Abstract
We develop a formal construction of a pointwise divergence-free basis in the nonconforming virtual element method of arbitrary order for the Stokes problem introduced in Zhao et al. (SIAM J. Numer. Anal. 57(6):2730–2759, 2019). The proposed construction can be seen as a generalization of the divergence-free basis in Crouzeix-Raviart finite element space (Brenner, Math. Comp. 55(192):411–437, 1990; Thomasset, 1981) to the virtual element space. Using the divergence-free basis obtained from our construction, we can eliminate the pressure variable from the mixed system and obtain a symmetric positive definite system. Several numerical tests are presented to confirm the efficiency and the accuracy of our construction.

1 Introduction

Recently, the virtual element method (VEM) was proposed in [5] as a generalization of the finite element method (FEM) to general polygonal and polyhedral meshes. In VEMs, the local discrete spaces on the mesh polygons/polyhedrons, called local virtual element spaces, consist of polynomials of certain degrees and some other

non-polynomial functions that are solutions of specific partial differential equations. Although such functions are not defined explicitly, they are characterized by degrees of freedom, such as values at mesh vertices, the moments on mesh edges/faces, and the moments on mesh polygons/polyhedrons. On each (polygonal or polyhedral) element, the discrete bilinear form can be computed using only the degrees of freedom, and satisfies two properties, called consistency and stability. Here the consistency means that the discrete bilinear form is equal to the continuous bilinear form when one of the arguments is a polynomial, and the stability means that the discrete bilinear form is coercive for general virtual elements. Moreover, the virtual element spaces can be extended to arbitrary order in straightforward way. Because of such advantages, VEMs have been developed for many different types of equations, and successfully applied to various problems. The authors in [4] presented nonconforming VEMs for elliptic problems. In [17], the conforming and nonconforming VEMs for general elliptic problems were proposed. Various VEMs for solving linear elasticity problems can be found in [9, 22, 25, 27]. In [6–8, 13], VEMs for magnetostatic problems and Maxwell’s equations were presented. The authors in [15] constructed $H(\text{div})$-conforming virtual elements and presented mixed VEMs for Darcy flow. Conforming and nonconforming VEMs for elliptic eigenvalue problems were studied in [20, 21], respectively. For more thorough survey, we refer to [1, 3–5, 10, 11, 15, 19, 28] and references therein.

There have appeared some results concerning the VEMs for the Stokes problem as well. In [2], a stream formulation of the VEM for the Stokes problem was presented. In [16, 23], the nonconforming VEM of arbitrary order for the Stokes problem on polygonal and polyhedral meshes was first introduced. Therein, each component of the velocity is approximated by the nonconforming virtual element space presented in [4]. However, the velocity approximation in [16, 23] is not pointwise divergence-free, and it is merely divergence-free in a relaxed (projected) sense.

In the two-dimensional case, some researchers have developed VEMs for the Stokes problem in which the velocity approximation is pointwise divergence-free. In [12], the divergence-free velocity approximation is presented in the conforming virtual element space of order $k \geq 2$. On each polygon, the virtual element space consists of velocity solutions of the local Stokes problem with Dirichlet boundary condition. On the other hand, the nonconforming virtual element space of arbitrary order was constructed by enriching a $H(\text{div})$-conforming virtual element space in [29]. However, the proposed methods in [12, 29] only showed that the computed velocity approximation is pointwise divergence-free. They do not discuss the construction of divergence-free basis functions. To the best of our knowledge, a formal construction of divergence-free bases in these VEMs has never been considered and developed.

The main goal of this paper is to present a formal construction of a divergence-free basis in the two-dimensional nonconforming VEMs for the Stokes problem introduced in [29]. We first compute the dimension of the divergence-free subspace of the nonconforming virtual element space, using Euler’s formula. We then construct basis functions of the subspace, in a similar fashion to the divergence-free basis functions proposed in [14, 26] but we generalize to polygonal meshes and higher-order virtual elements. Using the construction of a divergence-free basis, we can eliminate the
pressure variable from the coupled system and reduce the saddle point problem to a symmetric positive definite system having fewer unknowns in velocity variable only. Although we only consider the Stokes problem in this paper, we expect that our construction can be applied to more complicated problems, such as the incompressible Navier-Stokes problem.

The rest of this paper is organized as follows. In Section 2, we state the stationary Stokes problem and its variational formulation. In Section 3, we review the divergence-free nonconforming VEM for the Stokes problem introduced in [29]. In Section 4, we discuss a formal construction of divergence-free basis of the nonconforming virtual element space. In Section 5, we discuss implementations including nonhomogeneous Dirichlet boundary conditions. In Section 6, we offer some numerical experiments that verify the efficiency and the accuracy of our construction. Finally, conclusions are given in Section 7.

2 Model problem

Let \( \Omega \subset \mathbb{R}^2 \) be a bounded, convex polygonal domain with boundary \( \partial \Omega \). We consider the Stokes problem on \( \Omega \): Given \( f : \Omega \to \mathbb{R}^2 \) and \( g : \partial \Omega \to \mathbb{R}^2 \), find \( u : \Omega \to \mathbb{R}^2 \) and \( p : \Omega \to \mathbb{R} \) such that

\[
\begin{cases}
-\Delta u + \nabla p = f & \text{in } \Omega, \\
\text{div } u = 0 & \text{in } \Omega, \\
u = g & \text{on } \partial \Omega.
\end{cases}
\]

(1)

In order to obtain the variational formulation of (1), we introduce the usual notation for Sobolev spaces, norms, seminorms, and inner products. Let \( D \) be a bounded domain in \( \mathbb{R}^2 \). We then define \( L^2(D) = [L^2(D)]^2 \) and \( H^s(D) = [H^s(D)]^2 \) for \( s > 0 \). The \( L^2 \)-inner product of \( L^2(D) \) and \( L^2(D) \) is denoted by \( (\cdot, \cdot)_0,D \). Next, for \( s \geq 0 \), the \( H^s \)-norm of \( H^s(D) \) and \( H^s(D) \) is denoted by \( \| \cdot \|_{s,D} \). Similarly, for \( s > 0 \), the \( H^s \)-seminorm of \( H^s(D) \) and \( H^s(D) \) is denoted by \( | \cdot |_{s,D} \). The subspace \( L^2_0(D) \) of \( L^2(D) \) is defined by

\[
L^2_0(D) = \left\{ q \in L^2(D) : \int_D q \, dx = 0 \right\}.
\]

Let us define

\[
H^1_0(\Omega) = \{ v \in H^1(\Omega) : v = 0 \text{ on } \partial \Omega \},
\]

\[
H^1_g(\Omega) = \{ v \in H^1(\Omega) : v = g \text{ on } \partial \Omega \}.
\]

Then, the variational form of the Stokes problem (1) is written as follows: For a given \( f \in L^2(\Omega) \) and a given \( g \in H^{1/2}(\partial \Omega) \) satisfying

\[
\int_{\partial \Omega} g \cdot n_{\Omega} \, ds = 0
\]

(2)
where \( \mathbf{n}_\Omega \) is the unit normal vector on \( \partial \Omega \) in the outward direction with respect to \( \Omega \), find \( \mathbf{u} \in H^1_g(\Omega) \) and \( p \in L^2_0(\Omega) \) such that

\[
\begin{cases}
a(\mathbf{u}, \mathbf{v}) + b(\mathbf{v}, p) = (f, \mathbf{v})_{0, \Omega} & \forall \mathbf{v} \in H^1_g(\Omega),
b(\mathbf{u}, q) = 0 & \forall q \in L^2_0(\Omega),
\end{cases}
\]

where

\[
a(\mathbf{u}, \mathbf{v}) = \int_{\Omega} \nabla \mathbf{v} : \nabla \mathbf{u} \, dx,
b(\mathbf{v}, q) = -\int_{\Omega} q \, \text{div} \, \mathbf{v} \, dx.
\]

The functions \( \mathbf{u} \) and \( p \) are called velocity and pressure, respectively.

## 3 Divergence-free nonconforming VEM for the stokes problem

In this section, we summarize some preliminaries and review the divergence-free nonconforming VEM for the Stokes problem introduced in [29].

### 3.1 Notations and preliminaries

Let \( \{ \mathcal{P}_h \}_h \) be a family of decompositions (meshes) of the domain \( \Omega \) into polygonal elements \( K \) with maximum diameter \( h \). We assume that the decompositions satisfy the following regularity properties [4, 5, 12, 29].

**Assumption 1** There exists \( \rho > 0 \) independent of \( h \) such that

- the decomposition \( \mathcal{P}_h \) consists of a finite number of nonoverlapping convex polygonal elements;
- if \( K \in \mathcal{P}_h \) and \( e \) is an edge of \( K \) then \( h_e \geq \rho h_K \), where \( h_e \) and \( h_K \) denote the diameter of \( e \) and \( K \), respectively;
- every element \( K \) of \( \mathcal{P}_h \) is star-shaped with respect to the ball of radius \( \rho h_K \).

We next define some notations for sets of mesh items. We denote by \( \mathcal{V}_h \) and \( \mathcal{E}_h \) the set of all mesh vertices and mesh edges in \( \mathcal{P}_h \), respectively. We also denote by \( \mathcal{V}_h^i \) and \( \mathcal{V}_h^\partial \) the set of all mesh vertices in the internal and the boundary of \( \mathcal{P}_h \), respectively. Similarly \( \mathcal{E}_h^i \) is the set of all mesh edges in the internal of \( \mathcal{P}_h \), and \( \mathcal{E}_h^\partial \) the set of all mesh edges in the boundary of \( \mathcal{P}_h \). We also define

\[
\begin{align*}
N_P & = \text{the number of polygons in } \mathcal{P}_h, \\
N_E & = \text{the number of edges in } \mathcal{E}_h, \\
N_{E,i} & = \text{the number of edges in } \mathcal{E}_h^i, \\
N_{E,\partial} & = \text{the number of edges in } \mathcal{E}_h^\partial, \\
N_V & = \text{the number of vertices in } \mathcal{V}_h, \\
N_{V,i} & = \text{the number of vertices in } \mathcal{V}_h^i, \\
N_{V,\partial} & = \text{the number of vertices in } \mathcal{V}_h^\partial.
\end{align*}
\]
For each \( K \in \mathcal{P}_h \), let \( \mathbf{n}_K \) and \( \mathbf{t}_K \) denote its exterior unit normal vector and counterclockwise tangential vector, respectively. Let \( e \in \mathcal{E}^i_h \). We then define respectively \( \mathbf{n}_e \) and \( \mathbf{t}_e \) as the unit normal and tangential vector of \( e \) with orientation fixed once and for all. Next let \( e \in \mathcal{E}^\beta_h \), we define respectively \( \mathbf{n}_e \) and \( \mathbf{t}_e \) as the unit normal and tangential vector on \( e \) in the outward and counterclockwise direction with respect to \( \Omega \).

Let \( e \in \mathcal{E}^i_h \) and let \( K^- \) and \( K^+ \) be the polygons in \( \mathcal{P}_h \) that have \( e \) as a common edge, and satisfy \( \mathbf{n}_e = \mathbf{n}_K \) on \( e \) (i.e., \( \mathbf{n}_e \) points from \( K^+ \) to \( K^- \)). If \( e \in \mathcal{E}^\beta_h \), we define \( \mathbf{n}_e \) by the unit normal vector in the outward direction with respect to \( \Omega \).

Again let \( e \in \mathcal{E}^i_h \) and let \( K^- \) and \( K^+ \) be the polygons in \( \mathcal{P}_h \) having \( e \) as a common edge. For \( v : \Omega \rightarrow \mathbb{R}^2 \) satisfying \( v|_{K^+} \in H^1(K^+) \) and \( v|_{K^-} \in H^1(K^-) \), we define the jump of \( v \) on the edge \( e \) by

\[
[v]_e = v|_{K^+} \mathbf{n}_e \cdot \mathbf{n}_{K^+} + v|_{K^-} \mathbf{n}_e \cdot \mathbf{n}_{K^-}.
\]

If \( e \in \mathcal{E}^\beta_h \), we define \([v]_e = v|_e\).

We define the broken Sobolev space \( H^1(\Omega; \mathcal{P}_h) \) by

\[
H^1(\Omega; \mathcal{P}_h) = \{v \in L^2(\Omega) : v|_K \in H^1(K) \forall K \in \mathcal{P}_h\}
\]

and define its norm and seminorm by

\[
\|v\|_{1,h} = \left(\sum_{K \in \mathcal{P}_h} \|v\|^2_{1,K}\right)^{1/2}, \quad |v|_{1,h} = \left(\sum_{K \in \mathcal{P}_h} |v|^2_{1,K}\right)^{1/2}.
\]

We also define

\[
H^{1,nc}(\Omega; \mathcal{P}_h) = \left\{v \in H^1(\Omega; \mathcal{P}_h) : \int_e [v]_e \cdot q \, dx = 0 \forall q \in P_{k-1}(e), \forall e \in \mathcal{E}^i_h\right\}.
\]

Let \( O \) be an 1 or 2 dimensional geometrical object (edge or polygon). For an integer \( k \geq 0 \), \( P_k(O) \) denotes the space of polynomials of degree \( \leq k \) on \( O \). \( M_k(O) \) denotes the set of scaled monomials of degree \( \leq k \) on \( O \), that is,

\[
M_k(O) = \left\{(x - x_o)_{hO}^\alpha : \|\alpha\| \leq k\right\},
\]

where \( x \) is a local coordinate system on \( O \), \( x_o \) is the barycenter of \( O \) in the local coordinate system, \( \alpha \) is a multi-index, and \( h_O = \text{diam}(O) \).

Conventionally we define \( P_{-1}(O) = \{0\} \). We also define \( P_k(O) = (P_k(O))^2 \) for \( k \geq -1 \) and \( M_k(O) = (M_k(O))^2 \) for any nonnegative integer \( k \).

Let \( K \in \mathcal{P}_h \) and let \( k \) be a nonnegative integer. We define \((\nabla P_{k+1}(K))^\oplus\) as the subspace of \( P_k(K) \) satisfying

\[
P_k(K) = \nabla P_{k+1}(K) \oplus (\nabla P_{k+1}(K))^\oplus,
\]

and denote by \( M_k^\oplus \) a basis of the space \((\nabla P_{k+1}(K))^\oplus\). For example, one can choose

\[
(\nabla P_{k+1}(K))^\oplus = x^\perp P_{k-1}(K), \quad M_k^\oplus = \{m(x)x^\perp : m \in M_{k-1}(K)\},
\]

where \( x^\perp = (x_2, -x_1) \) with \( x = (x_1, x_2) \).
3.2 Virtual element space

We first define a local virtual element space on each element $K \in \mathcal{T}_h$. Let $k$ be a fixed positive integer. Let

$$W^1_h(K) := \{ v \in H^1(K) : \text{div} v \in P_{k-1}(K), \text{rot} v = 0, v \cdot n_K |_e \in P_k(e), \forall e \subset \partial K \},$$

where $\text{rot} v = \frac{\partial v_2}{\partial x_1} - \frac{\partial v_1}{\partial x_2}$ for $v = (v_1, v_2) \in H^1(K)$. Also, let

$$\Phi^1_h(K) := \{ \phi \in H^2(K) : \Delta^2 \phi \in P_{k-3}(K), \phi |_e = 0, \Delta \phi |_e \in P_{k-1}(e), \forall e \subset \partial K \},$$

with the convention that $P_{-1}(K) = P_{-2}(K) = \{0\}$. In [29, Lemma 2], it was shown that $W^1_h(K) \cap \text{curl} \Phi^1_h(K) = \{0\}$, where $\text{curl} q = \left( -\frac{\partial q}{\partial x_2}, \frac{\partial q}{\partial x_1} \right)$ for $q \in H^1(K)$. It was also shown in [29, Lemma 3] that if the local space $\tilde{V}_h(K)$ is defined by

$$\tilde{V}_h(K) = W^1_h(K) \oplus \text{curl} \Phi^1_h(K),$$

then the following degrees of freedom (DOFs) are unisolvent for $\tilde{V}_h(K)$:

- the moments $\frac{1}{|e|} \int_e v \cdot n_e q ds$, $q \in M_k(e)$,
- the moments $\frac{1}{|e|} \int_e v \cdot t_e q ds$, $q \in M_{k-1}(e)$,
- the moments $\frac{1}{|K|} \int_K v \cdot q dx$, $q \in M_{k-2}(K)$.

We define a local projection $\Pi^\nabla_K : H^1(K) \rightarrow P_k(K)$ on each polygon $K$ in $\mathcal{T}_h$. It is defined by

$$\int_K \nabla (\Pi^\nabla_K v) : \nabla q dx = \int_K \nabla v : \nabla q dx, \quad \forall v \in H^1(K), \forall q \in P_k(K),$$

$$\int_{\partial K} \Pi^\nabla_K v ds = \int_{\partial K} v ds,$$

for $v \in H^1(K)$. Note that $\Pi^\nabla_K q = q$ for any $q \in P_k(K)$ and the local projection $\Pi^\nabla_K$ is computable using only the moments of $v$ up to order $(k - 1)$ on each edge $e \subset \partial K$ and the moments of $v$ up to order $(k - 2)$ on $K$.

Now the local nonconforming virtual element space $V_h(K)$ on $K$ is defined by

$$V_h(K) = \left\{ v \in \tilde{V}_h(K) : \int_e (v - \Pi^\nabla_K v) \cdot n_e q ds = 0, \forall q \in P_k(e)/P_{k-1}(e), \forall e \subset \partial K \right\},$$

where $P_k(e)/P_{k-1}(e)$ is the subspace of polynomials in $P_k(e)$ that are $L^2(e)$-orthogonal to $P_{k-1}(e)$. It was shown in [29] that the following DOFs are unisolvent
for $V_h(K)$:

$$
\frac{1}{|e|} \int_e v \cdot n_q ds, \quad q \in M_{k-1}(e), \\
\frac{1}{|e|} \int_e v \cdot t_q ds, \quad q \in M_{k-1}(e), \\
\frac{1}{|K|} \int_K v \cdot q dx, \quad q \in M_{k-2}(K).
$$

For each $i = 1, 2, \cdots, N_K := \dim V_h(K)$, let $\chi_i$ be the operator associated to the $i$th local DOF. Then, for any $v \in H^1(K)$, there exists a unique element $I^K_h v \in V_h(K)$ such that

$$
\chi_i (v - I^K_h v) = 0 \quad \forall i = 1, 2, \cdots, N_K.
$$

The operator $v \mapsto I^K_h v$ is called a local interpolation operator for $V_h(K)$. It was shown in [29] that we can obtain the following interpolation error estimates.

**Proposition 1** (see [29, Lemma 6]) There exists a positive constant $C$ independent of $h$ such that for every $K \in \mathcal{P}_h$ and every $v \in H^{s}(K)$ with $1 \leq s \leq k + 1$,

$$
\|v - I^K_h v\|_{0,K} + h|v - I^K_h v|_{1,K} \leq C h^s |v|_{s,K}.
$$

The global nonconforming virtual element spaces are defined as follows:

$$
V_h = \left\{ v_h \in L^2(\Omega) : v_h|_K \in V_h(K) \quad \forall K \in \mathcal{P}_h, \right. \\
\left. \int_e [v_h]_e \cdot q ds = 0 \quad \forall q \in \mathcal{P}_{k-1}(e), \forall e \in \mathcal{E}_h^i \right\},
$$

$$
V_{h,0} = \left\{ v_h \in L^2(\Omega) : v_h|_K \in V_h(K) \quad \forall K \in \mathcal{P}_h, \right. \\
\left. \int_e [v_h]_e \cdot q ds = 0 \quad \forall q \in \mathcal{P}_{k-1}(e), \forall e \in \mathcal{E}_h \right\}.
$$

The global DOFs for $V_h$ can be chosen as, for any edge $e$ and polygon $K$ in $\mathcal{P}_h$,

$$
\chi^n_{e,q}(v_h) := \frac{1}{|e|} \int_e v_h \cdot n_e q ds, \quad q \in M_{k-1}(e),
$$

$$
\chi^t_{e,q}(v_h) := \frac{1}{|e|} \int_e v_h \cdot t_e q ds, \quad q \in M_{k-1}(e),
$$

$$
\chi_{K,q}(v_h) := \frac{1}{|K|} \int_K v_h \cdot q dx, \quad q \in \nabla M_{k-1}(K) + M_{k-2}(K).
$$

Similarly, the global DOFs for $V_{h,0}$ can be chosen. We also define the global interpolation operator $I_h : H^{1,nc}(\Omega; \mathcal{P}_h) \rightarrow V_h$ by $(I_h v)|_K = I^K_h (v|_K)$ for each $K \in \mathcal{P}_h$ and $v \in H^{1,nc}(\Omega; \mathcal{P}_h)$.

The discrete pressure space $Q_h$ is defined by

$$
Q_h = \{ q_h \in L^2_0(\Omega) : q_h|_K \in P_{k-1}(K) \quad \forall K \in \mathcal{P}_h \}. $$
The global DOFs for the space $Q_h$ can be chosen as
\[
\frac{1}{|K|} \int_K q_h \phi dx, \quad \phi \in M_{k-1}(K), \ K \in \mathcal{P}_h.
\]
It was shown in [29] that $\text{div} \ V_h(K) \subset P_{k-1}(K)$ for each $K \in \mathcal{P}_h$, and $\text{div}_h V_{h,0} \subset Q_h$, where $\text{div}_h$ denotes the discrete divergence operator defined by $(\text{div}_h v_h)|_K = \text{div}(v_h|_K)$ for each $K \in \mathcal{P}_h$ and $v_h \in V_h$. Therefore, the nonconforming virtual element space $V_h$ is divergence-free.

3.3 The discrete problem

We define a local discrete bilinear form $a^K_h$ for each polygon $K$ in $\mathcal{P}_h$, as follows.
\[
a^K_h(v_h, w_h) = a^K(\Pi_K^\nabla v_h, \Pi_K^\nabla w_h) + S^K((I - \Pi_K^\nabla)v_h, (I - \Pi_K^\nabla)w_h), \quad v_h, w_h \in V_h(K),
\]
where $a^K$ is the bilinear form defined by
\[
a^K(v, w) = \int_K \nabla v : \nabla w dx, \quad v, w \in H^1(K),
\]
and $S^K$ is a symmetric positive definite bilinear form defined as
\[
S^K(v_h, w_h) = \sum_{i=1}^{N_K} \chi_i(v_h)\chi_i(w_h), \quad v_h, w_h \in V_h(K),
\]
where $N_K = \text{dim}(V_h(K))$ and $\chi_i$ denotes the operator associated to the $i$th local DOF for $i = 1, 2, \ldots, N_K$. As described in [5, 29], we obtain the $k$-consistency and stability of $a^K_h$:
- (k-consistency) $a^K_h(q, v_h) = a^K(q, v_h)$ for any $q \in P_k(K)$, $v_h \in V_h(K)$;
- (stability) there exist constants $c_*, c^* > 0$ independent of $h$ such that
\[
c_*a^K(v_h, v_h) \leq a^K_h(v_h, v_h) \leq c^*a^K(v_h, v_h) \quad \forall v_h \in V_h(K).
\]

The global bilinear form $a_h$ is defined by
\[
a_h(v_h, w_h) = \sum_{K \in \mathcal{P}_h} a^K_h(v_h, w_h), \quad v_h, w_h \in V_h.
\]
On the other hand, the discrete bilinear form $b_h$ is simply defined by
\[
b_h(v_h, q_h) = \sum_{K \in \mathcal{P}_h} b^K(v_h, q_h), \quad v_h \in V_h, q_h \in Q_h,
\]
where
\[
b^K(v, q) = -\int_K q \ \text{div} v dx,
\]
for $v \in H^1(K)$, $q \in P_{k-1}(K)$, and $K \in \mathcal{P}_h$. Note that $b_h(v_h, q_h)$ is also computable using only the DOFs (5)–(7) and we do not rely on the discrete version of it, indeed we omit the subscript $h$ on such bilinear form.
We next discretize the right-hand side \((f, \cdot)_{0,\Omega}\) as follows:

\[
(f_h, v_h) = \begin{cases} (f_h, v_h)_{0, \Omega} & \text{if } k = 1 \\ (f_h, v_h)_{0, \Omega} & \text{if } k > 1 \end{cases}, \quad v_h \in V_h,
\]

where \(f_h, v_h \in L^2(\Omega)\) are defined by

\[
f_h|_K = \begin{cases} \Pi^K_1 f & \text{if } k = 1 \\ \Pi^K_{k-2} f & \text{if } k > 1 \end{cases}, \quad v_h|_K = \frac{1}{|\partial K|} \int_{\partial K} v_h ds, \quad K \in \mathcal{P}_h.
\]

Here, \(\Pi^K_1\) denotes the \(L^2\)-projection operator onto \(P_1(K)\) for each \(K \in \mathcal{P}_h\).

In order to consider the nonhomogeneous Dirichlet boundary condition, let

\[
V_{h,g} = \left\{ v_h \in V_h : \int_e g \cdot q ds = \int_e v_h \cdot q ds, \quad \forall q \in P_{k-1}(e), \quad \forall e \in \mathcal{E}_h \right\}.
\]

We formulate the nonconforming VEM for the Stokes problem (3) as follows: Find \(u_h \in V_{h,g}\) and \(p_h \in Q_h\) such that

\[
\begin{aligned}
\{a_h(u_h, v_h) + b_h(v_h, p_h) &= (f_h, v_h) \quad \forall v_h \in V_{h,0}, \\
b_h(u_h, q_h) &= 0 \quad \forall q_h \in Q_h.
\}
\]

Here \(u_h\) and \(p_h\) will be called discrete velocity and discrete pressure, respectively. It was shown in [29] that the bilinear form \(b_h(\cdot, \cdot)\) satisfies the inf-sup condition and the discrete problem (8) is well-posed. Moreover, for the case \(g = 0\), we can obtain the following error estimate.

**Theorem 1** (see [29, Theorem 13]) Suppose that \(f \in H^{k-1}(\Omega)\) and \(g = 0\). Let \((u, p) \in (H^1(\Omega) \cap H^{k+1}(\Omega)) \times (L^2(\Omega) \cap H^1(\Omega))\) be the solution of the continuous problem (3). Let \((u_h, p_h) \in V_{h,0} \times Q_h\) be the solution of the discrete problem (8). Then,

\[
|u - u_h|_{1,\Omega} + \|p - p_h\|_{0,\Omega} \leq Ch^k(|u|_{k+1,\Omega} + |p|_{k,\Omega} + |f|_{k-1,\Omega}),
\]

where \(C\) is a positive constant independent on \(h\).

### 4 A formal construction of divergence-free basis

In this section, we present a formal construction of a divergence-free basis for the virtual element space \(V_{h,0}\).

We first define the canonical basis associated with the DOFs (5)–(7) of the space \(V_h\). Recall that the global DOFs of \(V_h\) are given by

\[
\chi^n_{e, q}(v_h) = \frac{1}{|e|} \int_e v_h \cdot n e q ds, \quad q \in M_{k-1}(e), \quad e \in \mathcal{E}_h,
\]

\[
\chi^t_{e, q}(v_h) = \frac{1}{|e|} \int_e v_h \cdot t e q ds, \quad q \in M_{k-1}(e), \quad e \in \mathcal{E}_h,
\]

\[
\chi_K q(v_h) = \frac{1}{|K|} \int_K v_h \cdot q dx, \quad q \in \nabla M_{k-1}(K) + M_{k-2}^\oplus(K), \quad K \in \mathcal{P}_h.
\]
We sometimes write $\chi$ to denote $\chi_{e,q}^n$, $\chi_{e,q}^l$, or $\chi_{K,q}$ when it is clear from the context. Using these notations, we define the canonical basis functions of $V_h$ associated to the DOFs (5)–(7) as follows:

- For $e \in \mathcal{E}_h$ and $q \in \mathcal{M}_{k-1}(e)$, let $\varphi_{e,q}^n$ be the function in $V_h$ such that $\chi_{e,q}^n(\varphi_{e,q}^n) = 1$ and $\chi(\varphi_{e,q}^n) = 0$ for all other DOFs.
- For $e \in \mathcal{E}_h$ and $q \in \mathcal{M}_{k-1}(e)$, let $\varphi_{e,q}^l$ be the function in $V_h$ such that $\chi_{e,q}^l(\varphi_{e,q}^l) = 1$ and $\chi(\varphi_{e,q}^l) = 0$ for all other DOFs.
- For $K \in \mathcal{P}_h$ and $q \in (\mathcal{M}_{k-1}(K)) + M_{k-2}(K)$, let $\varphi_{K,q}$ be the function in $V_h$ such that $\chi_{K,q}(\varphi_{K,q}) = 1$ and $\chi = 0$ for all other DOFs.

Let us define 

$$Z_h = \{v_h \in V_h : \text{div}_h v_h = 0\}, \quad Z_{h,0} = \{v_h \in V_{h,0} : \text{div}_h v_h = 0\}.$$ 

We first compute the dimension of $Z_{h,0}$.

**Proposition 2** The dimension of $Z_{h,0}$ is 

$$N_{V,i} + kN_{E,i} + (k - 1)N_{E,i} + \frac{(k - 1)(k - 2)}{2}N_P.$$ 

**Proof** Since $\text{div}_h V_{h,0} = Q_h$ and since $\text{div}_h V_{h,0} \cong V_{h,0}/Z_{h,0}$, we obtain 

$$\dim Z_{h,0} = \dim V_{h,0} - \dim(\text{div}_h V_{h,0}) = \dim V_{h,0} - \dim Q_h.$$ 

Note that 

$$\dim V_{h,0} = 2 \left(\frac{k(k - 1)}{2}N_P + kN_{E,i}\right), \quad \dim Q_h = \frac{k(k + 1)}{2}N_P - 1,$$

Since $N_P - N_{E,i} + N_{V,i} = 1$ from Euler’s formula, we have 

$$\dim Z_{h,0} = \dim V_{h,0} - \dim Q_h = k(k - 1)N_P + 2kN_{E,i} - \frac{k(k + 1)}{2}N_P + 1$$

$$= k(k - 1)N_P + 2kN_{E,i} - \frac{k(k + 1)}{2}N_P + N_P - N_{E,i} + N_{V,i}$$

$$= N_{V,i} + kN_{E,i} + (k - 1)N_{E,i} + \frac{(k - 1)(k - 2)}{2}N_P.$$ 

This concludes the proof of the proposition. 

In order to construct a basis of $Z_{h,0}$, we first define some functions in $V_h$.

**D1** For each vertex $v \in \mathcal{V}_h$, let $e_1, \cdots, e_l$ be the edges in $\mathcal{E}_h$ having $v$ as an end point, and let $K_1, \cdots, K_l$ be the elements in $\mathcal{P}_h$ having $v$ as a vertex. For each $i = 1, \cdots, l$, let $n_{e_i,v}$ be a unit vector normal to $e_i$ pointing in the counterclockwise direction with respect to the vertex $v$ (see Fig. 1a). Define $\psi_v \in V_h$ by 

$$\psi_v := h \sum_{i=1}^{l} \frac{\langle n_{e_i}, n_{e_i,v} \rangle}{|e_i|} \varphi_{e_i,1}^n + \sum_{j=1}^{l} \sum_{q \in \mathcal{M}_{k-1}(K_j) \setminus \{1\}} c_{j,q} \varphi_{K_j,\nabla q}.$$ 

 Springer
where
\[ c_{j,q} = \frac{h}{|K_j|} \sum_{i=1}^{l} \frac{\langle n_{e_i}, n_{e_i,v} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} \phi_{e_i,1} \cdot n_{K_j} q ds \]
for \( q \in M_{k-1}(K_j) \setminus \{1\} \) and \( j = 1, \ldots, l \).

**(D2)** For each edge \( e \in \mathcal{E}_h \) and each \( q \in M_{k-1}(e) \), define \( \psi_{e,q}^l \) by
\[ \psi_{e,q}^l = \phi_{e,q}^l. \]

**(D3)** Assume \( k \geq 2 \). For each edge \( e \in \mathcal{E}_h \) and each \( q \in M_{k-1}(e) \setminus \{1\} \), define \( \psi_{e,q}^n \) by
\[ \psi_{e,q}^n = \phi_{e,q}^n + \sum_{K \in \mathcal{P}_h} \sum_{r \in M_{k-1}(K) \setminus \{1\}} c_{K,r} \phi_{K,r}, \]
where
\[ c_{K,r} = \frac{1}{|K|} \int_{e \cap \partial K} \phi_{e,q}^n \cdot n_K r ds, \quad r \in M_{k-1}(K) \setminus \{1\}, \; K \in \mathcal{P}_h. \]
(See Fig. 1b.)

**(D4)** Assume \( k \geq 3 \). For each \( K \in \mathcal{P}_h \) and each \( q \in M_{k}^{\oplus} \), define \( \psi_{K,q} \) by
\[ \psi_{K,q} = \phi_{K,q}. \]

**Remark 1** The coefficients \( c_{j,q} \) and \( c_{K,r} \) defined in (D1) and (D3) are exactly computable using the DOFs (5)–(7). Moreover, since it is computed elementwise, the cost of computing the coefficients is negligible.

We first show that the functions defined in (D1)–(D4) are indeed contained in \( Z_h \).

**Lemma 1** The functions defined in (D1)–(D4) are contained in \( Z_h \).

**Proof** Since \( \text{div} \; V_h(K) \subset P_{k-1}(K) \) for each \( K \in \mathcal{P}_h \), if \( v_h \in V_h \), then
\[ v_h \in Z_h \quad \text{if and only if} \quad \int_K q \text{div} \; v_h dx = 0 \; \forall q \in M_{k-1}(K), \; \forall K \in \mathcal{P}_h. \]
From (9), the functions in (D2) and (D4) are obviously contained in $Z_h$. We first show that the functions in (D1) belong to $Z_h$. Note that

$$\int_K q \text{div} \psi_v \, dx = 0 \quad \forall q \in M_{k-1}(K), \ \forall K \in \mathcal{P}_h \text{ with } K \neq K_1, \ldots, K_l.$$ 

Let $j = 1, \ldots, l$. Since $K_j$ is a polygon having $v$ as a vertex, there are exactly two edges $e_{i_1,v}$ and $e_{i_2,v}$ with $1 \leq i_1, i_2 \leq l$ such that $e_{i_1,v}, e_{i_2,v} \subset \partial K_j$. Moreover, one of the normal vectors $n_{e_{i_1,v}}$ and $n_{e_{i_2,v}}$ coincides with $n_{K_j}$, and the other has the opposite direction of $n_{K_j}$. We may assume that $n_{e_{i_1,v}} = n_{K_j}|_{e_{i_1}}$ and $n_{e_{i_2,v}} = -n_{K_j}|_{e_{i_2}}$. Then,

$$\int_{K_j} \text{div} \psi_v \, dx = \int_{\partial K_j} \psi_v \cdot n_{K_j} \, ds$$

$$\quad = \begin{cases} h \frac{\langle n_{e_{i_1}} \cdot n_{e_{i_1,v}} \rangle}{|e_{i_1}|} \int_{e_{i_1} \cap \partial K_j} \varphi_{e_{i_1,1}} \cdot n_{K_j} \, ds + h \frac{\langle n_{e_{i_2}} \cdot n_{e_{i_2,v}} \rangle}{|e_{i_2}|} \int_{e_{i_2} \cap \partial K_j} \varphi_{e_{i_2,1}} \cdot n_{K_j} \, ds & \text{if } q = q' \\
\sum_{q' \in M_{k-1}(K_j) \setminus \{1\}} c_{j,q'} \int_{K_j} \varphi_{K_j} \cdot \nabla q' \cdot \nabla \psi_v \, dx & \text{if } q \neq q'. \end{cases}$$

$$\quad = h \sum_{i=1}^l \frac{\langle n_{e_i} \cdot n_{e_{i,v}} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} \varphi_{e_i,1} \cdot n_{K_j} \, ds - c_{j,q} \int_{K_j} \varphi_{K_j} \cdot \nabla q \cdot \nabla \psi_v \, dx$$

$$\quad = h \sum_{i=1}^l \frac{\langle n_{e_i} \cdot n_{e_{i,v}} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} \varphi_{e_i,1} \cdot n_{K_j} \, ds - |K_j| c_{j,q}$$

$$\quad = 0.$$ 

Suppose $q \in M_{k-1}(K_j) \setminus \{1\}$. Then,

$$\int_{K_j} q \text{div} \psi_v \, dx = \int_{\partial K_j} q \psi_v \cdot n_K \, ds - \int_{K_j} \psi_v \cdot \nabla q \, dx$$

$$\quad = h \sum_{i=1}^l \frac{\langle n_{e_i} \cdot n_{e_{i,v}} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} q \varphi_{e_i,1} \cdot n_{K_j} \, ds$$

$$\quad - c_{j,q} \sum_{q' \in M_{k-1}(K_j) \setminus \{1\}} \int_{K_j} \varphi_{K_j} \cdot \nabla q' \cdot \nabla q \, dx$$

$$\quad = h \sum_{i=1}^l \frac{\langle n_{e_i} \cdot n_{e_{i,v}} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} q \varphi_{e_i,1} \cdot n_{K_j} \, ds - c_{j,q} \sum_{q' \in M_{k-1}(K_j) \setminus \{1\}} \int_{K_j} \varphi_{K_j} \cdot \nabla q' \cdot \nabla q \, dx$$

$$\quad = h \sum_{i=1}^l \frac{\langle n_{e_i} \cdot n_{e_{i,v}} \rangle}{|e_i|} \int_{e_i \cap \partial K_j} q \varphi_{e_i,1} \cdot n_{K_j} \, ds - |K_j| c_{j,q}$$

$$\quad = 0.$$ 

Here we used the relations

$$\int_{K_j} \varphi_{K_j} \cdot \nabla q' \cdot \nabla q \, dx = \begin{cases} |K_j| & \text{if } q = q' \\
0 & \text{if } q \neq q'. \end{cases}$$

Thus, $\psi_v \in Z_h$. We next show that the functions $\psi^n_{e,q}$ in (D3) belong to $Z_h$. Note that $c_{K,r} = 0$ for any $r \in M_{k-1}(K) \setminus \{1\}$ and any $K \in \mathcal{P}_h$ with $e \not\subset \partial K$. Then,

$$\int_K r \text{div} \psi^n_{e,q} \, dx = \int_{\partial K} r \psi^n_{e,q} \cdot n_K \, ds - \int_K \psi^n_{e,q} \cdot \nabla r \, dx$$

$$\quad = \int_{\partial K} r \psi^n_{e,q} \cdot n_K \, ds = 0.$$
for any $r \in M_{k-1}(K) \setminus \{1\}$ and $K \in P_h$ with $e \not\subset \partial K$. We next suppose that $K \in P_h$ satisfies $e \subset \partial K$. Since $q \neq 1$,

$$\int_K \text{div} \psi_{e,q}^n \, dx = \int_{\partial K} \psi_{e,q}^n \cdot n_K \, ds = 0,$$

and

$$\int_K r \text{div} \psi_{e,q}^n \, dx = \int_{\partial K} r \psi_{e,q}^n \cdot n_K \, ds - \int_K \psi_{e,q}^n \cdot \nabla r \, dx$$

$$= \int_{e \cap \partial K} r \varphi_{e,q}^n \cdot n_K \, ds - \sum_{r' \in M_{k-1}(K) \setminus \{1\}} c_{K,r'} \int_K \varphi_{K,r'} \cdot \nabla r \, dx$$

$$= \int_{e \cap \partial K} r \varphi_{e,q}^n \cdot n_K \, ds - c_{K,r} \int_K \varphi_{K,r} \cdot \nabla r \, dx$$

$$= \int_{e \cap \partial K} r \varphi_{e,q}^n \cdot n_K \, ds - |K| c_{K,r} = 0$$

for any $r \in M_{k-1}(K) \setminus \{1\}$. Here, as before, we used the relations

$$\int_K \varphi_{K,q} \cdot \nabla r \, dx = \begin{cases} |K| & \text{if } r = r' \\ 0 & \text{if } r \neq r' \end{cases}$$

Thus, $\psi_{e,q}^n \in Z_h$. This concludes the proof of the lemma.

The next theorem shows that some of these functions generate a basis for $Z_{h,0}$.

**Theorem 2** Let $Z_1, Z_2, Z_3, Z_4$ be the subspaces of $V_h$ defined by

$$Z_1 = \text{span}(\{ \psi_v : v \in V_h^i \})$$

$$Z_2 = \text{span}(\{ \psi_{e,q}^{t} : q \in M_{k-1}(e), e \in E^i_h \})$$

$$Z_3 = \begin{cases} \text{span}(\{ \psi_{e,q}^{n} : q \in M_{k-1}(e) \setminus \{1\}, e \in E^i_h \}) & \text{if } k \geq 2 \\ \{0\} & \text{otherwise} \end{cases}$$

$$Z_4 = \begin{cases} \text{span}(\{ \psi_{K,q} : q \in M_{k}^\oplus, K \in P_h \}) & \text{if } k \geq 3 \\ \{0\} & \text{otherwise} \end{cases}$$

where $\psi_v, \psi_{e,q}^t, \psi_{e,q}^n$, and $\psi_{K,q}$ are the functions given in (D1)–(D4), respectively. Then, the following hold.

(i) $Z_1, Z_2, Z_3, Z_4 \subset Z_{h,0}$.

(ii) $Z_i \cap Z_j = \{0\}$ for any pair $(i, j)$ with $i \neq j$.

(iii) The dimensions of the subspaces $Z_1, Z_2, Z_3, Z_4$ satisfy

$$\dim Z_1 = N_{V,i}, \quad \dim Z_2 = kN_{E,i},$$

$$\dim Z_3 = (k-1)N_{E,i}, \quad \dim Z_4 = \frac{(k-1)(k-2)}{2} N_{P}.$$ 

Consequently, $Z_{h,0} = Z_1 \oplus Z_2 \oplus Z_3 \oplus Z_4$. 

 Springer
Proof Since $Z_{h,0} = Z_h \cap V_{h,0}$, and from Lemma 1, it suffices to show that the functions in (D1)–(D4) are contained in $V_{h,0}$. Clearly $\psi_{K,q} \in V_{h,0}$ for any $K \in \mathcal{P}_h$ and any $q \in M_k$. If $e \in \mathcal{E}_h^i$, then $\psi_{e,q}^i \in V_{h,0}$ for any $q \in M_{k-1}(e)$ and $\psi_{e,q}^h \in V_{h,0}$ for any $q \in M_{k-1}(e) \setminus \{1\}$. If $v \in V_{h}^i$, then the edges in $\mathcal{E}_h$ that have $v$ as an end point are contained in $\mathcal{E}_h^i$. Thus, $\psi_v \in V_{h,0}$ for any $v \in V_{h}^i$. Hence, $Z_1, Z_2, Z_3,$ and $Z_4$ are subspaces of $Z_{h,0}$.

On the other hand, it is easy to show that $Z_i \cap Z_j = \{0\}$ for any pair $(i, j)$ with $i \neq j$ and

$$\dim Z_1 = N_{V,i}, \quad \dim Z_2 = kN_{E,i},$$

$$\dim Z_3 = (k - 1)N_{E,i}, \quad \dim Z_4 = \frac{(k - 1)(k - 2)}{2}N_p.$$  

Then, since $Z_1 \oplus Z_2 \oplus Z_3 \oplus Z_4 \subset Z_{h,0}$ and since $\dim Z_{h,0} = \dim Z_1 + \dim Z_2 + \dim Z_3 + \dim Z_4$ by Proposition 2, we obtain

$$Z_{h,0} = Z_1 \oplus Z_2 \oplus Z_3 \oplus Z_4.$$  

This concludes the proof of the theorem. 

Remark 2 If $k = 1$ and the mesh $\mathcal{P}_h$ is a triangular mesh, then the construction of the basis of $Z_{h,0}$ described in Theorem 2 is exactly the same with the divergence-free basis in the Crouzeix-Raviart finite element space [14, 26].

5 Implementation details

In this section, we present how to compute the solution $(u_h, p_h)$ of the discrete problem (8) by using the construction of $Z_{h,0}$ presented in Section 4.

5.1 Computing the discrete velocity $u_h$

We first consider the case $g = 0$. Note that the discrete velocity $u_h$ is the solution of the following discrete problem [18]: Find $u_h \in Z_{h,0}$ such that

$$a_h(u_h, v_h) = \langle f_h, v_h \rangle \quad \forall v_h \in Z_{h,0}. \quad (10)$$

Since $\dim Z_{h,0} = \dim V_{h,0} - \dim Q_h$, the system (10) has a smaller number of unknowns than system (8). Moreover, system (10) is symmetric positive definite, while problem (8) is a saddle point problem. Thus, it is more efficient to compute $u_h$ from (10) than from the problem (8).

We next consider the case $g \neq 0$. Let us decompose $u_h \in V_{h,g}$ into

$$u_h = u_{h,0} + \tilde{u}_h,$$

where $\tilde{u}_h \in V_{h,g} \cap Z_h$ and $u_{h,0} \in Z_{h,0}$ is the solution of the problem

$$a_h(u_{h,0}, v_h) = \langle f_h, v_h \rangle - a_h(\tilde{u}_h, v_h) \quad \forall v_h \in Z_{h,0}.$$  

Using the construction of $Z_{h,0}$ presented in Theorem 2, we can compute $u_{h,0}$ by solving a symmetric positive definite system of linear equations, as explained in the
case $g = 0$. It remains to find a function $\tilde{u}_h \in V_{h,g} \cap Z_h$. The following theorem shows that we can easily find such a function.

**Theorem 3** Let $N = N_V^\partial$ and label the vertices in $V_h^\partial$ by $1, 2, \ldots, N$ such that $v_1, \ldots, v_N$ are in counterclockwise order with respect to $\Omega$. We also label the edges in $\mathcal{E}_h^\partial$ by $1, 2, \ldots, N$, such that the endpoints of the edge $e_i$ are $v_i$ and $v_{i+1}$ for $i = 1, 2, \ldots, N - 1$, and the endpoints of the edge $e_N$ are $v_N$ and $v_1$ (since $\Omega$ is a simply connected polygon, $N_V^\partial = N_E^\partial$). Let $\tilde{u}_h$ be the function in $V_h$ defined by

$$
\tilde{u}_h = \sum_{v \in V_h^\partial} C_{1,v} \psi_v + \sum_{e \in \mathcal{E}_h^\partial} \sum_{q \in M_{k-1}(e)} C_{2,e,q} \psi_{e,q}^1 + \sum_{e \in \mathcal{E}_h^\partial} \sum_{q \in M_{k-1}(e) \setminus \{1\}} C_{3,e,q} \psi_{e,q}^n,
$$

where the coefficients $(C_{1,v})_v = (C_{1,v_1}, \ldots, C_{1,v_N})$ are given by

$$
C_{1,v_k} = -\sum_{i=k}^N \int_{e_i} g \cdot n_{e_i} \, ds, \quad k = 1, 2, \ldots, N,
$$

and the coefficients $(C_{2,e,q})_{e,q}$ and $(C_{3,e,q})_{e,q}$ are given by

$$
C_{2,e,q} = \frac{1}{|e|} \int_e g \cdot t_{e,q} \, ds, \quad q \in M_{k-1}(e), \quad e \in \mathcal{E}_h^\partial,
$$

$$
C_{3,e,q} = \frac{1}{|e|} \int_e g \cdot n_{e,q} \, ds, \quad q \in M_{k-1}(e) \setminus \{1\}, \quad e \in \mathcal{E}_h^\partial.
$$

Then, $\tilde{u}_h \in V_{h,g} \cap Z_h$.

**Proof** From the construction of $\tilde{u}_h$, it is obvious that $\text{div}_h \tilde{u}_h = 0$. Thus, it remains to show that $\tilde{u}_h \in V_{h,g}$. From the definition of the coefficients $(C_{2,e,q})_{e,q}$ and $(C_{3,e,q})_{e,q}$, we obtain

$$
\int_e \tilde{u}_h \cdot t_{e,q} \, ds = \int_e g \cdot t_{e,q} \, ds, \quad q \in M_{k-1}(e), \quad e \in \mathcal{E}_h^\partial,
$$

$$
\int_e \tilde{u}_h \cdot n_{e,q} \, ds = \int_e g \cdot n_{e,q} \, ds, \quad q \in M_{k-1}(e) \setminus \{1\}, \quad e \in \mathcal{E}_h^\partial.
$$

Since the boundary edge $e_i$ with $1 \leq i \leq N - 1$ has endpoints $v_i$ and $v_{i+1}$, and since the vertices $v_1, \ldots, v_N$ are labeled in counterclockwise order with respect to $\Omega$, we obtain

$$
n_{e_{i,v_{i+1}}} = n_{e_i} = -n_{e_i,v_i},
$$

where $n_{e_i}$ is a unit normal vector in the outward direction with respect to $\Omega$, and $n_{e_{i,v_i}}$ and $n_{e_{i,v_{i+1}}}$ are unit vectors normal to $e_i$ pointing in the counterclockwise direction with respect to $v_i$ and $v_{i+1}$, respectively (see Fig. 2). Similarly, we obtain

$$
n_{e_N,v_1} = n_{e_N} = -n_{e_{N,v_N}}.
$$
Thus, we have
\[ \int_{e_i} \tilde{u}_h \cdot n_{e_i} \, ds = -C_{1,v_i} + C_{1,v_{i+1}} \quad \forall i = 1, 2, \cdots, N - 1, \]
\[ \int_{e_N} \tilde{u}_h \cdot n_{e_N} \, ds = -C_{1,v_N} + C_{1,v_1}. \]

Using the definition of the coefficients \((C_{1,v})\),
\[-C_{1,v_i} + C_{1,v_{i+1}} = \int_{e_i} g \cdot n_{e_i} \, ds \quad \forall i = 1, 2, \cdots, N - 1.\]

From (2) we obtain \(C_{1,v_1} = -\int_{\partial\Omega} g \cdot n_{\Omega} \, ds = 0\) and thus
\[-C_{1,v_N} + C_{1,v_1} = \int_{e_N} g \cdot n_{e_N} \, ds. \]
Therefore \(\tilde{u}_h \in V_{h,g}\).

\section{5.2 Recovery of the discrete pressure \(p_h\)}

Once we have the discrete velocity \(u_h\), the discrete pressure \(p_h\) can be obtained by solving the system
\[ b_h(v_h, p_h) = \langle f_h, v_h \rangle - a_h(u_h, v_h) \quad \forall v_h \in V_{h,0}. \quad (11) \]
This can be rewritten as an overdetermined linear system
\[ Bp = f \quad (12) \]
where \(B\) is a \(\text{dim}(V_{h,0}) \times \text{dim}(Q_h)\) matrix. Since \(b_h(\cdot, \cdot)\) satisfies the inf-sup condition and since the discrete problem (8) is well-posed, the matrix \(B\) has full rank and the linear system (12) has the unique solution. Note that this solution also solves the normal equation
\[ B^TBp = B^Tf. \quad (13) \]
Since the matrix \(B\) has full rank, the normal (13) is a symmetric positive definite linear system. Thus, (13) has only one solution, which is also the solution of (12).
6 Numerical experiments

In this section, we present several numerical experiments for the symmetric positive definite linear system (10) and the overdetermined linear system (11). Consider the Stokes problem (1) on the unit square domain $\Omega = [0, 1]^2$, where the exact solution is given by

$$ u(x, y) = ((1 - \cos(2\pi x)) \sin(2\pi y), -(1 - \cos(2\pi y)) \sin(2\pi x)), $$

$$ p(x, y) = xy^2 - \frac{1}{6}. $$

| $h$  | $\mathcal{P}_h^1$ | $\mathcal{P}_h^2$ |

We solve both (10) and (11) for $k = 1, 2, 3$, and we compute the velocity error in the discrete energy norm

$$E_v := a_h(u_h - I_h u, u_h - I_h u)^{1/2}$$

and the pressure error in the $L^2$-norm

$$E_p := \|p_h - \Pi_h p\|_{0, \Omega},$$

where $\Pi_h p$ is the piecewise polynomial function such that for each $K \in \mathcal{P}_h$ the restriction $\Pi_h p|_K$ is the $L^2$-projection of $p$ onto $P_{k-1}(K)$.

We decompose $\Omega$ into the following sequences of convex polygonal meshes:

(i) uniform square meshes $\mathcal{P}_h^1$ with $h = 1/4, 1/8, 1/16, 1/32, 1/64, 1/128$,

(ii) unstructured polygonal meshes $\mathcal{P}_h^2$ with $h = 1/4, 1/8, 1/16, 1/32, 1/64, 1/128$.

Some examples of the meshes are shown in Fig. 3. The unstructured polygonal meshes $\{\mathcal{P}_h^2\}_h$ are generated from PolyMesher [24]. Mesh data (the number of polygons, interior edges, and interior vertices) for each $h$ are given in Table 1.

In Tables 2, 3 and 4, we present the dimensions of the spaces $V_{h,0}, Q_h$, and $Z_{h,0}$, for each mesh $\mathcal{P}_h^1, \mathcal{P}_h^2$ and each $k = 1, 2, 3$. Since the number of unknowns of the

system (8) is $\dim V_{h,0} + \dim Q_h$ and the number of unknowns of the system (10) is $\dim Z_{h,0}$, we can see that the system (10) has fewer unknowns than the system (8).

The errors $E_v$ and $E_p$ and their orders on the sequences of the meshes for $k = 1, 2, 3$ are given in Figs. 4, 5 and 6. In these figures, we see that the convergence order of the errors $E_v$ and $E_p$ are $O(h^k)$ for $k = 1, 2, 3$. Thus, the numerical results confirm the theoretical analysis in Theorem 1.

In Table 5, we compare the CPU running times (on a PC with an Intel Core i5 processor and 16GB RAM) required to solve the reduced system (10) and the original saddle point system (8), for the uniform square meshes $\{P_h^1\}_h$ and $k = 1, 2, 3$. For a fair comparison, we use unpreconditioned conjugate gradient method (CG) to solve (10) and the standard Uzawa method to solve (8). The cost for computing the discrete pressure (by solving (11)) is a fraction of CG; hence, it is not included. For each $h$.

| $h$ | $k = 1$ | $k = 2$ | $k = 3$ |
|-----|---------|---------|---------|
|     | CG      | Uzawa   | CG      | Uzawa   | CG      | Uzawa   |

experiment, we write “∗” if the CPU time is more than 12,000 s. For all cases, the CPU time of solving the reduced system is much smaller than that of solving the saddle point system (Fig. 7).

7 Conclusions

We presented a formal construction of divergence-free bases in the nonconforming VEM for solving the stationary Stokes problem on arbitrary polygonal meshes introduced in [29]. If $k = 1$ and the mesh is triangular, then the proposed construction of the basis is exactly the same as the divergence-free basis in the Crouzeix-Raviart finite element space [14, 26]. Using our construction, we are able to eliminate the pressure variable from the discrete saddle point formulation, and reduce it to a symmetric positive definite linear system in the velocity variable only. Thus, we can apply many efficient solvers available for symmetric positive definite systems. Finally, we provided some numerical experiments confirming the theoretical results and the efficiency of our construction of divergence-free bases in the nonconforming VEM for the Stokes problem.
