Abstract: Applications of multicomponent reactions (MCRs) in the preparation of diverse types of heterocyclic compounds carries a unique place in chemical synthesis. Biginelli reaction, among the loop of multicomponent reactions, provide an efficient way to access of highly functionalized dihydropyrimidones (-thiones) (DHPMs). In the current study, we employed multicomponent Biginelli reaction to synthesis range of different dihydropyrimidones (-thiones) derivatives in variable yields. A solvent-free eco-friendly green protocol without any expensive catalyst has been optimized and expand to synthesize series of DHMPS in 34 to 72% yield. The optimized method proved to be successful with various types of different aromatic aldehydes, 1, 3-dicarbonyl compounds and urea (thiourea) under solvent and catalyst free condition to access dihydropyrimidones (-thiones). Different spectroscopic techniques include NMR, FTIR etc. have used to confirm the structures of compounds. Further exploration of Biginelli reaction to prepare DHPMs and related compounds is under way in the lab and will be published in due course.

1. Introduction

The one-pot cyclo condensation reaction of aldehydes, β-ketoesters, and urea to give 3, 4-dihydropyrimidine-2-ones was first reported in 1893 by Biginelli under strongly acidic conditions. The dihydropyrimidinone derivatives are significant due to their pharmacological properties and have emerged as vital backbones of several calcium channel blockers, antihypertensive agents, and α-la-antagonists [1-3]. Several marine alkaloids containing the dihydropyrimidine-5-carboxylate core unit have been isolated [4], the most important of which are the batzelladine alkaloids which were found to be potent HIV gp-120-CD4 inhibitors [5-7]. Because of the importance of dihydropyrimidinones, the Biginelli reaction has been well studied and several variations and improvements have been realized through the discovery of milder and more competent procedures using a variety of catalysts [8-12].

Our continuous interest in Biginelli reaction has led us to explore diverse catalysts and reaction conditions which include: metal acetate [13], alcohols [14], amino acids [15], carboxylic acids [16], and aromatic and heteroaromatic acids [17]. While our current work was in progress, a short report has appeared where this reaction is claimed to be conducted on heating but details of the detailed experimental is reclusive [18]. In view of this, we would like to communicate
our success with this reaction under solvent and catalyst free conditions.

2. Experimental

2.1 Materials and Reagents

All the chemicals and reagents used in the present study were commercially available. These were purified by usual methods of distillation (for liquids) and crystallization from appropriate solvents (for solids). Melting points were determined on a Gallenkamp melting point apparatus and are uncorrected. IR spectra were recorded on Perkin Elmer spectrum BX 1 and NMR on a Brucker 400 MHz spectrometer using tetramethylsilane as an internal reference.

2.2. General Procedure for the Preparation of 3, 4-Dihdropyrimidin-2 (1H)-Ones or Thiones

Equimolar quantities of aryl aldehyde (0.02 moles), an active methylene compound (0.02 moles) and urea/thiourea (0.02 moles) were heated in an oil bath at 120-130°C for 8 hours and progress of the reaction was monitored by TLC using ethyl acetate and n-hexane (1:2) as eluent. After completion of the period the reaction mixture was cooled, precipitates formed were filtered, washed, dried and crystallized from ethanol.

According to this general procedure, the following compounds were prepared from various aldehydes. All the products of these reactions were compared with the authentic samples prepared by the literature methods and were found to be identical in all respects [M. P. (Table 1), mixed M. P., FTIR or other spectra]:

2.2.1. Ethyl 6-methyl-2-oxo-4-phenyl-1, 2, 3, 4-tetrahydropyrimidin-5-carboxylate

Yield: 3.75g (72%), m. p: 200-202°C (Lit. m. p: 202-204°C). 1H NMR (DMSO-d6): δ 9.17 (s, 1H, NH), 7.72 (s, 1H, NH), 7.21-7.32 (m, 5H, Ar-H), 5.5 (s, 1H, Ar-CH), 3.98 (q, 2H, OCH2CH3, J=7.2 Hz), 2.24 (s, 3H, CH3), 1.08 (t, 3H, OCH2CH3, J=7.2 Hz). 13C NMR (DMSO-d6): δ 165.4, 152.2, 148.4, 144.9, 128.4, 127.9, 127.8, 127.3, 126.3, 99.3, 59.2, 54.0, 17.8, 14.1. FTIR (KBr): 3414 (NH), 3230, 3109, 2936, 1735 (C=O, ester), 1680 (C=O, Pyrimidine), 1620 and 1490 (Aromatic) cm⁻¹.

2.2.2. Ethyl 4- (2’-methoxyphenyl)-6-methyl-2-oxo-1, 2, 3, 4-tetrahydropyrimidin-5-carboxylate

Yield: 0.49g (59%), m. p: 249-251°C (Lit. m. p: 249-250°C). 1H NMR (DMSO-d6): δ 9.33 (s, 1H, NH), 7.77 (s, 1H, NH), 7.31-7.57 (m, 3H, Ar-H), 5.59 (s, 1H, Ar-CH), 3.90 (q, 2H, OCH2CH3, J=7.2 Hz), 2.29 (s, 3H, CH3), 1.00 (t, 3H, OCH2CH3, J=7.2 Hz). 13C NMR (DMSO-d6): δ 164.7, 151.0, 149.5, 140.9, 132.6, 132.5, 130.2, 128.6, 127.9, 97.4, 59.0, 51.1, 17.6, 13.8. FTIR (KBr): 3415 (NH), 3219, 3104, 2969, 1737 (C=O, ester), 1678 (C=O, Pyrimidine), 1614 and 1425 (Aromatic) cm⁻¹.

2.2.3. Ethyl 4- (2’, 4’-dichlorophenyl)-6-methyl-2-oxo-1, 2, 3, 4-tetrahydropyrimidin-5-carboxylate

Yield: 0.49g (59%), m. p: 249-251°C (Lit. m. p: 249-250°C). 1H NMR (DMSO-d6): δ 9.33 (s, 1H, NH), 7.77 (s, 1H, NH), 7.31-7.57 (m, 3H, Ar-H), 5.59 (s, 1H, Ar-CH), 3.90 (q, 2H, OCH2CH3, J=7.2 Hz), 2.29 (s, 3H, CH3), 1.00 (t, 3H, OCH2CH3, J=7.2 Hz). 13C NMR (DMSO-d6): δ 164.7, 151.0, 149.5, 140.9, 132.6, 132.5, 130.2, 128.6, 127.9, 97.4, 59.0, 51.1, 17.6, 13.8. FTIR (KBr): 3415 (NH), 3219, 3104, 2969, 1737 (C=O, ester), 1678 (C=O, Pyrimidine), 1614 and 1425 (Aromatic) cm⁻¹.
(C=O, ester), 1650 (C=O, Pyrimidine), 1630 cm⁻¹.

2.2.8. Ethyl 6-methyl-4-phenyl-2-thioxo-1, 2, 3, 4-tetrahydropyrimidine-5-carboxylate

Yield: 0.4g (72%). m. p: 207-209°C (Lit. m. p: 209-211°C). ¹H NMR (DMSO-d₆): δ 7.27-7.31 (m, 5H, Ph), 5.30 (s, 1H, CH, Ar-CH), 4.07 (q, 2H, OCH₂CH₃), J=7.32 Hz), 2.44 (s, 1H, NH), 2.34 (s, 3H, CH₃), 2.15 (s, 1H, NH), 1.16 (t, 3H, OCH₃, J=7.23 Hz). ¹³C NMR (DMSO-d₆): δ 176.0, 166.9, 145.6, 144.5, 129.9, 128.8, 127.6, 127.4, 126.2 102.8, 61.0, 56.1, 17.8, 14.5. FTIR (KBr): 3359 (NH), 1739 (C=O, ester), 1695, 1624 and 1498 (Aromatic) cm⁻¹.

2.2.9. Ethyl 4-(2', 4'-dichlorophenyl)-6-methyl-2-thioxo-1, 2, 3, 4-tetrahydropyrimidine-5-carboxylate

Yield: 0.25g (56%). m. p: 285-287°C (Lit. m. p: 287-288°C). ¹H NMR (DMSO-d₆): δ 9.12 (s, 1H, NH), 7.12 (s, 1H, NH), 6.85-7.21 (m, 4H, Ar-H), 3.77 (s, 3H, OCH₃), 5.37 (s, 1H, Ar-CH), 2.32 (s, 3H, CH₃), 2.09 (s, 3H, CH₂). ¹³C NMR (DMSO-d₆): δ 199.5, 156.3, 150.3, 147.2, 128.0, 127.4, 121.3, 120.9, 114.1, 107.5, 56.2, 38.7, 27.1, 15.4. FTIR (KBr): 3264 (NH), 2926, 1710 (C=O, Pyrimidine), 1590 (C=O, Pyrimidine), 759 cm⁻¹.

2.2.10. Ethyl 4-(4'-hydroxyphenyl)-6-methyl-2-thioxo-1, 2, 3, 4-tetrahydropyrimidine-5-carboxylate

Yield: 0.3g (58%). m. p: 224-226°C (Lit. m. p: 226-228°C). ¹H NMR (DMSO-d₆): δ 7.52-7.36 (m, 3H, Ar-H), 5.37 (s, 1H, Ar-CH), 4.09 (q, 2H, OCH₂CH₃), J=7.2 Hz), 2.61 (s, 1H, NH), 2.36 (s, 3H, CH₃), 2.10 (s, 1H, NH), 1.19 (t, 3H, OCH₂CH₃), J=4.68 Hz). ¹³C NMR (DMSO-d₆): δ 174.4, 167.2, 160.3, 140.9, 133.7, 133.2, 130.2, 129.8, 126.8, 104.2, 61.7, 45.5, 17.7, 14.0. FTIR (KBr): 3359 (NH), 1739 (C=O, ester), 1695, 1624 and 1498 (Aromatic) cm⁻¹.

2.2.11. Ethyl 4-(3'-hydroxyphenyl)-6-methyl-2-thioxo-1, 2, 3, 4-tetrahydropyrimidine-5-carboxylate

Yield: 0.45g (61%). m. p: 200-202°C (Lit. m. p: 202-203°C). FTIR (KBr): 3245 (NH), 3187 (OH), 1745 (C=O, ester), 1679, 1642 cm⁻¹. ¹H NMR (DMSO-d₆): δ 6.94-7.45 (m, 4H, Ar-H), 5.27 (s, 1H, Ar-CH), 4.24 (q, 2H, OCH₂CH₃), J=7.15 Hz), 5.13 (1H, OH), 2.46 (s, 1H, NH), 2.14 (s, 1H, NH), 1.91 (s, 3H, CH₃), 1.30 (t, 3H, OCH₂CH₃), J=7.15 Hz). ¹³C NMR (DMSO-d₆): δ 167.2, 156.5, 150.3, 147.2, 135.9, 128.4, 126.4, 119.7, 115.7, 106.4, 61.7, 49.2, 14.9, 14.4.

3. Results and Discussion

There are many new methodologies for the synthesis of substituted Dihydropyrimidones. Very advance work has been done on Biginelli reaction by different research groups. But all the variabilities are majorly in the use of catalysts. In 1989 aliphatic aldehydes were used instead of aromatic aldehydes [19]. However, it has been seen that many organic solvents and the catalysts employed are not always environmentally friendly, and many catalysts used are uncommon or exotic, to say the least.

In our work with Biginelli reaction, we have earlier used different catalysts and solvents [13-17]. This encouraged us to initiate a methodical study to look into the feasibility of solvent-free and catalyst-free reactions under modified experimental conditions towards the development of a green
methodology for useful scaffolds.

In the following efforts at developing some “green” protocol is presented. The results of various experiments are prepared using this solvent and catalyst-free conditions and the products isolated during the present work compared well with the reported in the literature (M. P, FTIR, and NMR spectra) (Scheme 1, Table 1).

![Figure 1. General synthetic approach to pyrimidones and thiones.](image)

$^1$H NMR spectra of compound 1-11, where ethyl acetoacetate was used as active methylene compound showed triplet for the ester methyl at 1.00-1.30 ppm (OCH$_2$CH$_3$) and a quartet of methylene protons at 3.90-4.13 ppm (OCH$_2$CH$_3$). Methyl group showed a singlet in different cases in between 1.91 to 2.36 ppm. A singlet at 5.04-5.68 ppm was due to proton at position 4 of the pyrimidine ring. The two different broad signals around 9.2 and 7.7 ppm were assigned to the resonance of two NH protons of the pyrimidine rings. Other protons of the aryl group were observed in the aromatic region.

In the $^{13}$C NMR, methyl carbon (OCH$_2$CH$_3$) of the ester group showed signals near 14 ppm and methylene carbons around 60 ppm due to its attachment with oxygen. The carbon of the pyrimidine rings where a methyl group is attached shows signals near 148 ppm. A peak near 152 ppm represents pyrimidine carbonyl carbon and that of around 165 ppm, represents ester carbonyl.

FTIR spectra were also consistent with the structure reported in the literature. Carbonyl (C=O) of the ester group showed absorption at 1725-1740 cm$^{-1}$, NH at 3260-3270 cm$^{-1}$, and carbonyl (C=O) of pyrimidine ring at 1680 cm$^{-1}$. Peaks at 1620 cm$^{-1}$ and 1490 cm$^{-1}$ represented the presence of an aromatic ring in the compound.

In reactions 12-16 where acetylacetone is used instead of ethyl acetoacetate give proton signals in between 2.09 to 2.50 ppm for methyl of the acetyl group.

| Compound No. | Ar     | R       | X   | Yield (%) | Melting point (°C) |
|-------------|--------|---------|-----|-----------|-------------------|
|             |        |         |     |           | Found             |

| 10          | 4-HOC$_6$H$_5$ | OEt      | S   | 61        | 200-202           |
| 11          | 3-HOC$_6$H$_5$ | OEt      | S   | 63        | 185-187           |
| 12          | Pyridine-3-yl | Me       | O   | 54        | 210-212           |
| 13          | 2-CH$_3$OC$_6$H$_5$ | Me       | O   | 56        | 285-287           |
| 14          | 2, 4-CIC$_6$H$_4$ | Me       | O   | 52        | 240-242           |
| 15          | 2, 6-CIC$_6$H$_4$ | Me       | O   | 34        | 250-252           |
| 16          | Thiophene-2-yl | Me       | O   | 66        | 190-192           |

The yields of the above described reactions are in most cases in between 60 to 70% which is comparable to or higher than the yields obtained by using different catalysts and solvents as listed in Table 1. The yields were not optimized and are based on the recrystallized products. However, it may be enhanced by increasing temperature or reaction time.

### 4. Conclusion

In conclusion, we have optimized and developed as eco-friendly, solvent free, catalyst free conditions Biginelli reaction to synthesize dihydropyrimidones (thiones) (DHPMs) in variable yields. A series of DHPMs has been synthesized in good to excellent yield via easy separation to show the significance of methodology. Further, the Biginelli reaction will be diversely to access more compounds to explore their biological potential to find lead as new therapeutic agents.
