Factors and Recommendations to Support Students’ Enjoyment of Online Learning With Fun: A Mixed Method Study During COVID-19

Alexandra Okada* and Kieron Sheehy

Rumpus Research Group, Faculty of Wellbeing, Education and Language Studies, The Open University, Milton Keynes, United Kingdom

Understanding components that influence students’ enjoyment of distance higher education is increasingly important to enhance academic performance and retention. Although there is a growing body of research about students’ engagement with online learning, a research gap exists concerning whether fun affect students’ enjoyment. A contributing factor to this situation is that the meaning of fun in learning is unclear, and its possible role is controversial. This research is original in examining students’ views about fun and online learning, and influential components and connections. This study investigated the beliefs and attitudes of a sample of 551 distance education students including pre-services and in-service teachers, consultants and education professionals using a mixed-method approach. Quantitative and Qualitative data were generated through a self-reflective instrument during the COVID-19 pandemic. The findings revealed that 88.77% of participants valued fun in online learning; linked to well-being, motivation and performance. However, 16.66% mentioned that fun within online learning could take the focus off their studies and result in distraction or loss of time. Principal component analysis revealed three groups of students who found (1) fun relevant in socio-constructivist learning (2) no fun in traditional transmissive learning and (3) disturbing fun in constructivist learning. This study also provides key recommendations extracted from participants’ views supported by consensual review for course teams, teaching staff and students to enhance online learning experiences with enjoyment and fun.

Keywords: COVID-19, online learning, fun, higher education, academic performance, epistemic views, responsible research and innovation, recommendations

INTRODUCTION

Online learning has been considered vital in 21st century to provide flexible education for students as well to address the gap between demand for higher education and supply. Governments have advocated increasing rates of completion of secondary and higher education in the face of rapid population growth. However, they face financial pressure to support these larger numbers directly through additional infrastructure, in addition to scholarships and student loans (Cooperman, 2014:1).
In recent years, there has been an increasing interest in distance online learning not only to educate students who work but also who live too remotely or cannot access traditional campus universities for other reasons. However, literature shows that online distant education has dropout rates higher than traditional universities (Xavier and Meneses, 2020). Studies also suggest that the students’ level of satisfaction about their online learning and own academic performance have significant correlation with their level of persistence toward completion (Gortan and Jereb, 2007; Higher Education Academy (HEA), 2015).

Understanding components that influence students’ enjoyment in distance higher education is fundamental to promote student retention and success (Higher Education Academy (HEA), 2015) during and post COVID-19 pandemic. There is a growing body of research about students’ engagement in virtual learning environments (Arnone et al., 2011). However, there are key issues that whilst extensively researched in traditional teaching, remain relatively absent from research into distance education. For example, a long established body of research exists that demonstrates a link between students’ epistemological beliefs and their study, engagement, and outcomes (Rodriguez and Cano, 2007; Richardson, 2013). The types of epistemological beliefs typically examined fall into two broad categories. The first is derived from Schommer’s research (Schommer, 1990), in which she elicited dimensions that reflected students differing beliefs. This included “simple knowledge” (knowledge as isolated facts vs. knowledge as integrated conceptions) and “innate ability” (ability to learn is genetically determined vs. the ability to learn is enhanced through experience). The second category of research is more directly aligned with pedagogy. This has positioned epistemological beliefs in relation to traditional or constructivist beliefs. Traditional views of learning see learning occurring via the non-problematic transfer of untransformed knowledge from expert to student (Chan and Elliott, 2004). This contrasts with constructivist beliefs in which knowledge arises through reasoning, which is facilitated by teaching (Lee et al., 2013). This type of framing can be seen in large scale international comparative research, such as the Organization for Economic Co-operation and Development’s survey of teachers’ epistemological beliefs across 23 countries (Organisation for Economic Co-operation and Development (OECD), 2010, 2013).

However, in relation to online and distance higher education, epistemological research is relatively absent (Richardson, 2013; Knight et al., 2017). Given the impact of epistemological beliefs on students’ study experiences there is a need for greater epistemologically focused research in the context of online education.

Another underrepresented research area concerns fun in online learning, in particular, because the meaning of fun is unclear and controversial. There is no consensus about the value of fun in learning and what a fun learning experience means in higher education (McManus and Furnham, 2010; Lesser et al., 2013; Tews et al., 2015; Whitton and Langan, 2018). Tews et al. (2015) argue that fun is a term used regularly in various contexts including education. Yet there is no clear agreement about its role and relationships with students’ learning experience. Congruently, McManus and Furnham (2010) highlight that fun has different meanings for different people and literature is limited about what generally comprises fun for learners. Similarly, Lesser et al. (2013) indicate that views about fun among educators are ambivalent as fun is perceived as too difficult or time-consuming to be implemented and it may distract students from serious learning. These three studies indicate that evidence about fun and learning are circumstantial and subjective for teaching staff to consider it as a compelling component for making their students’ experience more impactful. So that, further studies would be worthwhile to examine the practical meaning and educational value of fun on Distance Higher Education with a systematic and rigorous methodological approach.

To explore this challenge, this paper investigates students’ reflective views about fun and online learning and whether fun and enjoyment are interconnected components to enhance enthusiasm to learn and excel in online distant education. This investigation considers a critical question framed by the authors from Whitton and Langan (2018:11)’s work. How can we explore the impact of fun in higher education in view of the complexity of factors involved? To explore this question, this work is based on Responsible Research and Innovation (RRI) approach to understanding the what, how and why fun might be a valuable key in education with and for distinctive representatives: learners, educators, researchers, consultants, and policy makers. “For pedagogic innovation to succeed, learners must personally perceive the benefits of learning activities” designed to be fun and also “these gains must be translated into outcomes that are viewed positively within the institution quality monitoring by teaching staff.” Whitton and Langan (2018) also explain that there is a negative influence from the competitive job market that values “serious” performance – as the opposite of fun – so potentially this make course teams less likely to embed playful and fun approaches in the higher education curriculum.

The RRI approach implies that community-members and researchers interact together to better align both its process and outcomes with the values, needs and expectations of society (European Commission, 2013; von Schomberg, 2013). The purpose of RRI is to promote greater involvement of societal members with research-authors in the process of research to increase knowledge, understanding and better decision-making about both societal needs and scientific research through eight principles: diversity and inclusion; transparency and openness, anticipation and reflexivity, adaptation and responsiveness (RRI-Tools, 2016; European Commission, 2020). These principles were used to adapt, implement and refine a self-reflective instrument about learning and fun. So that, the following section--Previous Studies about Fun and Learning--present Learning and Fun views from literature. Section--“Methodology” shows the self-reflective instrument, which was used integrated with the methodological approach. Section--“Findings” shows the
findings and section—“Discussion and Final Remarks” discussion with final remarks.

PREVIOUS STUDIES ABOUT FUN AND LEARNING

Studies that appear to research fun and learning, typically focus on types of activity and the extent to which these are seen as enjoyable and indicated as being fun, rather than drilling down to examine or define fun. While fun is consistently recognized as an important part of the lived experience of children, youth and adults, relatively few seek a deeper understanding of what the construct of fun means (Kimiecik and Harris, 1996; Harmston, 2005; Garn and Cothran, 2006). This situation is in stark contrast to how fun is generally positioned with regard to the domain of learning and education.

There are different views in the literature about fun and learning, in terms of meanings and its effects. Negative perspectives describe fun as the opposite concept of meaningful “work” and consider it as an unnecessary distraction for learning.

Fun is a term that has changed over time. In the 1900s, it came to indicate an absence of seriousness, work, and labor. “Fun can be seen both as a resistance to the rigid demarcation between work and pleasure and also as a means of reproducing that dichotomy” (Blythe and Hassenzahl, 2018, p92). As it took on these meanings, fun became a loaded term that challenges the status quo (Beckman, 2014). It can be positioned as a challenge to the traditional split between fun and learning; welcomed by those who embrace social views of the learning process but seen as an unnecessary distraction for those who hold a traditional transmission view of how learning takes place.

The etymological meaning of fun (fonna and fon from Germanic), which refers to “simple, foolish, silly, unwise” (Etymonline, 2020) have still influence on the meanings attributed by people and researchers nowadays. The argument that fun can have a negative influence on learning was highlighted in newspaper reports of research by the Centre for Education Economics (CEE): “Making lessons fun does not help students learn, a new report has found. The widely held belief that fun can contribute to the maintenance of cognitive functioning and emotional growth (Crosnoe et al., 2004 cited by Feldberg).

Dismore and Bailey's (2011, p.499) study indicates positive feelings associated with enjoyment, engagement and optimal experience. The authors described fun and enjoyment underpinned by the concept of “flow” (Csikszentmihalyi, 2015) which refers to “an optimum state of inner experience incorporating joy, creativity, total involvement and an exhilarating feeling of transcendence.” The optimum state is a key component to lead students to enjoyable accomplishment and optimal learning when their perceived skill and challenge are balanced and suitable. Flow is an important concept for educators to be aware that students’ anxiety caused when their challenge becomes higher compared to their skill, and boredom when challenge becomes too little compared to their skill will reduce their enjoyment and have a negative effect on their learning. Fun learning with flow experiences is relevant for learners to grow with positive opportunities where their skill meets their effort producing intrinsic rewards (Dismore and Bailey, 2011; Chu et al., 2017; Whiton and Langan, 2018).

Literature about the meaning of fun in online learning is very limited. A set of studies about engaging e-learning games highlight that fun and challenge are essential for promoting students' enjoyment and making them want to learn (Fu et al., 2009). An engaging e-learning game facilitates the flow of experiences of students by increasing their attention, achieving learning goals and enjoyment with their learning experience (Virvou et al., 2005; De Freitas and Oliver, 2006).

This study focuses on fun and learning in the context of Distance Higher Education supported by RRI. To explore what fun is, its meaning and the effects of the phenomenon need to be understood with learners. As a first step, there is a need to identify how the relationship between fun and online learning is conceived by learners based on their own learning experience. A second step is to examine whether this relationship connection has any connection with their epistemic views.
The aim of this study is to address the following questions:

- What are the relationships between fun and online learning practices identified by students?
- What are the connections between students’ epistemic views about online learning and fun?
- What are the recommendations for students, teaching staff and course teams?

**METHODOLOGY**

This work is part of a research program OLAF – *Online Learning and Fun* led by Rumpus Research Group. The methodology used in this study adopts the established epistemological questionnaire approach (Feucht et al., 2017), and provides an opportunity to facilitate participants’ epistemic reflectivity (Feucht et al., 2017). In this way the study is underpinned by the concept of reflective practitioners, by which participants “think in action” about principles and practices to share their reflective views (Schon, 2015).

This study is based on a mixed-method approach. Quantitative and qualitative data were generated through a self-reflective instrument (Feucht et al., 2017) constituted by two parts, both developed in Qualtrics. The first part was a Likert-scale survey with 25 statements about learning and fun. The second part was an open question (see “Instruments”).

The approach used for qualitative analysis was a systematic and novel multi-methodical procedure that combined: word cloud visualization in Qualtrics (Figure 2); automated thematic analysis map (Figure 3) and sentiment analysis (Figures 4–6) in NVivo 12. This integration of visualizations enabled us to identify seven themes to analyze the value of fun; and 26 themes of relationships between fun and learning. The quantitative analysis was supported by PCA – Principal Content Analysis (see “Relationships Between Fun and Learning Supported by Quantitative Analysis”). This approach enabled us to group our multi-method qualitative analysis categorized by themes – into three groups (see “Relationships Between Fun and Learning Supported by Qualitative Analysis”) as well present our findings (section–“Findings”) with global recommendations underpinned by students’ needs, priorities and expectations, which were revealed in the qualitative data and grouped by quantitative analysis.

This study acknowledges 8 principles (Box 1) of RRI (von Schomberg, 2013; RRI-Tools, 2016) in the context of open educational research (Okada and Sherborne, 2018) by which all participants reflect about practices and beliefs for better alignment between learners’ needs and research-based recommendations. The instrument with a special code to allow the withdrawal of participation without the collection of personal data was approved by the Ethics Committee and the Student Research Project Panel of the Open University–United Kingdom.

**Participants**

The OU offers flexible undergraduate and postgraduate courses and qualifications supported distance and open learning for 174,898 people from the United Kingdom, Europe and some worldwide. Approximately 76% of directly registered students work full or part-time during their studies; 23% of Open University United Kingdom undergraduates live in the 25% most deprived areas and 34% of new OU undergraduates are under 25, 14% with disabilities and 32% with lower qualification at entry.

This study focused on one of the largest introductory modules offered by the Wellbeing Education and Language Studies – WELS Faculty of The Open University. Currently this module has more than 4,300 students and is part of various qualifications. So that, participants were students from all levels and qualification’ interests with different occupations, include novices, undergraduates who had just completed secondary education, pre-service and in-service teachers; as well professionals interested in Education, Psychology and Social Care.

A balanced and representative sample were constituted by a total of 625 students who participated in this study as volunteers, 551 completed a self-reflective questionnaire to reflect about fun and learning and 206 provided their reflective views by answering an “optional” open question. The response rate (40%) for the open views about fun and learning was higher than expected.

In terms of students’ previous study experience 48.55% students completed pre-A levels or equivalent (secondary school), 26.81% had already finished other OU course modules (level 1, level 2, and level 3) and 24.64% reported other different experiences in terms of qualification pathway targeted by students: 28.80% are interested in childhood studies; 34.24% in secondary education, pre-service and in-service teachers; 20.64% for professionals interested in Education; 27.17% Education primary, 4.53% Open and 1.81% Social Care.

| **Box 1** RRI in the context of open education (Okada, 2020). |
|-------------------------------------------------------------|
| **Principles** | **Recruitment** | **Implementation** | **Analysis** |
| Diversity and inclusion | Voluntary basis with no personal data requested | Completely anonymous | Diverse participants (SEND, workers, novices, teachers, …) |
| Transparency and openness | Objectives and process open to all participants | Open Online data | Open access to results |
| Anticipation and reflexivity | No implications for participants’ studies | Reflective instrument with open question | In Open Repository (ORO) and OpenLearn |
| Adaptation and responsiveness | Variety of approaches needed (news, email and course team support) | Optional withdrawal with a coded survey developed in Qualtrics | Peer-reviewers with distinctive roles were co-authors |

Mixed methods, analytical database available in an Open data Repository (ORDO).
Procedures
This study focuses on a 9-month-module course with twenty-four weekly units and four assessment activities. The course integrates reading materials, online audio-visual materials, a YouTube channel “The student hub live” and radio-style broadcast audio repository. Students have also access to a set of library resources, news and special “quick guides” to provide extra-support for developing activities successfully. Students’ interaction with peers and communication with tutors typically occur asynchronously in the online discussion forum and synchronously in online tutorials (in Adobe Connect) and face-to-face tutorials organized in a specific period and locations. In addition, the course provides a channel in social media (Twitter and Facebook) for students’ social engagement. This course module presentations are opened 3 weeks prior to the start in order to provide time for students to smoothly engage in their initial activities including a series of fun and friendly online workshops to promote interaction.

Recruitment
Students’ recruitment occurred at the middle of the online module. It was supported by the course chair and the module course tutors through an invitation shared in course news page and via central email sent to all students. Recruitment and data generation occurred during 5 weeks (February–March 2020) and was more effective after an email invitation sent to all students.

Instruments
The use of self-report questionnaires is well established as a methodology within research examining epistemological beliefs (Feucht et al., 2017). The self-reflective instrument was underpinned by previous work led by the second author (Sheehy et al., 2019b) and adapted to the context of online learning and fun.

Box 2 indicates the questionnaire statements:

| Theoretical Principles | Variables | Statements |
|------------------------|-----------|------------|
| Socio-constructivism   | 1. SocialActivities | 1. Meaningful learning takes place when individuals are engaged in social activities. |
|                       | 2. CollaborativeActivities | 2. Students learn best through collaborative activities. |
|                       | 3. SocialProduction | 3. Learning can be defined as the social production of knowledge. |
|                       | 4. TalkProductively | 4. Helping students to talk to one another productively is a good way of teaching |
| Traditional           | 5. TeachHowToSolve | 5. Effective/good teachers demonstrate the correct way to solve a problem. |
|                       | 6. TeachingProblemAnswer | 6. Teaching should be built around problems with clear, correct answers. |
|                       | 7. TeachingFacts | 7. The teacher’s role is to teach facts. |
|                       | 15. LearnOwnEffort | 15. How much students get from their learning depends mostly on their effort. |
| Constructivism        | 8. TeachInquiry | 8. The teacher’s role is to facilitate students’ own inquiry. |
|                       | 10. LearnFindSolution | 10. Students learn best by finding solutions to problems on their own. |
|                       | 11. LearnThinkSolve | 11. Students should be allowed to think of solutions to practical problems themselves before the teacher shows them how they are solved. |
|                       | 12. LearnReasoning | 12. Thinking and reasoning processes are more important than specific curriculum content. |
| Banking               | 13. AbilityNotFixed | 13. Students’ educational potential is not fixed at birth. |
|                       | 14. AbilityMayChange | 14. Students who begin university with “average” ability do not remain “average” throughout their studies. |
|                       | 16. TeachHomogenous | 16. All students should be taught in classes according to their intelligence. |
|                       | 17. TeachSingleWay | 17. I believe there should be a single teaching method applicable to all learning situations. |
| Fun                   | 18. LearnHappy | 18. To learn effectively students must be happy |
|                       | 19. LearnWithFun | 19. Learning should involve fun |
|                       | 09. EnjoyLearning | 09. To learn effectively, students must enjoy learning |
|                       | 20. FunHampers | 20. Fun activities can get in the way of student learning |
|                       | 21. EnjoyOnlineLearning | 21. I am enjoying studying online |

The adapted questionnaire was implemented in Qualtrics with consent forms, study objectives and a novel embedded code to enable students’ withdrawal. This is the first study that provides anonymous withdrawal in Qualtrics. It was then tested in two pre-pilots to check its reliability and the embedded code.

The first phase of implementation, the self-reflective instrument was used by online students to reflect about the topic “Fun and Learning” through a series of 21 statements using Likert-scale to indicate the level of agreement.

In the second phase, students were invited to complete an optional open-ended question (What is your opinion about fun in online learning?) to provide their reflective views and freely express their feelings on this topic.
FINDINGS

Preliminary outcomes of this study (Figure 1) were presented to all participants through an article published in OpenLearn (Okada, 2020) and also in a journal paper (Okada and Sheehy, 2020: 608). The framework 'Butterfly of fun' including four types of fun in online learning was developed underpinned by Piaget and Inhelder (1969), Vygotsky et al. (1978), Csikszentmihalyi (2020), and Freire (1967, 1984, 1996, 2009) and supported by students' views.

**Optimal fun** is the joy of being fully involved in learning, moving toward full capability and creativity. **Individual fun** is the happiness of fulfilling accomplishments, supported by clear goals and strategies. **Collaborative fun** is the happiness of making connections with others, creating social bonding and developing group identity. **Emancipatory fun** is the joy of being curious, able to search and discover whilst being critically aware (Okada and Sheehy, 2020).

**Relationships Between Fun and Online Learning Supported by Qualitative Analysis**

This study started with a content analysis in NVivo 12 after importing from Qualtrics a csv file with 206 responses about students' views related to fun and learning (qualitative data). The word cloud visualization in Qualtrics (Figure 2) about students' views indicated the most frequent words: 148 fun, 123 learning, 50 enjoy/enjoyed/enjoyable/enjoyment, 45 students, 40 distance, 31 tutorials, 29 activity, and 26 time.

The automated thematic analysis map (Figure 3) in NVivo 12; represented in Cmap tools provided 89 codes grouped through seven themes: fun, learning, students, tutorials, material, online and activities, which enabled to identify connections between fun and learning presented as following.

NVivo12 sentiment analysis tool (Figure 4) indicated a significant amount of neutral and positive comments associated to narratives that included learning and fun. A small percentage of negative and mixed views emerged across all categories apart from course module “material.” Three largest clusters emerged focused on fun, learning and activities. Four medium clusters were online, tutorials, fun activities, and students. Two small clusters were material and group.
NVivo 12 sentiment analysis were used to obtain an overview about students’ negative views (Figure 5) and positive opinions (Figure 6) which were highlighted in red and green by the authors to show the students’ responses with a significant narrative.

These visualizations were useful to identify two sets of themes and sub-themes (Box 3) related to value and relationships between learning and fun as well review the automated sentiment analysis code manually to check nuances and recode it based on the meaning of narratives.

A total of 206 students’ testimonials were coded with these themes and the frequency of codes were represented by percentages (Box 3). The first set of themes was used to code the value of fun for students; a total of 43% students indicated positive values about fun in learning, 24% indicated neutral, and 23% mixed. Only 10% indicated negative views about fun in learning. The second set of themes were used to explore the value and relationships about fun and learning. Approximately 18% of students indicated that fun is valuable, 12% fun is important, 13%
fun is useful, 24% fun is needed, 11% fun is difficult, 12% fun depends, and 10% fun is unnecessary.

Relationships Between Fun and Learning Supported by Quantitative Analysis

Quantitative data analysis (Graph 1) revealed largely positive views about fun and learning. Most students agreed that fun (as enjoyment) had value in supporting learning. The majority of students agreed with the following statements: 98% To learn effectively, students must enjoy learning; 91% To learn effectively, students must be happy to learn. 88.77% Learning should involve fun. However, a small group of students 16.66% beliefs that Fun activities can get in the way of student learning.

The questionnaire data about 21 statements using Likert scale (1–5) were analyzed through SPSS 24. Cronbach’s alpha 0.717 confirmed that the principal components analysis (PCA) was supported (Cohen et al., 2007). The instrument proved to be reliable for both PCAs (Tavakol and Dennick, 2011). The Kaiser-Meyer-Olkin score of 0.756 indicated sample adequacy and the Bartlett’s sphericity test (Chi-square = 2329.046 with 210 degree of freedom, Sig. 0.000 < 0.5) confirmed consistency.

Table 2 illustrates factor analysis with principal components, with Varimax rotation and Kaiser Normalization indicated six groups emerged: (1) socio-constructivist perspective, (2) traditional perspective (3) fun and learning perspective, (4) constructivist perspective, (5) banking perspective, and (6) Emancipatory Learning. Table 1 using the same method but unrotated solution, indicated three relevant groups: (1) Socio-constructivist learning with traditional teaching and fun; (2) Banking model, transmissive learning and no fun and (4) Constructivist learning and disturbing fun; This approach was selected to examine students’ views and beliefs in order to develop recommendations. Therefore, based on the testimonies of the students grouped with PCA unrotated, twenty-one recommendations were listed and grouped according to three groups: apprentices, teaching professionals and the online course team. Three indexes were generated using the variables from the PCA to get an average among each group related to Fun, No Fun and Bad fun:

- C1 Fun = (V19 + V09 + V03 + V18 + V02 + V05 + V04 + V01 + V08)/9;
- C2 No fun = (V17 + V07 + V16 + V06 + V21)/5;
- C3 Fun bad (hampers learning) = (V10 + V20 + V11)/3.

These indexes (above 3.5 – 5) allowed to group participants’ testimonies, select a variety of views and elaborate a representative list of recommendations to enhance students’ enjoyment with online learning. NVivo 12 was used to carry out a thematic qualitative analysis with an interpretative approach to extract 21 recommendations supported by inductive mapping (Tables 3–5). A consensual review (Hill et al., 1997) through three systematic checks between the recommendations against qualitative data were developed with two experts and a student: individually, in pairs and in group. Five types of feedback enabled reviewers to suggest improvements: 1. Reduce (too long, use...
| Theme1 Sentiment Analysis | Theme2 V = Value of Fun | Theme3 R = Relationship of fun and online learning | Qualitative data Examples of Students’ views about fun and online learning Extracted from 206 participants |
|--------------------------|-------------------------|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Positive 43%             | 7. FUN Valuable 18%     | 7. Fun: helps to feel good                     | A person’s perspective when learning is quite important. To be able to cope and show self-competence will make you feel good. Fun, to have a non-serious outlook helps for some and at different times through their learning experience (Student 291) |
|                          | 7. Fun: enables to reduce stress pressure |                                                 | Being able to connect with other students who have chosen the same life path with you, they have lots in common with me and I have found they have more passion than students at brick university. Tutors have passion as well and stress has been relieved as they are more approachable (in my case so far) (Student 615) |
|                          | 7. Fun: helps to enjoy the experience |                                                 | Fun in distance learning is key to enjoying the module and keeping people focused and engaged with their studies. (25) |
|                          | 7. Fun: enjoy, make effort, achieve |                                                 | People put more effort in if they enjoy or are having fun (Student 84). |
|                          | 7. Fun: enables to learn best |                                                 | Having fun interactive learning maintains interest allowing the student to learn effectively and efficiently (Student 578) |
| Neutral 24%              | 6. FUN Important 12%   | 6. Fun: engage, participate, learn             | I believe that having fun and enjoying your studies improves motivation and helps you to remember what you have learned. However, I feel that not all enjoyment comes from interacting with other students (although that is also very important). I would personally enjoy quizzes, word/diagram games or flash cards that track your progress on remembering definitions. I think things that help set small learning goals enable fun as it helps people to see their progress and hopefully encourage them to want to learn more (Student 480). |
|                          | 6. Fun: enables to gather and recall Knowledge |                                                 | I think having fun within learning is essential, as you sometimes don’t realize the information your brain has gathered within this time (Student 423) |
|                          | 6. Fun: supports interest and motivation |                                                 | Distance learning is what you make of it. The amount of fun had is determinate on the person’s own enjoyment and interest of their studies (Student 548). |
|                          | 5. FUN Useful 13%      | 5. Fun: supports learning                      | Like anything if there is not an element of fun you would not do it (Student 356) |
|                          | 5. Fun: enables to connect with others |                                                 | I think for me I cannot attend the face: face tutorials I don’t get to meet others so when I do talk to others it’s always through the online tutorials. I think it’s important that there’s some light-heartedness and maybe a forum where tutors are not on allowing students to feel more comfortable expressing their ideas and frustrations (Student 211). |
|                          | 4. FUN Needed 24%      | 4. Fun: is hard when feeling isolated          | There is little “fun” in distance learning as you are more often a “lone” learner. I do enjoy face to face learning and wish there was more of it, I learn better that way and it maintains my interest (Student 533). |
|                          | 4. Fun: is needed in a reading-based course |                                                 | Learning should be fun, just read and writing from textbooks is not what a call learning, I’m an active learning with dyslexia and find it hard from textbooks (Student 170) |
|                          |                        |                                                 | Reading and answering online questions isn’t enjoyable and isn’t helpful for learners who prefer to be practical which will aid their learning. Student (196) |
| Theme1 Sentiment Analysis | Theme2 V = Value of Fun | Theme3 R = Relationship of fun and online learning | Qualitative data Examples of Students’ views about fun and online learning Extracted from 206 participants |
|--------------------------|------------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------|
| Mixed 23%                | 3. FUN Difficult       | 4. Fun: elements must be embedded              | There needs to be an element of fun in order to maintain motivation (Student 19)                     |
|                          | 3. Fun is not possible when I struggle | 4. Fun: enables to break the intensity of learning | Those who chose to learn distance learning may still need some form of fun element to break up the intensity of learning (Student 266) |
|                          | 3. Fun needs face-to-face interaction | 4. Fun: means managing flexible time           | Fun is Great. Teaches independence, time management and flexibility (Student 461)                   |
|                          | 3. Fun online is limited | 4. Fun: requires interactive learning         | Meeting other students doing the same course is good, and feels supportive, but not many take up the opportunity (Student 162) |
| Negative 10%            | 1. FUN Unnecessary     | 2. Fun: activities require different approaches | I think being to be able to meet the weekly online tasks and reading takes up so much time, I wouldn’t expect any more. Seeing results is fun, but there needs to be concerted effort involved. So it is hard to keep fun at high levels because of periods of stress (Student 288). |
|                          | 1. Fun is not needed nor expected | 2. Fun is ambiguous and subjective           | It’s hard to get it across when you are using online facilities and textbooks to do a majority of learning. I’m quite a light-hearted person and am finding it difficult not having that face-to-face humor! (Student 232) |
|                          | 1. Fun must not affect Individual productivity | 2. Fun must be sensible for productive time   | You may have to make your own fun but the tutors can help too with in the tutorials (Student 31) |
|                          | 1. Fun is not needed nor expected | 2. Fun must not be forced                    | Readers like to read the module books, other learners like to watch videos and other people thrive in the tutor forum. Development of resources that suit a wide range of learning styles would make it more fun for adult learners who don’t attend classes on a campus (Student 142) |
|                          | 1. Fun must not affect Individual productivity | 2. Fun is ambiguous and subjective           | I think “fun” is subjective. Some people find the online activities fun, others find reading about a subject that interests them is fun. Some may find engaging with other students at a tutorial to be fun, for others it may be the opposite of fun (Student 59) |
|                          | 1. Fun must not affect Individual productivity | 2. Fun must be sensible for productive time   | If the fun remains relevant and helps to highlight a point or theory then I believe it would be well received. Students do not want fun activities if they do not add benefit to their current learning, it would be deemed a waste of study time (Student 391). |
|                          | 1. Fun must not affect Individual productivity | 2. Fun must not be forced                    | I find the forced fun activities, ones that start with “now, just for fun let’s try X” to be in many cases an annoying distraction (Student 380) |
|                          | 1. Fun must not affect Individual productivity | 2. Fun must not be forced                    | There is no fun in it at all but you don’t have to have fun to learn (Student 191) |
|                          | 1. Fun must not affect Individual productivity | 2. Fun must not be forced                    | Fun is not an option studying without the cost of the course. Students should be focused (Student 232). |

| R15. Design a variety of engaging learning activities for individuals and groups to select based on their preferences and abilities. | ok | Reduce | clear | Being able to work on my own as I don’t have the time to sit and wait around for other people to be able to do group work. Student-432 | 1. Fun must not affect Individual productivity | 3.1 | 2.6 | 3.0 |
of views and consistency with a proportional representation among qualitative themes and quantitative components.

DISCUSSION AND FINAL REMARKS

The value of students’ enjoyment with online learning has become fundamental in today’s world. The World Bank (2020) and UNESCO (2020) emphasized that more than 160 countries are facing a crisis in education due to the COVID-19 pandemic with loss of learning and in human capital; and over the long term, the economic difficulties will increase inequalities. Various factors will affect educational systems; in particular, low learning outcomes and high dropout rates in secondary school and higher education.

Students’ confidence and satisfaction with online learning are highly relevant in a world in which distance education has rapidly become a necessary practice in response to the global pandemic. This mixed-methods research revealed significant online students’ opinions about fun for enjoyable and meaningful learning. Fun is as an important part of the lived experience; however, its meaning is underexplored by literature.

This paper provided a methodology to examine fun in online learning supported by students’ epistemic beliefs, underpinned by RRI – Responsible Research and Innovation. A self-reflective instrument with valid and reliable measurement scales with epistemic constructs of online learning and fun helped participants to think about their views about how learning occurs and its relationship with fun. An open database with a three sets of code scheme was generated and shared with all participants during the covid-19 pandemic.

In this study, light is shed on the elements, meaning and relationships about fun and learning considering the students’ “nuanced views” that integrate fun and learning in different ways. Our results provided evidence that a large majority of higher education students (88.77%) value fun because they believe it has a positive social, cognitive and emotional effects on their distance online education. A small group (16.66%) highlighted that fun impairs learning.

This study confirmed that students should experience enjoyable learning so that learning should involve joy. Freire (1996) highlight that the joy of the “serious act” of learning does not refer to the easy joy of being inactive by doing nothing. “Emancipatory fun” (Okada and Sheehy, 2020) underpinned by Freire's pedagogy of autonomy is related to the hope and confidence that students can have fun by acting, reflecting and learning with enjoyment and consciousness. They can search, research and solve problems, identify and overcome obstacles as well transform and innovate their lives with knowledge, skills and resilience to shape a desirable future.

A key contribution of this study is that different epistemological beliefs are associated with different conceptualizations of the relationship between fun and learning (Sheehy et al., 2019a; Okada and Sheehy, 2020). Principal component analysis revealed three groups of students who found (1) fun relevant in socio-constructivist learning (2) no fun in traditional transmissive learning and (3) disturbing fun in constructivist learning. A set of 21 recommendations underpinned by systematic mixed methods and consensual review is provided for Higher Education community including course teams, teaching staff and students to enhance online learning experiences with optimal fun, emancipatory fun, collaborative fun and individual fun. Creating opportunities for students to voice and reflect on their own views and values is fundamental to develop more effective online course designs aligned with their needs.
In contrast, those who believe that learning is a social achievement described in the CEE report mentioned above. The balancing act between happiness with fun and academic education" (Freire, 2000). This separation may be reflected in learning (OECD, 2009) also known as the “banking model of knowledge” from expert to student, in a traditional model where people see teaching as a simple transfer of “untransformed knowledge” from expert to student. The latter concerned instructor-focused teaching that included the use of humor, creative examples, and storytelling. Their findings indicated that fun delivery, and not fun activities, was positively associated with students’ motivation, interest, and engagement.

Notably, their findings indicated fun delivery, but not fun activities, was positively related to student motivation, interest and engagement. Prior examining activities and delivery, our study highlights the importance of investigating students’ epistemic views. There is therefore the opportunity for novel research to examine factors and effects of fun and student learning experience including epistemic-guided learning design.

Our study highlights the importance of investigating students’ epistemic beliefs and its connections with the essence of their views. There is therefore the opportunity for novel research to examine factors and effects of fun and within student learning experience including the influence of epistemic-guided learning and teaching design.

A series of studies with Indonesian teachers (Sheehy et al., 2019a) suggested that their beliefs about how learning occurs are influenced by their views about happiness and, by implication, fun in relation to learning. These teachers often commented on the relationship between happiness and learning, and many saw happiness as an essential feature of good classroom teaching. However, they described a relationship between happiness and learning that was different in nature to that found in Western educational research. There is a tendency for Western educators to see happiness as “a tool for facilitating effective education” (Fox et al., 2013, p1), and as something that is promoted alongside educational excellence. In contrast, many Indonesian teachers see learning not as separate from happiness but as part of it (Budiyanto et al., 2017; Budiyanto and Sheehy, 2019).

Other research has implied that this belief in separation arises when people see teaching as a simple transfer of “untransformed knowledge” from expert to student, in a traditional model of learning (OECD, 2009) also known as the “banking model of education” (Freire, 2000). This separation may be reflected in the balancing act between happiness with fun and academic achievement described in the CEE report mentioned above. In contrast, those who believe that learning is a social constructivist process are more likely to see happiness with fun as important to the process of learning. The situation remains that we have an incomplete understanding of fun in the domain of learning (Tews et al., 2017) and it remains to be clarified by empirical research (Iten and Petko, 2016); in particular under the lens of epistemological beliefs (Sheehy et al., 2019a) and practical experiences.

Our study also complemented a previous research about fun on traditional university campus whose students highlighted that fun in learning must integrate stimulating pedagogy; lecturer engagement; a safe learning space; shared experience; and a low-stress environment (Whitton and Langan, 2018). Some key effects of fun, for example, pleasant communication and creation of a relaxed state to reduce stress (Bisson and Luckner, 1996) are important factors to support learners during the isolation. Fun as an inner joy of wellbeing and engagement is an important component to propitiate learning with the creation of new patterns that are interesting, surprising and meaningful (Schmidhuber, 2010) to involve students with formal education during uncertain time of post-pandemic.

As indicated by the research-authors and collaborators, further studies are important based on the RRI approach to construct new questions and also explore the issues indicated by preliminary studies (Okada and Sheehy, 2020). New issues must be also examined on the effects of fun on online learning, also considering age, gender, socio-cultural aspects, accessibility, digital skills, and geographical differences. Developing further recommendations at broader institutional, national and international levels about effective and engaging online learning is also important to empower individuals and society to face, innovate and reconstruct a sustainable and enjoyable world.

DATA AVAILABILITY STATEMENT

The open database can be accessed, downloaded and reused: Okada and Sheehy (2020) OLAF PROJECT data set. Open Research Data Online. The Open University. https://doi.org/10.21954/ou.rd.12670949 (November 2020). The Open Questionnaire can be accessed from the supplementary material Qualtrics Survey OLAF project.pdf.

ETHICS STATEMENT

The studies involving human participants were reviewed and approved by The Open University, HREC – Human Research and Ethics Committee. The patients/participants provided their written informed consent to participate in this study.

AUTHOR CONTRIBUTIONS

AO wrote the first draft of the abstract and prepared the manuscript. KS provided the instrument and feedback about the final version. AO was responsible for the survey
implementation in Qualtrics, data generation, instrument’s tests, data analysis through mixed methods, and validation supported by collaborators with consensual review. Additionally, AO created the figures, graphs, and tables. Both authors contributed to manuscript revision, read, and approved the submitted version.

**FUNDING**

This study was funded by the Open University UK and is part of the international project OLAF – Online Learning and Fun. http://www.open.ac.uk/blogs/rumpus/index.php/projects/olaf/.

**ACKNOWLEDGMENTS**

We are grateful to our collaborators who supported the recruitment of participants, our expert colleagues Prof. Dr. Daniela Meleré Barros; Prof. Dr. Maria Elizabeth de Almeida; Dr. Victoria Cooper, and Miss Ana Beatriz Rocha who provided valuable feedback and our external reviewers for useful suggestions.
