w} \sim \| \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})(f - \rho)) \|_{p,w}
\]
\[
\lesssim \| f \|_{F^\alpha_{\lambda,q,W}} \lesssim \| \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})f) \|_{p,w}.
\]
Moreover, the distribution \( \rho \) in the inequalities above can be removed if \( f \in L^2 \).

Proof. Arguing similarly to the proof of Proposition 3.13 and using Theorem 3.6 we show that
\[
\| \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})(f - \rho)) \|_{p,w} \lesssim \| f \|_{F^\alpha_{\lambda,q,W}}.
\]

It remains to prove that
\[
(67) \quad \| f \|_{F^\alpha_{\lambda,q,W}} \lesssim \| \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})f) \|_{p,w}.
\]

To do this, we divide into 2 cases.

If \( q \in (0,1] \), then applying (60) with \( \lambda \) replaced by \( \lambda + \bar{n}/q \), \( r = q \) and \( A - \lambda - \bar{n}/q + \alpha > 0 \), and using (3), we deduce that
\[
\sum_{j \in \mathbb{Z}} \int_{2^{-j}}^{2^{-j+1}} (t^{-\alpha}|\varphi(t\sqrt{L})f(x)|)^q \frac{dt}{t} \lesssim \sum_{j \in \mathbb{Z}} \sum_{k \in \mathbb{Z}} \int_{2^{-k}}^{2^{-k+1}} \int_X \frac{2^{-|k-j|(A-\lambda-\bar{n}/q+\alpha)}}{V(x,t)} \frac{|\varphi(t\sqrt{L})f(z)|^q}{(1 + |d(x,z)/t|)^{\lambda q}} d\mu(z) \frac{dt}{t}.
\]

Hence,
\[
\int_0^\infty (t^{-\alpha}|\varphi(t\sqrt{L})f(x)|)^q \frac{dt}{t} \lesssim \int_0^\infty \int_X \frac{1}{V(x,t)} \frac{|\varphi(t\sqrt{L})f(z)|^q}{(1 + |d(x,z)/t|)^{\lambda q}} d\mu(z) \frac{dt}{t}.
\]

As a consequence,
\[
\left[ \int_0^\infty (t^{-\alpha}|\varphi(t\sqrt{L})f(x)|^q \frac{dt}{t} \right]^{1/q} \lesssim \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L})f)(x).
\]

This, along with Theorem 3.6, yields (67).

If \( q > 1 \), then for a partition of unity function \( \psi \) we have
\[
f = c \int_0^\infty \psi(s\sqrt{L})\varphi(s\sqrt{L})f \frac{ds}{s} \quad \text{in} \quad \mathcal{S}'.
\]

It follows that, for each \( t > 0 \) and \( x \in X \),
\[
\psi(t\sqrt{L})f(x) = c \int_{t/4}^{4t} \psi(t\sqrt{L})\psi(s\sqrt{L})\varphi(s\sqrt{L})f(x) \frac{ds}{s}.
\]

Using Lemma 2.6, for \( \lambda > \frac{mq}{p+q} \), we see that
\[
|\psi(t\sqrt{L})f(x)| \lesssim \int_{t/4}^{4t} \int_X \frac{1}{V(x \vee y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda q |\varphi(s\sqrt{L})f(y)| d\mu(y) \frac{ds}{s}.
\]

Hölder’s inequality and Lemma 2.2 then imply that
\[
|\psi(t\sqrt{L})f(x)|^q \lesssim \int_{t/4}^{4t} \int_X \frac{1}{V(x \vee y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda q |\varphi(s\sqrt{L})f(y)|^q d\mu(y) \frac{ds}{s}\]
\[
\times \left[ \int_{t/4}^{4t} \int_X \frac{1}{V(x \vee y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda q d\mu(y) \frac{ds}{s} \right]^{\gamma q/q'}
\]
\[
\lesssim \int_{t/4}^{4t} \int_X \frac{1}{V(x \vee y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda q |\varphi(s\sqrt{L})f(y)|^q d\mu(y) \frac{ds}{s}.
\]
Consequently,
\[
\int_0^\infty (t^{-\alpha} |\psi(t\sqrt{L}) f(x)|)^q \frac{dt}{t} \leq \int_0^\infty \int_0^{t/4} \int_X \frac{1}{(x/y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda (s^{-\alpha} |\varphi(s\sqrt{L}) f(y)|)^q d\mu(y) \frac{ds \, dt}{s^t} \\
\leq \int_0^\infty \int_0^{t/4} \int_X \frac{1}{(x/y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda (s^{-\alpha} |\varphi(s\sqrt{L}) f(y)|)^q d\mu(y) \frac{ds \, dt}{s^t} \\
\leq \int_0^\infty \int_X \frac{1}{(x/y,s)} \left( \frac{s}{s + d(x,y)} \right)^\lambda (s^{-\alpha} |\varphi(s\sqrt{L}) f(y)|)^q d\mu(y) \frac{ds}{s} \\
\leq \mathcal{G}^\alpha_{\lambda,q}(\varphi(t\sqrt{L}) f(x))^q.
\]

This, along with Theorem 3.5, yields (67).

This completes our proof. \( \square \)

**Corollary 3.15.** Let \( w \in A_\infty \), \( 0 < p < \infty \), \( 0 < q < \infty \), \( \alpha \in \mathbb{R} \), \( \lambda > \frac{n w}{p q} \) and \( m > \alpha/2 \). Then for each \( f \in S' \) there exists \( \rho \in \mathcal{P} \) such that
\[
\| \mathcal{G}^\alpha_{\lambda,q} \left( \Psi_{m,t}(L)(f - \rho) \right) \|_{p,w} \sim \| S^\alpha_q \left( \Psi_{m,t}(L)(f - \rho) \right) \|_{p,w} \\
\leq \| f \|_{F^\alpha_{p,q},w} \leq \| \mathcal{G}^\alpha_{\lambda,q} \left( \Psi_{m,t}(L)f \right) \|_{p,w} \sim \| S^\alpha_q \left( \Psi_{m,t}(L)f \right) \|_{p,w}
\]
where \( \Psi_{m,t}(L) = (t^2 L)^m e^{-t^2 L} \).

Moreover, the distribution \( \rho \) can be removed if \( f \in L^2 \).

### 3.5. Weighted Triebel-Lizorkin space \( F^\alpha_{\infty,q} \) and its characterizations.

In this section we will give the definition of the weighted Triebel-Lizorkin space \( F^\alpha_{\infty,q} \) and prove some characterizations for this space.

**Definition 3.16.** Let \( 0 < q \leq \infty \), \( \alpha \in \mathbb{R} \) and \( w \in A_\infty \). Let \( \psi \) be a partition of unity. The space \( F^\alpha_{\infty,q} \) is defined as the set of all \( f \in S'_\infty \) so that
\[
\| f \|_{F^\alpha_{\infty,q},w} = \sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \right) \int_Q \sum_{j \geq -\log_2 r_Q} (2^{-j\alpha} |\psi_j(\sqrt{L}) f(x)|)^q d\mu(x) \right)^{1/q},
\]
where the supremum is taken over all balls \( Q \) in \( X \) with radius \( r_Q \), with the interpretation that when \( q = \infty \), one has
\[
\| f \|_{F^\alpha_{\infty,q},w} = \sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \right) \int_Q (2^{-j\alpha} |\psi_j(\sqrt{L}) f(x)|)^q d\mu(x) \right)^{1/q},
\]

**Proposition 3.17.** Let \( 0 < q \leq \infty \), \( \alpha \in \mathbb{R} \) and \( w \in A_\infty \). Let \( \psi \) and \( \varphi \) be partitions of unity. Then the spaces \( F^\alpha_{\infty,q} \) and \( F^\alpha_{\infty,q} \) are equivalent. Hence we define the space \( F^\alpha_{\infty,q} \) as any space \( F^\alpha_{\infty,q} \) with \( \varphi \) being a partition of unity.

The proposition is a direct consequence of Lemma 3.18 and Lemma 3.19 below.

**Lemma 3.18.** Let \( 0 < q \leq \infty \), \( \alpha \in \mathbb{R} \) and \( w \in A_\infty \). Let \( \psi \) and \( \varphi \) be partitions of unity. Then for each \( \lambda > n p/q + 2 n p^2/q \) we have
\[
\sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \right) \int_Q \sum_{j \geq -\log_2 r_Q} (2^{j\alpha} |\psi_j^\lambda(\sqrt{L}) f(x)|)^q d\mu(x) \right)^{1/q} \\
\sim \sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \right) \int_Q \sum_{j \geq -\log_2 r_Q} (2^{j\alpha} |\varphi_j^\lambda(\sqrt{L}) f(x)|)^q d\mu(x) \right)^{1/q}
\]

**Proof.** The proposition follows easily from (36). \( \square \)
Lemma 3.19. Let $0 < q \leq \infty$, $\alpha \in \mathbb{R}$ and $w \in A_p, 1 < p < \infty$. Let $\psi$ be a partition of unity. Then for each $\lambda > np/q + 2np^2/q$ we have the norm equivalence:

$$\sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \int_{Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} 2^{j\alpha} |\psi^*_{j,\lambda}(\sqrt{L})f(x)|^q d\mu(x) \right)^{1/q} \sim \|f\|_{E_{\infty,q,w}^{\lambda}}.$$ 

Proof. We consider the case $0 < q < \infty$. It suffices to prove

$$\sup_{Q: \text{balls}} \left( \frac{V(Q)}{w(Q)^2} \int_{Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} 2^{j\alpha} |\psi^*_{j,\lambda}(\sqrt{L})f(x)|^q d\mu(x) \right)^{1/q} \lesssim \|f\|_{E_{\infty,q,w}^{\lambda}}.$$ 

Indeed, fix a ball $Q$ and let $x \in Q$. For $j \geq \nu$, applying Proposition 2.17 with $r = q/p$, we obtain

$$|\psi^*_{j,\lambda}(\sqrt{L})f(x)|^q \lesssim \left[ \int_X \frac{1}{V(z, 2^{-j})} \frac{|\psi_j(\sqrt{L})f(z)|^{q/p}}{(1 + 2^j d(x, z))^\lambda q/p} d\mu(z) \right]^p \lesssim \left[ \int_{Q} \frac{1}{V(z, 2^{-j})} \frac{|\psi_j(\sqrt{L})f(z)|^{q/p}}{(1 + 2^j d(x, z))^\lambda q/p} d\mu(z) \right]^p + \left[ \int_{X \setminus Q} \frac{1}{V(z, 2^{-j})} \frac{|\psi_j(\sqrt{L})f(z)|^{q/p}}{(1 + 2^j d(x, z))^\lambda q/p} d\mu(z) \right]^p := E_{j,1}(x) + E_{j,2}(x).$$

Using Lemma 2.2 we can bound $E_{j,1}$ as follows:

$$E_{j,1}(x) \lesssim \left[ \mathcal{M}_r(|\psi_j(\sqrt{L})f|\chi_{4Q})(x) \right]^q.$$ 

Therefore,

$$\frac{V(Q)}{w(Q)^2} \int_{Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} 2^{j\alpha} E_{j,1}(x) d\mu(x) \lesssim \frac{V(Q)}{w(Q)^2} \int_{Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} 2^{j\alpha} \left[ \mathcal{M}_r(|\psi_j(\sqrt{L})f|\chi_{4Q})(x) \right]^q d\mu(x).$$

Since $\mathcal{M}_r$ is bounded on $L^p_{w}(X)$, the inequality above and Fefferman–Stein’s inequality imply that

$$\frac{V(Q)}{w(Q)^2} \int_{Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} 2^{j\alpha} E_{j,1}(x) dx \lesssim \frac{V(Q)}{w(Q)^2} \int_{4Q \geq -log_2 r_Q} \sum_{j \geq -log_2 r_Q} (|2^j |\psi_j(\sqrt{L})f(x)||^q d\mu(x) \lesssim \|f\|_{E_{\infty,q,w}^{\lambda}}^q.$$ 

We now use Hölder’s inequality to dominate $E_{j,2}(x)$ by

$$\left[ \int_{X \setminus 4Q} \frac{1}{V(z, 2^{-j})} \frac{|\psi_j(\sqrt{L})f(z)|^{q'}}{(1 + 2^j d(x, z))^\lambda q/p} d\mu(z) \right] \left[ \int_{X \setminus 4Q} \frac{1}{V(z, 2^{-j})} (1 + 2^j d(x, z))^{-q/p} d\mu(z) \right]^{p'/p}. $$

Recalling Lemma 2.2,

$$\left[ \int_{X \setminus 4Q} \frac{1}{V(z, 2^{-j})} (1 + 2^j d(x, z))^{-q/p} d\mu(z) \right]^{p'/p} \lesssim 1$$

provided $\lambda > np/q.$
Plugging this into (68) yields
\[
E_{j,2}(x) \lesssim \sum_{k=3}^{\infty} \frac{2^{j\alpha k} V(Q)^2}{w(Q)^2} \int_{Q_{j,\log_2 r_Q}} \sum_{j} 2^{j\alpha q} E_{j,2}(x) d\mu(x)
\]
\[
\lesssim \sum_{k=3}^{\infty} \frac{2^{-k(\lambda q/p-n)} V(Q)^2}{w(Q)^2} \int_{2^k Q} \sum_{j,\nu} 2^{j\alpha} |\psi_j(\sqrt{L}) f(z)|^q d\mu(z)
\]
\[
\lesssim \sum_{k=3}^{\infty} \frac{2^{-k(\lambda q/p-n)} V(Q)^2}{w(Q)^2} \int_{2^k Q} \sum_{j,\nu-k} 2^{j\alpha} |\psi_j(\sqrt{L}) f(z)|^q d\mu(z)
\]
\[
\lesssim \sum_{k=0}^{\infty} 2^{-k(\lambda q/p-n-2np)} \|f\|_{E_{\alpha,\psi,L}}^q
\]
where \( \nu \) is the integer part of \(-\log_2 r_Q\), and in the last inequality we use the fact that \( j \geq \nu \).

Hence, using (5), we deduce that
\[
\frac{V(Q)^2}{w(Q)^2} \int_{Q_{j,\log_2 r_Q}} \sum_{j} 2^{j\alpha q} E_{j,2}(x) d\mu(x)
\]
\[
\lesssim \sum_{k=3}^{\infty} \frac{2^{-k(\lambda q/p-n)} V(Q)^2}{w(Q)^2} \int_{2^k Q} \sum_{j,\nu} 2^{j\alpha} |\psi_j(\sqrt{L}) f(z)|^q d\mu(z)
\]
\[
\lesssim \sum_{k=3}^{\infty} \frac{2^{-k(\lambda q/p-n-2np)} V(Q)^2}{w(Q)^2} \int_{2^k Q} \sum_{j,\nu-k} 2^{j\alpha} |\psi_j(\sqrt{L}) f(z)|^q d\mu(z)
\]
\[
\lesssim \sum_{k=0}^{\infty} 2^{-k(\lambda q/p-n-2np)} \|f\|_{E_{\alpha,\psi,L}}^q
\]
as long as \( \lambda > np/q + 2np^2/q \).

Combining the estimates for \( E_{j,1} \) and \( E_{j,2} \) we conclude that
\[
\left( \frac{V(Q)}{w(Q)^2} \int_{Q_{j,\log_2 r_Q}} \sum_{j} 2^{j\alpha} |\psi_j^*(\sqrt{L}) f(x)|^q d\mu(x) \right)^{1/q} \lesssim \|f\|_{E_{\alpha,\psi,L}}^q
\]
which implies the desired result when \( q < \infty \).

The proof for the case \( q = \infty \) is similar with minor modifications, and hence we leave it to the reader. \( \square \)

**Proposition 3.20.** Let \( 0 < q \leq \infty, \alpha \in \mathbb{R} \) and \( w \in A_p, 1 < p < \infty \). Let \( \psi \) be a partition of unity. Then for \( \lambda > np/q + 2np^2/q \) we have
\[
\|f\|_{\hat{F}_{\alpha,L}^{\#}} \sim \sup_{x \in \mathcal{O}, t > 0} \frac{V(x,t)}{w(B(x,t))^{2\alpha}} \int_{B(x,t)} \int_0^t \frac{(s^{\alpha}|\psi(s\sqrt{L}) f(y)|^q ds d\mu(y))^{1/q}}{s^{\alpha}} =: N_{\alpha,q,L} f
\]
\[
\sim \sup_{x \in \mathcal{O}, t > 0} \frac{V(x,t)}{w(B(x,t))^{2\alpha}} \int_{B(x,t)} \int_0^t \frac{(s^{\alpha}|\psi^*(s\sqrt{L}) f(y)|^q ds d\mu(y))^{1/q}}{s^{\alpha}} =: N_{\lambda,q,L} f
\]
for all \( f \in S'_{\infty} \).

**Proof.** As usual we will only prove the proposition for \( 0 < q < \infty \). We first claim that
\[
\|f\|_{\hat{F}_{\alpha,L}^{\#}} \lesssim N_{\lambda,q,L} f.
\]
Indeed, from Proposition 2.18 we have, for every $j \in \mathbb{Z}$ and $x \in X$,
\[
|\psi_j(\sqrt{L})f(x)|^q \lesssim \int_{2^{-j-2}}^{2^{-j+2}} |\psi^*_j(s\sqrt{L})f(x)|^q \frac{d\nu}{s}.
\]
Hence, for any $\nu \in \mathbb{Z}$,
\[
\sum_{j \geq \nu} (2^j |\psi_j(\sqrt{L})f(x)|)^q \lesssim \sum_{j \geq \nu} \int_{2^{-j-2}}^{2^{-j+2}} (s^{-\alpha}|\psi^*_j(s\sqrt{L})f(x)|)^q \frac{d\nu}{s} = \int_0^{2^{-\nu+2}} (s^{-\alpha}|\psi^*_j(s\sqrt{L})f(x)|)^q \frac{d\nu}{s}.
\]
This implies that
\[
\frac{V(Q)}{w(Q)^2} \int_Q \sum_{j \geq \nu} (2^j |\psi_j(\sqrt{L})f(x)|)^q d\mu(x) \lesssim \frac{V(Q)}{w(Q)^2} \int_0^{2^{-\nu+2}} (s^{-\alpha}|\psi^*_j(s\sqrt{L})f(x)|)^q d\mu(x) \frac{d\nu}{s}
\]
for every ball $Q$. Hence (69) follows.

We next prove that
\[(70) \quad N_{\lambda,q,L}^*(f) \lesssim N_{\lambda,q,L}(f).
\]
To do this, we employ Proposition 2.17 to find that
\[
|\psi^*_j(s\sqrt{L})f(x)|^q \lesssim \left[ \int_X \frac{1}{V(z,s)} \left(1 + \frac{d(x,z)}{s}\right)^{-\lambda r} |\psi(s\sqrt{L})f(z)|^r d\mu(z) \right]^{1/r}
\]
where $r = q/p$. Fix a ball $Q = B(x_1,t)$. Then the above implies that, for every $x \in Q$,
\[
\int_0^t (s^{-\alpha}|\psi^*_j(s\sqrt{L})f(x)|)^q \frac{d\nu}{s} \lesssim \int_0^t \left[ \int_{B(x,t)} \frac{1}{V(z,s)} \left(1 + \frac{d(x,z)}{s}\right)^{-\lambda r} |s^{-\alpha}\psi(s\sqrt{L})f(z)| d\mu(z) \right]^{q/r} \frac{d\nu}{s} + \int_0^t \left[ \int_{X \setminus B(x,t)} \frac{1}{V(z,s)} \left(1 + \frac{d(x,z)}{s}\right)^{-\lambda r} |s^{-\alpha}\psi(s\sqrt{L})f(z)| d\mu(z) \right]^{q/r} \frac{d\nu}{s}.
\]
Using the above estimates and an argument similar to the proof of Lemma 3.19 we obtain (70).

It remains to show that
\[(71) \quad N_{\lambda,q,L}(f) \lesssim \|f\|_{\tilde{F}_{\infty,q}^{\delta,\nu}}.
\]
Observe that for $t \in (2^{-\nu-1}, 2^{-\nu}]$ with $\nu \in \mathbb{Z}$,
\[
\frac{V(x,t)}{w(B(x,t))^2} \int_{B(x,t)} \int_0^t (s^{-\alpha}|\psi(s\sqrt{L})f(y)|)^q \frac{d\nu}{s} dy \lesssim \frac{V(x,2^{-\nu})}{w(B(x,2^{-\nu}))^2} \int_{B(x,2^{-\nu})} \int_0^{2^{-\nu}} (s^{-\alpha}|\psi(s\sqrt{L})f(y)|)^q \frac{d\nu}{s} dy \lesssim \frac{V(x,2^{-\nu})}{w(B(x,2^{-\nu}))^2} \int_{B(x,2^{-\nu})} \sum_{j \geq \nu} \int_{2^{-j-1}}^{2^{-j}} (s^{-\alpha}|\psi(s\sqrt{L})f(y)|)^q \frac{d\nu}{s} dy.
\]
By Proposition 2.16, for $\lambda > 0$ and $s \in [2^{-j-1}, 2^{-j}]$ we have
\[
|\psi(s\sqrt{L})f(x)| \lesssim \sum_{k=j-2}^{j+3} \psi_{k,\lambda} f(x), \quad x \in X.
\]
Substituting this into (72) and using Lemma 3.19, we obtain (71).

The conclusion of the proposition follows immediately from (69), (70) and (71).

\[\square\]

**Theorem 3.21.** Let $0 < q \leq \infty$, $\alpha \in \mathbb{R}$, $m > \alpha/2$, and $w \in A_p, 1 \leq p < \infty$. Let $\varphi \in \mathcal{S}_m(\mathbb{R})$. Assume $\lambda > np/q + 2np^2/q$. 

(i) If $p = 1$, then for each $f \in S'$ there exists $\rho \in \mathcal{D}$ so that

\begin{equation}
K_{\lambda, \alpha, q, L}^*(f - \rho) := \sup_{x \in X, t > 0} \left( \frac{V(x, t)}{w(B(x, t))^2} \right) \int_{B(x, t)} \left( s^{-n} |\varphi_\lambda^*(s\sqrt{L})(f - \rho)(y)|^q \frac{ds}{s} d\mu(y) \right)^{1/q} \lesssim \|f\|_{\tilde{L}_\infty, q, w}^q.
\end{equation}

(ii) If $p > 1$, then

\begin{equation}
\|f\|_{\tilde{L}_\infty, q, w}^q \lesssim \sup_{x \in X, t > 0} \left( \frac{V(x, t)}{w(B(x, t))^2} \right) \int_{B(x, t)} \left( s^{-n} |\varphi(s\sqrt{L})f(y)|^q \frac{ds}{s} d\mu(y) \right)^{1/q} =: K_{\alpha, q, L}(f)
\end{equation}

for every $f \in S'$.

Moreover, the distribution $\rho$ in (73) can be omitted if $f \in L^2(X)$.

**Proof.** We will only prove the theorem for $0 < q < \infty$, as the case $q = \infty$ is similar and so we omit the details.

We prove (73) first. Recall from (55) that we can find $\rho \in \mathcal{D}$ such that for each $u \in [2^{-\nu - 1}, 2^{-\nu})$ for some $\nu \in \mathbb{Z}$ and $\lambda > 0$,

\[ |\varphi_\lambda^*(u\sqrt{L})(f - \rho)| \lesssim \sum_{j \in \mathbb{Z}} 2^{-2m|\nu - j|} |\psi_{j, \lambda}^*(\sqrt{L})f|. \]

It follows that if $q \leq 1$, then we have

\begin{equation}
\int_{2^{-\nu - 1}}^{2^{-\nu}} (u^{-\alpha} |\varphi_\lambda^*(u\sqrt{L})(f - \rho)|^q \frac{du}{u}) \lesssim \sum_{j \in \mathbb{Z}} 2^{-q(2m - \alpha)|\nu - j|} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q
\end{equation}

for every $\nu \in \mathbb{Z}$. Therefore, for any $t > 0$ so that $t \in [2^{-\nu_0 - 1}, 2^{-\nu_0})$, and $x \in X$, we have

\[ \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \int_{0}^{t} (u^{-\alpha} |\varphi_\lambda^*(u\sqrt{L})(f - \rho)|^q \frac{du}{u} d\mu) \lesssim \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \sum_{\nu \geq \nu_0} \int_{2^{-\nu - 1}}^{2^{-\nu}} (u^{-\alpha} |\varphi_\lambda^*(u\sqrt{L})(f - \rho)|^q \frac{du}{u}) d\mu \]

\[ \lesssim \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \sum_{\nu \geq \nu_0} \sum_{j \in \mathbb{Z}} 2^{-q(2m - \alpha)|\nu - j|} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q d\mu \]

\[ \lesssim \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \sum_{\nu \geq \nu_0} \sum_{j \geq j_0} \sum_{\nu_0} \ldots + \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \sum_{\nu \geq \nu_0} \sum_{j < \nu_0} \ldots 
\]

\[ =: I_1 + I_2. \]

Assume $w \in A_1$ and $\lambda > n/q + 2n/q$. Choose $p > 1$ such that $\lambda > np/q + 2np^2/q$. Then, since $w \in A_p$, using Lemma 3.19 we deduce that

\begin{equation}
I_1 \lesssim \|f\|_{\tilde{L}_\infty, q, w}^q.
\end{equation}

For the term $I_2$ we have

\[ I_2 = \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} \sum_{\nu \geq \nu_0} 2^{-q(2m - \alpha)(\nu - \nu_0)} \sum_{j < \nu_0} 2^{-q(2m - \alpha)(\nu - j - \nu_0)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q d\mu \]

\begin{equation}
\lesssim \sum_{j < \nu_0} 2^{-q(2m - \alpha)(\nu_0 - j)} \frac{V(x, t)}{w(B(x, t))^2} \int_{B(x, t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q d\mu.
\end{equation}

We now claim that

\begin{equation}
\frac{1}{V(x, t)} \int_{B(x, t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q d\mu(y) \lesssim \frac{1}{V(x, 2^{-\nu_0} t)} \int_{B(x, 2^{-\nu_0} t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L})f|)^q d\mu(y).
\end{equation}
Indeed, for any $y \in B(x, t)$, and $y' \in B(x, 2^{\alpha_0-j}t)$ with $j < \nu_0$, we have $d(y, y') \lesssim 2^{-j}$. Hence,

$$
\psi_{j, \lambda}^*(\sqrt{L}) f(y) = \sup_{z \in X} \frac{|\psi_{j, \lambda}^*(\sqrt{L}) f(z)|}{(1 + 2^j d(y, z))^{\lambda}} \lesssim \sup_{z \in X} \frac{|\psi_{j, \lambda}^*(\sqrt{L}) f(z)|}{(1 + 2^{\nu} d(y, z) + 2^j d(y, y'))^{\lambda}}
$$

$$
\lesssim \sup_{z \in X} \frac{|\psi_{j, \lambda}^*(\sqrt{L}) f(z)|}{(1 + 2^j d(y, z))^{\lambda}}
$$

$$
= \psi_{j, \lambda}^*(\sqrt{L}) f(y'),
$$

so that $\sup_{y \in B(x, t)} \psi_{j, \lambda}^*(\sqrt{L}) f(y) \lesssim \inf_{y' \in B(x, 2^{\alpha_0-j}t)} \psi_{j, \lambda}^*(\sqrt{L}) f(y')$. Thus (78) follows.

Using (78) and Lemma 3.19, for each $j < \nu_0$ we have

$$
\frac{V(x, t)}{w(B(x, t))^{\frac{2}{\alpha}}} \int_{B(x, t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L}) f|)^q d\mu \lesssim \frac{V(x, t)^2}{w(B(x, t))^{\frac{2}{\alpha}}} \frac{1}{V(x, 2^{\alpha_0-j}t)} \int_{B(x, 2^{\alpha_0-j}t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L}) f|)^q d\mu
$$

$$
\lesssim \frac{V(x, 2^{\alpha_0-j}t)}{w(B(x, 2^{\alpha_0-j}t))^{\frac{2}{\alpha}}} \int_{B(x, 2^{\alpha_0-j}t)} (2^{j\alpha} |\psi_{j, \lambda}^*(\sqrt{L}) f|)^q d\mu
$$

$$
\lesssim ||f||_{F_{\infty, q, w}^{\alpha, L}}^q,
$$

where in the second inequality we used the fact that

$$
\frac{V(x, t)}{w(B(x, t))} \lesssim \frac{V(x, 2^{\alpha_0-j}t)}{w(B(x, 2^{\alpha_0-j}t))},
$$

which is a consequence the $A_1$-condition (see Lemma 2.1). Inserting (79) into (77) yields

$$
I_2 \lesssim ||f||_{F_{\infty, q, w}^{\alpha, L}}^q.
$$

The above estimate for $I_2$ and (76) imply (73).

If $q > 1$, using Young’s inequality and a similar argument, we also obtain that

$$
\frac{V(x, t)}{w(B(x, t))^{\frac{2}{\alpha}}} \int_{B(x, t)} \int_0^t (u^{-\alpha} |\varphi_{s}^*(u \sqrt{L})(f - \rho)|)^q \frac{du}{u} d\mu(x) \lesssim ||f||_{F_{\infty, q, w}^{\alpha, L}}^q.
$$

This completes the proof of (73) in all cases.

It remains to prove (74). We first show that

$$
||f||_{F_{\infty, q, w}^{\alpha, L}} \lesssim K_{\lambda, q, L}^*(f).
$$

To do this, let $\psi$ be a partition of unity. Assume that $t \in (2^{-\nu+1}, 2^{-\nu+2}]$ with $\nu \in \mathbb{Z}$. By Proposition 2.18, for any $\lambda > 0$,

$$
\sum_{j \geq \nu} (2^{j\alpha} |\varphi_{j}^*(\sqrt{L}) f(x)|)^q \lesssim \sum_{j \geq \nu} \int_{2^{j-1}}^{2^{j+2}} |t^{-\alpha} \varphi_{s}^*(s \sqrt{L}) f(x)|^q \frac{ds}{s}
$$

$$
\lesssim \int_{0}^{2^{-\nu+2}} |t^{-\alpha} \varphi_{s}^*(s \sqrt{L}) f(x)|^q \frac{ds}{s}.
$$

This clearly implies (80).

Therefore, to complete the proof of (74), it suffices to prove that

$$
K_{\lambda, q, L}^*(f) \lesssim K_{\alpha, q, L}(f).
$$

To this end, fix $A > \lambda + \alpha$. Then for each $j \geq \nu$ and $t \in [1, 2]$, recall that

$$
\varphi_{s}^*(2^{-j} t \sqrt{L})(L)f(x) = \sup_{k \geq j} \sup_{y \in \lambda} 2^{-(k-j)A} |\varphi(2^{-k} t \sqrt{L}) f(y)| (1 + 2^j d(x, y))^\lambda.
$$
Applying (58) with \( r = q/p \) gives
\[
|\varphi_\lambda^* (2^{-j} t \sqrt{L}) f(x)|^r \lesssim \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda)r} \int_X |\varphi(2^{-k} t \sqrt{L}) f(z)|^r \frac{dt}{t} V(z, 2^{-k}) (1 + 2^k d(x, z))^{2r} d\mu(z).
\]
Since \( p = q/r > 1 \), it follows that
\[
\left[ \int_1^2 \left| \varphi_\lambda^* (2^{-j} t \sqrt{L}) f(x) \right|^q \frac{dt}{t} \right]^{r/q} \lesssim \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda)r} \left\{ \int_1^2 \left[ \int_X |\varphi(2^{-k} t \sqrt{L}) f(z)|^r \frac{dt}{t} V(z, 2^{-k}) (1 + 2^k d(x, z))^{2r} d\mu(z) \right]^{r/q} \right\}.
\]
(81)

Fix a ball \( Q \) and let \( x \in Q \). The argument in the proof of Lemma 3.19 then shows that
\[
\left[ \int_X |\varphi(2^{-k} t \sqrt{L}) f(z)\chi_{4Q}(x)|^r \frac{dt}{t} V(z, 2^{-k}) (1 + 2^k d(x, z))^{2r} d\mu(z) \right]^{q/r} \lesssim \left[ \mathcal{M}_r(|\varphi(2^{-k} t \sqrt{L}) f\chi_{4Q}(x)|^q) + \sum_{\ell = 3}^{2-\ell(\lambda q/p-n)} \frac{2^{-\ell(\lambda q/p-n)}}{V(2^\ell Q)} \int_{S_t(Q)} |\varphi(2^{-k} t \sqrt{L}) f(z)|^q d\mu(z) \right]^{q/r}.
\]
Inserting this into (81), we obtain
\[
\left[ \int_1^2 \left| \varphi_\lambda^* (2^{-j} t \sqrt{L}) f(x) \right|^q \frac{dt}{t} \right]^{r/q} \lesssim \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda)r} \left\{ \int_1^2 \left[ \mathcal{M}_r(|\varphi(2^{-k} t \sqrt{L}) f\chi_{4Q}(x)|^q) + \sum_{\ell = 3}^{2-\ell(\lambda q/p-n)} \frac{2^{-\ell(\lambda q/p-n)}}{V(2^\ell Q)} \int_{S_t(Q)} |\varphi(2^{-k} t \sqrt{L}) f(z)|^q d\mu(z) \right]^{q/r} \right\}.
\]
This implies that, for any \( \nu \in \mathbb{Z} \),
\[
\sum_{j \geq \nu} \int_{2^{-j}}^{2^{-j+1}} (2^{j\alpha} |\varphi_\lambda^* (t \sqrt{L}) f(x)|^q) \frac{dt}{t} \lesssim \sum_{j \geq \nu} \left( \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda - \alpha)r} \left\{ \int_{2^{-k}}^{2^{-k+1}} 2^{k\alpha q} \left[ \mathcal{M}_r(|\varphi(t \sqrt{L}) f\chi_{4Q}(x)|^q) + \sum_{\ell = 3}^{2-\ell(\lambda q/p-n)} \frac{2^{-\ell(\lambda q/p-n)}}{V(2^\ell Q)} \int_{S_t(Q)} |\varphi(t \sqrt{L}) f(z)|^q d\mu(z) \right]^{q/r} \right\} \right)^{q/r}.
\]
We now use Young’s inequality to get the bound:
\[
\sum_{j \geq \nu} \int_{2^{-j}}^{2^{-j+1}} (t^{-\alpha} |\varphi_\lambda^* (t \sqrt{L}) f(x)|^q) \frac{dt}{t} \lesssim \sum_{j \geq \nu} \left( \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda - \alpha)r} \left[ \mathcal{M}_r(|\varphi(t \sqrt{L}) f\chi_{4Q}(x)|^q) \frac{dt}{t} \right] \right)^{q/r} \lesssim \sum_{j \geq \nu} \left( \sum_{k \geq j} 2^{-(k-j)(\Lambda - \lambda - \alpha)r} \left[ \frac{1}{V(2^\ell Q)} \int_{S_t(Q)} (t^{-\alpha} |\varphi(t \sqrt{L}) f(z)|^q d\mu(z) \frac{dt}{t} \right] \right)^{q/r}.
\]
It follows that
\[
\int_0^{2^{-\nu+1}} (t^{-\alpha} |\varphi_1^*(t\sqrt{L})f(x)|)^q \frac{dt}{t} \lesssim \int_0^{2^{-\nu+1}} t^{-\alpha q} \left[ M_r(|\varphi(t\sqrt{L})f|\chi_{4Q})(x) \right]^q \frac{dt}{t} + \int_0^{2^{-\nu+1}} \sum_{j=1}^\infty 2^{-j(\lambda q/p-n)} V(2^j Q) \int_{S_i(Q)} (t^{-\alpha} |\varphi(t\sqrt{L})f(z)|)^q d\mu(z) \frac{dt}{t}.
\]

Using the above estimate and arguing similarly to the proof of Lemma 3.19, we deduce that
\[
K_{\lambda,q,L} f \lesssim K_{\alpha,q,L} f.
\]
This completes the proof of (74), and hence the theorem follows. \(\square\)

**Remark 3.22.** It is natural to question if the estimate (73) holds true for \(w \in A_\infty\). We note that when \(L = -\Delta\) is the Laplacian on \(\mathbb{R}^n\), we show in Theorem 5.6 that the classical weighted BMO space \(\text{BMO}_w(\mathbb{R}^n)\) coincides with \(\dot{F}_{\infty,2,w}^{0,-\Delta}(\mathbb{R}^n)\) for \(w \in A_1 \cap RH_2\). In this case, the estimate (73) is known as the Carleson measure condition and to the best of our knowledge, the problem of obtaining the estimate (73) on the classical weighted BMO space with all \(w \in A_\infty\) is still open. In this sense, the restriction \(w \in A_1\) is reasonable.

If we replace the definition of \(\|f\|_{\dot{F}_{\infty,2,w}^{\alpha,q,L}}\) in Definition 3.16 by the following quantity
\[
\sup_{Q: \text{balls}} \left( \frac{1}{w(Q)} \right) \int_Q \sum_{j=1}^\infty \left( 2^{j\alpha} |\varphi_j(\sqrt{L})f(x)|^q w(x) d\mu(x) \right)^{1/q},
\]
then by a similar argument we can show that (73) holds true for \(w \in A_\infty\). However, one of the main drawbacks of this definition is that when \(L = -\Delta\), we have \(\dot{F}_{\infty,2,w}^{0,-\Delta}(\mathbb{R}^n) \equiv \text{BMO}(\mathbb{R}^n)\) for every \(w \in A_\infty\). See for example [15].

We have the following results as a direct consequence of Theorem 3.21:

**Corollary 3.23.** Let \(0 < q \leq \infty, \alpha \in \mathbb{R}, m > \alpha/2,\) and \(w \in A_p, 1 \leq p < \infty\). Assume \(\lambda > np/q + 2np^2/q\). Let \(\Psi_{m,t}(L) = (t^2 L)^m e^{-t^2 L}\) and
\[
\Psi_{m,t,\lambda}(L)f(x) = \sup_{y \in X} \frac{|\Psi_{m,t}(L)f(y)|}{(1 + d(x,y)/t)^{\lambda}}.
\]

(i) If \(p = 1\), then for each \(f \in S'\), there exists \(\rho \in \mathcal{P}\) so that
\[
\sup_{x \in X, t > 0} \left( \frac{V(x,t)}{w(B(x,t))^\alpha} \int_{B(x,t)} \int_0^t (s^{-\alpha} |\Psi_{m,s,\lambda}(L)(f - \rho)(y)|)^q \frac{ds}{s} dy \right)^{1/q} \lesssim \|f\|_{F_{\infty,2,w}^{\alpha,q,L}}.
\]

(ii) If \(p > 1\), then
\[
\|f\|_{F_{\infty,2,w}^{\alpha,q,L}} \lesssim \sup_{x \in X, t > 0} \left( \frac{V(x,t)}{w(B(x,t))^\alpha} \int_{B(x,t)} \int_0^t (s^{-\alpha} |\Psi_{m,s}(L)f(y)|)^q \frac{ds}{s} dy \right)^{1/q}
\]
for every \(f \in S'\).
Moreover, the distribution \(\rho\) can be removed if \(f \in L^2(X)\).

4. **Atomic decompositions**

We now prove atomic decomposition theorems for our new Besov and Triebel-Lizorkin spaces. We first introduce the definition of weighted atoms related to \(L\).

**Definition 4.1.** Let \(0 < p \leq \infty, M \in \mathbb{N}_+\) and \(w \in A_\infty\). A function \(a\) is said to be an \((L,M,p,w)\) atom if there exists a dyadic cube \(Q \in \mathcal{D}\) so that

(i) \(a = L^M b\);
(ii) \(\sup L^k b \subset 3B_Q, k = 0, \ldots, 2M;\)
(iii) \(|L^k b(x)| \leq \ell(Q)^{2(M-k)}w(Q)^{-1/p}, k = 0, \ldots, 2M;\)
where \(B_Q\) is a ball associated to \(Q\) defined in Remark 2.4.
4.1. Atomic decompositions for Besov spaces $\dot{B}^{\alpha,L}_{p,q,w}$. Our first main result in this section is the following theorem in which we show that each function in $\dot{B}^{\alpha,L}_{p,q,w}$ can be characterized in terms of atomic decompositions.

**Theorem 4.2.** Let $\alpha \in \mathbb{R}$, $0 < p, q \leq \infty$, $M \in \mathbb{N}_+$ and $w \in A_\infty$. Assume $f \in \dot{B}^{\alpha,L}_{p,q,w}$. Then there exist a sequence of $(L, M, p, w)$ atoms $\{a_Q\}_{Q \in D_v, \nu \in \mathbb{Z}}$ and a sequence of coefficients $\{s_Q\}_{Q \in D_v, \nu \in \mathbb{Z}}$ so that

$$f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_v} s_Q a_Q \text{ in } S'_\infty.$$  

Moreover,

$$\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q} \left( \sum_{Q \in D_v} |s_Q|^q \right)^{q/p} \right]^{1/q} \lesssim \|f\|_{\dot{B}^{\alpha,L}_{p,q,w}}.$$  

**Proof.** Let $\psi$ be a partition of unity and $\Phi$ be a function as in Lemma 2.5. Due to Proposition 2.11, for $f \in S'_\infty$ we have

$$f = c \int_0^\infty \psi(t\sqrt{L}) \Phi(t\sqrt{L}) f dt$$

in $S'_\infty$, where $c = \left[ \int_0^\infty \psi(\xi) \Phi(\xi) \frac{d\xi}{\xi} \right]^{-1}$.

As a consequence, by Lemma 2.3 we have

$$f = c \sum_{\nu \in \mathbb{Z}} \int_{2^{-\nu-1}}^{2^{-\nu}} (t^2 L)^M \Phi(t\sqrt{L}) |\psi_M(t\sqrt{L}) f| dt$$  

(83)

$$= c \sum_{Q \in D_v, \nu \in \mathbb{Z}} \int_{2^{-\nu-1}}^{2^{-\nu}} (t^2 L)^M \Phi(t\sqrt{L}) \psi_M(t\sqrt{L}) f \cdot \chi_Q \frac{dt}{t}$$

where $\psi_M(\xi) = \xi^{-2M} \psi(\xi)$.

For each $\nu \in \mathbb{Z}$ and $Q \in D_v$, we set

$$s_Q = w(Q)^{1/p} \sup_{y \in Q} \int_{2^{-\nu-1}}^{2^{-\nu}} |\psi_M(t\sqrt{L}) f(y)| \frac{dt}{t},$$

and $a_Q = L^M b_Q$, where

$$b_Q = \frac{1}{s_Q} \int_{2^{-\nu-1}}^{2^{-\nu}} t^{2M} \Phi(t\sqrt{L}) |\psi_M(t\sqrt{L}) f \cdot \chi_Q| \frac{dt}{t}$$

(84)

Obviously, we deduce from (83) that

$$f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_v} s_Q a_Q \text{ in } S'_\infty.$$

For $k = 0, \ldots, 2M$, we have

$$L^k b_Q(x) = \frac{1}{s_Q} \int_{2^{-\nu-1}}^{2^{-\nu}} t^{2(M-k)} (t^2 L)^k \Phi(t\sqrt{L}) |\psi_M(t\sqrt{L}) f \cdot \chi_Q| \frac{dt}{t}$$  

$$= \frac{1}{s_Q} \int_{2^{-\nu-1}}^{2^{-\nu}} \int_Q t^{2(M-k)} K_{(t^2 L)^k \Phi(t\sqrt{L})} (x, y) \psi_M(t\sqrt{L}) f(y) d\mu(y) \frac{dt}{t}.$$  

Using the finite propagation property in Lemma 2.5 we can see that

$$\text{supp } L^k b \subset 3B_Q,$$

and

$$|L^k b_Q(x)| \lesssim \frac{2^{-2\nu(M-k)}}{s_Q} \int_{2^{-\nu-1}}^{2^{-\nu}} \int_Q \frac{1}{V(y, 2^{-\nu})} |\psi_M(t\sqrt{L}) f(y)| d\mu(y) \frac{dt}{t}$$  

$$\lesssim 2^{-\nu(2M-2k)} w(Q)^{-1/p}.$$
It follows that $a_Q$ is (a multiple of) an $(L, M, p, w)$ atom. We now prove that
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \sim \| f \|_{B_{p,q}^\alpha}.
\]
Indeed, for any $\lambda > 0$ we note that
\[
s_Q \sim w(Q)^{1/p} \sup_{y \in Q} \int_{2^{-\nu-1}}^{2^{-\nu}} |\psi_M(t \sqrt{L}) f(y)| \frac{dt}{t} \leq \left[ \int_Q |F_{M,\lambda}(\sqrt{L}) f(x)|^p w(x) d\mu(x) \right]^{1/p}
\]

where
\[
F_{M,\lambda}(\sqrt{L}) f(x) = \sup_{y \in \chi} \int_{2^{-\nu-1}}^{2^{-\nu}} |\psi_M(t \sqrt{L}) f(y)| \frac{dt}{1 + 2^\nu d(x, y)}^{\lambda}.
\]

As a consequence,
\[
\sum_{Q \in D_{\nu}} \left| s_Q \right|^p \leq \int_{\chi} \left| F_{M,\lambda,\nu}^*(\sqrt{L}) f(x) \right|^p w(x) d\mu(x).
\]

On the other hand, fixing a $m > \alpha/2$ and arguing similarly to (55) we obtain
\[
|F_{M,\lambda}^*(\sqrt{L}) f(x)| \lesssim \sum_{j \in \mathbb{Z}} 2^{-2m|\nu-j|} \psi_{j,\lambda}^*(\sqrt{L}) f.
\]

Therefore,
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{j \in \mathbb{Z}} 2^{-2m|\nu-j|} \left\| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right\|^q \right)^{1/q} \right].
\]

(85)

**Case 1:** $p \geq 1$. We have
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \left( \sum_{j \in \mathbb{Z}} 2^{-2m(\alpha-\alpha/2)} \| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right)^{q} \right]^{1/q}.
\]

At this stage, if $q \geq 1$ we then use Young’s inequality and Proposition 3.3 to further imply
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \left( 2^{\alpha \lambda} \| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right)^{q} \right]^{1/q} \sim \| f \|_{B_{p,q}^\alpha}.
\]

Otherwise if $0 < q < 1$, we then have
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \left( 2^{-2m(\alpha-\alpha/2)} \| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right)^{q} \right]^{1/q} \sim \| f \|_{B_{p,q}^\alpha}.
\]

where in the last line we use Proposition 3.3.

**Case 2:** $0 < p < 1$. From (85), we obtain
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \left( 2^{-p(2m-\alpha)} \| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right)^{q/p} \right]^{1/q}.
\]

If $q/p \geq 1$, we then use Young’s inequality and Proposition 3.3 to get the estimate
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} \left| s_Q \right|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \left( 2^{\alpha \lambda} \| \psi_{j,\lambda}^*(\sqrt{L}) f \|_{p,w} \right)^{q} \right]^{1/q} \sim \| f \|_{B_{p,q}^\alpha}.
\]
Otherwise if \(0 < q/p < 1\), we then have
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q\alpha} \left( \sum_{Q \in \mathcal{D}_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q} \leq \left[ \sum_{\nu \in \mathbb{Z}} \sum_{j \in \mathbb{Z}} \left( 2^{-(2m-\alpha)|\nu-j|} 2^j \|\psi_{j,\lambda}^* (\sqrt{L} f)\|_{p,w} \right)^q \right]^{1/q} \leq \left[ \sum_{j \in \mathbb{Z}} \left( \sum_{Q \in \mathcal{D}_\nu} \|\psi_{j,\lambda}^* (\sqrt{L} f)\|_{p,w} \right)^q \right]^{1/q} \sim \|f\|_{\dot{B}^{\alpha,L}_{p,q,w}}
\]
where in the last line we use Proposition 4.3.

This completes the proof. \(\square\)

Conversely, each atomic decomposition with suitable coefficients belong to the spaces \(\dot{B}^{\alpha,L}_{p,q,w}\).

**Theorem 4.3.** Let \(\alpha \in \mathbb{R}, 0 < p, q \leq \infty\) and \(w \in A_\infty\). Assume that
\[
f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in \mathcal{D}_\nu} s_Q a_Q \text{ in } S'_\infty,
\]
where \(\{a_Q\}_{Q \in \mathcal{D}_\nu, \nu \in \mathbb{Z}}\) is a sequence of \((L,M,p,w)\) atoms and \(\{s_Q\}_{Q \in \mathcal{D}_\nu, \nu \in \mathbb{Z}}\) is a sequence of coefficients satisfying
\[
\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q\alpha} \left( \sum_{Q \in \mathcal{D}_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q} < \infty.
\]
Then \(f \in \dot{B}^{\alpha,L}_{p,q,w}\) and
\[
\|f\|_{\dot{B}^{\alpha,L}_{p,q,w}} \lesssim \left[ \sum_{\nu \in \mathbb{Z}} \left( \sum_{Q \in \mathcal{D}_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q}
\]
provided \(M > \frac{n}{2} + \frac{1}{2} \max\{\alpha, \frac{npq}{1+npq} - \alpha\}\).

Before coming to the proof of Theorem 4.3 we need the following technical results.

**Lemma 4.4.** Let \(w \in A_q, N > n, \kappa \in [0,1], \) and \(\eta, \nu \in \mathbb{Z}, \nu \geq \eta\). Assume that \(\{f_Q\}_{Q \in \mathcal{D}_\nu}\) is a sequence of functions satisfying
\[
|f_Q(x)| \lesssim \left( \frac{V(Q)}{V(x_Q,2^{-\eta})} \right)^\kappa \left( 1 + \frac{d(x,x_Q)}{2^{-\eta}} \right)^{-N}.
\]
Then for \(\frac{n \eta}{N} < r \leq 1\) and a sequence of numbers \(\{s_Q\}_{Q \in \mathcal{D}_\nu}\), we have
\[
\sum_{Q \in \mathcal{D}_\nu} |s_Q| \|f_Q(x)\| \lesssim 2^{n(\nu-\eta)(\eta/r - \kappa)} M_{w,r} \left( \sum_{Q \in \mathcal{D}_\nu} |s_Q| \chi_Q \right)(x).
\]

**Proof.** In the particular case when \(\kappa = 0\), \(w \equiv 1\) and \(X = \mathbb{R}^n\), this lemma was proved in [39]. We adapt some of this argument to our present situation.

Fix \(x \in X\). We set
\[
\mathcal{B}_0 = \{Q \in \mathcal{D}_\nu : d(x,x_Q) \leq 2^{-\eta}\}, \quad \mathcal{Q}_0 = \bigcup_{Q \in \mathcal{B}_0} Q
\]
and
\[
\mathcal{B}_k = \{Q \in \mathcal{D}_\nu : 2^{k-\eta - 1} < d(x,x_Q) \leq 2^{k-\eta}\}, \quad \mathcal{Q}_k = \bigcup_{j \leq k} \bigcup_{Q \in \mathcal{B}_j} Q, \quad k \in \mathbb{N}_+.
\]
Then we write
\[
\sum_{Q \in \mathcal{D}_\nu} |s_Q| \|f_Q(x)\| = \sum_{k \in \mathbb{N}} \sum_{Q \in \mathcal{B}_k} |s_Q| \|f_Q(x)\| \leq \sum_{k \in \mathbb{N}} \sum_{Q \in \mathcal{B}_k} |s_Q| \left( \frac{V(Q)}{V(x_Q,2^{-\eta})} \right)^\kappa \left( 1 + \frac{d(x,x_Q)}{2^{-\eta}} \right)^{-N}
\]
\[
= : \sum_{k \in \mathbb{N}} E_k.
\]
For each $k \in \mathbb{N}$, we have
\[
E_k \lesssim \sum_{Q \in B_k} 2^{-kN} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} |s_Q| \lesssim 2^{-kN} \left[ \sum_{Q \in B_k} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} |s_Q| \right]^r \frac{1}{r}.
\]
(86) \[
\lesssim 2^{-kN} \left\{ \int_{Q_k} \left[ \sum_{Q \in B_k} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} w(Q)^{-1/r} |s_Q| \chi_Q(y) \right]^r w(y) d\mu(y) \right\}^{1/r}
\]
\[
\lesssim 2^{-kN} \left\{ \frac{1}{w(Q_k)} \int_{Q_k} \left[ \sum_{Q \in B_k} \left( \frac{w(Q)}{w(Q)} \right)^{1/r} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} |s_Q| \chi_Q(y) \right]^r d\mu(y) \right\}^{1/r}.
\]

It is easy to see that $V(Q_k) \sim V(x, 2^{-\eta+k}) \sim V(x_Q, 2^{-\eta+k})$, for each $Q \in B_k$. Therefore,
\[
\left( \frac{w(Q_k)}{w(Q)} \right)^{1/r} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} \lesssim \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} = \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} \left( \frac{V(Q)}{V(x_Q, 2^{-\eta})} \right)^{\kappa} \lesssim 2^{k\eta \bar{q}/r} 2^{n(\nu-\eta)(\bar{q}/r-\kappa)}.
\]
Inserting this into (86) gives
\[
E_k \lesssim 2^{-kN} 2^{k\eta \bar{q}/r} 2^{n(\nu-\eta)(\bar{q}/r-\kappa)} \left\{ \frac{1}{w(Q_k)} \int_{Q_k} \left[ \sum_{Q \in B_k} |s_Q| \chi_Q(y) \right]^r w(y) d\mu(y) \right\}^{1/r}
\]
\[
\lesssim 2^{-k(N-n\bar{q}/r)} 2^{n(\nu-\eta)(\bar{q}/r-\kappa)} M_{w,r} \left( \sum_{Q \in D_{\nu}} |s_Q| \chi_Q(x) \right).
\]
Since $r > \frac{\eta \bar{q}}{N}$, we find that
\[
\sum_{k \in \mathbb{N}} E_k \lesssim 2^{n(\nu-\eta)(\bar{q}/r-\kappa)} M_{w,r} \left( \sum_{Q \in D_{\nu}} |s_Q| \chi_Q(x) \right).
\]

This completes our proof. \(\square\)

**Lemma 4.5.** Let $\psi$ be a partition of unity and let $a_Q$ be an $(L, M, p, w)$ atom with some $Q \in D_{\nu}$. Then for any $t > 0$ and $N > 0$ we have:
\[
|\psi(t\sqrt{L}) a_Q(x)| \lesssim \left( \frac{t}{2^{-\nu}} \right)^{2M-n} w(Q)^{-1/p} \left( 1 + \frac{d(x, x_Q)}{2^{-\nu} \vee t} \right)^{-N}.
\]

**Proof.** We now consider two cases: $t \leq 2^{-\nu}$ and $t > 2^{-\nu}$.

**Case 1:** $t \leq 2^{-\nu}$. Observe that
\[
\psi(t\sqrt{L}) a_Q = t^{2M} \psi_M(t\sqrt{L})(L^M a_Q)
\]
where $\psi_M(\lambda) = \lambda^{-2M} \psi(\lambda)$.

This, along with Lemma 2.6 and the definition of the atoms, yields
\[
|\psi(t\sqrt{L}) a_Q(x)| \lesssim \int_{3B_Q} \left( \frac{t}{2^{-\nu} \vee t} \right)^{2M} \left( 1 + \frac{d(x, y)}{t} \right)^{-N} |L^K a_Q(y)| d\mu(y)
\]
\[
\lesssim \left( \frac{t}{2^{-\nu}} \right)^{2M} w(Q)^{-1/p} \int_{3B_Q} \left( 1 + \frac{d(x, y)}{t} \right)^{-N} d\mu(y).
\]

Note that, for $t \leq 2^{-\nu}$ and $y \in 3B_Q$, we have
\[
\left( 1 + \frac{d(x, y)}{t} \right)^{-N} \leq \left( 1 + \frac{d(x, y)}{2^{-\nu}} \right)^{-N} \sim \left( 1 + \frac{d(x, x_Q)}{2^{-\nu}} \right)^{-N}.
\]
Therefore,
\[
|\psi(t\sqrt{L})a_Q(x)| \lesssim \left( \frac{t}{2^{\nu}} \right)^{2M} w(Q)^{-1/p} \left( 1 + \frac{d(x,x_Q)}{2^{\nu}} \right)^{-N} \frac{V(3B_Q)}{V(y,t)}
\]
\[
\lesssim \left( \frac{t}{2^{\nu}} \right)^{2M-n} w(Q)^{-1/p} \left( 1 + \frac{d(x,x_Q)}{2^{\nu}} \right)^{-N}
\]
where in the last inequality we use (2). This leads us to (87).

**Case 2:** \( t > 2^{\nu} \). We first write \( a_Q = L^M b_Q \). Hence,
\[
\psi(t\sqrt{L})a_Q = t^{-2M} \tilde{\psi}_M(t\sqrt{L})b_Q
\]
where \( \tilde{\psi}_M(\lambda) = \lambda^{2M} \psi(\lambda) \).

This, along with Lemma 2.6, implies that
\[
|\psi(t\sqrt{L})a_Q(x)| \lesssim \int_{3B_Q} \frac{t^{-2M}}{V(y,t)} \left( 1 + \frac{d(x,y)}{t} \right)^{-N} |b_Q(y)| d\mu(y)
\]
\[
\lesssim \left( \frac{2^{-\nu}}{t} \right)^{2M} \frac{V(3B_Q)}{V(y,t)} \left( 1 + \frac{d(x,y)}{t} \right)^{-N} d\mu(y).
\]
Note that for \( y \in 3B_Q \) and \( t \geq 2^{\nu} \sim \ell(Q) \) we have
\[
\left( 1 + \frac{d(x,y)}{t} \right)^{-N} \sim \left( 1 + \frac{d(x,x_Q)}{t} \right)^{-N}.
\]
Hence, the above inequality simplifies into
\[
|\psi(t\sqrt{L})a_Q(x)| \lesssim \left( \frac{2^{-\nu}}{t} \right)^{2M} w(Q)^{-1/p} \left( 1 + \frac{d(x,x_Q)}{t} \right)^{-N} \frac{V(3B_Q)}{V(y,t)}
\]
\[
\lesssim \left( \frac{2^{-\nu}}{t} \right)^{2M} w(Q)^{-1/p} \left( 1 + \frac{d(x,x_Q)}{t} \right)^{-N}.
\]
Hence (87) follows. \( \square \)

We are now ready to give the proof for Theorem 4.3.

**Proof of Theorem 4.3:** The proof can be done by using similar arguments to those in [38, 39]. However, for the sake of completeness, we will provide the details.

Fix \( \tilde{q} \in (q_q, \infty) \) and \( r < \min\{1, p, q\} \) so that \( w \in A_{\tilde{q}} \) and \( M > n/2 + n\tilde{q}/r - s \). We now fix \( N > \frac{nr}{\tilde{q}} \). Let \( \psi \) be a partition of unity. Since
\[
f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q a_Q \text{ in } S'_\infty,
\]
we then, for each \( j \in \mathbb{Z} \) have
\[
\psi_j(\sqrt{L})f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q \psi_j(\sqrt{L})a_Q
\]
\[
= \sum_{\nu \geq j} \sum_{Q \in D_\nu} s_Q \psi_j(\sqrt{L})a_Q + \sum_{\nu < j} \sum_{Q \in D_\nu} s_Q \psi_j(\sqrt{L})a_Q.
\]
Using Lemma 4.4 and Lemma 4.5 we see that
\[
|\psi_j(\sqrt{L})f| \lesssim \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q \psi_j(\sqrt{L})a_Q
\]
\[
= \sum_{\nu \geq j} 2^{-(\nu-j)(2M-n-n\tilde{q}/r)} M_{w,r} \left( \sum_{Q \in D_\nu} |s_Q| w(Q)^{-1/p} \chi_Q \right)
\]
\[
+ \sum_{\nu < j} 2^{-(2M-n)(j-n)} M_{w,r} \left( \sum_{Q \in D_\nu} |s_Q| w(Q)^{-1/p} \chi_Q \right).
\]
Therefore,
\[ \|f\|_{\dot{B}^{\alpha}_{p,q,w}} := \left[ \sum_{j \in \mathbb{Z}} (2^{j \alpha} \| \psi_j(\sqrt{\lambda}) f \|_{p,w})^q \right]^{1/q} \]
\[ \leq \left[ \sum_{j \in \mathbb{Z}} \left( \| \sum_{\nu, \nu' \geq j} 2^{-(\nu-j)(2M-nq/r+\alpha)} M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \right)^q \right]^{1/q} + \left[ \sum_{j \in \mathbb{Z}} \left( \| \sum_{\nu, \nu < j} 2^{-(2M-n-\alpha)(j-\nu)} M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \right)^q \right]^{1/q} =: E_1 + E_2. \]

If \( p \geq 1 \), then we have
\[ E_1 \lesssim \left[ \sum_{j \in \mathbb{Z}} \left( \sum_{\nu, \nu' \geq j} 2^{-(\nu-j)(2M-nq/r+\alpha)} \| M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \right)^q \right]^{1/q}. \]
We now apply Young’s inequality when \( q \geq 1 \) and the inequality \((\sum_j |a_j|)^q \leq \sum_j |a_j|^q\) when \( 0 < q < 1 \) to simplify
\[ E_1 \lesssim \left[ \sum_{\nu \in \mathbb{Z}} \left( \| M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \right)^q \right]^{1/q}. \]
as long as \( 2M > nq/r - \alpha \).

On the other hand, since the maximal function \( M_{w,r} \) is bounded on \( L^p_w(X) \) as \( p > r \), we have
\[ \| M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \lesssim \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right)_{p,w} \sim \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| \right)^{1/p}. \]
As a consequence,
\[ E_1 \lesssim \left[ \sum_{\nu \in \mathbb{Z}} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| \right)^{q/p} \right]^{1/q} = \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q}. \]
Similarly,
\[ E_2 \lesssim \left[ \sum_{\nu \in \mathbb{Z}} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| \right)^{q/p} \right]^{1/q} = \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q}. \]
Hence,
\[ \|f\|_{\dot{B}^{\alpha}_{p,q,w}} \lesssim \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q} \]
as desired.

If \( 0 < p < 1 \), then we have
\[ E_1 \lesssim \left[ \sum_{j \in \mathbb{Z}} \left( \sum_{\nu, \nu' < j} 2^{-p(\nu-j)(2M-nq/r+\alpha)} \| M_{w,r} \left( \sum_{Q \in D_{\nu}} 2^{\nu \alpha} |s_Q| w(Q)^{-1/p} \chi_Q \right) \|_{p,w} \right)^q \right]^{1/q}. \]
Arguing similarly to the case \( p \geq 1 \) by considering two cases \( q/p \geq 1 \) and \( 0 < q/p < 1 \), we come up with
\[ E_1 \lesssim \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu \alpha q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q}. \]
By the same manner, we have
\[ E_2 \lesssim \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q}. \]

Therefore,
\[ \|f\|_{\dot{B}^{\alpha,L}_{p,q,w}} \lesssim \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q q} \left( \sum_{Q \in D_{\nu}} |s_Q| \right)^{q/p} \right]^{1/q} \]
as desired. \(\square\)

### 4.2. Atomic decompositions for Triebel-Lizorkin spaces \(\dot{F}^{\alpha,L}_{p,q,w}\)

Our second main result is the following atomic decomposition theorem for the space \(\dot{F}^{\alpha,L}_{p,q,w}\). More precisely, we prove the following theorem.

**Theorem 4.6.** Let \(\alpha \in \mathbb{R}, 0 < p < \infty, 0 < q \leq \infty, m \in \mathbb{N}_+\) and \(w \in A_\infty\). If \(f \in \dot{F}^{\alpha,L}_{p,q,w}\), then there exist a sequence of \((L,M,p,w)\) atoms \(\{a_Q\}_{Q \in D_{\nu}, \nu \in \mathbb{Z}}\) and a sequence of coefficients \(\{s_Q\}_{Q \in D_{\nu}, \nu \in \mathbb{Z}}\) so that
\[ f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_{\nu}} s_Q a_Q \text{ in } S'_\infty. \]
Moreover,
\[ \left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q q} \left( \sum_{Q \in D_{\nu}} w(Q)^{-1/p} |s_Q| \chi_Q \right)^{q} \right]^{1/q} \right\|_{p,w} \lesssim \|f\|_{\dot{F}^{\alpha,L}_{p,q,w}}. \]

**Proof.** Recall that in the proof of Theorem 4.2, we have proved the representation
\[ f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_{\nu}} s_Q a_Q \text{ in } S'_\infty, \]
where
\[ s_Q = w(Q)^{1/p} \sup_{y \in Q} \int_{2^{-\nu - 1}}^{2^{-\nu}} |\psi_M(t\sqrt{L}) f(y)| dt \]
and \(a_Q = L^M b_Q\) is an \((L,M,p,w)\) atom defined by
\[ b_Q = \frac{1}{s_Q} \int_{2^{-\nu - 1}}^{2^{-\nu}} \Phi(t\sqrt{L}) |\psi_M(t\sqrt{L}) f(y)| \cdot \chi_Q dt. \]

It remains to prove (89). Indeed, for any \(\lambda > 0\) it is easy to see that
\[ w(Q)^{-1/p} s_Q \chi_Q = \sup_{y \in Q} \int_{2^{-\nu - 1}}^{2^{-\nu}} |\psi_M(t\sqrt{L}) f(y)| \cdot \chi_Q \lesssim \chi_Q F_{M,\lambda}^{*} (\sqrt{L}) f \]
where
\[ F_{M,\lambda}^{*}(\sqrt{L}) f(x) = \sup_{y \in \mathbf{X}} \int_{2^{-\nu - 1}}^{2^{-\nu}} |\psi_M(t\sqrt{L}) f(y)| \cdot \chi_Q \frac{dt}{(1 + 2^\nu d(x,y))^\lambda}. \]
As a consequence,
\[ \sum_{Q \in D_{\nu}} w(Q)^{-1/p} |s_Q| \chi_Q \lesssim F_{M,\lambda}^{*} (\sqrt{L}) f. \]
On the other hand, fixing a \(m > \alpha/2\) and arguing similarly to (55) we show that
\[ |F_{M,\lambda}^{*}(\sqrt{L}) f| \lesssim \sum_{j \in \mathbb{Z}} 2^{-2m|\nu - j|} |s_Q| \psi_j^*(\sqrt{L}) f. \]
We then apply Young’s inequality when \( q \geq 1 \) and the inequality \( (\sum_j |a_j|)^q \leq \sum_j |a_j|^q \) when \( 0 < q < 1 \) to find that

\[
\left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q} \left( \sum_{Q \in \mathcal{D}_\nu} w(Q)^{-1/p} |s_Q| \chi_Q \right) \right]^{1/q} \right\|_{p,w} \lesssim \left\| \left[ \sum_{j \in \mathbb{Z}} \left( 2^{j \alpha} \psi_{j,\lambda}^\ast (\sqrt{L}) f \right)^q \right]^{1/q} \right\|_{p,w} \lesssim \| f \|_{\dot{F}_{p,q,w}^{\alpha,L}}.
\]

where in the last inequality we use Proposition 3.3.

This completes our proof.

\( \square \)

For the converse direction, we have the following theorem:

**Theorem 4.7.** Let \( \alpha \in \mathbb{R}, 0 < p < \infty, 0 < q \leq \infty \) and \( w \in A_\infty \). If

\[
f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in \mathcal{D}_\nu} s_Q a_Q \text{ in } S'_\infty
\]

where \( \{a_Q\}_{Q \in \mathcal{D}_\nu, \nu \in \mathbb{Z}} \) is a sequence of \((L, M, p, w)\) atoms and \( \{s_Q\}_{Q \in \mathcal{D}_\nu, \nu \in \mathbb{Z}} \) is a sequence of coefficients satisfying

\[
\left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q} \left( \sum_{Q \in \mathcal{D}_\nu} w(Q)^{-1/p} |s_Q| \chi_Q \right) \right]^{1/q} \right\|_{p,w} < \infty,
\]

then \( f \in \dot{F}_{p,q,w}^{\alpha,L} \) and

\[
\| f \|_{\dot{F}_{p,q,w}^{\alpha,L}} \lesssim \left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q} \left( \sum_{Q \in \mathcal{D}_\nu} w(Q)^{-1/p} |s_Q| \chi_Q \right) \right]^{1/q} \right\|_{p,w}
\]

provided \( M > \frac{\alpha}{2} + \frac{1}{2} \max\{\alpha, \frac{m_w}{1 + \alpha} \} \).

**Proof.** The proof of this theorem is similar to that of Theorem 4.3. Hence, we just sketch the main ideas.

With the same notations as in the proof of Theorem 4.3, from (88) we have

\[
2^{j \alpha} |\psi_j (\sqrt{L}) f| \lesssim \sum_{\nu \geq j} 2^{-(\nu-j)(2M-nq/r-\alpha)} M_{w,r} \left( \sum_{Q \in \mathcal{D}_\nu} 2^{\nu q} |s_Q| w(Q)^{-1/p} \chi_Q \right)
\]

\[+ \sum_{\nu < j} 2^{-(2M-\alpha)(j-\nu)} M_{w,r} \left( \sum_{Q \in \mathcal{D}_\nu} 2^{\nu q} |s_Q| w(Q)^{-1/p} \chi_Q \right).
\]

By using (10) we conclude that

\[
\| f \|_{\dot{F}_{p,q,w}^{\alpha,L}} = \left\| \left[ \sum_{j \in \mathbb{Z}} (2^{j \alpha} |\psi_j (\sqrt{L}) f|)^q \right]^{1/q} \right\|_{p,w}
\]

\[
\lesssim \left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu q} \left( \sum_{Q \in \mathcal{D}_\nu} w(Q)^{-1/p} |s_Q| \chi_Q \right) \right]^{1/q} \right\|_{p,w}.
\]

This completes our proof.

\( \square \)
Remark 4.8. By a careful examination the proof of Theorem 4.2 and Theorem 4.6, it is easy to see that each atom $a_Q = L^{2M}b_Q$, defined by (84), belongs to the spaces of test functions $S_{\infty}$. As a direct consequence of the atomic decomposition results in these two theorems, the test functions space $S_{\infty}$ is dense in both $B_{p,q,w}$ and $F^{0,L}_{p,q,w}$ when $0 < p, q < \infty$.

We can mimic Definition 4.1 to define new molecules associated to $L$ as follows: Let $0 < p \leq \infty$, $N > 0$, $M \in \mathbb{N}^+$, and $w \in A'_{\infty}$. A function $m$ is said to be an $(L, M, N, p, w)$ molecule if there exists a dyadic cube $Q \in D$ so that

(i) $m = L^{M}b$;

(ii) $|L^{k}b(x)| \leq \ell(Q)^{2(M-k)}w(Q)^{-1/p}(1 + \frac{|x - x_Q|}{\ell(Q)})^{-N}$, $k = 0, \ldots, 2M$;

where $B_Q$ is a ball associated to $Q$ defined in Remark 2.4.

Then we can adapt the arguments in the proofs of Theorem 4.2 and Theorem 4.6 to obtain the molecular decompositions for our new Besov and Triebel–Lizorkin spaces. However, we do not aim to present the results in this paper and leave the details to the interested reader. We note that the molecular decomposition theorem for the unweighted case was obtained in [41] under the additional assumptions (H) and (C) by using a different approach. See Remark 6.3 below.

5. IDENTIFICATIONS OF OUR NEW BESOV AND TRIEBEL–LIZORKIN SPACES WITH KNOWN FUNCTION SPACES

5.1. Coincidence with $L^p_w(X)$ spaces. We have the following results.

Theorem 5.1. For $1 < p < \infty$ and $w \in A_p$, we have

\[ F^{0,L}_{p,2,w}(X) \equiv L^p_w(X). \]

Proof. Arguing similarly to the proof of [4, Theorem 7.2] we prove that for any $m \in \mathbb{N}^+$,

\[ \left\| \left[ \int_{0}^{\infty} |\Psi_{m,L}(t)| f(t)^2 dt \right]^{1/2} \right\|_{p,w} \sim c_{p,w} \|f\|_{p,w}. \]

This, along with Corollary 3.8, implies (90). \qed

5.2. Coincidence with the weighted Hardy spaces $H^p_{L,w}$. Let $0 < p \leq 1$ and $w \in A'_{\infty}$. The weighted Hardy space $H^p_{L,w}$ is defined as the completion of the set

\[ \{ f \in L^2 : S_L f \in L^p_w \} \]

under the norm $\|f\|_{H^p_{L,w}} = \|S_L f\|_{p,w}$ where

\[ S_L f(x) = \left[ \int_{0}^{\infty} \int_{d(x,y) < t} |t^2 L^{-t} f(y)|^2 \frac{du dt}{lV(x,t)} \right]^{1/2}. \]

The Hardy spaces $H^1_L$ was initiated in [3]. See also [36]. The theory of Hardy spaces associated to operators satisfying Davies–Gaffney estimates $H^1_L$ was established in [49]. The weighted version for $H^p_{L,w}$ was investigated in [16]. From Proposition 3.14 we obtain:

Theorem 5.2. Let $0 < p \leq 1$ and $w \in A'_{\infty}$. Then we have

\[ H^p_{L,w} \equiv F^{0,L}_{p,2,w}. \]

Moreover, we have an interesting characterization for the weighted Hardy spaces:

Proposition 5.3. Let $0 < p \leq 1$ and $w \in A'_{\infty}$ and let $\psi$ be a partition of unity and $\varphi \in \mathcal{S}_1(\mathbb{R})$.

Then for any $f \in L^2 \cap H^p_{L,w}$ we have

\[ \|f\|_{H^p_{L,w}} \sim \left\| \left[ \int_{0}^{\infty} |\psi(t\sqrt{L}) f(t)^2 dt \right]^{1/2} \right\|_{p,w} \sim \left\| \left[ \int_{0}^{\infty} |\varphi(t\sqrt{L}) f(t)^2 dt \right]^{1/2} \right\|_{p,w} \sim \|G_{\lambda,2}(\psi(t\sqrt{L}) f)\|_{p,w} \sim \|S_2(\psi(t\sqrt{L}) f)\|_{p,w} \sim \|G_{\lambda,2}(\varphi(t\sqrt{L}) f)\|_{p,w} \sim \|S_2(\varphi(t\sqrt{L}) f)\|_{p,w}. \]
where $\mathcal{S}_2$ and $\mathcal{G}_{\lambda,2}$ are square functions defined in (64) and (65).

**Proof.** The proposition follows immediately from Theorem 3.5, Theorem 3.6, Proposition 3.13 and Proposition 3.14. $\square$

**Remark 5.4.** These equivalent norm estimates for weighted Hardy spaces $H^p_{L,w}$ are new. It is worth noticing that in the particular case when $\varphi(\xi) = \xi^2 e^{-\xi^2}$ with $M \geq 1$ the equivalent estimate in Proposition 5.3

$$\|f\|_{H^p_{L,w}} \sim \left\|\left[\int_0^\infty |\varphi(t\sqrt{L}) f|^2 \frac{dt}{t}\right]^{1/2}\right\|_{p,w}$$

reads

$$\|f\|_{H^p_{L,w}} \sim \left\|\left[\int_0^\infty |(t^2 M e^{-t^2 L}) f|^2 \frac{dt}{t}\right]^{1/2}\right\|_{p,w}.$$  

Note that this estimate was proved in [45] (see also [37]) for $M = 1$.

### 5.3. Coincidence with the weighted BMO spaces $BMO_{L,w}(X)$

**Definition 5.5.** Let $w \in A_\infty$. The function $f \in \mathcal{S} \cap L^1_{\text{loc}}(X)$ is said to be in $BMO_{L,w}(X)$, the weighted space of functions of bounded mean oscillation associated to $L$, if

$$\|f\|_{BMO_{L,w}(X)} := \sup_{B: \text{balls}} \frac{1}{w(B)} \int_B |f(x)| \mu(dx) < \infty. \quad (92)$$

The unweighted BMO space $BMO_L(X)$ associated to operators $L$ was first introduced by [35]. The weighted version was studied in [19, 44].

It was proved in Theorem 5.5 [44] that when $L = -\Delta$ on $\mathbb{R}^n$, we have

$$BMO_{-\Delta,w}(\mathbb{R}^n) = BMO_w(\mathbb{R}^n) \quad (93)$$

for all $w \in A_1 \cap RH_2$, where

$$BMO_w(\mathbb{R}^n) = \left\{ f \in L^1_{\text{loc}} : \|f\|_{BMO_w} := \sup_{B: \text{balls}} \frac{1}{w(B)} \int_B |f - f_B| \mu(dx) < \infty \right\}.$$

We now prove the coincidence between the weighted BMO space $BMO_{L,w}(X)$ and the weighted Triebel–Lizorkin space $\dot{F}^{0,L}_{\infty,2,w}(X)$.

**Theorem 5.6.** We have the following identities.

(a) $BMO_L(X) \equiv \dot{F}^{0,L}_{\infty,2}(X)$ in the sense that if $f \in BMO_L(X)$ then $f \in \dot{F}^{0,L}_{\infty,2}(X)$; conversely, if $f \in \dot{F}^{0,L}_{\infty,2}(X)$ then there exists $\rho \in \mathcal{P}$ so that $f - \rho \in BMO_L(X)$.

(b) Let $w \in A_1 \cap RH_2$. Then we have $BMO_w(\mathbb{R}^n) \equiv \dot{F}^{0,-\Delta}_{\infty,2,w}(\mathbb{R}^n)$ in the similar sense to that of (a).

**Proof.** (a) It was proved in Theorem 4.2 [50] that

$$\sup_{x \in \mathbb{R}^n, t > 0} \left( \frac{1}{V(x,t)} \int_{B(x,t)} \int_0^t s^2 L e^{-s^2 L} e^{-s^2 L} f \left( \int_0^t \frac{ds}{s} \right)^2 \mu(dy) \right)^{1/2} \sim \|f\|_{BMO_{L,w}(X)}.$$  

This, along with Theorem 3.21, implies the assertion.

(b) It was proved in [44] that

$$\|f\|_{BMO_w(\mathbb{R}^n)} \sim \sup_{x \in \mathbb{R}^n, t > 0} \left( \frac{|B(x,t)|}{w(B(x,t))^2} \int_{B(x,t)} \int_0^t s^2 \Delta e^{s^2 \Delta} (I - e^{s^2 \Delta}) f \left( \int_0^t \frac{ds}{s} \right)^2 \mu(dy) \right)^{1/2}. \quad (94)$$

Using this and Theorem 3.21, we derive part (b). $\square$
5.4. Coincidence with the weighted Sobolev spaces $\dot{W}_{p,w}^{s,L}$. For $s \in \mathbb{R}$, we define $L^{s/2} : S_{\infty} \to S_{\infty}$ by setting:

\begin{equation}
L^{s/2} f = \frac{1}{\Gamma(m-s/2)} \int_0^{\infty} t^{-s/2}\langle tL \rangle^m e^{-tL} f \frac{dt}{t}
\end{equation}

for any $m \in \mathbb{N}, m > s/2$.

Arguing similarly to Proposition 2.10, we can prove that the right hand side in (94) converges in $S_{\infty}$. Moreover, by integration by part we can see that

\begin{equation}
\frac{1}{\Gamma(m-s/2)} \int_0^{\infty} t^{-s/2}\langle tL \rangle^m e^{-tL} f \frac{dt}{t} = \frac{1}{\Gamma(\ell-s/2)} \int_0^{\infty} t^{-s/2}\langle tL \rangle^\ell e^{-tL} f \frac{dt}{t}
\end{equation}

for any $m, \ell \in \mathbb{N}, m, \ell > s/2$.

Therefore, $L^{s/2}$ given by (94) is well-defined as an operator from $S_{\infty}$ into $S_{\infty}$. Moreover, it is easy to check that

\begin{equation}
L^\alpha [L^\beta f] = L^{\alpha+\beta} f, \quad \forall f \in S_{\infty}.
\end{equation}

We now define the weighted Sobolev spaces $\dot{W}_{p,w}^{s,L}$ as follows: Let $s \in \mathbb{R}, 1 < p < \infty$ and $w \in A_{\infty}$. The weighted Sobolev space $\dot{W}_{p,w}^{s,L}$ is defined as the completion of the set

\begin{equation}
\left\{ f \in S_{\infty} : \|L^{s/2} f\|_{p,w} < \infty \right\}
\end{equation}

under the norm $\|f\|_{\dot{W}_{p,w}^{s,L}} = \|L^{s/2} f\|_{p,w}$.

**Theorem 5.7.** Let $s \in \mathbb{R}, 1 < p < \infty$ and $w \in A_{\infty}$. Then we have

$\dot{W}_{p,w}^{s,L} \equiv \dot{F}_{p,2,w}^{s,L}$.

**Proof.** From Remark 4.8, we need only to show that

$\dot{W}_{p,w}^{s,L} \cap S_{\infty} \equiv \dot{F}_{p,2,w}^{s,L} \cap S_{\infty}$.

Indeed, let $f \in \dot{F}_{p,2,w}^{s,L} \cap S_{\infty}$ and $\psi$ be a partition of unity. Then by Theorem 5.1 and the spectral theory, for $g \in L^p_{w^{1-p'}}$,

\begin{equation}
\|L^{s/2} f, g\| \leq c_\psi \int_X \int_0^{\infty} \psi^2(t\sqrt{L}) L^{s/2} f(x) g(x) \frac{dt}{t} d\mu(x) \leq c_\psi \int_X \int_0^{\infty} \psi^2(t\sqrt{L}) L^{s/2} f(x) \frac{dt}{t} d\mu(x) \leq c_\psi \left[ \int_0^{\infty} \psi(t\sqrt{L})^2 L^{s/2} f \frac{dt}{t} \right]^{1/2} \|g\|_{p',w^{1-p'}}\|p',w^{1-p'}
\end{equation}

where $c_\psi = \left[ \int_0^{\infty} \psi^3(s) ds \right]^{-1}$, and we use Hölder’s inequality in the last inequality.

On the other hand, since $w \in A_p, w^{1-p'} \in A_{p'}$. By Theorem 5.1 and Theorem 3.5 we have

\begin{equation}
\left[ \int_0^{\infty} \psi(t\sqrt{L})^2 L^{s/2} f \frac{dt}{t} \right]^{1/2} \|g\|_{p',w^{1-p'}} \sim \|g\|_{p',w^{1-p'}}.
\end{equation}

Therefore,

\begin{equation}
\|L^{s/2} f, g\| \leq \|g\|_{p',w^{1-p'}} \left[ \int_0^{\infty} \psi(t\sqrt{L})^2 L^{s/2} f \frac{dt}{t} \right]^{1/2} \|p',w^{1-p'}
\end{equation}

Using (94) we have

\begin{equation}
\psi^2(t\sqrt{L}) L^{s/2} f(x) = \frac{1}{\Gamma(m-s/2)} \int_0^{\infty} u^{-s/2} \psi(t\sqrt{L}) (uL)^m e^{-uL} \psi(t\sqrt{L}) f \frac{du}{u}
\end{equation}

\begin{equation}
= \int_{t^2} \ldots + \int_0^{\infty} \ldots =: E_1(x,t) + E_2(x,t).
\end{equation}
Fix \( \lambda > \max\{n/q, nqw/p\} \) and \( M > (\lambda + s)/2 \). By Lemma 2.6 we have, for \( N > n \),

\[
|E_1(x, t)| \lesssim \int_0^t \int_X u^{-s/2} \left( \frac{t}{u} \right)^M \left( 1 + \frac{d(x, y)}{u} \right)^{-N-\lambda} |\psi(t\sqrt{L})f(y)| d\mu(y) \frac{dt}{t} \\
\lesssim \int_0^t \int_X u^{-s/2} \left( \frac{t}{u} \right)^{M-\lambda/2} \left( 1 + \frac{d(x, y)}{u} \right)^{-N} \psi_\lambda^s(t\sqrt{L})f(x) d\mu(y) \frac{dt}{t} \\
\lesssim t^{-s} \psi_\lambda^s(t\sqrt{L})f(x).
\]

Similarly, we have

\[
|E_2(x, t)| \lesssim t^{-s} \psi_\lambda^s(t\sqrt{L})f(x).
\]

Hence, with \( s, \lambda \) as in (97),

\[
(|\psi^2(t\sqrt{L})L^{s/2}f(x)| \lesssim t^{-s} \psi_\lambda^s(t\sqrt{L})f(x)
\]

Inserting this into (96), then using Theorem 3.5 we get that

\[
\left| \langle L^{s/2}f, g \rangle \right| \lesssim \left\| g \|_{p', w^{1-p}} \right\| \left[ \int_0^\infty \left( t^{-s} \psi_\lambda^s(t\sqrt{L})f \right)^2 \frac{dt}{t} \right]^{1/2} \|_{p,w} \\
\lesssim \left\| g \|_{p', w^{1-p}} \right\| \| f \|_{p^0, w}.
\]

This implies \( \|L^{s/2}f\|_{p,w} \lesssim \|f\|_{p^0, w} \). Hence, \( \tilde{W}_{p, w}^{s,L} \cap S_\infty \hookrightarrow \tilde{W}_{p, w}^{s,L} \cap S_\infty \).

Conversely, let \( \psi \in \mathcal{S}(\mathbb{R}) \) so that \( \psi^3 \) is a partition of unity. Then for \( f \in \tilde{W}_{p, w}^{s,L} \cap S_\infty \), by (95) we have

\[
\|f\|_{\tilde{W}_{p, w}^{s,L}} := \left\| \left\{ \sum_{j \in \mathbb{Z}} (2^{-js} |\psi^3(2^{-j\sqrt{L}}f)|^2) \right\}^{1/2} \right\|_{p,w} \\
\lesssim \left\| \left\{ \sum_{j \in \mathbb{Z}} (2^{-js} L^{-s/2} \psi^3(2^{-j\sqrt{L}}(L^{s/2}f)))^2 \right\}^{1/2} \right\|_{p,w}.
\]

Arguing similarly to the proof of (97) we have, for each \( j \in \mathbb{Z} \),

\[
|L^{-s/2} \psi^3(2^{-j\sqrt{L}})(L^{s/2}f)| \lesssim 2^{js} \psi_\lambda^s(\sqrt{L})(L^{s/2}f).
\]

Therefore,

\[
\|f\|_{\tilde{W}_{p, w}^{s,L}} \lesssim \left\| \left\{ \sum_{j \in \mathbb{Z}} \psi_\lambda^s(\sqrt{L})(L^{s/2}f) \right\}^{1/2} \right\|_{p,w}.
\]

This, together with Proposition 2.16 and Proposition 3.3, yields

\[
\|f\|_{\tilde{W}_{p, w}^{s,L}} \lesssim \|L^{s/2}f\|_{p^0, w}.
\]

On the other hand, from Theorem 5.1 we have \( \|L^{s/2}f\|_{p^0, w} \sim \|L^{s/2}f\|_{p,w} \). Hence,

\[
\|f\|_{\tilde{W}_{p, w}^{s,L}} \lesssim \|L^{s/2}f\|_{p,w}.
\]

This completes our proof. \( \square \)

5.5. Coincidence with weighted Hardy–Sobolev spaces \( H^{S_{s,L}}_{p,w} \). For \( s \in \mathbb{R} \), \( 0 < p \leq 1 \), and \( w \in A_\infty \) the weighted Hardy-Sobolev space \( H^{S_{s,L}}_{p,w} \) is defined as the completion of the set

\[
\left\{ f \in S_\infty : \|L^{s/2}f\|_{H_{p,w}^L} < \infty \right\}
\]

under the norm \( \|f\|_{H^{S_{s,L}}_{p,w}} = \|L^{s/2}f\|_{H_{p,w}^L} \), where \( H_{p,w}^L \) is the weighted Hardy space defined as in Subsection 5.2.

**Theorem 5.8.** Let \( s \in \mathbb{R} \), \( 0 < p \leq 1 \), and \( w \in A_\infty \). Then we have

\[
H^{S_{s,L}}_{p,w} = \tilde{F}_{s,L}^{w,p}.
\]
**Proof.** Since $S_\infty$ is dense in both spaces, we need only to verify that
$$H^{s,L}_{p,w} \cap S_\infty \equiv \dot{H}^{s,L}_{p,w} \cap S_\infty.$$  

We first verify that $\dot{F}^{s,L}_{p,2,w} \cap S_\infty \subset H^{s,L}_{p,w} \cap S_\infty$. Indeed, if $f \in \dot{F}^{s,L}_{p,2,w} \cap S_\infty$, then by Theorem 5.2 and Theorem 3.5 we have
$$\|f\|_{H^{s,L}_{p,w}} = \|L^{s/2}f\|_{H^p_{p,w}} \sim \left[ \int_0^\infty \psi(t\sqrt{L})(L^{s/2}f) \right]^{1/2},$$

where $\psi \in \mathcal{S}(\mathbb{R})$ so that $\dot{\psi}^3$ is a partition of unity.

At this stage, we argue similarly to the proof of Theorem 5.8 to obtain that
$$\|f\|_{H^{s,L}_{p,w}} \lesssim \|f\|_{F^{s,L}_{p,2,w}}$$

which implies $\dot{F}^{s,L}_{p,2,w} \cap S_\infty \subset H^{s,L}_{p,w} \cap S_\infty$.

The converse direction is similar and we omit the details.

\[
\square
\]

6. Comparison with classical Besov and Triebel-Lizorkin spaces

**Definition 6.1.** Let $0 < p \leq \infty, w \in A_\infty$ and $\epsilon > 0$. A function $a$ is said to be a $(p, w, \epsilon)$ atom if there exists a dyadic cube $Q \in D_\nu$ such that

(i) $\text{sup} \, a \subset 3B_0$;
(ii) $|a(x)| \leq w(Q)^{-1/p}$;
(iii) $|a(x) - a(y)| \leq w(Q)^{1/p} \left( \frac{d(x, y)}{2^\nu} \right)$;
(iv) $\int a(x)d\mu(x) = 0$.

Let $0 < p < \infty, w \in A_\infty$ and $\epsilon > 0$. We say that a function $f$ has a $(p, w, \epsilon)$ atomic representation of Besov type if

$$f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q a_Q \text{ in } L^2$$

where $\{a_Q\}$ is a sequence of $(p, w, \epsilon)$ atoms and $s := \{s_Q\}$ is a sequence of numbers satisfying

$$\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu a_Q} \left( \sum_{Q \in D_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q} < \infty.$$

Then the weighted Besov space is defined as follows

**Definition 6.2.** Let $\alpha \in (-1, 1), 0 < p, q < \infty$ and $w \in A_\infty$. The weighted Besov space $B^\alpha_{p,q,w}$ is defined as the completion of the set of all $L^2$-functions having a $(p, w, \epsilon)$ atomic representation of Besov type under the norm

$$\|f\|_{B^\alpha_{p,q,w}} = \inf \left\{ \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu a_Q} \left( \sum_{Q \in D_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q} : f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q a_Q \right\}.$$

Similarly, the weighted Triebel-Lizorkin spaces $F^\alpha_{p,q,w}$ is defined by replacing the quantity

$$\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu a_Q} \left( \sum_{Q \in D_\nu} |s_Q|^p \right)^{q/p} \right]^{1/q},$$

by

$$\left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu a_Q} \left( \sum_{Q \in D_\nu} w(Q)^{-1/p} |s_Q|^q \right)^{1/q} \right].$$
Remark 6.3. Up to now we have stated and proved our results under rather mild assumptions on \( L \); namely, we have assumed that \( L \) is a nonnegative self-adjoint operator for which its heat kernel \( p_t(x,y) \) satisfies the Gaussian upper bound \((GE)\). In some applications below we will require \( L \) also to satisfy one or both of the following additional conditions:

\( \text{(H)} \) There exists \( \delta_0 \in (0,1] \) so that

\[
|p_t(x,y) - p_t(\bar{x},y)| \lesssim \left( \frac{d(x,\bar{x})}{\sqrt{t}} \right)^{\delta_0} \frac{1}{V(x,\sqrt{t})} \exp \left( - \frac{d(x,y)^2}{ct} \right)
\]

whenever \( d(x,\bar{x}) < \sqrt{t} \). (Hölder Continuity Property.)

\( \text{(C)} \) \( \int_X p_t(x,y) \, d\mu(x) = 1 \) for all \( y \in X \) and \( t > 0 \). (Conservation Property.)

We have the following estimate:

Lemma 6.4. Let \( \Phi \) be a function as in Lemma 2.1. Also assume that \( L \) satisfies \( \text{(H)} \). Then for any \( M \in \mathbb{N} \) we have

\[
|K_{(t^2)\mu} \Phi(t\sqrt{L})(x,y) - K_{(t^2)\mu} \Phi(t\sqrt{L})(\bar{x},y)| \lesssim \left( \frac{d(x,\bar{x})}{t} \right)^{\delta_0} \frac{1}{V(x,t)}
\]

whenever \( d(x,\bar{x}) < t \).

Proof. The proof of this lemma is similar to that of Theorem 1 in [57]. We leave the details to the interested reader. \( \square \)

The following theorem is the main result of this section.

Theorem 6.5. Assume that \( L \) also satisfies \( \text{(H)} \) and \( \text{(C)} \). Then we have

\[
\hat{F}_{p,q,w}^{\alpha,L} = \hat{F}_{p,q,w}^{\alpha}
\]

for all \( \alpha \in (-\delta_0,\delta_0), 0 < p, q < \infty \) and \( w \in A_\infty \) such that \( \alpha + n + \delta_0 > \frac{nqw}{p} \); and

\[
\hat{F}_{p,q,w}^{\alpha,L} = \hat{F}_{p,q,w}^{\alpha}
\]

for all \( \alpha \in (-\delta_0,\delta_0), 0 < p, q < \infty \) and \( w \in A_\infty \) such that \( \alpha + n + \delta_0 > \frac{nqw}{p} \).

Proof. We will only prove \( \hat{F}_{p,q,w}^{\alpha,L} = \hat{F}_{p,q,w}^{\alpha} \), since the proof of \( \hat{F}_{p,q,w}^{\alpha,L} = \hat{F}_{p,q,w}^{\alpha} \) can be done similarly.

We split the proof into 2 steps:

**Step 1:** Proof of \( \hat{F}_{p,q,w}^{\alpha,L} \cap L^2 \rightarrow \hat{F}_{p,q,w}^{\alpha} \cap L^2 \). To do this, we will employ the same notations as in the proof of Theorem 5.6. If \( f \in \hat{F}_{p,q,w}^{\alpha,L} \cap L^2 \), then repeating the proof of Theorem 5.6 we can find a sequence of \( (L, M, p, w) \) atoms \( \{a_Q\}_{Q \in D_\nu, \nu \in \mathbb{Z}} \) and a sequence of coefficients \( \{s_Q\}_{Q \in D_\nu, \nu \in \mathbb{Z}} \) so that

\[
f = \sum_{\nu \in \mathbb{Z}} \sum_{Q \in D_\nu} s_Q a_Q \text{ in } L^2
\]

where

\[
a_Q = \frac{1}{s_Q} \int_{2^{-\nu-1}}^{2^{-\nu}} (t^2)\mu \Phi(t\sqrt{L}) \left[ \psi_M(t\sqrt{L})f \chi_Q \right] \frac{dt}{t}
\]

and moreover,

\[
\left\| \left[ \sum_{\nu \in \mathbb{Z}} 2^{\nu a_Q} \left( \sum_{Q \in D_\nu} w(Q)^{-1/p} |s_Q| \chi_Q \right) \right]^{1/q} \right\|_{p,w} \lesssim \|f\|_{\hat{F}_{p,q,w}^{\alpha,L}}.
\]

We now claim that each \( (L, M, p, w) \) atom is also \( (p, w, \delta_0) \) atom. Indeed, it is clear that each \( (L, M, p, w) \) atom satisfies (i) and (ii) in Definition 6.1. The argument as in Lemma 9.1 in [26]
implies that an \((L, M, p, w)\) atom satisfies (iv) in Definition 6.1. The condition (iii) in Definition 6.1 can be verified by making use of Lemma 6.4 and hence we omit the details. This completes the first step.

**Step 2: Proof of \(\mathcal{F}^\alpha_{p,q,w} \cap L^2 \hookrightarrow \mathcal{F}^\alpha_{p,q,w} \cap L^2\).** To do this, we need the following estimates:

**Lemma 6.6.** Let \(a_Q\) be a \((p, w, \delta_0)\) atom associated to some dyadic cube \(Q \in \mathcal{D}_\nu, \nu \in \mathbb{Z}\). Then, for any \(N > 0\), we have:

\[
(i) \ |t^{\alpha}L^{-\Delta}a_Q(x)| \lesssim w(Q)^{-1/p} \left( \frac{2^{\nu}}{t} \right)^{\delta_0} \left( 1 + \frac{d(x, x_Q)}{t} \right)^{-N}, \text{for all } t \leq 2^{-\nu};
\]

\[
(ii) \ |t^{\alpha}L^{-\Delta}a_Q(x)| \lesssim \left( \frac{2^{\nu}}{t} \right)^{\delta_0} \frac{V(Q)}{V(x_Q, t)} \left( 1 + \frac{d(x, x_Q)}{t} \right)^{-N}, \text{for all } 2^{-\nu} \leq t.
\]

**Proof.** We just sketch the main ideas. Denote by \(q_t(x; y)\) the kernel of \(tL^{-\Delta}\).

(i) If \(x \in 6B_Q\), then from (A4), we have

\[
|t^{\alpha}L^{-\Delta}a_Q(x)| \lesssim w(Q)^{-1/p} \int_{X} \frac{1}{V(y, t)} \left( 1 + \frac{d(x, y)}{t} \right)^{-K_0 - \delta_0} \frac{d(x, x_Q)}{t} \, d\mu(y)
\]

\[
\lesssim w(Q)^{-1/p} \left( \frac{t}{2^{-\nu}} \right)^{\delta_0} \left( 1 + \frac{d(x, x_Q)}{2^{-\nu}} \right)^{-N} (\text{since } y \in 6B_Q)
\]

If \(x \notin 6B_Q\), then we have \(d(x, y) \sim d(x, x_Q) \geq 2^{-\nu}\). This, together with Lemma 2.2, implies that

\[
|t^{\alpha}L^{-\Delta}a_Q(x)| \lesssim w(Q)^{-1/p} \int_{3B_Q} \frac{1}{V(y, t)} \left( 1 + \frac{d(x, y)}{t} \right)^{-K_0 - \delta_0} |a_Q(y)| \, d\mu(y)
\]

\[
\lesssim w(Q)^{-1/p} \left( \frac{t}{2^{-\nu}} \right)^{\delta_0} \left( 1 + \frac{d(x, y)}{2^{-\nu}} \right)^{-N} \int_{3B_Q} \frac{1}{V(y, t)} \left( 1 + \frac{d(x, y)}{t} \right)^{-K} \, d\mu(y)
\]

where in the last inequality we use Lemma 2.2.

This completes the proof of (i).

(ii) By (iv) in Definition 6.1, we can write

\[
|t^{\alpha}L^{-\Delta}a_Qa_Q(x)| = \left| \int_{3B_Q} [q_{t/2}(x, y) - q_{t/2}(x, x_Q)]a_Q(y) \, d\mu(y) \right|
\]

Since \(q_t(x, y) = 2 \int_X q_{t/2}(x, z) q_{t/2}(z, y) \, d\mu(z)\), we see that \(q_t(x, y)\) satisfies (98). Hence,

\[
|t^{\alpha}L^{-\Delta}a_Q(x)| \lesssim \int_{3B_Q} \left( \frac{d(y, x_Q)}{t} \right)^{\delta_0} \frac{1}{V(x_Q, t)} \left( 1 + \frac{d(x, x_Q)}{t} \right)^{-N} |a_Q(y)| \, d\mu(y)
\]

\[
\lesssim w(Q)^{-1/p} \left( \frac{2^{-\nu}}{t} \right)^{\delta_0} \frac{V(Q)}{V(x_Q, t)} \left( 1 + \frac{d(x, x_Q)}{t} \right)^{-N}.
\]

This completes the proof of (ii).
We now turn to the proof of Step 2. Using Lemma 6.6, and arguing similarly to (88) we have

$$|\psi_j(\sqrt{L})f| \lesssim \sum_{\nu: \nu \geq j} 2^{-(\nu-j)(\delta_0+n-nq/\rho)} M_{\nu,r}(\sum_{Q \in \mathcal{D}_r} |s_Q|w(Q)^{-1/p}\chi_Q)$$

$$+ \sum_{\nu: \nu < j} 2^{-\delta_0(n-\nu)} M_{\nu,r}(\sum_{Q \in \mathcal{D}_r} |s_Q|w(Q)^{-1/p}\chi_Q).$$

At this stage, the argument in the proof of Theorem 4.7 (see also Theorem 4.3) shows that $f \in \dot{F}_{p,q,w}^{\alpha,L}$ provided that $\alpha + n + \delta_0 > \frac{nq}{pq}$. \hfill \Box

**Remark 6.7.** Some comments for the condition $\alpha + n + \delta_0 > \frac{nq}{pq}$ are in order:

(i) If $1 \leq p, q < \infty$, the identities (99) and (100) holds true for all $\alpha \in (-\delta_0, 0)$ and $w \in A_\infty$ with $q_\infty < \min\{p, q\} \times \frac{n+\delta_0+\alpha}{n}$.

(ii) If $w \equiv 1$, the identities (99) and (100) holds true for all $\frac{n}{n+\delta_0} < p, q < \infty$ and $\frac{n}{pq} - n - \delta_0 < \alpha < \delta_0$

7. Applications

The theory of Besov and Triebel–Lizorkin spaces have a wide range of applications. See for example [9, 20, 30] and the references therein. In this section, we just give two applications to the fractional power and the spectral multipliers. Further application would be an upcoming project and will be investigated in the future.

7.1. Fractional powers.

**Theorem 7.1.** Let $s \in \mathbb{R}$ and let $L^{s/2}$ be defined as in (94). Then for $\alpha \in \mathbb{R}$ and $w \in A_\infty$, the fractional integral $L^{s/2}$ maps continuously from $\dot{B}^{\alpha,L}_{p,q,w}$ into $\dot{B}^{\alpha+s,L}_{p,q,w}$ for $0 < p, q \leq \infty$ and from $\dot{F}^{\alpha,L}_{p,q,w}$ into $\dot{F}^{\alpha+s,L}_{p,q,w}$ for $0 < p < \infty$ and $0 < q \leq \infty$.

**Proof.** Let $\psi$ be a partition of unity and let $\varphi \in \mathcal{S}(\mathbb{R})$ be supported in $[1/4, 4]$ such that $\varphi = 1$ on $[1/2, 2]$. For $f \in \dot{F}^{\alpha,L}_{p,q,w}(X)$, using (94) we have

$$\psi(t\sqrt{L})L^{s/2}f(x) = \frac{1}{\Gamma(m-s/2)} \int_0^\infty u^{-s/2}(t\sqrt{L})(uL)^m e^{-uL}(\psi(t\sqrt{L})f) \frac{du}{u}$$

$$= \int_{t^2}^{t^2/2} \ldots + \int_{t^2}^\infty \ldots =: I_1(x, t) + I_2(x, t).$$

Fix $\lambda > \max\{n/q, nq/p\}$ and $M > (\lambda + s)/2$. By Lemma 2.6 we have, for $N > n$,

$$|I_1(x, t)| \lesssim \int_0^{t^2} \int_X u^{-s/2} \left( \frac{t}{u} \right)^M \frac{1}{V(x, u)} \left( 1 + \frac{d(x, y)}{u} \right)^{-N-\lambda} |\psi(t\sqrt{L})f(y)| d\mu(y) \frac{dt}{t}$$

$$\lesssim \int_0^{t^2} \int_X u^{-s/2} \left( \frac{t}{u} \right)^{M-\lambda/2} \frac{1}{V(x, u)} \left( 1 + \frac{d(x, y)}{u} \right)^{-N} |\psi^\lambda(t\sqrt{L})f(x)| d\mu(y) \frac{dt}{t}$$

$$\lesssim t^{-s} \psi^\lambda(t\sqrt{L})f(x).$$

Similarly,

$$|I_2(x, t)| \lesssim t^{-s} \psi^\lambda(t\sqrt{L})f(x).$$

Hence,

$$|\psi(t\sqrt{L})L^{s/2}f(x)| \lesssim t^{-s} \psi^\lambda(t\sqrt{L})f(x).$$
This, along with Theorem 3.5, implies
\[
\|L^{s/2}f\|_{\dot{F}^\alpha_{p,q,w}(X)} \sim \left( \int_0^\infty \left[ t^{-\alpha} \|\psi(t\sqrt{L})L^{s/2}f\|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q}
\]
\[
\lesssim \left( \int_0^\infty \left[ t^{-\alpha-s} \|\psi_t^*(t\sqrt{L})f\|_{p,w} \right]^q \frac{dt}{t} \right)^{1/q}
\]
\[
\sim \|f\|_{\dot{F}^\alpha_{p,q,w}(X)}.
\]
Arguing similarly by using the item (b) in Theorem 3.5 we obtain
\[
\|L^{s/2}f\|_{\dot{F}^\alpha_{p,q,w}(X)} \lesssim \|f\|_{\dot{F}^\alpha_{p,q,w}(X)}.
\]
This completes our proof. \(\square\)

7.2. Spectral multiplier of Laplace transform type. Let \(m : [0, \infty) \to \mathbb{C}\) be a bounded function. We now define

(101) \[\tilde{m}(L) = \int_0^\infty tL e^{-t^2 L} m(t^2) dt\]

to be the spectral multiplier of Laplace transform type of \(L\). We have the following result:

**Theorem 7.2.** Let \(\alpha \in \mathbb{R}\) and \(w \in A_\infty\). Then the spectral multiplier of Laplace transform type \(\tilde{m}(L)\) defined by (101) is bounded on \(\dot{B}^\alpha_{p,q,w}(X)\) for \(0 < p, q \leq \infty\) and is bounded on \(\dot{F}^\alpha_{p,q,w}(X)\) for \(0 < p < \infty\) and \(0 < q \leq \infty\).

**Proof.** We will provide the proof for the Triebel-Lizorkin spaces. The boundedness on the Besov spaces can be proved similarly.

Let \(\psi\) be a partition of unity. For \(f \in \dot{F}^\alpha_{p,q,w}(X)\) we have

\[
\psi(s\sqrt{L})\tilde{m}(L)f(x) = c_\psi \int_{s/4}^{4s} \psi(u\sqrt{L})\tilde{m}(L)\psi(s\sqrt{L})f \frac{du}{u}
\]
\[
= c_\psi \int_{s/4}^{4s} \int_0^\infty m(t^2)(t^2 L)e^{-t^2 L}\psi(u\sqrt{L})\psi(s\sqrt{L})f \frac{dt}{t} \frac{du}{u}
\]
\[
= c_\psi \int_{s/4}^{4s} \int_0^u \cdots + c_\psi \int_{s/4}^{4s} \int_u^{+\infty} \cdots
\]
\[
=: E(x) + F(x)
\]

Fix \(\lambda > \max\{n/q, nw/p\}\) and \(N > n\). Lemma 2.6 and Lemma 2.2, we have

\[
|E(x)| \lesssim \int_{s/4}^{4s} \int_0^u \frac{t^2}{u^2 V(y,u)} \left( 1 + \frac{d(x,y)}{u} \right)^{-N-\lambda} |\psi(s\sqrt{L})f(y)| d\mu(y) \frac{dt}{t} \frac{du}{u}
\]
\[
\sim \int_{s/4}^{4s} \int_0^u \int_X \frac{1}{u^2 V(y,s)} \left( 1 + \frac{d(x,y)}{s} \right)^{-N-\lambda} |\psi(s\sqrt{L})f(y)| d\mu(y) \frac{dt}{t} \frac{du}{u}
\]
\[
\sim \int_{s/4}^{4s} \int_0^u \frac{t^2}{u^2} \psi_\lambda^*(s\sqrt{L})f(x) \frac{dt}{t} \frac{du}{u} \sim \psi_\lambda^*(s\sqrt{L})f(x)
\]
Similarly, for $M > \lambda/2$,
\[
|F(x)| \lesssim \int_{s/4}^{4s} \int_0^{2u} \left( \frac{u}{t} \right)^{2M} \frac{1}{V(y,t)} \left( 1 + \frac{d(x,y)}{t} \right)^{-N-\lambda} |\psi(s\sqrt{L})f(y)| \frac{dt}{t} \frac{du}{u} \\
\sim \int_{s/4}^{4s} \int_0^{2u} \left( \frac{u}{t} \right)^{2M-\lambda} \frac{1}{V(y,t)} \left( 1 + \frac{d(x,y)}{u} \right)^{-N} \left( 1 + \frac{d(x,y)}{u} \right)^{-\lambda} |\psi(s\sqrt{L})f(y)| \frac{dt}{t} \frac{du}{u} \\
\sim \psi_{\lambda}^*(s\sqrt{L})f(x).
\]
As a consequence,
\[
|\psi(s\sqrt{L})\tilde{m}(L)f(x)| \lesssim \psi_{\lambda}^*(s\sqrt{L})f(x).
\]
Therefore, the conclusion of the theorem follows immediately from Theorem 3.5. \(\square\)

**Remark 7.3.** Theorem 7.2 only requires the Gaussian upper bound condition for the operator $L$. This is a very mild condition and allows us to apply the results to a large number of applications such as the sub-Laplacians on Lie groups of polynomial growth, the Laplacians on the Heisenberg groups or the Laplace-Beltrami operators on certain Riemannian manifolds. For further details concerning examples satisfying this condition we refer to [32, Section 7] and the references therein. It is natural to ask the question on the sharp estimate for the general spectral multipliers of $L$. This problem is more complicated and we leave it as an upcoming project.
