**Normalized multi-bump solutions for saturable Schrödinger equations**

https://doi.org/10.1515/anona-2020-0054
Received December 21, 2018; accepted October 28, 2019.

**Abstract:** In this paper, we are concerned with the existence of multi-bump solutions for a class of semiclassical saturable Schrödinger equations with an density function:

$$\Delta v + I(\varepsilon x) + \frac{v^2}{1 + I(\varepsilon x) + v} = \lambda v, \quad x \in \mathbb{R}^2.$$  

We prove that, with the density function being radially symmetric, for given integer \(k \geq 2\) there exist a family of non-radial, \(k\)-bump type normalized solutions (i.e., with the \(L^2\) constraint) which concentrate at the global maximum points of density functions when \(\varepsilon \to 0^+\). The proof is based on a variational method in particular on a convexity technique and the concentration-compactness method.

**Keywords:** Schrödinger equations; saturable nonlinearity; semiclassical states; multi-bump solution; concentrations

**MSC:** 35J20, 35Q60

## 1 Introduction and main results

This paper deals with the existence of solutions \((v, \lambda) \in H^1(\mathbb{R}^2, \mathbb{R}) \times \mathbb{R}\) to the following nonlinear eigenvalue problem with saturable nonlinearity

$$\Delta v + I(\varepsilon x) + \frac{v^2}{1 + I(\varepsilon x) + v} = \lambda v, \quad x \in \mathbb{R}^2, \quad (1.1)$$

where \(\varepsilon\) is a small parameter (related to the Planck constant), \(I\) is a coupling constant, and \(I(x)\), the density function, is a bounded continuous function. This model describes paraxial counter-propagating beams in isotropic local media (e.g., [1–5]). An interesting issue concerning (1.1) is the existence of semiclassical states, which concerns the study of (1.1) for small \(\varepsilon > 0\). From the physics point of view, semiclassical states describe a sort of transition from quantum mechanics to classical mechanics as the parameter \(\varepsilon\) goes to zero. In (1.1), one can either consider the parameter \(\lambda \in \mathbb{R}\) to be given, or to be an unknown of the problem. In this paper, we study the latter case, i.e., we look for normalized solutions with the \(L^2\) norm prescribed and \(\lambda\) as a Lagrange multiplier. For small \(\varepsilon > 0\) in (1.1), we will make a first attempt to study the existence and concentration behavior of multi-bump type solutions in \(H^1(\mathbb{R}^2)\). We refer [6–8] for results on the problems of saturable nonlinearity without constraints and references therein such as existence and concentration property of solutions.
The main goal of this paper is to establish the existence and concentration behavior of multi-bump solutions with a localizing potential \( I(\varepsilon x) \) for small \( \varepsilon > 0 \)

\[
-\Delta u + \Gamma \frac{I(\varepsilon x)}{1 + I(\varepsilon x)} + u^2 u = \lambda u, \quad \text{for } x \in \mathbb{R}^2. \tag{1.2}
\]

It is well known that equation (1.2) is the Euler-Lagrange equation of the following minimization problem subject to a \( L^2 \) constraint

\[
m_{\varepsilon}(\Gamma, I) = \inf \{ E_\varepsilon(\rho) \mid \rho \in H^1(\mathbb{R}^2), \int_{\mathbb{R}^2} \rho^2 = 1 \}, \tag{1.3}
\]

where

\[
E_\varepsilon(\rho) = \int_{\mathbb{R}^2} |\nabla \rho|^2 + \Gamma [\rho^2 - \ln(1 + \frac{\rho^2}{1 + I(\varepsilon x)})].
\]

Also observe that in this case the parameter \( \lambda \in \mathbb{R} \) depending on \( \varepsilon \) (so in what follows, we denote \( \lambda = \lambda_\varepsilon \)), comes from problem (1.3) and can be interpreted as a Lagrange multiplier. Among all possible standing waves for equation (1.2), typically the most relevant are ground state solutions. Recently, in [9], by a global minimization method, we have obtained the existence and concentration behavior of positive normalized ground state solutions of equation (1.2) in \( H^1(\mathbb{R}^2) \) for small \( \varepsilon > 0 \), under the condition

(B1) \( I(x) \) satisfies

\[
I_2 = \max_{x \in \mathbb{R}^2} I(x) > \limsup_{|x| \to +\infty} I(x) = I_\infty \geq I_1 = \inf_{\mathbb{R}^2} I(x) > -1.
\]

We remark that in most cases the global minimizers are not necessarily multi-bump solutions, and that when \( I(x) \) is radially symmetric the global minimizers may be radially symmetric functions. In this paper we investigate conditions on \( I(x) = I(|x|) \) under which the minimizers are non-radial and multi-bump type solutions. In order to solve this problem, we introduce a local minimization procedure and work on a subspace of \( H^1(\mathbb{R}^2) \). The main ideas come from the methods introduced in [10, 11] of the second author. This local minimization procedure has been successfully used to treat nonlinear Dirichlet problems [10, 12] and nonlinear Neumann problems [13]. The advantage of this method is that we can get qualitative properties of the solutions constructed such as the concentration behavior and the shape of solutions with a discrete number of bumps. However this type of method and results have not been studied before for normalized solutions and there are new difficulties which require new ideas and variational techniques.

Let \( k \geq 2 \) be a fixed positive integer. We define

\[
H^1_k(\mathbb{R}^2) = \left\{ u \in H^1(\mathbb{R}^2) \mid u(g^{-1} x) = u(x), \text{ a.e. in } \mathbb{R}^2, \text{ for all } g \in G_k \right\},
\]

where

\[
G_k = \left\{ g \in O(2) \mid g(x_1, x_2) = (x_1 \cos \frac{2\pi l}{k} + x_2 \sin \frac{2\pi l}{k}, -x_1 \sin \frac{2\pi l}{k} + x_2 \cos \frac{2\pi l}{k}), (x_1, x_2) \in \mathbb{R}^2 \right\},
\]

\( l = 1, 2, \ldots, k \), and \( O(2) \) is the group of orthogonal transformations in \( \mathbb{R}^2 \). It is easy to see that \( G_k \) is a cyclic group of order \( k \). In order to get multi-bump type solutions, we consider the following minimization problem

\[
m_{\Gamma, k}(\varepsilon) = \inf_{u \in H^1_k(\mathbb{R}^2), |u|_{\varepsilon}^2 = 1} H_\varepsilon(u) = \inf_{u \in H^1_k(\mathbb{R}^2), |u|_{\varepsilon}^2 = 1} \int_{\mathbb{R}^2} |\nabla u|^2 + I[|u|^2 - \ln(1 + \frac{u^2}{1 + I(\varepsilon x)})] dx. \tag{1.4}
\]

If (B1) is satisfied and \( I(x) = I(|x|) \in C(\mathbb{R}^2, \mathbb{R}) \cap L^\infty(\mathbb{R}^2, \mathbb{R}) \) is radially symmetric, using a similar procedure as in the proof of Theorem 2.1 in [9], we may deduce the existence result of a minimizer for the above minimization problem \( m_{\Gamma, k}(\varepsilon) \). But to show the minimizers are non-radial and of multi-bump type we would need additional conditions on the density function \( I(x) \).

By (B1) we deduce that the maximum value of \( I(x) \) must be obtained on a bounded closed set. We suppose that
that if $\varepsilon$ Theorem 1.1. This conclusion is not necessarily true. For example, if only (B1) is satisfied, by Theorem 2.4 in [14], we see that $r$ and $s$ satisfy (B1).

Then we have the following Theorem.

**Theorem 1.1.** Assume that $I(x)$ satisfies (B1)–(B2). For any integer $k \geq 2$ fixed, there exists $\Gamma_0 = \Gamma_0(I_{\infty}, k, \delta_0, r_0)$ (but independent of $\varepsilon > 0$, $I_1$ and $I(0)$), for each fixed $\Gamma < \Gamma_0$, there exist $\varepsilon_0 = \varepsilon_0(\Gamma) > 0$ and $\alpha_0 = \alpha_0(\Gamma) > 0$ such that if $0 < \varepsilon < \varepsilon_0$ and $0 < 1 + I(0) < \alpha_0$, $m_{r,k}(\varepsilon)$ has a minimizer solution $u_\varepsilon \in H_1^1(\mathbb{R}^2)$ satisfying

$$(i) \quad \lim_{\varepsilon \to 0^+} m_{r,k}(\varepsilon) = km_0(\frac{1}{k}, I_2),$$

where

$$m_0 \left( \frac{1}{k}, I_2 \right) = \inf_{u \in H^1_0(\mathbb{R}^2), I_1 \geq \frac{1}{k}} \int_{\mathbb{R}^2} \left| \nabla u \right|^2 + \Gamma |u|^2 - \ln(1 + \frac{u^2}{1 + I(x)}) \, dx.$$ 

(ii) $u_\varepsilon$ is of $k$-bump type in the sense that $u_\varepsilon$ has exactly $k$ maximum points which form a $G_k$-orbit $G_k(y_\varepsilon)$ for some $y_\varepsilon \in \mathbb{R}^2$ satisfying $|y_\varepsilon| \to 1$ and up to subsequences

$$\left| u_\varepsilon - \sum_{i=1}^{k} \frac{w(x + \frac{y_\varepsilon e_1}{\varepsilon})}{\varepsilon} \right|_{H^1(\mathbb{R}^2)} \to 0, \text{ as } \varepsilon \to 0^+,$$

where $w(x)$ is a minimizer of $m(\frac{1}{k}, I_2)$ and $e_1 \in S^1 = \{ x \in \mathbb{R}^2 | |x| = 1 \}.$

The existence of a minimizer follows from the work of [14] (will be stated in Theorem 2.1), and we mainly concern whether there are multi-bumps for the local minimizers $u_\varepsilon \in H_1^1(\mathbb{R}^2)$ as $\varepsilon \in (0, \varepsilon_0)$. Generally speaking, this conclusion is not necessarily true. For example, if only (B1) is satisfied, by Theorem 2.4 in [14], we see that $u_\varepsilon \in H_1^1(\mathbb{R}^2)$ may be a radially symmetric solution and has only one bump centered at the origin. Therefore, in order to construct multi-bump solutions, we need to impose some additional conditions on $I(x)$. We prove that (B2) and the condition on $I(0)$ are sufficient to assure the minimizers are of multi-bump type solutions.

This paper is structured as follows. In Section 2 we will present and show some useful lemmas which are useful for the proof of Theorem 1.1. Afterwards, in Section 3 we will give the proof of Theorem 1.1.

**Notation.** Throughout this paper, we denote by $C$ a positive constant, which may vary from line to line; all integrals are taken over $\mathbb{R}^2$; all $dx$ in the integrals are omitted; $L^p \equiv L^p(\mathbb{R}^2)$ $(1 \leq p < +\infty)$ is the usual Lebesgue space with the norm $|u|_p = \int_{\mathbb{R}^2} |u|^p$; $H^1 \equiv H^1(\mathbb{R}^2)$ denotes the usual Sobolev space with the norm $|u|^2 = \int_{\mathbb{R}^2} (\nabla u|^2 + |u|^2)$; $o_\varepsilon(1)$ (resp. $o_\varepsilon(1)$) will denote a generic infinitesimal as $n \to \infty$ (resp. $\varepsilon \to 0^+$); $\rightharpoonup$ denotes the strong convergence and $\to$ the weak convergence.

## 2 Some technical results

In this section, we will establish several lemmas, which will be useful to prove Theorem 1.1 in next Section. First using a similar procedure as in the proof of Theorem 2.1 in [9], we may deduce the existence result of a minimizer for $m_{r,k}(\varepsilon)$.

**Theorem 2.1.** Suppose that $I(x) = I(|x|)$ satisfies (B1)–(B2). Then for given integer $k \geq 2$, there exists $\Gamma'_0 = \Gamma'_0(I_{\infty}, k) < 0$ (independent of $\varepsilon > 0$, $I_1$ and $I(0)$), for each fixed $\Gamma < \Gamma'_0$, there exists $\varepsilon_0 = \varepsilon_0(\Gamma) > 0$ such that for all $\varepsilon \in (0, \varepsilon_0)$, the minimization problem

$$m_{r,k}(\varepsilon) = \inf_{u \in H_1^1(\mathbb{R}^2), I_1 \geq \frac{1}{k}} H_\varepsilon(u)$$

$$= \inf_{u \in H_1^1(\mathbb{R}^2), I_1 \geq \frac{1}{k}} \int_{\mathbb{R}^2} (\nabla u|^2 + \Gamma |u|^2 - \ln(1 + \frac{u^2}{1 + I(x)})).$$
possesses a solution \( u_\epsilon \), which solves equation (1.2) for some \( \lambda < 0 \).

This follows from the proofs in [9], in which \( I(x) \) is fixed throughout the proof there. As we need to place a condition on \( I(0) \) as in Theorem 1.1, closer examination tells us that the proof of the above result works through if we fix the property of \( I \) in the neighborhood of the maximum points while allowing changes of \( I(0) \). We omit the details here.

Next in order to analyze the asymptotic behavior of the minimizers \( u_\epsilon \) we prepare some estimates.

**Lemma 2.1.** For given integer \( k \geq 2 \), there exist \( \Gamma_1 = \Gamma_1(I_2, k) < 0 \) and \( 0 < a = a(I_2, k) < \frac{1}{k} \), such that for each fixed \( \Gamma < \Gamma_1 \),

\[
m(\frac{1}{k}, I_2) = \inf_{u \in H^1(\mathbb{R}^2), \int_{\mathbb{R}^2} u^2 = \frac{1}{k}} \int_{\mathbb{R}^2} \left[ |\nabla u|^2 + \Gamma |u|^2 - \ln(1 + \frac{u^2}{1 + I_2}) \right]
\]

is achieved by \( u_k \) which is radially symmetric. Moreover,

\[
km(\frac{1}{k}, I_2) < \frac{\Gamma I_2}{1 + I_2}.
\]

In particular, we have

\[
m(\frac{1}{k}, I_2) \leq \frac{a \Gamma}{2} \text{ and } \frac{ka \Gamma}{2} + 1 < 0.
\]

**Proof.** Using the same arguments as Theorem 2.1 in [14], we know that there exists \( \Gamma'_1 = \Gamma'_1(I_2, k) < 0 \), such that for each fixed \( \Gamma < \Gamma'_1 \) the minimization problem \( m(\frac{1}{k}, I_2) \) is attained by \( u_k \). In addition, by Theorem 2.3 in [14], \( u_k \) is a radially symmetric function.

Moreover, we have

\[
m(\frac{1}{k}, I_2) = \inf_{u \in H^1(\mathbb{R}^2), \int_{\mathbb{R}^2} u^2 = \frac{1}{k}} \int_{\mathbb{R}^2} \left[ |\nabla u|^2 + \Gamma |u|^2 - \ln(1 + \frac{u^2}{1 + I_2}) \right]
\]

and this implies

\[
km(\frac{1}{k}, I_2) < \frac{\Gamma I_2}{1 + I_2}.
\]

On the other hand, we may find a sequence of functions \( u_n \) such that \( ||u_n||^2 = \frac{1}{k} \) and \( a_n = \int_{\mathbb{R}^2} [u_n^2 - \ln(1 + \frac{u_n^2}{1 + I_2})] \to \frac{1}{k} \) as \( n \to \infty \). In fact, this can be done by choosing \( v(x) \in C_0^\infty(B_1(0)) \) such that \( \int_{\mathbb{R}^2} v^2 = \frac{1}{k} \), and setting \( u_n(x) = nv(nx) \), then

\[
a_n = \int_{\mathbb{R}^2} [u_n^2 - \ln(1 + \frac{u_n^2}{1 + I_2})] = \int_{\mathbb{R}^2} [n^2 v^2(nx) - \ln \left( 1 + \frac{n^2 v^2(nx)}{1 + I_2} \right)]
\]

\[
= \int_{\mathbb{R}^2} \left[ v^2(y) - \frac{1}{n^2} \ln \left( 1 + \frac{n^2 v^2(y)}{1 + I_2} \right) \right] = \frac{1}{k} - \int_{\mathbb{R}^2} \frac{1}{n^2} \ln \left( 1 + \frac{n^2 v^2(y)}{1 + I_2} \right)
\]

\[
\to \frac{1}{k}, \text{ as } n \to \infty.
\]

Here we used the fact for \( b > 0 \) fixed,

\[
\frac{\ln(1 + b \rho)}{\rho} \to 0, \text{ as } \rho \to +\infty.
\]

Hence, there is a function \( u_0 \) with \( ||u_0||^2 = \frac{1}{k} \) and

\[
0 < a \equiv a(I_2, k) = \int_{\mathbb{R}^2} [u_0^2 - \ln(1 + \frac{u_0^2}{1 + I_2})] < \frac{1}{k}.
\]
Noticing that
\[
\lim_{I' \to -\infty} \frac{m(\frac{1}{k}, I_2)}{I'} \geq \lim_{I' \to -\infty} \frac{\int_{\mathbb{R}^2} |\nabla u_0|^2 + I[u_0^2 - \ln(1 + \frac{u_0^2}{I'})]}{I'} = a > 0.
\]
Therefore, there exists \( I''_1 = I''_1(I_2, k) \), such that
\[
m(\frac{1}{k}, I_2) \leq \frac{aI'}{2} \quad \text{and} \quad \frac{kaI'}{2} + 1 < 0
\]
if \( I < I''_1 \).
As a result, taking
\[
I_1 = I_1(I_2, k) = \min\{I''_1(I_2, k), I''_1(I_2, k)\},
\]
we can get the desired results for Lemma 2.1.

Now in the following, for given \( k \in \mathbb{N}^+ \), we always fix
\[
I < I_0 = I_0(I_2, I_\infty, k) \equiv \min\{I_1(I_2, k), I'_0(I_\infty, k)\} < 0,
\]
where \( I'_0(I_\infty, k) \) is given in Theorem 2.1.
We remark that by Theorem 2.1 and (B2), we know that no matter how \( I(x) \) changes outside the neighborhood of \(|x| - 1 | \leq 2r_0 \), for each fixed \( I < I_0 \), there exists \( \epsilon_0 = \epsilon_0(I) > 0 \), such that \( m_{I, \epsilon}(\epsilon) \) is always achieved by some \( u_{\epsilon} \in H^1_k(\mathbb{R}^2) \) for \( \epsilon \in (0, \epsilon_0) \). At the same time, by Theorem 2.1, we know that \( u_{\epsilon} \) satisfies
\[
-\Delta u_{\epsilon} + \frac{I(\epsilon x) + u_{\epsilon}^2}{1 + I(\epsilon x) + u_{\epsilon}^2} u_{\epsilon} = \lambda_{\epsilon} u_{\epsilon}, \quad x \in \mathbb{R}^2,
\]
where \( \lambda_{\epsilon} \) is associated Lagrange multiplier.

Next, we start to study the qualitative properties for the minimizer \( u_{\epsilon} \) of \( m_{I, \epsilon}(\epsilon) \).

**Lemma 2.2.** It holds that
\[
\lim_{\epsilon \to 0^+} m_{I, \epsilon}(\epsilon) \leq km(\frac{1}{k}, I_2).
\]

**Proof.** Taking \( \epsilon_1 \in S^1 \) and the \( G_k \)-orbit of \( \epsilon_1 \) containing exactly \( k \) points, \( \{g_i \epsilon_1 | i = 1, 2, \ldots, k\} \), and defining
\[
U_{\epsilon}(x) = \sum_{i=1}^{k} w(x + \frac{g_i \epsilon_1}{\epsilon}),
\]
where \( w(x) \in H^1(\mathbb{R}^2) \) is the minimizer of \( m(\frac{1}{k}, I_2) \) so \( w(x) \to 0 \) as \(|x| \to \infty \). Moreover, by Lemma 2.1, \( w \) is radially symmetric. Since
\[
\lim_{\epsilon \to 0^+} \frac{g_i \epsilon_1 - g_j \epsilon_1}{\epsilon} = +\infty \quad \text{for} \quad i \neq j,
\]
we have
\[
||U_{\epsilon}(x)||^2 = \int_{\mathbb{R}^2} \left( \sum_{i=1}^{k} w(x + \frac{g_i \epsilon_1}{\epsilon}) \right)^2 dx
\]
\[
= \sum_{i=1}^{k} \int_{\mathbb{R}^2} |w(x + \frac{g_i \epsilon_1}{\epsilon})|^2 dx + o_\epsilon(1)
\]
\[
\to 1, \quad \text{as} \quad \epsilon \to 0^+.
\]
Setting
\[
V_{\epsilon}(x) = \frac{U_{\epsilon}(x)}{||U_{\epsilon}(x)||_2},
\]
then \( ||V_{\epsilon}(x)||_2 = 1 \) and \( V_{\epsilon}(x) \in H^1_k(\mathbb{R}^2) \).
Therefore, according to $I(x) = I(|x|)$ satisfying (B2), we have

\[
m_{\rho, k}(\varepsilon) \leq H_\varepsilon(V_\varepsilon) = \int_{\mathbb{R}^2} |\nabla V_\varepsilon|^2 + \Gamma[V_\varepsilon^2 - \ln(1 + \frac{V_\varepsilon}{1 + I(|x|)})]
\]

\[
= \int_{\mathbb{R}^2} \left| \frac{\nabla U_\varepsilon}{|U_\varepsilon(x)|} \right|^2 + \Gamma \left[ \frac{U_\varepsilon^2}{|U_\varepsilon(x)|^2} - \ln(1 + \frac{U_\varepsilon^2}{1 + I(|x|)}) \right]
\]

\[
= \int_{\mathbb{R}^2} \left( \sum_{i=1}^k |\nabla w(x + \frac{\varepsilon e_i}{t})|^2 \frac{w(x + \frac{\varepsilon e_i}{t})^2}{|U_\varepsilon(x)|^2} - \ln(1 + \frac{|w(x + \frac{\varepsilon e_i}{t})|^2}{|U_\varepsilon(x)|^2(1 + I(|x|))}) \right) + o_\varepsilon(1)
\]

\[
= \int_{\mathbb{R}^2} \left( \sum_{i=1}^k |\nabla w(x)|^2 \frac{|w(x)|^2}{|U_\varepsilon(x)|^2} - \ln(1 + \frac{|w(x)|^2}{|U_\varepsilon(x)|^2(1 + I(|x| - g_i e_i))}) \right) + o_\varepsilon(1)
\]

\[
\to \int_{\mathbb{R}^2} \left( |\nabla w|^2 + \Gamma |w|^2 - \ln(1 + \frac{w^2}{1 + I(|x| - g_i e_i)}) \right) \quad \text{as } \varepsilon \to 0^+
\]

\[
k = \int_{\mathbb{R}^2} |\nabla w|^2 + \Gamma |w|^2 - \ln(1 + \frac{w^2}{1 + I(|x| - g_i e_i)}) = km(\frac{1}{k}, I_2).
\]

Thus,

\[
\lim_{\varepsilon \to 0} m_{\rho, k}(\varepsilon) \leq km(\frac{1}{k}, I_2).
\]

\[\square\]

**Lemma 2.3.** There exists $0 < \varepsilon_1 \leq \varepsilon_0$, such that for $\varepsilon \in (0, \varepsilon_1)$, the Lagrange multiplier $\lambda_\varepsilon$ in (2.3) satisfies

\[
m(1, I_2) + \frac{\Gamma}{1 + I_1} \leq \lambda_\varepsilon \leq \frac{ka \Gamma}{2} + 1 < 0,
\]

where $a > 0$ is given in Lemma 2.1.

**Proof.** By Lemma 2.2, we know that there exists $0 < \varepsilon_1 \leq \varepsilon_0$, such that for $\varepsilon \in (0, \varepsilon_1)$, we have

\[
m_{\rho, k}(\varepsilon) \leq km(\frac{1}{k}, I_2) + 1.
\]

Therefore, by (2.2), we have

\[
\lambda_\varepsilon = \frac{\lambda_\varepsilon}{k} \int_{\mathbb{R}^2} |\nabla u_\varepsilon|^2 + \Gamma \left[ \frac{I(|x|)}{1 + I(|x|)} + u_\varepsilon^2 \right]
\]

\[
= \int_{\mathbb{R}^2} \left[ |\nabla u_\varepsilon|^2 + \Gamma \left[ \frac{I(|x|)}{1 + I(|x|)} + u_\varepsilon^2 \right] - \ln(1 + \frac{u_\varepsilon^2}{1 + I(|x|)}) \right] + \Gamma \int_{\mathbb{R}^2} \left[ \frac{I(|x|)}{1 + I(|x|)} + u_\varepsilon^2 \right] - u_\varepsilon^2 + \ln(1 + \frac{u_\varepsilon^2}{1 + I(|x|)})
\]

\[
= m_{\rho, k}(\varepsilon) + \Gamma \int_{\mathbb{R}^2} \left[ \frac{I(|x|)}{1 + I(|x|)} + u_\varepsilon^2 \right] - u_\varepsilon^2 + \ln(1 + \frac{u_\varepsilon^2}{1 + I(|x|)})
\]

\[
\leq m_{\rho, k}(\varepsilon) \leq km(\frac{1}{k}, I_2) + 1
\]

\[
\leq \frac{ka \Gamma}{2} + 1 < 0.
\]
Here we have used \( \int_{\mathbb{R}^2} u_{\varepsilon}^2 = 1 \) and \( \int_{\mathbb{R}^2} [\ln(1 + \frac{u_{\varepsilon}^2}{1 + I(x)}) - \frac{u_{\varepsilon}^2}{1 + I(x) + u_{\varepsilon}^2}] \geq 0 \).

On the other hand, according to (2.3), we obtain

\[
\lambda_\varepsilon = \lambda_\varepsilon \int_{\mathbb{R}^2} u_{\varepsilon}^2 = \int_{\mathbb{R}^2} |\nabla u_{\varepsilon}|^2 + \Gamma \frac{I(x)}{1 + I(x) + u_{\varepsilon}^2} u_{\varepsilon}^2
\]

\[
= \int_{\mathbb{R}^2} |\nabla u_{\varepsilon}|^2 + \Gamma [u_{\varepsilon}^2 - \ln(1 + \frac{u_{\varepsilon}^2}{1 + I(x)})] + \Gamma \int_{\mathbb{R}^2} \left[ \frac{I(x)}{1 + I(x) + u_{\varepsilon}^2} u_{\varepsilon}^2 - u_{\varepsilon}^2 + \ln(1 + \frac{u_{\varepsilon}^2}{1 + I(x)}) \right]
\]

\[
\geq m_{\Gamma,k}(\varepsilon) + \Gamma \int_{\mathbb{R}^2} \left[ 1 + \frac{I(x)}{1 + I(x) + u_{\varepsilon}^2} u_{\varepsilon}^2 - u_{\varepsilon}^2 + \ln(1 + \frac{u_{\varepsilon}^2}{1 + I(x)}) \right]
\]

\[
= m_{\Gamma,k}(\varepsilon) + \Gamma \int_{\mathbb{R}^2} \left[ 1 + \frac{u_{\varepsilon}^2}{1 + I(x)} \right] \geq m_{\Gamma,k}(\varepsilon) + \Gamma \int_{\mathbb{R}^2} \ln(1 + \frac{u_{\varepsilon}^2}{1 + I(x)})
\]

\[
\geq m_{\Gamma,k}(\varepsilon) + \Gamma \int_{\mathbb{R}^2} \frac{u_{\varepsilon}^2}{1 + I_{1}}
\]

\[
\geq m(1, I_2) + \Gamma \frac{1}{1 + I_{1}}.
\]

Therefore, we have finished the proof of Lemma 2.3. \( \square \)

**Lemma 2.4.** There exists \( 0 < \varepsilon_2 \leq \varepsilon_0 \), such that for \( \varepsilon \in (0, \varepsilon_2) \), the minimizer \( u_\varepsilon \) of \( m_{\Gamma,k}(\varepsilon) \) satisfies

\[
||u_\varepsilon||_{H^1(\mathbb{R}^2)} \leq L = \sqrt{2 + \frac{\Gamma}{1 + I_{1}}}
\]

**Proof.** By Lemma 2.2, there exists \( 0 < \varepsilon_2 \leq \varepsilon_0 \), such that for \( \varepsilon \in (0, \varepsilon_2) \), we have

\[
1 + km\left( \frac{1}{\varepsilon}, I_2 \right) \geq m_{\Gamma,k}(\varepsilon) = \int_{\mathbb{R}^2} |\nabla u_\varepsilon(x)|^2 + \Gamma [u_\varepsilon^2(x) - \ln(1 + \frac{u_{\varepsilon}^2(x)}{1 + I(x)})]
\]

\[
\geq \int_{\mathbb{R}^2} |\nabla u_\varepsilon(x)|^2 + \Gamma.
\]

Here we have used the fact that \( \int_{\mathbb{R}^2} u_{\varepsilon}^2(x) = 1 \). Thus, by Lemma 2.1, we have

\[
||u_\varepsilon||_{H^1(\mathbb{R}^2)}^2 = \int_{\mathbb{R}^2} |\nabla u_\varepsilon(x)|^2 + u_\varepsilon^2(x)
\]

\[
\leq 2 - \Gamma + km\left( \frac{1}{\varepsilon}, I_2 \right)
\]

\[
\leq 2 - \Gamma + \frac{\Gamma I_{1}}{1 + I_{1}}
\]

\[
= 2 + \frac{\Gamma}{1 + I_{1}} := L^2.
\]

\( \square \)

Let \( u_\varepsilon \) be the minimizer of \( m_{\Gamma,k}(\varepsilon) \) for \( \varepsilon \in (0, \min\{\varepsilon_1, \varepsilon_2\}) \). Now we can obtain that there exists a sequence of points \( \{y_n\} = \{y_{n}\}_n \) in \( \mathbb{R}^2 \) such that most of the “mass” of \( u_{\varepsilon}^k(x) = u_{\varepsilon}^k(x) \) is contained in a ball of fixed size centered at \( y_n \). Here and below, we note that \( \varepsilon_n \to 0 \) if and only if \( n \to +\infty \). At the same time, in the following we may assume that, up to a subsequence, \( u_n \to v \) in \( H^1(\mathbb{R}^2) \) as \( n \to +\infty \).

**Lemma 2.5.** There exist positive constants \( R \) and \( \beta \) and a sequence \( \{y_n\} \) such that

\[
\lim\inf_{n \to +\infty} \int_{B_R(y_n)} u_{n}^2(x) \geq \beta > 0.
\]
Proof. We will do it by a contradiction argument. If not, for any \( R > 0 \), there exists a sequence \( u_n \equiv u_\varepsilon_n \) such that
\[
\lim_{n \to +\infty} \sup_{y \in \mathbb{R}^2} \int_{B_R(y)} u_n^2(x) = 0.
\]
Then by Lions’s Lemma (e.g., [15]) one has \( \|u_n\|_p \to 0 \) for any \( p > 2 \). By the fact that \( t^2 - \ln(1 + t^2) \leq Ct^4 \) for some \( C > 0 \), we have
\[
H_{\varepsilon_n}(u_n) = \int_{\mathbb{R}^2} \left| \nabla u_n \right|^2 + \Gamma \left[ |u_n^2| - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)}) \right]
\]
\[
= \int_{\mathbb{R}^2} \left| \nabla u_n \right|^2 + \Gamma \int_{\mathbb{R}^2} \frac{I(\varepsilon_n x)}{1 + I(\varepsilon_n x)} u_n^2 + \Gamma \int_{\mathbb{R}^2} \left[ \frac{u_n^2}{1 + I(\varepsilon_n x)} - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)}) \right]
\]
\[
\geq \int_{\mathbb{R}^2} \left| \nabla u_n \right|^2 + \frac{\Gamma I \varepsilon_n}{1 + I_2} + o_\varepsilon(1).
\]
Therefore, by extracting a further subsequence if necessary, we can define \( Z \) as
\[
Z = \lim_{n \to \infty} H_{\varepsilon_n}(u_n).
\]
In view of Lemma 2.2, we have \( km(\frac{1}{\varepsilon}, I_2) \geq Z \geq \frac{\Gamma I \varepsilon_n}{1 + I_2} \), a contradiction to (2.1).

**Lemma 2.6.** If the sequence \( \{y_n\} \subset \mathbb{R}^2 \) obtained in Lemma 2.5 is bounded, and \( u_n \to v \) in \( H^1_\varepsilon(\mathbb{R}^2) \) as \( n \to +\infty \), then \( \|v\|_2 = 1 \).

Proof. Without loss of generality, we may assume that \( y_n \equiv 0 \). By Lemma 2.5, we know that there exist positive constants \( R \) and \( \beta \) such that
\[
\liminf_{n \to +\infty} \int_{B_R(0)} u_n^2(x) \geq \beta > 0.
\]
Since \( u_n \to v \) in \( H^1_\varepsilon(\mathbb{R}^2) \) as \( n \to +\infty \), by (2.4), we have
\[
\int_{B_R(0)} v^2(x) \geq \beta > 0.
\]
Thus, \( v \neq 0 \) and \( u_n \to v \) in \( L^2_{\text{loc}}(\mathbb{R}^2) \) as \( n \to +\infty \).

Therefore, \( u_n(x) \to v(x) \) in \( H^1(\mathbb{R}^2) \) and \( u_n \to v \) in \( L^2(B_R(0)) \). Hence, up to a subsequence, we may assume that \( u_n(x) \to v(x) \) a.e. in \( B_R(0) \). In view of (2.5), \( v \neq 0 \) in \( B_R(0) \). By (2.5) there exists \( \sigma > 0 \) such that
\[
u_n(x) \to v(x) \text{ in } \Omega,
\]
where
\[
\Omega = \{ x : |v(x)| \geq \sigma, x \in B_R(0) \} \subset B_R(0)
\]
and
\[
\mu(\Omega) > 0.
\]
Here \( \mu(\Omega) \) is the Lebesgue measure of \( \Omega \).

Now we assert that \( \|v\|_2 = 1 \). We argue it by contradiction, assuming that \( A = \|v\|_2^2 \leq (0, 1) \). We get a contradiction as follows. For the sake of convenience, we write \( \hat{v}(x) = \frac{v(x)}{\sqrt{1 + I(\varepsilon_n x)}} \) and \( \hat{u}_n = \frac{u_n - v}{\sqrt{1 + I(\varepsilon_n x)}} \). Then, by (2.6) and (2.7), we have
\[
\hat{v}^2(x) = \frac{v^2(x)}{1 + I(\varepsilon_n x)} \geq \frac{\sigma^2}{1 + I_2} > 0 \text{ in } \Omega \text{ for } \forall n
\]
and
\[
\hat{u}_n^2(x) = \frac{(u_n(x) - v(x))^2}{1 + I(\varepsilon_n x)} \leq \frac{(u_n(x) - v(x))^2}{1 + I_1} \to 0 \text{ in } \Omega \text{ as } n \to +\infty.
\]
Let \( f(s) = s - \ln(1 + s) \), \( s \geq 0 \). By (2.8) and (2.9), using Lemma 5.2 in [14], we can find \( \alpha > 0 \) independent of \( n \) such that
\[
\int_{\Omega} \left( A\left( \frac{\nabla^2 v^2}{A} + (1 - A)\frac{\bar{u}_n^2}{|u_n - v|_2^2} \right) \right) \leq -\alpha + \int_{\Omega} Af\left( \frac{\nabla^2 v^2}{A} + (1 - A)f\left( \frac{\bar{u}_n^2}{|u_n - v|_2^2} \right) \right),
\]

as \( n \to \infty \).

Then using the convexity of \( f(s) = s - \ln(1 + s) \), \( s \geq 0 \) and (2.10), we have
\[
m_{r, k}(\varepsilon_n) = H_{\varepsilon_n}(u_n)
= \int_{\mathbb{R}^2} |\nabla u_n|^2 + \Gamma|u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)})|
= \int_{\mathbb{R}^2} |\nabla(v + (u_n - v))|^2 + \Gamma \left[ (v + (u_n - v))^2 - \ln \left( 1 + \frac{(v + (u_n - v))^2}{1 + I(\varepsilon_n x)} \right) \right]
= \int_{\mathbb{R}^2} A|\nabla(v/|v|_2)^2 + (1 - A)|\nabla((u_n - v)/|u_n - v|_2)|^2
+ \Gamma \int I(\varepsilon_n x)(\nabla^2 v + \bar{u}_n^2) + \Gamma \int f\left( A\left( \frac{\nabla^2 v^2}{A} + (1 - A)f\left( \frac{\bar{u}_n^2}{|u_n - v|_2^2} \right) \right) \right) + o_{\varepsilon_n}(1)
\geq \int_{\mathbb{R}^2} A|\nabla(v/|v|_2)^2 + (1 - A)|\nabla((u_n - v)/|u_n - v|_2)|^2
+ \Gamma \int I(\varepsilon_n x)(\nabla^2 v + \bar{u}_n^2) + \Gamma \int f\left( A\left( \frac{\nabla^2 v^2}{A} + (1 - A)f\left( \frac{\bar{u}_n^2}{|u_n - v|_2^2} \right) \right) \right) dx - \Gamma \alpha + o_{\varepsilon_n}(1)
= AH_{\varepsilon_n}(v/|v|_2) + (1 - A)H_{\varepsilon_n}(u_n - v/|u_n - v|_2) - \Gamma \alpha + o_{\varepsilon_n}(1)
\geq Am_{r, k}(\varepsilon_n) + (1 - A)m_{r, k}(\varepsilon_n) - \Gamma \alpha + o_{\varepsilon_n}(1).
\]

In particular, by (2.11), for sufficiently small \( \varepsilon_n \) satisfying \( |o_{\varepsilon_n}(1)| \leq \frac{\Gamma \alpha}{2} \), we have
\[
m_{r, k}(\varepsilon_n) \geq m_{r, k}(\varepsilon_n) - \Gamma \alpha + o_{\varepsilon_n}(1)
\geq m_{r, k}(\varepsilon_n) - \frac{\Gamma \alpha}{2},
\]
a contradiction. Therefore, we have showed \( |v|_2 = 1 \) and Lemma 2.6 is proved. \( \square \)

**Proposition 2.1.** The sequence \( \{y_n\} \) obtained in Lemma 2.5 satisfies \( |y_n| \to +\infty \) as \( n \to +\infty \).

**Proof.** Suppose for the contrary, there exist a constant \( C > 0 \) and a subsequence of \( \{y_n\} \), still denoted by \( \{y_n\} \), such that
\[
|y_n| \leq C.
\]
We may assume without loss of generality that \( y_n \equiv 0 \).

According to Lemma 2.4, \( \{u_n(x)\} \) is bounded in \( H_1^2(\mathbb{R}^2) \). Then, passing to a subsequence if necessary, we have that \( u_n \to v \) in \( H_1^2(\mathbb{R}^2) \) as \( n \to +\infty \).

By Lemma 2.6, we know that
\[
|\nabla|^2 = 1.
\]

Since \( u_n \) satisfies
\[
-\Delta u_n + \Gamma \frac{I(\varepsilon_n x) + u_n^2}{1 + I(\varepsilon_n x) + \bar{u}_n^2} u_n = \lambda_{\varepsilon_n} u_n, \quad x \in \mathbb{R}^2,
\]
by the elliptic estimates to (2.13), we have
\[
-\Delta \bar{v} + \Gamma \frac{I(0) + \bar{v}^2}{1 + I(0) + \bar{v}^2} \bar{v} = \lambda \bar{v}, \quad x \in \mathbb{R}^2.
\]
Here we have used Lemma 2.3 which implies \( \lambda_{e_n} \to \lambda > 0 \) as \( e_n \to 0 \) (up to a subsequence). Since \( v \geq 0 \) satisfying (2.14) depends on \( \Gamma \), we denote \( v \) as \( v_{\Gamma} \). Rewriting (2.14) as

\[
-\Delta v_{\Gamma} + d(x)v_{\Gamma} = 0, \quad x \in \mathbb{R}^2,
\]

with \( d(x) = \Gamma \frac{I(0) + v_{\Gamma}^2}{1 + I(0) + v_{\Gamma}^2} - \lambda_{\Gamma} \). Moreover,

\[
d(x)^- = \lambda_{\Gamma} - \Gamma \left( \frac{I(0) + v_{\Gamma}^2}{1 + I(0) + v_{\Gamma}^2} \right)^+ \leq |\Gamma|, \quad x \in \mathbb{R}^2,
\]

where \( u^+ = \max\{u, 0\} \), \( u^- = \max\{-u, 0\} \).

Now we will prove that there exists \( M = M(\Gamma) > 0 \) depending only on \( \Gamma \), such that

\[
||v_{\Gamma}||_{\infty} = ||v_{\Gamma}||_{L^\infty(\mathbb{R}^2)} \leq M.
\]

(2.17)

In particular, \( ||v_{\Gamma}||_{\infty} \) is independent of \( I(0) \).

To prove (2.17), we need the following lemma.

**Lemma 2.7.** (Subsolution estimate, Theorem C.1.2 of [16])

Suppose \( u \in H^1(B_2(x_0)) \) solves

\[
-\Delta u + V(x)u = 0 \quad \text{in} \ B_2(x_0).
\]

Then

\[
|u(x_0)| \leq C \int_{B_2(x_0)} |u|,
\]

where \( C > 0 \) is a constant depending only on the following quantities:

\[
\sup_{x \in B_2(x_0)} \int_{|y-x| < 1} V(y)^- \ dy \quad \text{if} \ N = 1;
\]

\[
\sup_{x \in B_2(x_0)} \int_{|y-x| < \frac{1}{2}} \ln(|x-y|^{-1}) V(y)^- \ dy \quad \text{if} \ N = 2;
\]

\[
\sup_{x \in B_2(x_0)} \int_{|y-x| < \frac{1}{3}} |x-y|^{2-N} V(y)^- \ dy \quad \text{if} \ N \geq 3.
\]

By (2.16), for \( N = 2 \), we have

\[
\int_{|y-x| < \frac{1}{2}} \ln(|x-y|^{-1}) \ d(y)^- \ dy \leq |\Gamma| \int_{|y-x| < \frac{1}{2}} \ln(|x-y|^{-1}) \ dy
\]

\[
\leq |\Gamma| \int_{|z| < \frac{1}{2}} \ln(|z|^{-1}) \ dz \leq C_1 |\Gamma|.
\]

(2.18)

Here \( C_1 \) does not depend on \( \Gamma \).

Therefore, by Lemma 2.7 and (2.18), we obtain

\[
|v_{\Gamma}(x_0)| \leq C \int_{B_2(x_0)} |v_{\Gamma}(y)| \ dy \quad \text{for} \ x_0 \in \mathbb{R}^2,
\]

(2.19)

where \( C = C(\Gamma) > 0 \) is a constant depending only on \( \Gamma \). In view of \( \int_{\mathbb{R}^2} |v_{\Gamma}(y)|^2 \ dy = 1 \), by (2.19), we know that there exists \( M = M(\Gamma) > 0 \) depending only on \( \Gamma \), such that

\[
|v_{\Gamma}(x_0)| \leq M \quad \text{for} \ x_0 \in \mathbb{R}^2.
\]

(2.20)
Thus, the proof of (2.17) is complete. Meanwhile, we have

$$\lim_{\varepsilon_n \to 0} H_{\varepsilon_n}(u_n) = \lim_{\varepsilon_n \to 0} \int_{\mathbb{R}^2} |\nabla u_n|^2 + I[u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n)}))] \geq \inf_{v \in H^1_0(\mathbb{R}^2), f_{\alpha_2} \neq 1} \int_{\mathbb{R}^2} |\nabla v|^2 + I[v^2 - \ln(1 + \frac{v^2}{1 + I(0)})].$$

(2.21)

Now we will prove

**Assertion 2.1.**

$$\inf_{v \in H^1_0(\mathbb{R}^2), f_{\alpha_2} \neq 1} \int_{\mathbb{R}^2} |\nabla v|^2 + I[v^2 - \ln(1 + \frac{v^2}{1 + I(0)})] > km(\frac{1}{k}, I_2).$$

(2.22)

Postponing the proof of Assertion 2.1, we finish the proof of Proposition 2.1. If Assertion 2.1 holds, by (2.21), we have

$$\lim_{\varepsilon_n \to 0} H_{\varepsilon_n}(u_n) > km\left(\frac{1}{k}, I_2\right),$$

which is a contradiction to Lemma 2.2. Therefore, the previous assumption (2.12) is false, and we obtain the conclusions of Proposition 2.1.

We now return to the proof for Assertion 2.1.

Firstly, we note that

**Lemma 2.8.** For given $T > 0$, there exists $a_0 > 0$, such that

$$1 + \frac{y}{1 + I(0)} > e^{\frac{y}{1 + I(0)}}, \quad \text{for } 0 < y \leq T,$$

as long as $0 < 1 + I(0) < a_0$.

The proof of Lemma 2.8 is elementary, we omit it here.

For given $k \in \mathbb{N}^+$, it is easy to see

$$e^{\frac{y}{1 + I(0)}} \geq \left(1 + \frac{y}{k(1 + I_2)}\right)^k \quad \text{for } 0 < y \leq M^2.$$

Then, by Lemma 2.8, for $T = M^2$, there exists $a_0 = a_0(I) > 0$, such that

$$1 + \frac{y}{1 + I(0)} > \left(1 + \frac{y}{k(1 + I_2)}\right)^k \quad \text{for } 0 < y \leq M^2$$

(2.23)

if $0 < 1 + I(0) < a_0$.

Since $0 < \nu_T(x) \leq M$ for $x \in \mathbb{R}^2$, by (2.23), we have

$$\int_{\mathbb{R}^2} \ln \left(1 + \frac{\nu_T^2}{1 + I(0)}\right) > \int_{\mathbb{R}^2} \ln \left(1 + \frac{\nu_T^2}{k(1 + I_2)}\right) = \int_{\mathbb{R}^2} \left(\frac{\nu_T^2}{k} + \ln(1 + \frac{\nu_T^2}{k(1 + I_2)}\right)^k.$$

(2.24)

On the other hand, since $\nu_T$ satisfies (2.14) and $\int_{\mathbb{R}^2} \nu_T^2 = 1$, denoting $\bar{\nu}_T = \frac{\nu_T}{\sqrt{k}}$, we have $\int_{\mathbb{R}^2} \bar{\nu}_T^2 = \frac{1}{k}$ and

$$k \int_{\mathbb{R}^2} \frac{\nabla \nu_T^2}{k} + kI \int_{\mathbb{R}^2} \left(\frac{\nu_T^2}{k} + \ln(1 + \frac{\nu_T^2}{k(1 + I_2)})\right) = k \int_{\mathbb{R}^2} \left|\nabla \bar{\nu}_T^2\right|^2 + I[\bar{\nu}_T^2 - \ln(1 + \frac{\bar{\nu}_T^2}{1 + I_2})]$$

$$\geq km\left(\frac{1}{k}, I_2\right).$$

(2.25)
Consequently, by (2.25) and (2.24), we obtain
\[
\inf_{v \in H^1_0(\mathbb{R}^2), \int_{\mathbb{R}^2} v^2 = 1} \int_{\mathbb{R}^2} |\nabla v|^2 + \Gamma \left[ v^2 - \ln(1 + \frac{v^2}{1 + I(0)}) \right] \\
= \int_{\mathbb{R}^2} |\nabla v|^2 + \Gamma \left[ v^2 - \ln(1 + \frac{v^2}{1 + I(0)}) \right] \\
> \int_{\mathbb{R}^2} |\nabla v|^2 + \Gamma \left[ v^2 - \ln \left( 1 + \frac{v^2}{k(1 + I_2)} \right) \right] \\
= k \int_{\mathbb{R}^2} \frac{|\nabla v|^2}{k} + k \Gamma \int_{\mathbb{R}^2} \left[ \frac{v^2}{k} - \ln(1 + \frac{v^2}{k(1 + I_2)}) \right] \\
\geq k \text{m}(\frac{1}{k}, I_2).
\]

Here we have used \( \int_{\mathbb{R}^2} v^2 = 1 \).

Hence, by (2.26), the proof of Assertion 2.1 is complete. 

\[\square\]

Lemma 2.9. Let \( \epsilon_n \to 0 \) and \( u_n(x) \in H^1_0(\mathbb{R}^2) \) satisfy \( \int_{\mathbb{R}^2} u_n^2(x) = 1 \) and
\[
\lim_{R \to +\infty} H_{\epsilon_n}(u_n) \leq \text{km}(\frac{1}{k}, I_2),
\]
where \( u_n(x) \) is the minimizer of \( m_{R,k}(\epsilon_n) \). Then there exist a subsequence of \( \{u_n(x)\} \) (still denoted by \( \{u_n(x)\} \)) and \( \{y_n\} \) satisfying \( \#G_k(y_n) = k \), such that for each \( \gamma > 0 \) there exists \( R = R(\gamma) > 0 \),
\[
\int_{B_k(y_n)} u_n^2(x) \geq \frac{1}{k} - \gamma,
\]
where \( y_n^i = g_i y_n, \ g_i \in G_k, \ i = 1, 2, \ldots, k \) and \( g_k y_n = y_n \).

Remark 2.1. The \( \#G_k(x) \) in Lemma 2.9 stands for the cardinal number of \( G_k(x) \), the orbit of \( x \) under the action \( G_k \).

Proof. We only consider \( k \geq 2 \) (for \( k = 1 \), this is the case of Lemma 3.1 in [9]). Applying the concentration compactness principle [17, 18], we get three possibilities: vanishing, dichotomy and compactness. Vanishing can be ruled out by using Lemma 2.5. If compactness happens, there exists a subsequence of \( \{u_n(x)\} \) (still denoted by \( \{u_n(x)\} \)), and \( \{y_n\} \) such that for any \( \gamma > 0 \) there exists \( R = R(\gamma) > 0 \) with the property that
\[
\int_{B_k(y_n)} u_n^2(x) \geq 1 - \gamma.
\]

(2.27)

Now we can also get a contradiction as follows. Firstly, we claim that there exists \( R_0 > 0 \) such that \( \{y_n\} \) in (2.27) satisfying
\[
|y_n| \leq R_0.
\]

(2.28)

If (2.28) is not true, then for a subsequence \( |y_n| \to +\infty \) as \( n \to +\infty \). By the symmetry of \( \mathbb{R}^2 \) and \( u_n(g^{-1} x) = u_n(x) \) with \( g \in G_k \), we have
\[
\int_{\mathbb{R}^2} u_n^2(x) \geq \int_{B_k(y_n)} u_n^2(x) \geq k - k\gamma.
\]

This is a contradiction with \( \int_{\mathbb{R}^2} u_n^2(x) = 1 \).

On the other hand, by Proposition 2.1, we know that \( \{y_n\} \) in (2.27) satisfying \( |y_n| \to +\infty \) as \( n \to +\infty \), which produces a contradiction with (2.28). Therefore, compactness does not happen.
With vanishing and compactness both being ruled out, we obtain dichotomy of the sequence. Now by Proposition 2.1, we note that the orbit of \( \{ y_n \} \) under the action of \( G_k \) contains exactly \( k \) points:

\[
y_n^1, y_n^2, \ldots, y_n^{k-1}, y_n^k = y_n
\]

and the distance between any two of these \( k \) points tends to infinity as \( n \to \infty \). By the symmetry of the domain \( \mathbb{R}^2 \) and the fact that \( u_n(x) \) are \( G \)-invariant, one obtains for any fixed \( n \) sufficiently large,

\[
0 < \int_{B_\delta(y_n^i)} u_n^2(x) \leq \frac{1}{k}, \quad i = 1, 2, \ldots, k.
\]

Since \( u_n(g_i x) = u_n(x) \), \( i = 1, 2, \ldots, k \), we have

\[
\int_{B_\delta(y_n^i)} u_n^2(x) = \int_{B_\delta(y_n^j)} u_n^2(x), \quad i \neq j.
\]

Now we claim that for all \( \gamma > 0 \), there exists \( R = R(\gamma) > 0 \), such that

\[
\int_{B_\delta(y_n^i)} u_n^2(x) \geq \frac{1}{k} - \gamma, \quad i = 1, 2, \ldots, k,
\]

as \( n \to +\infty \). If not, we assume that there exists \( \alpha \) satisfying \( 0 < \alpha < \frac{1}{k} \), such that for all \( \gamma > 0 \), there exists \( R = R(\gamma) > 0 \),

\[
| \int_{B_\delta(y_n^i)} u_n^2(x) - \alpha | \leq \gamma, \quad i = 1, 2, \ldots, k,
\]

(2.29)

as \( n \to +\infty \). Then \( A := k\alpha < 1 \). We will derive a contradiction as follows.

Let

\[
w_{n,i}(x) = u_n(x + y_n^i), \quad i = 1, 2, \ldots, k.
\]

(2.30)

Then

\[
-\Delta w_{n,i} + \frac{1}{I} (\epsilon_n x + \epsilon_n y_n^i) + \frac{\gamma}{1 + (\epsilon_n x + \epsilon_n y_n^i)} + \frac{\lambda}{2} w_{n,i} = \lambda \epsilon_n u_n(x), \quad x \in \mathbb{R}^2.
\]

(2.31)

By Lemma 2.5, for \( 0 < \gamma < \frac{\alpha}{2} \), there exists \( R = R(\gamma) > 0 \), such that

\[
\liminf_{n \to +\infty} \int_{B_{\delta}(0)} w_{n,i}^2(x) \geq \frac{\alpha}{2} \geq \beta > 0, \quad i = 1, 2, \ldots, k.
\]

(2.32)

From Lemma 2.4,

\[
w_{n,i} \text{ is bounded in } H^1(\mathbb{R}^2), \quad i = 1, 2, \ldots, k.
\]

(2.33)

Hence, \( w_{n,i} \to w_i \) in \( H^1(\mathbb{R}^2) \) and \( w_{n,i} \to w_i \neq 0 \) in \( L^2(B_R(0)) \), \( i = 1, 2, \ldots, k \).

By (2.32), \( \int_{B_\delta(0)} w_i^2 \geq \beta > 0, \quad i = 1, 2, \ldots, k \). Therefore, there exists \( \tau > 0 \) such that

\[
D_i = \{ x : w_i(x) \geq \tau, x \in B_R(0) \} \subset B_R(0)
\]

(2.34)

and

\[
\mu(D_i) > 0,
\]

(2.35)

where \( \mu(D_i) \) denotes Lebesgue measure of \( D_i \), \( i = 1, 2, \ldots, k \).

Denoting

\[
D_i^l := D_i + y_n^l = \{ x + y_n^l : x \in D_i \}, \quad i = 1, 2, \ldots, k,
\]

we have

\[
w_i(x + y_n^l) \geq \tau, \quad x \in D_i, \quad i = 1, 2, \ldots, k.
\]
Moreover, from the fact $w_{n,i} \to w_j$ in $L^2(B_R(0))$, we have
\[ \lim_{n \to \infty} \int_{D_i} |w_{n,i}(x) - w_j(x)|^2 = 0 \quad \text{and} \quad w_{n,i}(x) \to w_j(x) \text{ a.e. in } D_i. \quad (2.36) \]

Then, by elliptic estimates we have $\max_{B_R(0)} |w_{n,i}(x) - w_j(x)| \to 0$ for $i = 1, 2, \ldots, k$ as $n \to \infty$.

Since $|y^i_n| \to +\infty$, $i = 1, 2, \ldots, k$, as $n \to +\infty$ and $|y^i_n - y^n_j| \to +\infty$, $i \neq j$ as $n \to +\infty$, we have
\[ D^n_i \cap D^n_j = \emptyset, \quad i \neq j, \quad (2.37) \]
as $n \to +\infty$. Then, we get
\[ \lim_{n \to +\infty} \sum_{i=1}^k \left| \int_{D^n_i} f_i(x) \right|^2 = \lim_{n \to +\infty} \sum_{i=1}^k \left| \int_{D^n_i} w_i(x) - w_j(x) \right|^2 = k \alpha = A. \quad (2.38) \]

Therefore, by (2.38) and Brezis-Lieb Lemma [19], we have
\[ 1 - A = \|u_n\|^2 - \sum_{i=1}^k \left| \int_{D^n_i} w_i(x) - w_j(x) \right|^2 + o_n(1) = \|u_n - \sum_{i=1}^k \int_{D^n_i} w_i(x)\|^2 + o_n(1). \quad (2.39) \]

Let $f(s) = s - \ln(1 + s)$. Based on (2.36) and the fact
\[ \max_{B_R(0)} |u_n - \sum_{i=1}^k w_i(x)| \leq \sum_{i=1}^k \max_{B_R(0)} |w_{n,i}(x) - w_j(x)| \to 0 \]
as $n \to \infty$, using Lemma 5.2 in [14] we can find $\delta > 0$ such that
\[ \int_{D^n_i} f \left( \frac{\sum_{i=1}^k w_i(x) - y^n_i}{\|\sum_{i=1}^k w_i(x) - y^n_i\|^2} \right) + (1 - A) \int_{D^n_i} \frac{\left( u_n - \sum_{i=1}^k w_i(x) \right)^2}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} (1 + I(\varepsilon_n x)) \leq -\delta + \int_{D^n_i} f \left( \frac{\sum_{i=1}^k w_i(x) - y^n_i}{\|\sum_{i=1}^k w_i(x) - y^n_i\|^2} \right) + \int_{D^n_i} (1 - A) f \left( \frac{\left( u_n - \sum_{i=1}^k w_i(x) \right)^2}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} (1 + I(\varepsilon_n x)) \right) \quad (2.40) \]
as $n \to \infty$.

Thus, using the above facts we have
\[ m_{\Gamma, k}(\varepsilon_n) = H_{\varepsilon_n}(u_n) = \int_{\mathbb{R}^2} |\nabla u_n|^2 + I[\frac{u_n^2}{1 + I(\varepsilon_n x)}] = \int_{B_R(0)} \nabla u_n^2 + \int_{\mathbb{R}^2 \setminus B_R(0)} \nabla u_n^2 + \Gamma \int_{\mathbb{R}^2 \setminus B_R(0)} \frac{I(\varepsilon_n x) u_n^2}{1 + I(\varepsilon_n x)} \]
\[ + \Gamma \int_{B_R(0)} I(\varepsilon_n x) u_n^2 + \Gamma \int_{\mathbb{R}^2 \setminus B_R(0)} \left[ \frac{u_n^2}{1 + I(\varepsilon_n x)} - \ln \left( 1 + \frac{u_n^2}{1 + I(\varepsilon_n x)} \right) \right] \]
\[ = \int_{\mathbb{R}^2} \left| \nabla \left( \sum_{i=1}^k w_i(x) - y^i_n \right) \right|^2 + (1 - A) \left| \nabla \left( u_n - \sum_{i=1}^k w_i(x) \right) \right|^2 \|u_n - \sum_{i=1}^k w_i(x)\|^2 \]
\[ + \Gamma \int_{\mathbb{R}^2} \frac{I(\varepsilon_n x) \left( \sum_{i=1}^k w_i(x) - y^i_n \right)^2}{\|\sum_{i=1}^k w_i(x) - y^i_n\|^2} (1 + I(\varepsilon_n x)) + (1 - A) \frac{\left( u_n - \sum_{i=1}^k w_i(x) \right)^2}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} (1 + I(\varepsilon_n x)) \]
\[ + \Gamma \int_{\mathbb{R}^2} f \left( \frac{\sum_{i=1}^k w_i(x) - y^n_i}{\|\sum_{i=1}^k w_i(x) - y^n_i\|^2} \right) + (1 - A) f \left( \frac{\left( u_n - \sum_{i=1}^k w_i(x) \right)^2}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} (1 + I(\varepsilon_n x)) \right) \frac{\|u_n - \sum_{i=1}^k w_i(x)\|^2}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} - \Gamma \delta + o_n(1) \]
\[ \geq A H_{\varepsilon_n} \left( \frac{\left( \sum_{i=1}^k w_i(x) - y^n_i \right)}{\|\sum_{i=1}^k w_i(x) - y^n_i\|^2} \right) + (1 - A) H_{\varepsilon_n} \left( \frac{u_n - \sum_{i=1}^k w_i(x) - y^n_i}{\|u_n - \sum_{i=1}^k w_i(x)\|^2} \right) - \Gamma \delta + o_n(1). \quad (2.41) \]
Sending $n \to \infty$ we obtain a contradiction.

Hence, we conclude that $a = \frac{1}{k}$.

As a result, there exist a subsequence $\{u_n(x)\}$ and $\{y_n\}$, such that for each $\gamma > 0$ there exists $R = R(\gamma) > 0$,

$$\int_{B_R(y_n)} u_n^2(x) \geq \frac{1}{k} - \gamma,$$

where $y_n = g_i y_n$, $g_i \in G_k$, $i = 1, 2, \ldots, k$ and $g_k y_n = y_n$.

\[\square\]

### 3 Proof of Theorem 1.1

In this section, we will give the proof for the conclusions (i) and (ii) of Theorem 1.1 as $\varepsilon \to 0^+$. To be more specific, the conclusions of (i) in Theorem 1.1 will be proved by Lemma 3.1, and the conclusions of (ii) in Theorem 1.1 will be proved by Lemma 3.2 and Lemma 3.3.

#### Lemma 3.1

$$\lim_{\varepsilon \to 0^+} m_{\Gamma,k}(\varepsilon) = km\left(\frac{1}{k}, I_2\right).$$

**Proof.** By Lemma 3.1 in [9], we have $\lim_{\varepsilon \to 0^+} m_{\Gamma,1}(\varepsilon) = m(1, I_2)$. Now in the following, we always assume $k \geq 2$.

Suppose the conclusion is not true, by Lemma 2.2, we know that there exist $\varepsilon_n \to 0$ and $u_n(x) \in H^1_0(\mathbb{R}^2)$ a solution of (1.2) with $\int_{\mathbb{R}^2} u_n^2(x) = 1$, such that

$$\lim_{\varepsilon_n \to 0} m_{\Gamma,k}(\varepsilon_n) = \lim_{\varepsilon_n \to 0} H_{\varepsilon_n}(u_n) = B < km\left(\frac{1}{k}, I_2\right).$$

On the other hand, by Lemma 2.9, for each $\gamma > 0$, there exists $R = R(\gamma) > 0$, such that

$$\int_{B_R(y_n)} u_n^2(x) \geq \frac{1}{k} - \gamma, \quad i = 1, 2, \ldots, k. \quad (3.2)$$

Let $\eta = \eta(t)$ be a smooth nonincreasing function on $[0, +\infty)$ such that $\eta(t) = 1$, for $t \in [0, 1]$, $\eta(t) = 0$, for $t \geq 2$, and $|\eta'(t)| \leq 2$. Setting

$$w_{n,i}(x) = \eta\left(\frac{x - y_n}{R}\right)u_n(x), \quad x \in \mathbb{R}^2,$$

then $w_{n,i}(x) \in H^1(\mathbb{R}^2)$. By choosing $R$ large enough (for fixed $\gamma > 0$), we may assume

$$\frac{1}{k} \geq \int_{\mathbb{R}^2} w_{n,i}^2(x) \geq \int_{B_R(y_n)} w_{n,i}^2(x) \geq \frac{1}{k} - 2\gamma, \quad i = 1, 2, \ldots, k. \quad (3.3)$$
Therefore, we have

\[
E_{\varepsilon_n}(u_n) = \int_{\mathbb{R}^d} |\nabla u_n|^2 + I'[u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)})] + o_\gamma(1)
\]

\[
\geq \int_{B_{\delta_n}(y_n)} |\nabla u_n|^2 + I'[u_n^2 - \ln(1 + \frac{u_n^2}{1 + I_\delta})] + o_\gamma(1)
\]

\[
= \sum_{i=1}^k \int_{\mathbb{R}^d} |\nabla w_{n,i}(x)|^2 + I'[w_{n,i}^2(x) - \ln(1 + \frac{w_{n,i}^2(x)}{1 + I_\delta})] + o_\gamma(1)
\]

\[
= k \inf_{w \in H^1(\mathbb{R}^d), \int w^2 = \frac{1}{d+1}} \int_{\mathbb{R}^d} |\nabla w|^2 + I'[w^2 - \ln(1 + \frac{w^2}{1 + I_\delta})] + o_\gamma(1)
\]

\[
= km\left(\frac{1}{k}, I_\delta\right) + o_\gamma(1).
\]

Letting \(\varepsilon_n \to 0\) and \(\gamma \to 0\), we have

\[
B \geq km\left(\frac{1}{k}, I_\delta\right),
\]

a contradiction to (3.1). \(\square\)

**Lemma 3.2.** The sequence \(\{y_n\}\) obtained in Lemma 2.5 satisfies

\[
|\varepsilon_n| |y_n| \to |e_1| = 1 \text{ as } n \to +\infty, \text{ where } e_1 \in S^1.
\]

**Proof.** Suppose on the contrary that there exists a sequence \(\varepsilon_n\) such that \(|\varepsilon_n y_n| \to +\infty\) as \(n \to +\infty\).

By (B1), we have \(I_\delta = \max_{|x| \to +\infty} I(x) > \limsup_{|x| \to +\infty} I(x) = I_\infty \geq I_1 > -1\), then there exists \(\delta > 0\), such that

\[
I(\varepsilon_n x + \varepsilon_n y_n) < I_\delta - \delta \text{ and } 1 + I_\delta - \delta > 0
\]

for \(n\) large enough and \(|\varepsilon_n x| \leq 1\).

Accordingly, under the action of \(G_k\), we have

\[
I(\varepsilon_n x + \varepsilon_n y_n^i) < I_\delta - \delta, \quad i = 1, 2, \ldots, k \text{ and } 1 + I_\delta - \delta > 0
\]

(3.4)

for \(n\) large enough and \(|\varepsilon_n x| \leq 1\).
Let \( \eta = \eta(t) \) be the cut-off function used in Lemma 3.1. Also, we define \( \overline{w}_{n,l}(x) = \eta(\frac{x}{n}) w_{n,l}(x) = \eta(\frac{x}{n}) u_n(x + y_n^l), \ x \in \mathbb{R}^2 \). Then we have

\[
E_{\varepsilon_n}(u_n) = \int_{\mathbb{R}^2} |\nabla u_n|^2 + \Gamma [u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)})]
\]

\[
= \int_{\cup_{B_k(y_n^l)}} |\nabla u_n|^2 + \Gamma [u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(\varepsilon_n x)})] + o_{\gamma}(1)
\]

\[
= k \int_{B_k(0)} |\nabla u_n(x + y_n^l)|^2 + \Gamma [u_n^2(x + y_n^l) - \ln(1 + \frac{u_n^2(x + y_n^l)}{1 + I(\varepsilon_n x + \varepsilon_n y_n^l)})] + o_{\gamma}(1)
\]

\[
= k \int_{\mathbb{R}^2} |\nabla \overline{w}_{n,l}(x)|^2 + \Gamma [\overline{w}_{n,l}^{-2}(x) - \ln(1 + \frac{\overline{w}_{n,l}^{-2}(x)}{1 + I(\varepsilon_n x + \varepsilon_n y_n^l)})] + o_{\gamma}(1)
\]

\[
\geq \sum_{i=1}^{k} \int_{\mathbb{R}^2} |\nabla \overline{w}_{n,i}(x)|^2 + \Gamma [\overline{w}_{n,i}^{-2}(x) - \ln(1 + \frac{\overline{w}_{n,i}^{-2}(x)}{1 + I(\varepsilon_n x + \varepsilon_n y_n^l)})] + o_{\gamma}(1)
\]

By (2.20), (2.23), Lemma 2.4 and Lemma 2.9, and let \( n \to +\infty \) and \( \gamma \to 0 \), one has

\[
k m(\frac{1}{K}, I_2) \geq \lim_{n \to +\infty} E_{\varepsilon_n}(u_n) \geq k \int_{\mathbb{R}^2} |\nabla \overline{w}_{n,i}|^2 + \Gamma [\overline{w}_{n,i}^{-2} - \ln(1 + \frac{\overline{w}_{n,i}^{-2}}{1 + I_2})] + o_{\gamma}(1)
\]

\[
\geq k \int_{\mathbb{R}^2} |\nabla \overline{w}_i|^2 + \Gamma [\overline{w}_i^2 - \ln(1 + \frac{\overline{w}_i^2}{1 + I_2})]
\]

\[
> k \int_{\mathbb{R}^2} |\nabla \overline{w}_i|^2 + \Gamma [\overline{w}_i^2 - \ln(1 + \frac{\overline{w}_i^2}{1 + I_2})]
\]

\[
\geq k m(\frac{1}{K}, I_2),
\]

a contradiction. Here we have used \( \overline{w}_{n,i} \to w_i \) in \( H^1(B_{R}(0)) \), strongly in \( L^2(B_R(0)) \) and for each \( \gamma > 0 \), there exists \( R = R(\gamma) > 0 \), such that \( \int_{B_R(0)} w_i^2 \geq \frac{1}{2} - \gamma, i = 1, 2, \ldots, k \).

Therefore, there exists a subsequence \( \varepsilon_n \) such that \( x_n^l \equiv \varepsilon_n y_n^l \to x_0^l, w_{n,i} \to w_i \geq 0 \) in \( H^1(\mathbb{R}^2) \) and a.e. in \( \mathbb{R}^2 \), where \( x_0^l = g_l x_0, g_l \in G_k, i = 1, 2, \ldots, k \) and \( g_k x_0 = x_0 \).

Applying the elliptic estimates theory to (2.31), we have \( w_{n,i} \to w_i \) in \( C_{loc}^2(\mathbb{R}^2) \) and

\[
-\Delta w_i + \Gamma \frac{I(x_0^i) + w_i^2}{1 + I(x_0^i) + w_i^2} w_i = \lambda_0 w_i, \ x \in \mathbb{R}^2, i = 1, 2, \ldots, k,
\]

here \( \lambda_0 < 0 \) derives from Lemma 2.3 which implies \( \lambda_{\varepsilon_n} \to \lambda_0 \) as \( \varepsilon_n \to 0^+ \) (up to a subsequence).
Next, we will prove \( I(x_0^i) = I_2, \ i = 1, 2, \ldots, k. \)

Since \( w_{n,i}(x) = u_n(x + y_n^i), \ i = 1, 2, \ldots, k, \) and as \( n \to +\infty, w_{n,i}(x) \to w_i(x) \) in \( L^2(B_R(0)) \), by Lemma 3.1, Lemma 2.9, and the weakly lower semi-continuity of norm, we have

\[
km \left( \frac{1}{R}, I_2 \right) = \lim_{n \to +\infty} m_{I, k}(e_n)
\]

\[
= \lim_{n \to +\infty} \int_{\mathbb{R}^2} |\nabla u_n|^2 + I[u_n^2 - \ln(1 + \frac{u_n^2}{1 + I(e_n x)})] \, dx
\]

\[
= \lim_{n \to +\infty} \sum_{i=1}^k \int_{B_R(\eta_n^i)} |\nabla u_n(x)|^2 + I[u_n^2(x) - \ln(1 + \frac{u_n^2}{1 + I(e_n x + \eta_n^i)})] + o_\gamma(1)
\]

\[
= \lim_{n \to +\infty} \sum_{i=1}^k \int_{B_R(0)} |\nabla w_{n,i}(x)|^2 + I[w_{n,i}^2(x) - \ln(1 + \frac{w_{n,i}^2}{1 + I(e_n x + \eta_n^i)})] + o_\gamma(1)
\]

\[
= k \int_{\mathbb{R}^2} |\nabla w_i|^2 + I[w_i^2 - \ln(1 + \frac{w_i^2}{1 + I(x_0^i)})] + o_\gamma(1)
\]

\[
\geq k \int_{\mathbb{R}^2} |\nabla w_i|^2 + I[w_i^2 - \ln(1 + \frac{w_i^2}{1 + I_2})] + o_\gamma(1)
\]

\[
\geq km \left( \frac{1}{R}, I_2 \right) + o_\gamma(1)
\]

Letting \( \gamma \to 0 \), this implies that \( I_2 = I(x_0^i), \ i = 1, 2, \ldots, k. \) By (B2), we let \( e_1 \in \{x_0^1, x_0^2, \ldots, x_0^k\} \subset S^1 \), then \( |e_1| = 1. \)

At last, combining Lemma 3.2 and the proof process of Lemma 3.2, we can obtain

**Lemma 3.3.** For \( \Gamma < \Gamma_0 \) fixed, let \( u_\varepsilon \) be a minimizer of \( m_{I, k}(\varepsilon) \), then we have

\[
\left| u_\varepsilon - \sum_{i=1}^k w_i(x + \frac{y_1^i}{\varepsilon}) \right|_{H^1(\mathbb{R}^2)} \to 0, \text{ as } \varepsilon \to 0 \text{ (up to a subsequence)},
\]

where \( w_i(x) \) is the minimizer of \( m(\frac{1}{R}, I_2) \) and \( e_1 \subset S^1 = \{x \in \mathbb{R}^2 \mid |x| = 1\}. \)
