Abstract
The Nearctic fauna (north of Mexico) of Eustrophinae is reviewed, and consists of the following five genera and 12 species: Pseudoholostrophus (Pseudoholostrophus) impressicollis (LeConte), P (Holostrophinus) discolor (Horn), Holostrophus bifasciatus (Say), Eustrophus tomentosus Say, Eustrophopsis confinis (LeConte), E. bicolor (Fabricius), E. bruneimarginatus (Dury), E. indistinctus (LeConte), E. arizonensis (Horn), E. ornatus (Van Dyke), E. crowdyi sp. n., and Synstrophus repandus (Horn). A lectotype is designated for Eustrophus bruneimarginatus Dury. A key is given to separate genera and species, supplemented with illustrations of relevant features, including aedeagi of all Nearctic species of Eustrophopsis. Detailed distribution (including Mexican records) and natural history data are provided.

Keywords
Tetratomidae, new species, Arizona, natural history, Nearctic, faunal review

Introduction
The Eustrophinae, like many groups within Tenebrionoidea, have not had a stable family-level placement until fairly recently. Various authors have commented on the taxonomic history of the group (e.g. Lawrence 1991; Young and Pollock 2002; Pollock 2008; Lawrence and Leschen 2010); however, the recent placement of eustrophines within an enlarged Tetratomidae (as proposed by Nikitsky 1998), is based in large part
on characteristics of larvae. Very few comprehensive phylogenetic analyses for Tenebrionoidea have been completed; the study by Lawrence et al. (2011), based on morphological characters of adults and larvae of the entire Coleoptera, used three exemplar taxa from Tetratomidae, including *Eustrophopsis bicolor* (Fabricius). Monophyly of Tetratomidae was not supported in this analysis; in fact, *Eustrophopsis* was shown to be the sister taxon to *Orchesia* (Melandryidae). *Tetrataoma* (Tetratomidae: Tetratominae) and *Penthe* (Tetratomidae: Penthinae) were part of a monophyletic group that also contained *Dipsaconia* (Ulodidae) and *Chalcodrya* (Chalcodryidae). An earlier study by Beutel and Friedrich (2005) hypothesized Tetratomidae (data taken from the literature) as part of a very large, unresolved branch of basal Tenebrionoidea.

There have been no large-scale studies of the Eustrophinae specifically, although Nikitsky (1998) provided an overview of the classification of the entire family Tetratomidae. Also, Nikitsky (2007) revised the genus *Holostrophus*, representing the only published work on a single genus of Eustrophinae. Pollock (2008) reviewed the Canadian eustrophe fauna, as part of a volume covering biodiversity, systematics, and ecology of Canadian Coleoptera. The present study treats all taxa found in North America, north of Mexico, including the description of a new species from southern Arizona. Much of the descriptive, ecological and distributional data for species occurring in Canada, treated herein, were given previously by Pollock (2008). As in Pollock (2008), the present study is not meant to be a detailed revision; rather, it is a review of a specific biogeographic group of Eustrophinae. Therefore, descriptions are rather diagnostic in nature, except for the description of *Eustrophopsis crowdyi*, new species, which is more detailed and complete.

Nikitsky (1998) provided a key to the five recognized subfamilies of Tetratomidae. The Eustrophinae have the following characteristics: body elongate oval, often more distinctly narrowed posteriorly; all legs with simple, narrow tarsi; antennomeres 3-7 more or less broadened, at least some antennomeres transverse; pronotum with two sublinear impressions basally, metepisterna distinctly subdivided into two sections; metendosternite without laminae.

The world fauna of Eustrophinae comprises 5 genera and 86 species (compiled from various sources), distributed worldwide except for Australia and New Zealand. The greatest diversity occurs in tropical areas, especially in the Neotropical region. Members of the subfamily are relatively homogeneous structurally, and both larvae and adults are associated with various groups of fungi on dead trees (Lawrence 1991; Pollock 2008). No studies are available that detail the ecological habits of any specific taxon of Eustrophinae. Most information available is taken from collection records. Lawrence (1991: 506) gave the following fungal associates with some genera and species of Eustrophinae: *Eustrophopsis* spp. (*Polyporus squamosus, Tyromyces albescens, Laetiporus sulphureus, Bjerkandera adusta, Inonotus munzii, I. vulpinus, Phellinus giguis, Pleurotus sapidus, Panus rudis, Lentinus lepideus*); *Synstrophus repandus* (Horn) (*Pleurotus ostreatus, Phaeolus schweinitzii, and Coriolus versicolor*); *Eustrophus tomentosus* Say (*Polyporus squamosus*). Individual fungal/collection records are given below for each species (from label data).
Adults of Eustrophinae are active at night, when they emerge from daytime hiding places and occupy exposed surfaces, on dead wood or on associated fungal bodies. Very long series of specimens are somewhat rare; collecting during the day will yield few specimens, whereas night collecting or mass-trapping can be very productive and effective methods for obtaining long series. During the day, potentially good, fungus-infested dead trees can be marked (for example, by using thumbtacks with reflective paint) and returned to at night, to collect the active adults.

Adults of *Eustrophopsis* are seemingly attracted to Lindgren funnel traps, and/or the scolytine baits often deployed along with these devices. For example, a single locality (Arizona, Cochise Co., Chiricahua Mts., Turkey Creek, 2000 m, 31°51.280’N, 109°19.883’W) yielded the following specimens over a two-week period: 7.vii.2002 (*E. arizonensis*: 54♂♂, 104♀♀; *E. ornatus*: 7♂♂; *E. crowdyi*, sp. n.: 10♂♂, 11♀♀); 14.vii.2002 (*E. arizonensis*, 45♂♂, 92♀♀; *E. ornatus*: 7♂♂, 17♀♀; *E. crowdyi*, sp. n.: 16♂♂, 11♀♀).

As in the majority of Tenebrionoidea, immature stages of Eustrophinae are rather imperfectly known. Larvae are found in the same habitats as adults; however, whereas adults are often found on surfaces at night, larvae remain within the rotting wood/fungal substrate (Pollock pers. observ.). Nikitsky (1998) provided a key to subfamilies of tetratomid larvae; however, only *Eustrophopsis* and *Holostrophus* were included. A key to larvae of *Holostrophus* (three Oriental species only) was also given by Nikitsky (1998). The most detailed description of a larva of *Eustrophopsis* is that of Węgrzynowicz (1995) who described the larva of *E. quindecimmaculata* (Laporte), a Neotropical species.

Among Nearctic eustrophines, the only species reasonably well known in the larval stage is *Eustrophopsis bicolor* (Fabricius); this is the most common species, so perhaps this is not surprising. Weiss (1919) provided a brief description of the larva, along with some reasonably detailed information on host preference and natural history. Böving and Craighead (1931) treated the larva of *E. bicolor* also, but only illustrated the posterior end of the abdomen (based on larval characters, they removed *Eustrophus* from Melandryidae and transferred it to Dacnidae). Lawrence (1991) illustrated the dorsal habitus of the larva, along with an SEM of the larval mandible. Lawrence and Leschen (2010) provided a comprehensive description of the larvae of Tetratomidae, with various details given for Eustrophinae (based on *Eustrophopsis* and *Holostrophus*).

**Materials and methods**

This study is based on 6,600 adult specimens examined and/or borrowed from the following private and public collections and museums:

- **AMNH** American Museum of Natural History, New York, NY
- **BBC** Brian Baldwin Collection (private)
- **BYUC** Monte L. Bean Life Science Museum, Brigham Young University, Provo, UT
- **CARR** J.B. and A. Carr Collection (now part of CNC)

Standard methods of examination and description of specimens were used in this study. Descriptions are somewhat diagnostic in nature, hopefully facilitating rapid identification of species. Details on the male genitalia, including illustrations, are presented for *Eustrophopsis* only, because 1) this genus is larger than the other genera of Eustrophinae and species are more difficult to distinguish; and 2) genital structures have already been described and/or illustrated for other taxa within Eustrophinae (e.g. Nikitsky 1998, 2007).

Annotations relating to natural history, as derived from specimen label data and published accounts, are given under each species. Locality data are summarized for each species using country, state (province) and county names (where available); complete data for non-type specimens are given in Appendix 1. In the descriptions, TL = length from anterior pronotal margin to apex of elytra (along midline); GEW = maximum width, across elytra. Type specimen label data are given verbatim, enclosed within quotation marks; individual labels are separated by a slash (/).

Digital images were taken with a Nikon Coolpix 5000® digital camera fitted to a Leica MZ95 stereoscope. The 10–30 separate images taken for each specimen/structure (focus adjusted manually) were imported into Combine ZP (Hadley 2010), which stacked and aligned the individual images, creating a final digital image. The images of the *Eustrophopsis* genitalia (Figures 56–64) were not stacked; each represents a single image only.

The range maps are presented in two different formats: collection records for Canadian and Mexican specimens are presented as specific “dot localities” on maps. All United States records are depicted as county records, only.

**Systematics**

**Key to genera and species of Nearctic Eustrophinae**

1. Outer faces of meso- and metatibiae smooth, without oblique ridges (Figures 53, 55) .......................................................................................................................................................... 2
   - Outer faces of meso- and metatibiae with numerous oblique, comb-like ridges (e.g. Fig. 54) .................................................................................................................................................. *(Eustrophini), 5*
Prosternal process narrowed distally, not extended posterad of procoxae (Fig. 49); elytral punctuation coarse, forming distinct striae; eyes narrowly separated (Fig. 37)................................. *Synstrophus repandus* (Horn)

– Prosternal process widened distally, separating procoxae (Figures 38–40); elytral punctuation fine, not forming distinct striae; eyes widely separated (Figures 26–28)...........................................(Holostrophini), 3

3 Eyes distinctly emarginate, distance between eyes less than transverse ocular diameter; elytra dark in color, with 4 lighter colored, subquadrate maculae (Fig. 3)................................................................. *Holostrophus bifasciatus* (Say)

– Eyes only indistinctly emarginate, distance between eyes greater than transverse ocular diameter; elytra uniformly rufous to piceous, without distinctly lighter markings (Figures 1–2) ............................................................... 4

4 Dorsal surface finely punctate, setae short and apressed against surface; impressions along posterior pronotal margin linear, parallel, distinctly impressed (Fig. 1); anterior pronotal margin not elevated above level of head (Fig. 14); known from western North America (BC, WA, OR, CA) .....................

.................................................. *Pseudoholostrophus impressicollis* (LeConte)

– Dorsal surface more coarsely punctate, setae more distinct and at least partially erect; impressions along posterior pronotal margin indistinct; anterior margin of pronotum elevated above level of head (Fig. 15); known from eastern North America (IN, MA, MD, NH, PA, QC, RI, VA, TN).........................

........................................................... *Pseudoholostrophus discolor* (Horn)

5 Prothoracic episterna without transverse suture (Fig. 50); male without profemoral sensillar patch; annular antennal sensilla interrupted, not present around entire circumference of antennomeres .... *Eustrophus tomentosus* Say

– Prothoracic episterna each with distinct, transverse suture (Fig. 51); male with small sensillar patch on ventral edge of profemur; annular antennal sensilla present around entire circumference of antennomeres ........... *Eustrophopsis*, 6

6 Medial margins of eyes widely separated, distance between eyes equal to or greater than length of antennomere 1 (Fig. 30); body broadly ovate, slightly tapered posteriorly (Fig. 5)......................... *Eustrophopsis confinis* (LeConte)

– Medial margins of eyes more narrowly separated, in some specimens virtually contiguous; if moderately widely separated, distance between medial margins less than length of antennomere 1; body more elongate oval, noticeably tapered posteriorly .......................................................................................... 7

7 Pronotum and elytra dark, piceous to near black, with distinctly contrasting lighter, rufous lateral margins (Figures 7, 20) .................................................................

.................................................. *Eustrophopsis bruneimarginatus* (Dury)

– Pronotum and elytra uniform in color, from rufous to black; some specimens with indistinct to distinct lighter colored markings on elytral disc, but not restricted only to lateral margins ........................................ 8

8 Prothoracic episterna with distinctly rugulose macrosculpturing, somewhat obscuring setae and punctuation (Fig. 52)....... *Eustrophopsis arizonensis* (Horn)
Prothoracic episterna smooth, without rugulose macrosculpturing, punctuation and setae not obscured (e.g., Fig. 51) ................................................................. 9

Antennomeres 5–10 distinctly broad, wider than long (Figures 35–36); antennomeres 5–11 of males flattened on one side, with distinct, fine sensillar setae; body size larger (TL 5.3–7.9 mm); known only from Arizona, New Mexico and Mexico .................................................................................. 10

Antennomeres 5–10 longer than wide; antennomeres 5–11 of males not flattened, without obvious sensillar setae; body size smaller (TL 4.2–6.5 mm); widespread in distribution, including Arizona, New Mexico and Mexico .... 11

Body, including venter, uniformly dark piceous to black, without distinctly contrasting lighter colored antennomeres 1–4 and 11 (Fig. 36); pronotal process relatively wide, broadly rounded distally (Fig. 48); eyes separated by approximately maximum width of antennomere 1 ...................................................

.......................................................................

Eustrophopsis crowdyi sp. n.

Body dorsally either uniformly black (Fig. 11), or with variously well developed reddish markings (typical form) (Fig. 10); antennomeres 1–4 dark rufous, contrasting with dark piceous to black antennomeres 5–10; antennomere 11 at least partially light reddish; pronotal process narrower, more acute distally (Fig. 47); eyes almost contiguous, separated by less than maximum width of antennomere 1 .......... Eustrophopsis ornatus (Van Dyke)

Body dorsally and ventrally distinctly brown (Fig. 8), not piceous or black in color; antennomeres 1–4 and 11 only slightly lighter in color than 5–10, not distinctly contrasting; pronotal punctuation relatively coarse, punctures larger in diameter than that of setae; known from southwestern U.S. only (Fig. 62) ........................................................................ Eustrophopsis indistinctus (LeConte)

Body dorsally dark piceous to black (Fig. 6); legs and antennomeres 1–4 distinctly reddish, contrasting dark color of elytra epipleura and prothorax; antennomere 11 orange-red, lighter than 1–4; pronotal punctuation fine, punctures not larger in diameter than that of setae; very widespread in distribution (Fig. 60) ................................................................. Eustrophopsis bicolor (Fabricius)

Tribe Holostrophini Nikitsky, 1998

Pseudoholostrophus Nikitsky, 1983
http://species-id.net/wiki/Pseudoholostrophus

Pseudoholostrophus Nikitsky 1983: 37.—Type species: Hallomenus klapperichi Pic 1954 (orig. des.); Nikitsky 1998: 40; Young and Pollock 2002: 416; Nikitsky 2008: 63; Pollock 2008: 268.

Note. This genus was described by Nikitsky (1983) on the basis of examination of Hallomenus klapperichi Pic, which now is included in (and is the type species of) Pseu-
doholostrophus. According to Nikitsky (1998), Pseudoholostrophus differs from Holostrophus in its smaller and more weakly emarginate eyes, and in the prosternal process not extending behind the posterior edge of the procoxae. There are four species in Pseudoholostrophus (Nikitsky 1998), two of which are Nearctic in distribution. The other two species, P. klapperichi (Pic) and P. chinensis Nikitsky, are known from China. Nikitsky (1998) divided the genus into two subgenera; all species other than P. discolor (Horn) are placed in the nominate subgenus. Holostrophus discolor (Horn) was transferred into the subgenus Holostrophinus of Pseudoholostrophus by Nikitsky (1998). There are two Nearctic species in this genus.

Subgenus Pseudoholostrophus Nikitsky, 1983

Pseudoholostrophus (Pseudoholostrophus) impressicollis (LeConte, 1874)
http://species-id.net/wiki/Pseudoholostrophus_impressicollis
Figures 1, 14, 26, 38, 53, 65

Eustrophus impressicollis LeConte 1874: 69.—Canada, Vancouver [Island?]; Austin 1880: 40; Henshaw 1885: 124.
Holostrophus impressicollis (LeConte).—Horn 1888: 36; Champion 1898: 66; Leng 1920: 238; Csiki 1924: 10; Hatch 1965: 67, Plate IX, fig. 1; LeSage 1991: 246; Poole and Gentili 1996: 299.
Pseudoholostrophus (Pseudoholostrophus) impressicollis (LeConte).—Nikitsky 1998: 47; Young and Pollock 2002: 416; Pollock 2008: 268, 290.

Diagnosis. This distinctive species may be separated by all other Nearctic Eustrophinae by the following combination of characters: color uniformly red-brown; dorsal setae very short, inconspicuous; eyes widely separated; meso- and metatibiae smooth, without oblique ridges; distribution in westernmost North America.

Description. Nikitsky (1998: 47-48, plate 7, Figures 9-11) provided a fairly detailed description of P. impressicollis. The following abbreviated description was taken from Pollock (2008: 268). TL 6.0-6.2 mm; GEW 2.0–2.7 mm. Body elongate oval, moderately parallel sided (Fig. 1), moderately convex dorsally (Fig. 14); dorsal and ventral color uniformly dark rufous, including antennae and legs; dorsal pubescence very short, inconspicuous; eyes widely separated (> 3× length of first antennomere) (Fig. 26), medial margin of eye slightly emarginate; antennae moderately elongate, antennomeres 7–10 distinctly widened (Fig. 26); antennomere 7 triangular, 8-10 wider than long; antennal sensilla completely annular; last maxillary palpomere distinctly widened, securniform; prosternal process (Fig. 38) elongate, spatulate distally, extended past posterior margin of procoxae, bent dorsally at distal end; prothoracic episternal suture absent; elytral punctuation fine, punctures not arranged in longitudinal striae; meso- and metatibiae with scattered short spines, without oblique ridges (Fig. 53).
Figures 1–4. Nearctic Eustrophinae, dorsal habitus. 1 *Pseudoholostrophus impressicollis*, CA: Humboldt Co., TL = 4.9 mm 2 *Pseudoholostrophus discolor*, NH: Strafford Co., TL = 5.0 mm 3 *Holostrophus bifasciatus*, IL: Clark Co. TL = 5.0 mm 4 *Eustrophus tomentosus*, AZ: Coconino Co., TL = 5.5 mm.
Distribution (Fig. 65). The range of this species is restricted to the western coast of North America, from the Queen Charlotte Islands in the north, to west central California. Hatch (1965) recorded it from Washington State, without giving a detailed locality. Only 21 specimens were examined, from the following: CANADA: BRITISH COLUMBIA. UNITED STATES: CALIFORNIA: Alpine, Humboldt, Siskiyou, Trinity. OREGON: Curry, Josephine, Lane, Lincoln, Polk. (Complete label data given in Appendix 1).

Types. Eustrophus impressicollis LeConte. LECTOTYPE, sex unknown, labeled “Vanc. / Type 4781 / Eu. impressicollis Lec.”, in MCZ.

Natural history. Label data: under bark of pine; in rotten log; fungus.

Subgenus Holostrophinus Nikitsky, 1998
http://species-id.net/wiki/Holostrophinus

Holostrophinus Nikitsky 1998: 40.—Type species: Holostrophus discolor Horn (orig. des.)

Note. According to Nikitsky (1998), this subgenus differs from Pseudoholostrophus in its double pronotal punctation and the indistinct pair of pronotal impressions. There is only a single world species in subgenus Holostrophinus.

Pseudoholostrophus (Holostrophinus) discolor (Horn, 1888)
http://species-id.net/wiki/Pseudoholostrophus_dicolor
Figures 2, 15, 27, 39, 65

Holostrophus discolor Horn 1888: 36.—U.S.A., Virginia (“Two specimens collected in Virginia by Mr. Ulke...”); Henshaw 1889: 131; Champion 1898: 66; Leng 1920: 238; Csiki 1924: 10; LeSage 1991: 246; Poole and Gentili 1996: 299. Pseudoholostrophus (Holostrophinus) discolor (Horn).—Nikitsky 1998: 43; Young and Pollock 2002: 416; Pollock 2008: 269, 290.

Diagnosis. This species may be diagnosed on the following combination of characters: eyes widely separated; dorsal setae conspicuous; pronotum with anterior margin elevated above level of head; meso- and metatibiae smooth, without oblique ridges; distribution in eastern North America.

Description. Nikitsky (1998: 43–44, plate 7, Figures 12–15) provided a description of the adult of P. (H.) discolor, based on examination of a single specimen only. Pollock (2008: 269) provided the following shorter description: TL 3.6–5.7 mm; GEW 1.6–2.4 mm; body (Fig. 2) elongate oval, rather parallel-sided, moderately convex dorsally (Fig. 15); dorsal color rufous, pronotum in most specimens slightly darker than elytra; some specimens with lighter humeral area on elytra; antennomeres 1–5 rufous, 6–10 rufopiceous, 11 light rufous; venter uniformly red-brown; dorsal pubes-
cence relatively long, conspicuous, with some erect hairs; eyes widely separated (space > 3× length of antennomere 1), inner eye margin slightly emarginate; antennae (Fig. 27) relatively short, antennomere 7–11 distinctly widened; antennomere 7 triangular, 8–10 distinctly wider than long; antennal sensilla completely annular; last maxillary palpmere slightly widened, subsecuriform; prosternal process (Fig. 39) elongate, spatulate distally, extended to past posterior margin of procoxae, bent dorsally at distal end; prothoracic episternal suture absent; elytral punctation relatively coarse, punctures not arranged in longitudinal striae; meso- and metatibiae with scattered short spines, oblique ridges absent.

**Distribution** (Fig. 65). Relatively few specimens of this species have been collected and/or examined for this study; the known distribution is distinctly eastern, the westernmost locality being in western Indiana (Parke County). The 25 specimens examined are from the following: **CANADA**: NEW BRUNSWICK, QUEBEC. **UNITED STATES**: INDIANA: Parke. MARYLAND: Calvert, Prince Georges. MASSACHUSETTS: Middlesex. NEW HAMPSHIRE: Carroll, Grafton, Strafford. PENNSYLVANIA: Warren. RHODE ISLAND: Kent. TENNESSEE: Sevier. VIRGINIA. (complete label data in Appendix 1).

**Types.** *Holostrophus discolor* Horn. LECTOTYPE, sex unknown, labeled “Va. / Henry Ulke Beetle Coll. CMNH Acc. No. 1645 / Holostrophus discolor Horn”, in CMNH. Paralectotype in MCZ.

**Natural history.** Label data: in polypore fungus; malaise trap (NH, August); intercept trap (PA, July-August; RI, July-August); on or near fleshy polypore fungi on beech log. According to Chantal (1985), individuals of this species are captured on small polypores on trunks of trees, especially *Prunus pensylvanica* and maples (*Acer* spp.).

**Holostrophus Horn, 1888**

[http://species-id.net/wiki/Holostrophus](http://species-id.net/wiki/Holostrophus)

*Holostrophus* Horn 1888: 32.—Type species: *Eustrophus bifasciatus* Say (subs. des.; Nikitsky 1998: 48); Blatchley 1910: 1293; Champion 1915: 139; Leng 1920: 238; Hatch 1965: 66; Nikitsky 1989: 17; LeSage 1991: 246; Nikitsky 1992: 434; Poole and Gentili 1996: 299; Young and Pollock 2002: 416; Nikitsky 2007: 13; Nikitsky 2008: 63; Pollock 2008: 270.

**Note.** According to Nikitsky (2007), this genus comprises 19 world species, distributed in the Russian Far East, Korea, China, Japan, Oriental region, and in the Nearctic region. In North America, there is a single species: *H. bifasciatus* (Say). In further justifying his separation of the genera *Pseudoholostrophus* and *Holostrophus*, Nikitsky (1998: 40) stated that “it seems noteworthy that species of *Pseudoholostrophus* display the elytra either one-color but not black or with a light humeral spot only, or with a clarified diffused transverse fascia in basal part. A more clearly evident reddish-yellow or red spotty pattern of the elytra is characteristic of *Holostrophus*,...
not Pseudoholostrophus”. Nikitsky (2007) added a new subgenus (Paraholostrophus), based on three Oriental species. The sole Nearctic species is a representative of the nominative subgenus.

**Holostrophus bifasciatus** (Say, 1824)

http://species-id.net/wiki/Holostrophus_bifasciatus

Figures 3, 16, 28, 40, 66

*Mycetophagus 4 maculatus* Melsheimer 1806: 14 [catalogue].—(“Pennsylvania”).

*Eustrophus* bifasciatus Say 1824: 282.—(“Inhabits United States...I obtained a specimen many years ago near Philadelphia, and we lately captured another in the North-Western Territory”); Melsheimer 1853: 143; Crotch 1873: 112; Henshaw 1885: 124.

*Eustrophus 4-maculatus* Melsheimer 1846: 58.—Melsheimer 1853: 143 (syn.); Leng 1920: 238; Csiki 1924: 9; Poole and Gentili 1996: 299; LeSage 1991: 246.

*Holostrophus bifasciatus* (Say).—Horn 1888: 36; Champion 1898: 66; Blatchley 1910: 1293; Leng 1920: 238; Csiki 1924: 9; Poole and Gentili 1996: 299; LeSage 1991: 246; Young and Pollock 2002: 416; Pollock 2008: 271, 290; Majka and Pollock 2010: 455.

**Diagnosis.** *Holostrophus bifasciatus* is the only Nearctic species of Eustrophinae with a distinct, quadrimaculate elytral color pattern; other diagnostic features include the widely separated eyes and smooth meso- and metatibiae (without oblique ridges).

**Description** (from Pollock 2008: 271). TL 4.1–5.5 mm; GEW 1.9–2.5 mm. Body elongate oval, distinctly tapered posteriorly (Fig. 3), distinctly convex dorsally (Fig. 16); dorsal color dark rufous to almost black; in most specimens, color of pronotum lighter than color of elytra; elytra with 4 yellow-red, subquadrate maculae (Figures 3, 16): anterior pair near humeri and not attaining suture, posterior pair in apical third of elytra, attaining suture in some specimens; antennomeres uniformly rufous in color, antennomere 11 slightly lighter in color than preceding articles; venter uniformly dark rufous; dorsal pubescence relatively short, inconspicuous; eyes widely separated (space > 3× length of antennomere 1), medial margin of eye moderately deeply emarginate (Fig. 28); antennae (Fig. 28) relatively short, antennomeres 7–11 distinctly widened; antennomere 7 triangular, 8–10 distinctly wider than long; antennal sensilla completely annular; last maxillary palpomere slightly widened, subsecuriform; prosternal process (Fig. 40) elongate, spatulate distally, extended to past posterior margin of procoxae, bent dorsally at distal end; prothoracic episternal suture absent; elytral punctuation fine, not arranged in longitudinal striae; meso- and metatibiae with scattered short spines, oblique ridges absent.

**Distribution** (Fig. 66). The range of this species encompasses much of eastern North America, with only several records from west of the Mississippi River in the United States. The westernmost record from Canada is from northwestern Ontario. The 557 specimens examined are from the following: **CANADA**: NOVA SCO-
TIA, ONTARIO, PRINCE EDWARD ISLAND, QUEBEC. UNITED STATES: ALABAMA: Dale, Lee, Shelby. ARKANSAS: Drew, Logan, Newton, Polk, Pulaski, Washington. CONNECTICUT: Fairfield, Hartford, Litchfield, New Haven. DELAWARE: Sussex. DISTRICT OF COLUMBIA. FLORIDA: Hamilton, Liberty, Monroe. GEORGIA: Bartow, Clarke, Fulton, Jackson, Taliaferro. ILLINOIS: Bond, Carroll, Champaign, Clark, Coles, Cook, DuPage, Edgar, Kendall, Knox, LaSalle, Peoria, Putnam, St. Clair, Sangamon, Union, Wabash, Will. INDIANA: Marion, Parke, Porter, Posey, Wayne. IOWA: Johnson. KANSAS: Shawnee. KENTUCKY: Butler, Jefferson. LOUISIANA: Natchitoches. MAINE: Kennebec. MARYLAND: Baltimore, Calvert, Cecil, Dorchester, Harford, Montgomery, Prince George’s, Talbot, Wicomico, Worcester. MASSACHUSETTS: Hampden, Hampshire, Middlesex, Norfolk, Suffolk. MICHIGAN: Livingston, Oakland, Wayne. MINNESOTA: Cook. MISSISSIPPI: George. MISSOURI: Hickory, Randolph, St. Louis. NEBRASKA: Sarpy. NEW HAMPSHIRE: Hillsborough, Rockingham, Strafford. NEW JERSEY: Bergen, Burlington, Cumberland, Essex, Middlesex, Ocean. NEW YORK: Bronx, Erie, Monroe, Onondaga, Orange, Richmond, Suffolk, Queens, Tompkins, Westchester. NORTH CAROLINA: Buncombe, Gaston, Moore, Wake. OHIO: Clark, Hamilton, Franklin, Ross, Wyandot. PENNSYLVANIA: Adams, Allegheny, Armstrong, Berks, Dauphin, Philadelphia, Pike, Westmoreland. SOUTH CAROLINA: Florence, Oconee, Pickens. TENNESSEE: Chester, Cumberland, Morgan. TEXAS: Sabine. VIRGINIA: Bath, Clarke, Fairfax, Lee. WEST VIRGINIA: Berkeley, Kanawha, Lewis, Morgan, Roane. WISCONSIN: Dane, Grant, Waukesha. (Complete label data given in Appendix 1).

Types. Eustrophus bifasciatus Say. NEOTYPE (designated by Pollock 2008), sex unknown, labeled “[faded pink circle] / E. bifasciatus Say 4-maculatus Mels.”, in MCZ (LeConte collection).

Natural history. Specimens have been collected in association with dead logs and/or associated fungi. Label data: Laetiporus sulphureus (AR); ex polypore in pine logs (AR); Trametes versicolor (AR); Schizopora paradoxa (AR); BLT (June, AL); ex polypore on cherry tree (AR); under loose pine bark (DE); under pine bark (GA); Malaise trap (March, June, GA); oak log (IL); sugar trap (May, IL); UV light (April, IL); flight trap (Aug-Sept, IL). Chantal (1985) stated that specimens have been collected from under bark of fallen Pinus strobus, on which polypores were growing; also, specimens are known from Polyporus betulinus.

Tribe Eustrophini Gistel, 1848

Eustrophus Illiger, 1802

http://species-id.net/wiki/Eustrophus

Eustrophus Illiger 1802: 301.—Type species: Mycetophagus dermestoides Fabricius 1792 (monotypy); Horn 1888: 32; Blanchley 1910: 1292; Champion 1915: 138; Champion 1916: 1; Leng 1920: 238; Hatch 1965: 66; Nikitsky 1989: 20; LeSage 1991:
Note. This genus comprises four species, distributed in Europe, Russian Far East, Japan, southern China, and North America (Nikitsky 1998). All of the older species of Eustrophinae were originally placed in *Eustrophus*, before the description of *Holostrophus* and *Eustrophinus*. Now, only a single Nearctic species is placed in *Eustrophus*.

**Eustrophus tomentosus** Say, 1826
http://species-id.net/wiki/Eustrophus_tomentosus
Figures 4, 17, 29, 41, 50, 67

**Mycetophagus niger** Melsheimer 1806: 14 [Catalogue]; Melsheimer 1846: 58.  
**Mycetophagus tomentosus** Melsheimer 1806: 14 [catalogue].—("Pennsylvania"); Say 1826: 239.  
**Eustrophus niger** Melsheimer 1846: 58.—Melsheimer 1853: 143 (syn.); Leng 1920: 238; LeSage 1991: 246; Poole and Gentili 1996: 299.  
**Eustrophus tomentosus** Say 1826: 239.—U.S.A., Illinois (no specific localities given in description); Melsheimer 1853: 143; Crotch 1873: 112; Provancher 1877: 466; Henshaw 1885: 124; Horn 1888: 35; Blatchley 1910: 1293; Leng 1920: 238; Csiki 1924: 10; Hatch 1965: 66; LeSage 1991: 246; Poole and Gentili 1996: 299; Young and Pollock 2002: 416; Majka and Pollock 2006: 53; Pollock 2008: 273, 290; Majka and Pollock 2010: 455.

Diagnosis. The following combination of characters is diagnostic for this species: widely separated eyes; antennal sensilla interrupted, not completely annular; dorsal setae distinctly golden to brown; meso- and metatibiae with oblique ridges.  
**Description** (from Pollock 2008: 273). TL 4.5–6.0 mm; GEW 2.1–3.0 mm. Body oval, parallel-sided (Fig. 4), distinctly convex dorsally (Fig. 17); dorsal color dark brown, with golden sheen due to dense pubescence; venter and antennae uniformly dark rufous, lighter than dorsal color; dorsal pubescence relatively short, but dense, giving distinct sheen (almost iridescent); eyes widely separated (space ~1.5 x length of first antennomere), inner margins deeply emarginate (Fig. 29); antennomeres 2–11 only slightly but evenly widened to apex, without distinct change in size between any 2 adjacent antennomeres; distal antennomeres subtriangular to nearly quadrate; antennal sensilla not completely annular, present on short sides of antennomeres only; last maxillary palpomere slightly securiform; prosternal process (Fig. 41) triangular, narrowed distally, extended to slightly short of posterior margin of procoxae; prothoracic episternal suture absent (Fig. 50); elytral punctuation relatively fine, punctures arranged in longitudinal striae; meso- and metatibiae with oblique ridges present.  
**Distribution** (Fig. 67). The distribution of this species is virtually transcontinental, with a gap in the interior; for example, no specimens are known from Saskatch-
ewan and Alberta. Most records from the United States are eastern, but specimens are also known from the Pacific Northwest, California, and Arizona. The 983 specimens examined in this study are from the following: CANADA: BRITISH COLUMBIA, MANITOBA, NOVA SCOTIA, ONTARIO, QUEBEC. UNITED STATES: ALABAMA: Lee, Madison, Marion, Mobile. ARIZONA: Coconino, Pima. ARKANSAS: Crawford, Faulkner, Fulton, Logan, Polk, Pulaski. CALIFORNIA: Butte, Calaveras, El Dorado, Placer, Yuba. COLORADO. CONNECTICUT: Litchfield. DELAWARE: Sussex. DISTRICT OF COLUMBIA. FLORIDA: Dixie, Monroe. GEORGIA: Bartow, Clarke, Echols. IDAHO: Boundary, Clearwater, Latah. IOWA: Johnson, Keokuk, Story. ILLINOIS: Bond, Champaign, Clark, Coles, Cook, LaSalle, McHenry, St. Clair, Union, Wabash. INDIANA: Montgomery, Parke, Porter, Tippecanoe, Vigo. KANSAS: Douglas. KENTUCKY: Butler, Henderson. LOUISIANA: Natchitoches. MARYLAND: Anne Arundel, Charles, Dorchester, Montgomery, Prince George’s, Talbot. MASSACHUSETTS. MICHIGAN: Berrien, Charlevoix, Fillmore, Gogebic, Ingham, Kalamazoo, Kent, Lapeer, Leelanau, Livingston, Macomb, Midland, Monroe, Oakland, St. Joseph, Shiawassee, Washenaw, Wayne. MINNESOTA: Crow Wing, Hennepin, Sherburne, Washington. MISSISSIPPI: George, Pearl River. MISSOURI: Boone, Dent, Franklin, Randolph, St. Charles. MONTANA: Dawson, Lake, Lincoln, Missoula, Ravalli, Rosebud, Sanders. NEBRASKA: Douglas, Sarpy. NEW HAMPSHIRE: Carroll. NEW JERSEY: Burlington, Gloucester. NEW MEXICO: San Miguel. NEW YORK: Erie, Essex, Genesee, Niagara, Onondaga, Orleans, St. Lawrence, Tompkins. NORTH CAROLINA: Durham, Moore, Stokes, Wake. NORTH DAKOTA: Pembina, Richland. OHIO: Athens, Butler, Clinton, Delaware, Hocking, Ottawa, Portage, Scioto, Vinton, Wayne, Wyandot. OKLAHOMA: Latimer, Oklahoma. OREGON: Benton, Crook, Douglas, Harney, Jackson, Lane, Linn, Multnomah, Wallowa, Yamhill. PENNSYLVANIA: Allegheny, Tioga, Westmoreland. SOUTH CAROLINA: Anderson, Florence, Pickens. TENNESSEE: Shelby. TEXAS: Angelina, Brewster, Montgomery, Sabine, Walker. UTAH: Washington. VERMONT: Franklin. VIRGINIA: Alexandria, Hampton, Nelson, Shenandoah. WASHINGTON: Walla Walla. WEST VIRGINIA: Braxton, Doddridge, Greenbrier, Hampshire, Jackson, Kanawha, Lincoln, Mason, Mineral, Nicholas, Pendleton, Randolph, Ritchie, Roane, Taylor, Webster, Wirr, Wood. WISCONSIN: Dane, Racine, Sauk, Washington. (Complete label data given in Appendix 1).

Types. *Eustrophus tomentosus* Say. NEOTYPE (designated by Pollock 2008), sex unknown, labeled “Ill. / E. tomentosus Say. niger Mels.”, in MCZ (LeConte collection).

Natural history. Label data: *Pseudotsuga taxifolia* (BC), from fungus (BC), evening flight, 4.ix (BC), ex *Populus trichocarpa* (BC), in bark *Larix occidentalis* (BC), fleshy fungus on tree (ON), under bark of pine (ON), under wet moldy bark on dead tree (ON), elm (QC), uv light trap (QC), cut surface of stump (QC), *Ulmus americana* (QC), under bark of pine (AL), *Spongipellis unicolor* (AR), *Climacodes septentrionale* (AR), *Trametes versicolor* (AR), under pine bark (CA), Lindgren trap with turpentine bait (CA), on *Pinus ponderosa* (CA), ex. *Polyporus* fungus (FL), uv light in oak-maple forest (IA), fungus on dead pine (ID), under bark of old pine stump (MD), in *Pero-
myscus nest debris under bark of dead standing Liriodendron (MD), fungus on oak (MN), funnel traps (MT), at black light, vi.1970 (NC), malaise trap, viii-ix (NE), window trap, 8–14.vi (NH), light trap, vi (NY), Lindgren funnel trap, alpha-pinene and ethanol lure (OR), stale molasses trap (SC), at wound on oak trunk (SC), malaise in mature hardwood forest, vi (SC), under bark of old dead decid. tree (VT), ex dead oak stump (WI), under bark of chestnut oak (WV). According to Chantal (1985), E. tomentosus are found under bark of dead trees, especially Ulmus americanus, as well as at sap exudations.

**Eustrophopsis** Champion, 1889

http://species-id.net/wiki/Eustrophopsis

*Eustrophopsis* Champion 1889: 77.—Type species: *Orchesia quindecimmaculatus* Laporte 1840 (orig. des.); Champion 1915: 138; Champion 1916: 1, 138; Csiki 1924: 7; Blackwelder 1945: 494; Nikitsky 1998: 58; Young and Pollock 2002: 416; Pollock 2008: 276.

*Eustrophinus* Seidlitz 1898: 438, 440.—Type species: *Mycetophagus bicolor* Fabricius 1798 (orig. des.); Champion 1916: 3; Leng 1920: 238; Csiki 1924: 8; Leng and Mutchler 1935: 36; Blackwelder 1945: 495; Hatch, 1965: 66; LeSage 1991: 246; Poole and Gentili 1996: 299; Nikitsky 1998: 58; Young and Pollock 2002: 416; Pollock 2008: 276.

*Eustrophus* Champion 1889: 75, nec. Illiger 1802.

**Note.** *Eustrophopsis* is the most diverse world genus of Eustrophinae, with approximately 55 species, known from Afrotropical, Neotropical and Nearctic regions. Descriptions of the species are scattered through the literature, and there does not exist a comprehensive work on the entire genus, which is in need of revision. Nikitsky (1998: 58) stated that it is “remarkable that *Eustrophopsis* seems to be absent both from the Oriental Region and Palaearctic. It may be so that it is replaced there by species of the genera *Holostrophus* and *Synstrophus* unknown from the Neotropical and Afrotropical regions”.

*Eustrophopsis* was described by Champion (1889) based on his examination of specimens collected in the Neotropics. Specimens that possessed a notched prosternal process were separated from *Eustrophinus* Seidlitz and placed in *Eustrophopsis*. Nikitsky (1998) synonymized these two genera, stating that the emarginated prosternal character was not satisfactory to separate them. Therefore, *Eustrophopsis* became a senior synonym of *Eustrophinus*.

Although admittedly preliminary, the Nearctic species of *Eustrophopsis* seem referable into a number of informal groupings: *E. confinis* (very widely separated eyes); *E. bicolor, E. brunneimarginatus,* and *E. indistinctus* (body shape, color pattern and shape of antennomeres); *E. arizonensis* (very rugose macrosculpture of proepisterna), and *E. ornatus* and *E. crowdyi*, sp. n. (enlarged, sexually dimorphic antennomeres, males with distinctive sensilla on antennomeres 5–10).
**Eustrophopsis confinis** (LeConte, 1866)
http://species-id.net/wiki/Eustrophopsis_confinis
Figures 5, 18, 30, 42, 56, 68

*Eustrophus confinis* LeConte 1866: 152.— (“Canada, Lake Superior, and Western States”); Crotch 1873: 112; Schwarz 1878: 463; Henshaw 1885: 124; Horn 1888: 35; Dury 1906b: 260; Csiki 1924: 10.

*Eustrophinus confinis* (LeConte).—Leng 1920: 238; Hatch 1965: 66; LeSage 1991: 246; Poole and Gentili 1996: 299.

*Eustrophopsis confinis* (LeConte).—Majka and Pollock 2006: 53; Pollock 2008: 280, 290; Majka and Pollock 2010: 455.

**Diagnosis.** *Eustrophopsis confinis* is the only Nearctic member of this genus with very widely separated eyes dorsally. Other diagnostic features include: uniformly dark body; meso- and metatibiae with oblique ridges.

**Description** (from Pollock 2008: 280). TL 4.8–6.1 mm; GEW 2.4–3.1 mm. Body ovate, subparallel-sided (Fig. 5), moderately convex dorsally (Fig. 18); dorsal and ventral color uniformly dark piceous to black; antennomeres 1–4 and 11 slightly lighter in color than antennomeres 5–10; dorsal pubescence relatively long, conspicuous; eyes widely separated (Fig. 30) (space 1–1.5 × length of antennomere 1), medial margin deeply emarginate; antennomeres 5–10 subquadrate; antennal sensilla completely annular; last maxillary palpomere unmodified, fusiform; prosternal process (Fig. 42) triangular, moderately narrowed distally, extended to slightly short of posterior margin of procoxae; prothoracic episternal suture present; elytral punctuation coarse, punctures arranged in longitudinal striae; meso- and metatibiae with oblique ridges; male with small, ovate setiferous pit on ventral edge of profemur; aedeagus (Fig. 56) with basal and apical piece of segment subequal in length; struts on median lobe relatively wide and short, inner margins U-shaped; sternite 9 basally Y-shaped, with very short stem.

**Distribution** (Fig. 68). Specimens of *E. confinis* are seemingly rarely collected, and localities are scattered across the northern United States and southern Canada. The record from northern Saskatchewan represents the northernmost extent of the entire subfamily in North America. The 32 specimens are from the following jurisdictions: CANADA: BRITISH COLUMBIA, MANITOBA, NOVA SCOTIA, ONTARIO, SASKATCHEWAN. UNITED STATES: IDAHO: Kootenai, Latah. MAINE: Androscoggin. MICHIGAN: Mackinac. MONTANA: Carter, Rosebud. NEBRASKA. NEW HAMPSHIRE: Coos, Hillsborough. SOUTH DAKOTA: Pennington. WASHINGTON: Stevens. WISCONSIN. (Complete label data given in Appendix 1).

**Types.** *Eustrophus confinis* LeConte. LECTOTYPE (designated by Pollock 2008), sex unknown, labeled “Wis / Type 4780 / E. confinis Lec”, in MCZ.

**Natural history.** Label data: *Polyporus aniceps* (ME). Chantal (1985) stated that although no details were available for this species, it should probably be similar in habits and ecology to other members of the genus.
Figures 5–8. Nearctic Eustrophinae, dorsal habitus. 5 *Eustrophopsis confinis*, MB, TL = 5.4 mm 6 *Eustrophopsis bicolor*, MB: Lockport, TL = 5.7 mm 7 *Eustrophopsis brunneimarginatus*, FL: Liberty Co., TL = 4.5 mm 8 *Eustrophopsis indistinctus*, NM: Roosevelt Co., TL = 5.4 mm.
Notes. As mentioned elsewhere, the very widely separated eyes of individuals of *E. confinis* seem to be unique within the genus, and are reminiscent of the condition seen in members of Holostrophini and *Eustrophus*.

**Eustrophopsis bicolor** (Fabricius, 1792)
http://species-id.net/wiki/Eustrophopsis_bicolor
Figures 6, 19, 31, 43, 57, 63, 69

*Mycetophagus bicolor* Fabricius 1792: 497.—Fabricius 1801: 566; Olivier 1811: 70.

*Eustrophus bicolor* (Fabricius).—Melsheimer 1853: 143; Crotch 1873: 112; LeConte 1873: 335; Provancher 1877: 467; Schwarz 1878: 463; Henshaw 1885: 124; Horn 1888: 35; Weiss 1919: 133; Weiss and West 1920: 10; Weiss 1922: 47; Csiki 1924: 8.

*Eustrophinus bicolor* (Fabricius).—Leng 1920: 238; Poole and Gentili 1996: 299; LeSage 1991: 246; Viedma 1971.

*Eustrophopsis bicolor* (Fabricius).—Pollock 2008: 277, 290; Lawrence and Leschen 2010: 515, fig. 11.5.2.D.

**Diagnosis.** This common species may be separated from the other Nearctic Eustrophinae based on the following combination of characters: antennomeres distinctly contrasting: 1–4 rufous, 5–10 dark piceous to black, 11 yellow-orange; pronotal punctuation very fine, punctures not larger than diameter of setae; males with oval, setiferous pit on ventral edge of profemur; meso- and metatibiae with numerous, oblique ridges.

**Description** (from Pollock 2008: 277). TL 4.2–6.5 mm; GEW 2.0–3.2 mm.

Body elongate oval, moderately tapered posteriorly (Fig. 6), distinctly convex dorsally (Fig. 19); dorsal color dark piceous to black; antennae tricolored: antennomeres 1–4 red, 5–10 piceous, antennomere 11 yellow-red, distinctly contrasting against preceding darker antennomeres; maxillary palpi similar in color to basal antennomeres; venter a combination of dark (same as dorsum) and lighter colored sclerites (abdominal ventrites in most specimens contrasting darker color of thorax); dorsal pubescence relatively long, conspicuous; eyes narrowly separated (Fig. 31), or almost contiguous (space < length of antennomere 1), medial margin moderately emarginate; antennomeres 2–4 short, submoniliform, antennomeres 5–10 widened, becoming more triangular toward antennomeres 9–10; antennal sensilla completely annular; last maxillary palpomere not modified; prosternal process (Fig. 43) triangular, narrowed distally, extended to slightly short of posterior margin of procoxae; prothoracic episternal suture present; elytral punctuation coarse, punctures arranged in longitudinal striae; meso- and metatibiae with oblique ridges present; male with small, ovate setiferous pit on ventral edge of profemur; aedeagus (Figures 57, 63) with basal and apical piece of tegmen subequal in length; struts on median lobe elongate, narrow, inner margins V-shaped; sternite 9 basally Y-shaped, with short stem.

**Distribution** (Fig. 69). *Eustrophopsis bicolor* is the most commonly collected and/or geographically widespread species in the subfamily. It exhibits an eastern distribu-
tion in Canada, with no records west of Winnipeg, Manitoba. In the United States, most records are eastern; however, scattered localities are known from several western states. This species is the only otherwise Nearctic eustrophine recorded from the West Indies. The 2,799 examined specimens are from the following jurisdictions: BAHAMAS. CANADA: MANITOBA, ONTARIO, QUEBEC. UNITED STATES: ALABAMA: Colbert, Greene, Jefferson, Lee, Madison, Mobile, Tuscaloosa. ARIZONA. Santa Cruz. ARKANSAS: Faulkner, Fulton, Garland, Hempstead, Johnson, Polk, Pulaski, Washington. CALIFORNIA: Trinity. COLORADO: Larimer. CONNECTICUT: Fairfield, Litchfield, New Haven, Tolland. DELAWARE: New Castle, Sussex. DISTRICT OF COLUMBIA. WEST VIRGINIA: Barbour, Braxton, Greenbrier, Hancock, Jackson, Marshall, Mineral, Preston, Putnam, Ritchie, Roane, Tyler, Webster. WYOMING: Goshen. (Complete label data given in Appendix 1).

Types. not examined. This species has been well characterized in the literature by authors such as Horn and LeConte.

Natural history. Label data: underside of fungus, dead log at night (MB), on piece of cut wood at night (MB), fungusy stump of Acer negundo (MB), bracket fungus (ON), in rotting Pleurotus (QC), on trunk of dead Ulmus americana (QC), under bark of dead maple (QC), under bark of rotting trunk of Pinus elliottii with polypore fungi (Bahamas), ex Fomes on Salix (Bahamas), under bark of Fagus (AR), Trametes versicolor (AR), Meripilus giganteus (AR), polypore tree fungus (AR), under rotting oak bark (CT), in litter at base of dying Abies (CT), large orange polypore shelf fungus [? Polyporus sulphureus] on standing tree trunk (CT), Ompahalotus olearius (CT), under bark (DE), shelf fungi (FL), Griffolida fungus (FL), Polyporus hypnoides (FL), Polyporus sulphureus (FL, MA), under bark of dead pine (FL), hibernating under bark, (GA), under bands of tar paper on apple trees (IL), Armillariella mellea (GA), Pleurotus ostreatus (IL), on shelf fungi (KS), in sweetgum stump (LA), Polyporus adustus (LA), Panus rudis (MA, NJ), under bark of dead Pinus virginiana (MA), under bark dead standing Quercus (MA), in Peromyscus nest debris under bark dead standing Liriodendron (MA), under bark of stump of Prunus serotina (MA), fungus on bark (MS), injured cypress (NC), oak (NC), under bark dead standing pine (NC), under oak bark (NC), Pleurotus sp. (NC, OK), in mushroom (NC), Trametes hysipida (ND), under hardwood bark (NJ), ex fungus on Mimosa stump (NJ), on polypore on dead Quercus (TX), polypore
fungus (UT), *Polyporus squamosus* (VT), under poplar bark (WI). Weiss and West (1920) recorded *E. bicolor* from *Pleurotus, Polyporus, Poria, Lentinus* and *Daedalia*. Chantal (1985) provided some details on fungal habitats on/with which adults were collected: *Pleurotus sapidus, Polyporus squamosus, P. betulinus, P. versicolor, P. confragosa*. Chantal (1985) and Pollock (2008) observed that individuals of this species are often collected together with adults of *Synstrophus repandus* in the same microhabitats.

**Notes.** According to LeConte (1873: 335), “the proper authority for this species is Say, its first describer; *Mycetophagus bicolor* Fabr. is probably a *Platydema.*” Pollock (2008) mentioned that no other reference to Say being the author of this species could be found, and in fact, Say himself (1826) considered Fabricius to be the correct author.

Taxonomically, the separation of southern specimens of *E. bicolor* from those of *E. indistinctus* proved to be the most difficult problem in this study. Specimens of *E. bicolor* from northern and eastern North America are very distinctive from the southern specimens of *E. indistinctus* (color and dorsal punctuation). However, as the ranges approach one another, distinguishing features between individuals of the two species become somewhat less conclusive.

Analysis of the male genitalia has revealed several consistent differences between *E. bicolor* (Figures 57, 63) and *E. indistinctus* (Figures 59, 64), as follows: 1) tegmen relatively narrow in *E. bicolor*, with apical and basal piece subequal in length; relatively wider in *E. indistinctus*, with apical piece distinctly shorter than basal piece; 2) basal struts of median lobe long and narrow in *E. bicolor*, while shorter and wider in *E. indistinctus*; and 3) ring-like portion of sternite 9 U-shaped in *E. bicolor*, while Y-shaped in *E. indistinctus* (i.e. with a short basal extension).

There appears to be a rather narrow zone of sympatry between the two species, e.g. Roosevelt County, New Mexico and Randall County, Texas. Hybridization may be occurring in the southwestern United States; for example, multiple specimens from Hidalgo County, Texas seem to exhibit a combination of features of both species. Future studies using molecular methods may be fruitful in “fine-tuning” relationships between *E. bicolor* and *E. indistinctus*.

**Eustrophopsis brunneimarginatus** (Dury, 1906a)
http://species-id.net/wiki/Eustrophopsis_brunneimarginatus
Figures 7, 20, 32, 44, 58, 70

*Eustrophus brunneimarginatus* Dury 1906a: 254.— (“Two specimens, Kentucky, near Cincinnati, Ohio”); Dury 1906b: 260; Csiki 1924: 10. *Eustrophinus brunneimarginatus* (Dury).— Leng 1920: 238; Poole and Gentili 1996: 299. *Eustrophopsis brunneimarginatus* (Dury).—Pollock 2008: 290.

**Diagnosis.** Specimens of this species may be distinguished from other members of Eustrophinae by the presence of the marginal bands of lighter color along the otherwise dark pronotum and elytra. It is possible that *E. marginatus* (Champion) also occurs
in the Nearctic region (see “notes”, below); however, the marginal light markings are even more extensive than in *E. brunneimarginatus*.

**Description.** TL 4.2–5.4 mm; GEW 2.0–2.8 mm. Body broadly ovate, moderately tapered posteriorly (Fig. 7), distinctly convex dorsally (Fig. 20); dorsal color from dark brown to near black, except for narrow lighter marginal band on pronotum and elytra (Figures 7, 20); light pronotal markings various, in some specimens restricted to extreme lateral margins only, in others extended further onto pronotal disc; light elytral band restricted to lateral margin, inward three striae at most; antennomeres 1–4 and 11 rufous, distinctly lighter than piceous antennomeres 5–10; ventral color uniformly dark rufous, without contrast between color of thoracic and abdominal sclerites; dorsal vestiture relatively long, conspicuous; eyes narrowly separated (Fig. 32), distance between less than maximum width of antennomere 1; eye deeply emarginated around antennal insertion; antennae relatively short, with no discernible sexual dimorphism; antennomeres 6–10 short, approximately equal in width and length, submoniliform; antennal sensilla completely annular; last maxillary palpomere unmodified, apex slightly oblique; pronotal punctation relatively coarse; prosternal process (Fig. 44) elongate, narrowly rounded distally, extended nearly to posterior margin of procoxae; prothoracic episternal suture present, surface of proepisternum smooth, punctures not obscured by rugose macrosculpture; coarse elytral punctures forming multiple striae; meso- and metatibiae with multiple, oblique ridges; male with small, ovate setiferous pit on ventral edge of profemur; aedeagus (Fig. 58) with basal piece of tegmen slightly shorter than apical piece; struts on median lobe long, relatively narrow, inner margins narrowly U-shaped; sternite 9 basally V-shaped to Y-shaped, with very short stem.

**Distribution** (Fig. 70). Specimens of *E. brunneimarginatus* are known from scattered localities in eastern United States, west to east-central Texas. The 45 examined specimens are from the following jurisdictions: **UNITED STATES**: ALABAMA: Dale, Madison. ARKANSAS: Pulaski. FLORIDA: Liberty. GEORGIA: Monroe. ILLINOIS: Edgar, Wabash. INDIANA: Tippecanoe. LOUISIANA: Grant, Natchitoches. MISSISSIPPI: Tishomingo. MISSOURI: Randolph. NEW HAMPSHIRE: Coos. NORTH CAROLINA: Rockingham. OKLAHOMA: Latimer. SOUTH CAROLINA: Anderson. TEXAS: Anderson, Milam, Sabine, San Augustine, Tyler, Wood. VIRGINIA: Norfolk. WEST VIRGINIA: Hardy. (Complete label data given in Appendix 1).

**Types.** *Eustrophus brunneimarginatus* Dury. LECTOTYPE (here designated), sex unknown, labeled “Ky near Cin. O. / [red, hand written] Type / [handwritten] Eustrophus brunneimarginatus Dury Type / CMNH E2065”, in CNHM. Paralectotype, with same label data as lectotype, except with “June” written on top label.

**Natural history.** Label data: flight intercept trap (AL); blacklight trap (AR); malaise trap, mixed hardwood/closed canopy seepage slope (FL); beach wash-up (NH); malaise, mature hardwood forest (SC); malaise trap in beech-magnolia forest (TX).

**Notes.** Dury (1906a) described this new species based on two specimens, which differed from *E. bicolor* based on being smaller, broader, less shining, much less narrowed posteriorly, less distinctly striate, and the light colored border of the pronotum and elytra. However, in the next article in the same journal issue, Dury (1906b)
seemingly synonymized his new species with *E. confinis* LeConte. These two species are quite different, however, and it is likely that Dury never examined actual specimen(s) of *E. confinis*.

A series of specimens from Hidalgo Co., Texas (TAMU) resemble *E. brunneimarginatus*, except that the marginal light markings are much more extensive on the pronotum and elytra. It is possible that these specimens represent *E. marginatus* Champion. In the description, Champion (1889) compared *E. marginatus* to *E. bicolor*, as *E. brunneimarginatus* was not yet described. Another species described by Champion (1889) – *E. ovatus* – possesses similar elytral and pronotal markings except that they are even more extensive than *E. marginatus*. I defer judgment on placement of the above mentioned specimens from southern Texas, as well as a possible synonymy of *E. brunneimarginatus* and *E. marginatus*, pending further study of the Neotropical eustrophines and detailed examination of Champion’s types.

**Eustrophopsis indistinctus** (LeConte, 1851)
http://species-id.net/wiki/Eustrophopsis_indistinctus
Figures 8, 21, 33, 45, 51, 54, 59, 64, 71, 76

*Eustrophus indistinctus* LeConte 1851: 151.— (“Colorado [River]”); Melsheimer 1853: 143; Crotch 1873: 112; Henshaw 1885: 124; Snow 1885: 69; Horn 1888: 34.

*Eustrophinus indistinctus* (LeConte).— Leng 1920: 238; Csiki 1924: 8; LeSage 1991: 246; Poole and Gentili 1996: 299.

*Eustrophopsis indistinctus* (LeConte).—Pollock 2008: 290.

**Diagnosis.** This is the only species of *Eustrophopsis* with a distinctly brown dorsal color; other diagnostic features include: antennomeres 1–4 and 11 not very distinctly contrasting in color with 5–10; eyes distinctly separated dorsally; pronotal punctuation (especially compared with *E. bicolor*) relatively coarse.

**Description.** TL 4.9–6.2 mm; GEW 2.4–3.0 mm. Body elongate oval (Fig. 8), moderately tapered posteriorly, distinctly convex dorsally (Fig. 21); dorsal color light to dark brown, vestiture also brownish; antennomeres 1–4 and 11 light to dark rufous, antennomeres 5–10 dark, piceous; venter rufous to brown, legs somewhat lighter in color than that of ventral sclerites; eyes moderately widely separated dorsally (Fig. 33), distance between eyes greater than maximum width of antennomere 1; eyes deeply emarginated around antennal insertions; antennae relatively long, with no discernible sexual dimorphism; all antennomeres longer than wide; antennomeres 5–10 slightly widened, submoniliform; antennal sensilla completely annular; last maxillary palpomere elongate, unmodified, apex slightly oblique; pronotal punctuation moderately coarse; prosternal process (Fig. 45) elongate, narrowly rounded distally, extended to slightly anterior of posterior margin of procoxae; prothoracic episternal suture present, surface of proepisternum smooth, punctures not obscured by rugose macrosculpture; coarse elytral punctures forming multiple striae; meso- and metastibiae with numerous, oblique
ridges; male with small, ovate, setiferous pit on ventral edge of profemur; aedeagus (Figures 59, 64) with basal piece of tegmen distinctly longer than apical piece; struts on median lobe wide, long, inner margins V-shaped; sternite 9 basally broadly U-shaped.

**Distribution** (Figures 71, 76). The range of this species is decidedly southwestern with most specimens from Arizona and New Mexico; southeastern Colorado is the northern extent. To the south, the species is known from northwestern Mexico. The 295 specimens examined were from the following jurisdictions: **MEXICO**: BAJA CALIFORNIA SUR, CHIHUAHUA. **UNITED STATES**: ARIZONA: Cochise, Gila, Graham, Greenlee, Maricopa, Pima, Pinal, Santa Cruz, Yavapai. COLORADO: Bent. NEW MEXICO: Bernalillo, Eddy, Roosevelt, Sierra. OKLAHOMA: Cimarron. TEXAS: Aransas, Blanco, Brewster, Cameron, Harris. (Complete label data given in Appendix 1).

**Types.** Eustrophus indistinctus LeConte. SYNTYPE, sex unknown, labeled “gold disk / Type 4779 / Eustrophus indistinctus Lec.” Specimen with gold disk (indicative of California); the “Colorado” referred to in the description is actually the Colorado River, and not the state.

**Natural history.** Fungi (AZ); on bracket fungus (AZ); ex fungus on dying willow (NM); on dead log at night (NM); at night on fungusy logs (NM); at fungi on burned Populus snags (NM); fungi on Salix (AZ).

**Notes.** This species was one of the earliest described Nearctic eustrophines; however, it was synonymized early on with *E. bicolor* by Horn (1888: 34) who stated that “specimens collected by me in very early spring, in Arizona, have a decidedly brownish color above...These are probably merely less mature specimens as no other structural differences have been observed”. This synonymy was followed by subsequent authors, e.g. Csiki (1924) and Poole and Gentili (1996). In fact, the relatively lighter coloration is one of the diagnostic features of adults of *E. indistinctus*. Therefore, *E. indistinctus* has been removed from synonymy with *E. bicolor* and re-established as a distinct species. There remains some difficulty in distinguishing southern specimens of *E. bicolor* from *E. indistinctus* (see “notes” for *E. bicolor*, above).

**Eustrophopsis arizonensis** (Horn, 1888)
http://species-id.net/wiki/Eustrophopsis_arizonensis
Figures 9, 22, 34, 46, 52, 60, 72, 76

*Eustrophus arizonensis* Horn 1888: 34.—(“occurs in Arizona and New Mexico”); Champion 1889: 75; Henshaw 1889: 131; Horn 1894: 353; Wickham 1895: 168; Champion 1898: 65; Griffith 1900: 570.

*Eustrophinus arizonensis* (Horn).— Leng 1920: 238; Csiki 1924: 8; Blackwelder 1945: 495; Poole and Gentili 1996: 299.

*Eustrophopsis arizonensis* (Horn).—Pollock 2008: 290.

**Diagnosis.** This distinctive species may be diagnosed on the following combination of features: eyes moderately widely separated; prothoracic episterna with distinctly ru-
gose macrosculpture; meso- and metatibiae with oblique ridges; distribution: western United States.

**Description.** TL 5.8–7.8 mm; GEW 2.6–3.6 mm. Body ovate (Fig. 9), slightly tapered posteriorly, moderately convex dorsally (Fig. 22); dorsal color uniform, piceous
Figures 14–19. Nearctic Eustrophinae, left lateral view. 14 Pseudoholostrophus impressicollis 15 Pseudoholostrophus discolor 16 Holostrophus bifasciatus 17 Eustrophus tomentosus 18 Eustrophopsis confinis 19 Eustrophopsis bicolor.

to near black; ventral color lighter than dorsal: venter rufous; legs, mouthparts and antennomeres 1–4 and 11 light to dark rufous; dorsal vestiture uniform, setae relatively short; eyes moderately widely separated dorsally (Fig. 34), distance between eyes greater than maximum width of antennomere 1; antennomeres 5–10 moderately wide,
Figures 20–25. Nearctic Eustrophinae, left lateral view. 20 Eustrophopsis brunneimarginatus 21 Eustrophopsis indistinctus 22 Eustrophopsis arizonensis 23 Eustrophopsis ornatus (dark form) 24 Eustrophopsis crowdyi, sp. n. 25 Synistrophus repandus.

Figures 29–31. Nearctic Eustrophinae, frontal view of head. 29 *Eustrophus tomentosus* 30 *Eustrophopsis confinis* 31 *Eustrophopsis bicolor*.
Figures 32–34. Nearctic Eustrophinae, frontal view of head. 32 *Eustrophopsis brunneimarginatus* 33 *Eustrophopsis indistinctus* 34 *Eustrophopsis arizonensis*. 
submoniliform, antennal sensilla annular; antennomeres 5–10 of male not flattened ventrally, without “accessory” setae; last maxillomere somewhat widened distally, apex oblique; prosternal process (Fig. 46) acute, narrowly rounded distally, not reaching posterior margin of procoxae; coarse elytral punctation forming longitudinal striae; prothoracic episternal suture present, punctation of surface of proepisternum anterior of suture somewhat obscured by very coarse, rugose macrosculpturing; meso- and metatibiae with multiple, oblique ridges; male with small, ovate, setiferous pit on ventral edge of profemur; aedeagus (Fig. 60) with basal piece of tegmen slightly longer than apical piece; struts on median lobe elongate, inner margins subparallel to elongate oval; sternite 9 basally V-shaped.

Distribution (Figures 72, 76). *Eustrophopsis arizonensis* is one of the most widespread species in the subfamily, when the Mexican distribution is included. Specimens are known from northern United States (southeast Montana) south to Oaxaca, Mexico. The 516 individuals examined are from the following: MEXICO: DURANGO, MORELOS, OAXACA, SONORA. UNITED STATES: ARIZONA: Apache, Cochise, Coconino, Gila, Graham, Navajo, Pima, Pinal, Santa Cruz, Yavapai. CALIFORNIA: Riverside, San Bernardino. COLORADO: Douglas, La Plata. MONTANA: Powder River. NEW MEXICO: Catron, Cibola, Grant, Hidalgo, Lincoln, Los Alamos, San Miguel, Torrance. SOUTH DAKOTA: Fall River. TEXAS: Brewster, Jeff Davis. UTAH: Washington. (Complete label data given in Appendix 1).

Types. *Eustrophus arizonensis* Horn. LECTOTYPE, sex unknown, labeled “Ariz / LectotYPE 8038 / E. arizonensis Horn / MCZ Type 34038”, in MCZ. Paralectotypes (3) in MCZ.

Natural history. Label data: under bark, *Quercus* (MX), under bark (AZ, MX), under pine bark (AZ), ex. fungi (AZ), dead oak at night (AZ), under log (AZ), pine stump (CA).

Notes. The rugose nature of the prothoracic episterna of this species seems to be unique in the genus, perhaps in the entire subfamily. The Mexican specimens have been included in *E. arizonensis*, based on possession of this feature.

**Eustrophopsis ornatus** (Van Dyke, 1928)
http://species-id.net/wiki/Eustrophopsis_ornatus
Figures 10–11, 23, 35, 47, 61, 73, 76

**Eustrophinus ornatus** Van Dyke 1928: 251.—U.S.A., Arizona, Cochise Co., Chiricahua Mts., near Cave Creek; Leng and Mutchler 1933: 36; Poole and Gentili 1996: 299. 
**Eustrophopsis ornatus** (Van Dyke).—Pollock 2008: 290.

Diagnosis. Individuals of *E. ornatus* share the following diagnostic features: antennomeres 5–10 distinctly widened, in males flattened on one side and with elongate, accessory setae; most specimens with at least faint indication of light elytral markings (seen in their maximum extent in Fig. 10). This species is a putative close relative of *E.*
Figures 35–37. Nearctic Eustrophinae, frontal view of head. 35 Eustrophopsis ornatus 36 Eustrophopsis crowdyi sp. n. 37 Synstrophus repandus.

crowdyi; males of the two species can be separated on the elytral color. However, non-maculate, dark males of *E. ornatus* have elongate antennal sensilla, whereas males of *E. crowdyi* have short sensilla. As well, the prosternal process of *E. crowdyi* is relatively
Figures 38–43. Nearctic Eustrophinae, prosternal process. 38 *Pseudoholostrophus impressicollis* 39 *Pseudoholostrophus discolor* 40 *Holostrophus bifasciatus* 41 *Eustrophus tomentosus* 42 *Eustrophopsis confinis* 43 *Eustrophopsis bicolor.*
Figures 44–49. Nearctic Eustrophinae, prosternal process. 44 *Eustrophopsis brunnemarginatus* 45 *Eustrophopsis indistinctus* 46 *Eustrophopsis arizonensis* 47 *Eustrophopsis ornatus* 48 *Eustrophopsis crowdyi*, sp. n. 49 *Synstrophus repandus*. 
blunter and more rounded than that of \textit{E. ornatus}. Finally, specimens of \textit{E. ornatus} tend to have antennae with contrastingly colored antennomeres, while antennomeres of \textit{E. crowdyi} are more or less similar in color.

**Description.** TL 5.3–7.6 mm; GEW 2.3–3.3 mm. Body elongate oval, relatively narrow, moderately tapered posteriorly (Figures 10–11), moderately convex dorsally (Fig. 23); dorsal color various, some specimens uniformly dark, piceous to near black (Fig. 11); other specimens with very faint indications of light(er) elytral markings; some specimens (typical form) with distinct rufous elytral markings, along lateral margin and encroaching upon disc (Fig. 10); ventral surface in most specimens at least slightly lighter in color than dorsum; antennomeres 1–4 dark rufous; at least the distal half of antennomere 11 in most specimens distinctly contrasting in color, orange-red; eyes approximate dorsally (Fig. 35), either touching, or separated by a distance equal to 1–2 facet diameters; antennomeres 5–10 distinctly widened in both sexes, subquadrate, wider than long; antennomeres 5–11 of male with ventral sides flattened, with long,
conspicuous “accessory” setae (sensilla) on ventral surface; last maxillary palpmere not widened distally, apex slightly oblique; prosternal process acute, narrowly rounded distally, not attaining posterior margin of procoxae; coarse elytral punctures forming striae; prothoracic episternal suture present, surface of proepisternum smooth, punctation not obscured by rugose macrsculpture; meso- and metatibiae with numerous, oblique ridges; male with small, ovate, setiferous pit on ventral edge of profemur; aedeagus (Fig. 61) with apical piece of tegmen longer than basal piece; struts on median lobe short, narrow, inner margins broadly U-shaped; sternite 9 basally V-shaped.

Distribution (Figures 73, 76). The Nearctic distribution of this species is restricted to southernmost Arizona and New Mexico; the range also extends south into Mexico. It is perhaps more widespread in Mexico and Central America, with the U.S. localities representing the northern extent of its range. The 132 specimens are from the following jurisdictions: MEXICO: JALISCO, SONORA. UNITED STATES: ARIZONA: Cochise, Pima, Santa Cruz. NEW MEXICO: Luna. (Complete label data given in Appendix 1).

Types. Eustrophinus ornatus Van Dyke. HOLOTYPE, sex unknown, labeled “Chiricahua Mrs. Ariz 7000ft. June 21, 1927 / Cave Creek Cochise Co. / J.A. Kusche Collector / Van Dyke Collection / Holotype Eustrophinus ornatus Van Dyke / California Academy of Sciences Type No. 2581”, in CASC.

Natural history. Label data: under dead pine bark (AZ); WPB-baited Lindgren funnel trap (AZ); at UV light (AZ).
Figures 56–61. Aedeagi of Nearctic *Eustrophopsis* spp. 56 *Eustrophopsis confinis* 57 *Eustrophopsis bicolor* 58 *Eustrophopsis brunneimarginatus* 59 *Eustrophopsis indistinctus* 60 *Eustrophopsis arizonensis* 61 *Eustrophopsis ornatus.*
Notes. Van Dyke described this species as “ornatus” due to the presence of distinctive, lighter colored markings on the dark elytra. In fact, of all specimens of *E. ornatus* examined for this study (other than the types), only very few specimens exhibited this “typical” coloration. Many specimens had only a very faint indication of the lighter coloration, while others were entirely dark. The remarkably modified male antennomeres of this species and *E. crowdyi* is an indication of their possible close relationship.

**Eustrophopsis crowdyi** sp. n.
urn:lsid:zoobank.org:act:309E2731-414C-4F7D-8B73-7D2F86D30F4D
http://species-id.net/wiki/Eustrophopsis_crowdyi
Figures 12, 24, 36, 48, 62, 74

**Types.** HOLOTYPE, male, labeled: "AZ, Cochise Co., Turkey Crk, 31°51.280’N, 109°19,883’W, 14.vii.02 ex. WPB-baited Lindgren funnel trap, ca. 2000 m. / HOLOTYPE ♂ *Eustrophopsis crowdyi* Pollock" (in USNM). ALLOTYPE, female, with same label data as holotype, except “ALLOTYPE ♀ *Eustrophopsis crowdyi* Pollock” (in USNM). Four male and 2 female paratypes, same label data as holotype; 5 male and 4 female paratypes, labeled: “AZ, Cochise Co., Turkey Crk, 31°51.280’N, 109°19.883’W, 7.vii.02 ex. WPB-baited Lindgren funnel trap, ca. 2000m. / near XPB-infested Chihuahua pine B. Fitzgibbon, coll.”; 1 male and 1 female paratypes, labeled: “USA, AZ, Apache Co., Apache N.F., Luna Lk cmpgrp. ca. 5 mi. E. Alpine, 33°50’04”, 109°05’03”; 22.vi.2002 / collected at night under ponderosa pine bark, 7960ft. D.A. Pollock”. (Paratypes in CASC, CUIC, DAPC, MTEC, UAIC, USNM)

**Diagnosis.** Individuals of *E. crowdyi* may be diagnosed from other species of *Eustrophopsis* on the following characters: overall dark body color; eyes not approximate dorsally; males with short antennal sensilla; prosternal process rather blunt, rounded distally. As mentioned above for *E. ornatus*, that species and *E. crowdyi* are thought to be close relatives, based on the modified antennomeres of the males.

**Description.** TL 5.6–7.9 mm; GEW 2.5–3.5 mm. Body elongate oval, relatively narrow, moderately tapered posteriorly (Fig. 12), moderately convex dorsally (Fig. 24); entire body piceous to nearly black, except for antennomeres 1–4 and tip of antennomere 11 somewhat lighter in color, very dark rufous.

Head with uniformly spaced, relatively coarse punctuation; eyes (Fig. 36) deeply emarginated around antennal insertions, separated dorsally by distance approximately equal to maximum width of first antennomere; antennomeres 5–10 (Fig. 36) distinctly widened in both sexes, and with different microsculpturing than antennomeres 1–4; antennomeres 7–10 subquadrate, wider than long; male with antennomeres 5–11 flattened on ventral side, ventral surface of antennomeres 5–10 with short, slender “accessory” setae (sensilla); distal maxillary palpomere not widened distally, subparallel-sided, apex slightly oblique.

Pronotum with uniform, shallow punctuation and short, apressed brownish setae; posterior margin with two clusters of coarser punctures, equidistant between middle
and lateral margins; posterior margin of pronotum bisinuate, inner sinuation deeper than outer; bead distinct along lateral, anterior, and posterior margins, somewhat obscured on middle lobe of posterior margin; prothoracic episternal suture present; surface of proepisternum smooth, regularly punctuate, without coarse or rugose macrosculpture; prosternal process (Fig. 48) moderately elongate, not attaining posterior margin of procoxae, apex moderately broadly rounded; mesosternum short, distinctly keeled.

Elytra elongate, slightly convex; punctation of two types: coarse punctures forming 10 striae on each elytron; other punctures finer, setose, setae uniformly distributed, decumbent; epipleuron distinct, narrowed posteriorly, but traceable to elytral apex; flight wings full, functional, membrane darkly pigmented.

Legs all relatively similar in shape; metathoracic legs more elongate than meso- or prothoracic legs; all tarsi cylindrical, without ventral lobes; outer surfaces of meso- and metatibiae with numerous, oblique ridges; tibial spurs distinct, paired; tarsal claws slender, without basal tooth or expansion; male profemur with small, ovate, setiferous pit on ventral surface, approximately ¼ to 1/3 distance from base of femur.

Abdominal ventrites with uniform, relatively coarse punctation, setae decumbent; male genitalia darkly pigmented (Fig. 62) with apical and basal piece of tegmen subequal in length; struts on median lobe elongate, relatively narrow, inner margins V-shaped; sternite 9 basally Y-shaped, with long stem.

**Distribution** (Fig. 74). This species is known only from the type locality, in southeastern Arizona. **UNITED STATES**: ARIZONA: Cochise.
Natural history. All known specimens, except two, were collected using Lindgren funnel traps baited with western pine beetle (Curculionidae: Scolytinae) attractant; some specimens were labeled as having been collected near a scolytine-infested Chihuahua pine (Pinus leiophylla). Two specimens were collected at night under ponderosa pine bark.
Derivation of specific epithet. I am very pleased to be able to name this new species after my oldest son, George “Crowdy” Pollock, who has accompanied me on many collecting expeditions and who has made many interesting discoveries along the way. In fact, he found larvae and adults of *E. indistinctus* in a neighbor’s fungus-colonized birch (*Betula*) stump, which were the first specimens of that species I had seen from New Mexico.

**Figure 66.** Known distribution of *Holostrophus bifasciatus*. 
Notes. *Eustrophopsis crowdyi* shares with *E. ornatus* conspicuously sexually dimorphic antennae, in males with a widening of antennomeres, one side of which is flattened and with setiform sensilla. While certainly not all world species of Eustrophinae have been studied in detail, this antennal modification is unique (so far) to these two species. As mentioned above, specimens of *E. crowdyi* were collected with many specimens of *E. arizonensis* and *E. ornatus* at the same locality in Cochise County, Arizona.
Synstrophus Seidlitz 1898
http://species-id.net/wiki/Synstrophus

Synstrophus Seidlitz 1898: 438.—Type species: Eustrophus macrophthalmus Reitter 1877 (orig. descr.); Leng 1920: 238; Hatch 1965: 66; Nikitsky 1989: 18; LeSage
Figure 69. Known distribution of *Eustrophopsis bicolor*.

1991: 246; Nikitsky 1992a: 435; Poole and Gentili 1996: 300; Nikitsky 1998: 58; Young and Pollock 2002: 416; Nikitsky 2008: 63; Pollock 2008: 282.

**Note.** There are five species of *Synstrophus* (Nikitsky 1998), distributed in China, Japan, Oriental region, and North America. Nikitsky (1998) mentioned that based on several characters, *S. repandus* (Horn) might eventually merit placement in a different genus-group taxon. A single species of *Synstrophus* is represented among Nearctic Eustrophinae.
Figure 70. Known distribution of *Eustrophopsis brunneimarginatus* (dot represents state record).

**Synstrophus repandus** (Horn, 1888)
http://species-id.net/wiki/Synstrophus_repandus
Figures 13, 25, 37, 49, 55, 75

*Eustrophus repandus* Horn 1888: 33.—U.S.A., Pennsylvania (“Its distribution seems to be across the northern half of our country from Canada and New Hampshire to Virginia, and from these points through all the States to the Pacific coast as far south as the extreme north of California”); Henshaw 1889: 131; Champion 1898: 65.

*Synstrophus repandus* (Horn).—Leng 1920: 238; Csiki 1924: 9; Hatch 1965: 66, Plate VIII, fig. 9; LeSage 1991: 246; Poole and Gentili 1996: 300; Young and Pollock 2002: 416; Pollock 2008: 282; Majka and Pollock 2010: 455.

**Diagnosis.** This species is easily diagnosed based on the following features: body color uniformly dark; eyes narrowly separated; meso- and metatibiae smooth, without oblique ridges.

**Description** (from Pollock 2008: 282). TL 5.6–7.0 mm; GEW 2.5–3.4 mm. Body ovate (Fig. 13), only somewhat tapered posteriorly, distinctly convex dorsally (Fig. 25); dorsal color dark piceous to black; antennae with basal 4 antennomeres dark rufous, distal half of antennomere 11 rufous; venter at least slightly lighter in color than dorsum; mouthparts similar in color to antennomeres 1–4; legs and abdominal ventrites dark rufous to piceous; dorsal pubescence relatively long, conspicuous; eyes narrowly separated (Fig. 37), or almost contiguous (space < length of antennomere 1), medial mar-
gin moderately emarginate; antennomeres 2–4 short, submoniliform; antennomeres 5–10 widened, becoming more triangular toward antennomeres 9–10; antennal sensilla completely annular; last maxillary palpi unmodified, fusiform; prosternal process (Fig. 49) triangular, narrowed distally, extended to slightly short of posterior margin of procoxae; prothoracic episternal suture absent; elytral punctation coarse, punctures arranged in longitudinal striae; meso- and metatibiae with scattered short spines, but distinct ridges absent; male lacking setiferous pit on ventral edge of profemur.

**Distribution** (Fig. 75). Another widely distributed species, *S. repandus* exhibits a transcontinental range, similar to that of *E. tomentosus*. Most records are eastern, with a general gap in the interior of the continent, but with records from British Columbia, Pacific Northwest, and California. The 1,175 examined specimens are from the following jurisdictions: CANADA: BRITISH COLUMBIA, MANITOBA, ONTARIO, QUEBEC. UNITED STATES: ALABAMA: Bibb, Green, Lee, Madison, Mobile, Shelby. ARKANSAS: Faulkner, Franklin, Fulton, Hempstead, Pulaski. CALIFORNIA: Riverside, Shasta, Siskiyou. CONNECTICUT: Litchfield, New Haven. DISTRICT OF COLUMBIA. DELAWARE: New Castle. FLORIDA: Alachua, Clay, Franklin, Jackson, Liberty, Leon, Orange, Wakulla. GEORGIA: Baker, Bibb, Bulloch, Charlton, Chattahoochee, Clarke, Coweta, DeKalb, Floyd, Fulton, Greene, Henry, Oglethorpe, Paulding, Whitfield. IDAHO: Bonner, Kootenai. ILLINOIS: Alexander, Champaign, Clark, Coles, Cook, DeKalb, Edgar, Jackson, Jasper, LaSalle, Ogle, Piatt, St. Clair, Sangamon, Union, Vermilion, Wabash. INDIANA: Clinton, LaPorte, Monroe, Parke, Porter, Putnam, Spencer, Tippeca-

WISCONSIN: Bayfield, Dane, Grant, Iowa, Oconto, Racine, Vilas. WYOMING. (Complete label data given in Appendix 1).
Types. *Eustrophus repandus* Horn. LECTOTYPE, sex unknown, labeled “Pen / Lectotype / Eustrophus repandus Horn / MCZ Type 34039”, in MCZ. Paralectotypes (3), in MCZ.

Natural history. Label data: *Pinus ponderosa* bark (BC), shelf fungus on birch (BC), fungus on cottonwood (BC), *Populus trichocarpa* (BC), ex fungus on *Betula*
Figure 76. Known Mexican distributions of southern Eustrophopsis species: E. arizonensis (■) E. indistinctus (●) E. ornatus (★).

(BC), underside of Populus trichocarpa log (BC), fleshy bracket fungus (ON), under wet moldy bark on dead tree (ON), Pleurotus ostreatus (IL, MA, QC), polypore on branch of old Quercus rubrus (QC), under dead pine bark (AL), Meripilus giganteus (AR), ex fungi and under bark (FL), large mushroom on log (IL), Polyporus adustus (IL), Laetiporus sulphureus (IL), under Pinus bark (LA), ex bracket fungi (NC), in slimy fungus under pine bark (NY), under dead bark (SC), ex. Polyporus schweinitzii (VT), under bark of pine (WY).

Notes. Among specimens in the LeConte collection (MCZ) a specimen of S. repandus is labeled “Eustrophus concolor Linn.” This is the only known instance of this name to me, and it seems doubtful that it represents a described species.

Discussion

The Eustrophinae is a good example of a group that is simultaneously rather obscure and poorly known to most coleopterists, and yet rather abundant, widespread and a
conspicuous component of the saproxylic fauna associated with dead coarse, woody material. Saproxylic beetles are important members of the insect community associated with the dead tree habitat in most forest types; they can be associated with the dead wood itself, fruiting bodies of wood-decaying fungi, or with other saproxylic species (Hammond 1997). As indicated by Majka and Pollock (2006), few comprehensive studies have been done on the entirety of the saproxylic fauna of any region in North America. Saproxylic beetles undoubtedly have an important role in the ecology of forests, and likewise, forest structure and disturbance have a distinct effect on the presence (or absence) of saproxylics, including the Eustrophinae (Majka and Pollock 2006). Indeed, in forests where coarse woody material is allowed to persist (i.e., with limited management), eustrophines can be very common. However, this abundance can only be appreciated by collecting at night, on logs, snags or stumps infested by various groups of wood-rotting fungi. As well, Lindgren funnel traps have shown their value as collecting devices for very long series of eustrophines (see example in Introduction). Collecting on exposed surfaces during the day, or relying on black lights at night, will produce relatively few specimens; this is likely why there were relatively few very long series of specimens from single collecting efforts, seen among examined material for this study.

Biogeographically, the Nearctic fauna of Eustrophinae is an interesting combination of distribution patterns. Species of Holostrophini are either eastern or western; for example, individuals of *Pseudoholostrophus impressicollis* are restricted to westernmost North America, from southern British Columbia to California. Conversely, *P. discolor* is known only from northeastern regions. The range of *Holostrophus bifasciatus* is more extensive, but it is still restricted to the eastern United States and Canada; only a few records are known from west of the Mississippi River.

Specimens of *Eustrophus tomentosus* and *Synstrophus repandus* are among the most commonly collected in the subfamily, and have a transcontinental distribution with an interior gap. This relative paucity of specimens from the interior has much to do with lack of extensive forest habitats, except perhaps for forests associated with rivers. For example, a very large log along the Red River at Lockport, Manitoba yielded many specimens of *S. repandus* over a three-year period. This log was transported to its resting place from a location further south along the Red River during spring flooding. It is unknown whether the fungus (and consequent eustrophines) was post-depositional, or was initiated before the log rafted north. In any event, the relative shade and moisture of the riverbank allowed for the maintenance of the moisture critical to fungal growth and development of multiple generations of eustrophine beetles (both *S. repandus* and *Eustrophopsis bicolor*).

Species of *Eustrophopsis* exhibit a definite split between western and eastern faunas, except for *E. confinis*, which is the only species with a more or less continuous distribution across North America (admittedly, with relatively few known specimens); also, this species is restricted to northern latitudes, with specimens examined from more localities in Canada than the United States. The most common species of eustrophine, *E. bicolor*, is very widespread east of the central plains states, with only scattered re-
cords from the western United States. In Canada, no records are known from west of Manitoba. Another eastern species is *E. brunneimarginatus*, which seems restricted to the southeastern United States, west to south-central Texas.

The most “complex” region for *Eustrophopsis* is the southwestern United States, especially Arizona. The forested mountains and canyons in southern Arizona represent a zone of sympathy for five of the seven species of Nearctic *Eustrophopsis*. Among these five, relatively few specimens of *E. bicolor* are known from the southwest. The vast majority of specimens of another western species, *E. arizonensis*, are known from Arizona and New Mexico, but specimens are also known from as far north as southeastern Montana. This species also has a Mexican range as far south as Oaxaca. Specimens of *E. indistinctus* are known mainly from New Mexico and Arizona, with a northern range limit in southeastern Colorado, and southern limit in Mexico. The two remaining species of *Eustrophopsis*: *E. ornatus* and *E. crowdyi*, are known only from southernmost Arizona and New Mexico, with *E. ornatus* extending south into Mexico as well. This preliminary analysis of Eustrophinae biogeography suggests that the Nearctic fauna is a mixture of elements with close relatives in Europe and/or Asia (e.g. *Holostrophus*, *Eustrophus*, and *Synstrophus*) or in the Neotropics (e.g. some southwestern U.S. *Eustrophopsis*).

While most genera of the Eustrophinae are relatively well known taxonomically (e.g. *Pseudoholostrophus*, *Holostrophus*, *Eustrophus*, and *Synstrophus*), the one group in need of detailed revisionary work is *Eustrophopsis*. Many species have been described from Neotropical and Afrotropical regions (including Madagascar), with more undoubtedly remaining to be discovered and/or described. This represents a complex biogeographic scenario, and at this point it is unknown (but perhaps doubtful) whether *Eustrophopsis* is a monophyletic taxon.

The seeming ecological importance of this group of tenebrionoid beetles, combined with the relatively high species diversity (especially in the tropics) make the Eustrophinae a group deserving of further research. Future work on the group should concentrate not only on the nomenclature and taxonomy of adults, but also on the collection and description of immature stages, and possible host preferences / associations between the eustrophines and the wood-decaying fungi in which they occur. This will contribute not only to a better, more robust classification of the Tetratomidae, but also to the overall phylogeny and evolution of the “lower Tenebrionoidea”.

**Acknowledgements**

Studies such as this one rely very heavily upon collected material, such as that from the collections listed above; I thank the various collectors and curators for the privilege of studying specimens under their care. For allowing access to type specimens, I especially thank Robert Davidson (Carnegie Museum of Natural History), David Kavanaugh (California Academy of Sciences), Steve Matters (Cincinnati Natural History Museum), and Phil Perkins (Museum of Comparative Zoology). Others with whom I have discussed various aspects of eustrophines and who have contributed advice and/
or specimens include Blaine Mathison, Nikolai Nikitsky, Mike Ivie, Dan Young, Rich Leschen, and John Moser. Thanks to Harold Widener who allowed access to “Boone Draw” (Roosevelt County, NM), an excellent site for *E. indistinctus* adults. My wife Lisa and sons Crowdy, Henry and Louis accompanied me on more than a few trips to the forest, most of which became beetle-collecting opportunities. Yves Bousquet and Dan Young provided very useful, constructive suggestions on improving the manuscript. Finally, I thank Patrice Caldwell, Jo Laney, and the administration of Eastern New Mexico University for their continued support of faculty research and scholarly activity.

Appendix I

Non-type specimen locality data for species of North American Eustrophinae

*Pseudoholostrophus (Pseudoholostrophus) impressicollis* (LeConte)

**CANADA**

**BRITISH COLUMBIA**

Gabriola, 2.vi.1994, BF & JL Carr, lot 7, (CARR, 1); Qualicum, 16.ix.1962, BF & JL Carr, lot 1, (CARR, 1); Vancouver Island, Kye Bay, nr. Comox, 5 m, 2.vii.1980, H. & A. Howden, (CMNC, 1); Queen Charlotte Islands, Laskeek Bay, Haswell Island, 2–22.vi.2000, 52°51’42”N, 131°41’06”W, Allombert, Sylvain, (RBCM, 1).

**UNITED STATES OF AMERICA**

**CALIFORNIA**

Alpine Co.: 38.4036°N, 119.8005°W, Stanislaus NF, Amot Ck., 21.viii.2005, M. Caterino, CA Beetle Project #CBP0034773, (SBMNH, 1).

Humboldt Co.: Arcata, 17.vii.1969, C. Slobodchikoff, (UCBC, 1); Larabee, 15.viii.1937, B.P. Bliven, (CAS, 4); same locality, 18.vii.1937, B.P. Bliven, (CAS, 1); same locality, 7.viii.1937, B.P. Bliven, (CAS, 1); Larabee Valley, 15.viii.1937, B.P. Bliven, (DAPC, 1).

Siskiyou Co.: 9 mi. N. Bartle, 12–15.vi.1974, D. Green, wh. fir log, (UCBC, 1).

Trinity Co.: Trinity Alps Resort, 20.viii.1973, under bark of pine, (DAPC, 1); same locality, 20.viii.1973, under bark of pine, (UCBC, 1).

**OREGON**

Curry Co.: Indian Creek, 25.vi.1978, J. Sehuh, L. Herman, fungus, (AMNH, 1).

Josephine Co.: Oregon Caves Nat. Mon, 3600ft, 4.vi.1972, R.L. Westcott, (ODAC, 1).

Lane Co.: Oakridge, 29.viii.1966, S. McCleve, in rotten log, (SMC, 1).

Lincoln Co.: 8.vi.1941, F.W. Nunami, (FMNH, 1).

Polk Co.: 4 mi. W Falls City, 25.iii.1969, R.L. Westcott, (ODAC, 1).

*Pseudoholostrophus (Holostrophinus) discolor* (Horn)

**CANADA**

**NEW BRUNSWICK**

Carleton Co., Wakefield, “Bell Forest Preserve”, 46.2200°N, 67.7231°W, 16.ix.2006, R.P. Webster, hardwood forest, on or near fleshy polypore fungi on beech log, (CNC, 1).
QUEBEC
[or Quebec City], 7.viii.1962, J.-C. Aubé, (DAPC, 1); same locality, 7.viii.1962, (FMNH, 2); Ste-Foy Quebec, Co., 31.vii.1962, J.-C. Aube, (AMNH, 2).

UNITED STATES OF AMERICA

INDIANA
Parke Co.: Turkey Run Sp, 1.vii.2001, L.E. Crofutt, (EIUC, 1).

MARYLAND
Calvert Co.: Battle Creek Cypress Swamp, 22.ix.1987, A.&B. Norden, D. Williams, (USNM, 1).
Prince Georges Co.: 39°3’N 76°47’W, 28.vi-5.vii.1992, J. Pickering, (MTEC, 2).

MASSACHUSETTS
Middlesex Co.: Tyngsboro, 27.vi.1897, (MCZ, 1).

NEW HAMPSHIRE
Carroll Co.: Moultonboro, 30.vii.1975, Malaise trap, (LSU, 1).
Grafton Co.: Bedell Bridge S.P. @ Oliverian Brook, 20.viii-8.ix.1992, D.S. Chandler, FIT, (DENH, 1).
Strafford Co.: 4 mi W Durham, 23–26.viii.1982, R.M Reeves, Malaise trap, (DENH, 1); same locality, 30.vii-2.ix.1982, R.M Reeves, window trap, (DENH, 1); same locality, 26–28.vii.1982, R.M Reeves, Malaise trap, (DENH, 1).

PENNSYLVANIA
Warren Co.: 8.6 km S. Irvine, Hedgehog Run, 530 m., 41–45–43N, 79–15–42W, 26.vii-1.viii.1995, J.R. Deeds, intercept, (DAPC, 1).

RHODE ISLAND
Kent Co.: West Greenwich, Alton Jones, 7.vii-18.viii.1995, D.S. Sikes, FI trap, (DAPC, 2); same locality, 7.vii-18.viii.1995, D.S. Sikes, FI trap, (DSSC, 4).

TENNESSEE
Sevier Co.: Great Smoky Mtns. Star Park, ix.1953, in polypore fungus, D. Kistner, (FMNH, 1).

VIRGINIA
Ulke collection, (CMNH, 1).
Holostrophus bifasciatus Say

CANADA

NOVA SCOTIA
Halifax Co., Pt. Pleasant Park, 15.vii.2001, C.G. Majka, mixed forest, deciduous vegetation, (CGMC, 1).

ONTARIO
Arnprior, 26.v.1935, W.J. Brown, (CNC, 12); Essex Co., Windsor Ojibway Prairie, 7.viii.2001, S. Paiero, Sweeps, (DEBU, 1); Jeannette Creek, 3.viii.1965, (FSCA, 1); Ottawa, (CNC, 6); same locality, (CUIC, 1); Peel Co., Port Credit, 10.iv.1966, I.M. Smith, (ROME, 1); Tillsonburg, 11.vii.1958, (CNC, 1); Toronto, 20.xi.1895, R.J. Crew, (CUIC, 1); no other data, (DEBU, 3); London, W. Saunders, (DEBU, 1); Ridgeway, (DEBU, 2).

PRINCE EDWARD ISLAND
Queens Co., St. Patricks, 25.vi.2003, C.G. Majka, coniferous forest, (CGMC, 2).

QUEBEC
Gatineau, Aylmer, 17.v.1992, Y. Bousquet, in flight, (SLC, 1).

UNITED STATES OF AMERICA

ALABAMA
Dale Co.: Enterprise, 8–12.vi.1992, R. Turnbow, blacklight trap, (RTC, 1).
Lee Co.: Auburn, 17.viii.1968, E.J. Kiteley, (CNC, 1); same locality, 7.iv.1972, E.J. Kiteley, (CNC, 1).
Shelby Co.: nr. Helena, 31.iii.1957, H.R. Steeves jr., in rotten logs, (FMNH, 1).

ARKANSAS
State record only, (INHS, 1).
Drew Co.: 5 mi. N. of Collins, 7 Devils Swamp, 16.iii.1987, R.A.B. Leschen, Laetiporus sulphureus, (RLC, 1).
Logan Co.: Cove Lake, 9 mi. SW of Paris on Hwy 309, 19.iii.1986, R.A.B. Leschen, ex. Polypore in pine logs, (RLC, 1); Mt. Magazine, 17 mi. S. of Paris on hwy 309, electronic site, 3.iv.1986, R.A.B. Leschen, Trametes versicolor, (RLC, 1).
Newton Co.: Ozark National Forest, Pedestal Rocks, 12 km E. Pelsor on Hwy 16, 16.v.1986, D.A. Pollock, (DAPC, 1).
Polk Co.: Mena, 18.vii.2007, B. Baldwin, U.V. light trap, (BBC, 1).
Pulaski Co.: Little Rock, 1.v.1997, B. Baldwin, flight intercept trap, (UGAC, 1); same locality, 9.vi.1997, B. Baldwin, flight intercept trap, (UGAC, 1); same locality and collector, 20.vi.1998, FIT, (BBC, 1); 4.v.1998, FIT, (BBC, 1); 6.v.1998, FIT, (BBC, 1); 2.vii.1998, FIT, (BBC, 1); 15.viii.2000, FIT, (BBC, 1); 11.vii.2000, FIT, (BBC, 1); 14.v.1998, FIT, (BBC, 1); 26.viii.2002, Malaise trap, (BBC, 1); 22.vii.1999, Malaise trap, (BBC, 1); 5.ix.1999, Malaise trap, (BBC, 1); 11.ix.2000, Malaise trap, (BBC, 1); 1.x.1986, D.A. Pollock, under bark, (DAPC, 2).

Washington Co.: L. Wedington, 19.iv.1986, R.A.B. Leschen, Schizopora paradoxa, (RLC, 1); Lk. Wedington, 26.x.1986, R.A.B. Leschen, ex polypore on cherry tree, (RLC, 1).

Counties unknown: South West, Chas Palm, (AMNH, 3).

CONNECTICUT
Fairfield Co.: Stamford, (AMNH, 1).
Hartford Co.: Newington, 13.v.1961, R.P. Zigas, (UCMS, 1).
Litchfield Co.: Sharon, 20.ii.1925, A. Wilcox, (CUIC, 2).
New Haven Co.: S. Meriden, H.L. Johnson, (MCZ, 2).

DISTRICT OF COLUMBIA
(INHS, 1); Ulke coll., (CMNH, 4); 30.viii.1905, (USNM, 2); 8.ix.1904, (USNM, 2).

DELAWARE
Sussex Co.: Middlesex Beach, 1.viii.1984, F. Guarnieri, under loose pine bark, (CUIC, 3).

FLORIDA
Hamilton Co.: E.B. Chope, (FMNH, 1).
Liberty Co.: Torreya St. Park, 27.xi.1989, J.T. Doyen, (UCBC, 1).
Monroe Co.: Key West, (CUIC, 1).

GEORGIA
Bartow Co.: Cartersville, 26.iii.1939, P. W. Fattig, (UGAC, 4). Clarke Co.: 1.1 mi SW Winterville, 20–23.iii.1994, C.L. Smith, ex: malaise trap, (UGAC, 2); Athens, 1–7.vi.1976, J.F. MacDonald & R.W. Matthews, Malaise trap, (UGAC, 1); U. Ga. Bot. Gar., 17.xi.1974, R. M. Duffield, (UGAC, 2).

Middlesex Co.: Avenel, 7.ix.1916, (UAIC, 1); Morgan, iv, (CUIC, 1).
Ocean Co.: Manchester, 15.iv, (CUIC, 2); same locality, 15.iv, L.B. Woodruff, (AMNH, 1).
Counties unknown: Catskil Mts., L.B. Woodruff, (AMNH, 1); Forest Park, 28.iii.1903, (CUIC, 1); Harrison Park, 10.iv.1916, E.R. Kalmbach, (USNM, 1); Woodside, iii, E.L. Dickerson, (AMNH, 2).

NEW YORK
State records only: (CUIC, 2); (MCZ, 2).
Bronx Co.: Van C Pk, (AMNH, 3).
Erie Co.: Buffalo, (CUIC, 2).
Monroe Co.: Rochester, 3.viii.1944, F.C. Fletcher, (LACM, 1).
Onondaga Co.: 15.v.1946, N.M. Downie, (FMNH, 1); 11.vi.1946, N.M. Downie, (FMNH, 1).
Orange Co.: West Point, 14.v.1910, W. Robinson, (USNM, 1).
Richmond Co.: Staten Isl., 8.v.1921, (USNM, 1).
Suffolk Co.: Bellport L.I., 17.vi.1914, A. Nicolay, (USNM, 3); Yaphank, L.I., v-17, (CUIC, 1).
Queens Co.: Flushing, 5.v.1926, E.L. Bell, (AMNH, 1); Jamaica, L.I., (CUIC, 1).
Jamaica L.I.N.Y., L.B. Woodruff, (AMNH, 2); L.I., Little Neck, 12.xii.1915, F.M. Schott, (AMNH, 1); Long Island, 22.xii.1912, F.M. Schott, (UAIC, 1).
Tompkins Co.: Town of Ulysses, N. of Jacksonville, 21.iv.1985, E.R. Hoebeke, (CUIC, 1); Trumansburg, H.A. Smith Woods, 26.viii.1987, E.R. Hoebeke, (CUIC, 1); Ithaca, V.M. Kirk, under willow bark, (NDSU, 1); same locality, (USNM, 2).
Westchester Co.: Peekskill, 3.12 1890, (CUIC, 2); Pelham, 12.iv.1931, L. Lacey, (AMNH, 1).
Counties unknown: Northwest, L.I., 1.vi.1942, (CUIC, 1).

OHIO
State records only: Ulke coll., (CMNH, 1); (CUIC, 6); (NDSU, 2); (USNM, 2); Hubbard & Schwarz, (USNM, 3); C.V. Riley, (USNM, 1).
Clark Co.: Clifton, 21.v, D.J. & J.N. Knoll, (OSUC, 1).
Franklin Co.: Darbydale, 7.iv.1974, K. Stephan, (FSCA, 1).
Hamilton Co.: Cincinnati, (CUIC, 1); Cincinnati, 14.vi, H.S. Itau, (USNM, 1); same locality, H. Soltau, (USNM, 2).
Ross Co.: Scioto Trail S.P., 17.iv.1989, (TAMU, 2); Tar Hollow St. For., 24.v.1985, R.S. Miller, (MTEC, 1).
Wyandot Co.: Sycamore, 24.v.1919, P.S. Bartholomew, (CAS, 1).

PENNSYLVANIA
State records only: Ulke coll., (CMNH, 2); (MCZ, 5).
Adams Co.: Chestnut Hill, 3.vii, (MCZ, 1).
Allegheny Co.: county records only: (MCZ, 3); (CMNH, 9); 6.ix, (CMNH, 1); 1.xi.1904, E.A. Klages, (CUIC, 2); 29.vii.1888, E.A. Klages, (CUIC, 1); 1.v.1906, E.A. Klages, (CUIC, 1); 17.iii.1889, E.A. Klages, (CUIC, 1); 23.vii.1896, E.A. Klages, (CUIC, 1); Pittsburgh, (CMNH, 6); same locality, 21.vi, (CMNH, 2); same locality, vii, (CMNH, 1); same locality, 10.vi, (CMNH, 1); same locality, 4.vii, (CMNH, 1); same locality, vii, (CMNH, 1); same locality, 10.vi, (CMNH, 2).
Armstrong Co.: Crooked Creek, Wickham Collection, (USNM, 1).
Bucks Co.: Neversink, 29.viii.1951, (FMNH, 1); 2.3 km W. Eckville, 270 m., 14.vii.1997, R.A. Androw, (DAPC, 2).
Dauphin Co.: Hummelstown, 1.v, J.N. Knoll, (OSUC, 1).
Philadelphia Co.: Frankford, 23.x, GeoM Greene, (USNM, 1); Lawndale, 27.iv.1902, GeoM Greene, (USNM, 1)
Pike Co.: Milford, 30.v-1.vi.1941, B. Malkin, (FMNH, 1).
Westmoreland Co. Jeannette, 20.vi, H.G. Klages, (CMNH, 1); same locality, vi, (CMNH, 3); same locality, vii, (CMNH, 2); same locality, 4.vi, (CMNH, 1); same locality, 4.vii, H.G. Klages, (CMNH, 1); same locality, 5.vii, H.G. Klages, (CMNH, 1); same locality, 11.vi, (CMNH, 1).
Counties unknown: Timicuim Is., 20.x.1901, GeoM Greene, (USNM, 1); Mt. Lebanon, ix.1930, R.J. Simon, (CMNH, 1).

SOUTH CAROLINA
State record only: (MCZ, 1).
Florence Co.: Florence, 13.xi.1952, V.M. Kirk, under dead bark, (NDSU, 2).
Oconee Co.: Clemson College, 19.xi.1933, O.L. Cartwright, (USNM, 1).
Pickens Co.: Clemson, 30.xi.1951, G.M. Chamberlain, under bark, (TAMU, 1); same locality, 30.iv.1975, J.R. Ables, (TAMU, 1).
Counties unknown: Union, 5.iii.1961, (USNM, 2); same locality, 4.iii.1962, (USNM, 1).

TENNESSEE
State records only: Ulke coll., (CMNH, 2); (CUIC, 2).
Chester Co.: Chickasas St. Park, 27.xii.1977, R.D. Ward, (CMNH, 1).
Cumberland Co.: Black Mt., v-viii.1917, A.C. Gill, (CUIC, 1).
Morgan Co.: Burrville, 17.vii.1954, B. Benesh, (FMNH, 1).

TEXAS
State record only: (MCZ, 1).
Sabine Co.: 9 mi. E. Hemphill, “beech bottom”, 10–16.iv.1989, Anderson & Morris, flight intercept trap, (DAPC, 1).

VIRGINIA
Bath Co.: Warm Sprgs., x.1, (CUIC, 1).
Clarke Co.: U. Va. Blandy Exp. Farm, 2 mi S boyce 3905N 7810W, 11–25.v.1993, D.R. Smith, Malaise trap, (USNM, 1).
Fairfax Co.: Alexandria, Huntley Meadows Pk., 12–19.vi.1991, B.V. Brown, Malaise trap in oak/maple forest, (DAPC, 1); Springfield, 11.iv.1992, E.R. Fuller & B.V. Brown, under bark of dead trees, (DAPC, 1); Mt. Vernon, 23.vi.1916, (USNM, 1).
Lee Co.: Jone’s Cr, (USNM, 1).
Counties unknown: St. Falls, 17.ix.1913, (USNM, 1).

WEST VIRGINIA
Berkeley Co.: Martinsburg, 15–22.vi.1994, W.L. Drosselmeyer, Lindgren funnel trap, (PPCD, 1).
Kanawha Co.: 1 mi E Rocky Fork, 31.viii-15.ix.1994, S.M. Clark, Lindgren funnel trap, (PPCD, 1).
Lewis Co.: Berlin, 26.v-1.vi.1995, M.D. Bombardière, Lindgren funnel trap, (PPCD, 1).
Morgan Co.: 3 mi NNE Largent, 19–31.iii.1998, W.L. Drosselmeyer, Lindgren funnel trap, (PPCD, 1).
Roane Co.: 1 km E. Kettle, Hungry Beech Preserve, 38–34N, 81–28W, 270 m+A62, 5–8.vi.1995, A. Harrity, R. Davidson, G. Onore, light trap in decid. forest, (CMNH, 1).

WISCONSIN
State records only: (CAS, 1); (FMNH, 2); (FMNH, 2); (INHS, 3); (WIRC, 1).
Dane Co.: 13.v.1965, R. Baier, (WIRC, 1); 6.10.1957, Nicholls, (WIRC, 1); Madison, 30.vii.1931, (FMNH, 1); same locality, 12.x.1940, H.R. Dodge, from fungus, Hypoloma perplexa, (FSCA, 1); Madison, Picnic Point, 6.vi.1995, R. Otto, coll. on oak log, (DAPC, 1); Madison, U.W. campus, 12.vi.1995, R. Otto, coll. on oak log, (DAPC, 1).
Grant Co.: Blue River, 28.vii.1916, D.M. DeLong, (OSUC, 1).
Oconto Co.: Mountain, 20.vi.1935, H. Dybas, (FMNH, 2).
Waukesha Co.: 4.ix.1970, B. Rogan, (WIRC, 3).
Eustrophus tomentosus Say

CANADA

BRITISH COLUMBIA
Canal Flats, 21.viii.1977, Carrs, lot 1, (CARR, 4); same locality, 21.viii.1977, B.F. & J.L. Carr, lot 1, (DAPC, 1); Creston, 17.v.1931, G. Stace Smith, (CNC, 5); same locality, 19.v.1956, G. Stace Smith, (CNC, 1); same locality, 17.v.1931, G. Stace Smith, (UBC, 11); same locality, 22.vii.1948, G. Stace Smith, from fungus, (UBC, 1); same locality, 12.vii.1946, G. Stace Smith, host: Pseudotsuga taxifolia, (UBC, 1); same locality, 3.viii.1945, G. Stace Smith, in fungi, (UBC, 1); same locality, 5.viii.1950, G. Stace Smith, from fungus, (UBC, 1); same locality, 17.v.1957, G. Stace Smith, evening flight, (UBC, 1); same locality, 4.ix.1951, G. Stace Smith, evening flight, (UBC, 1); same locality, 17.vi.1951, G. Stace Smith, ex fungus, (UBC, 1); same locality, 11.ix.1951, G. Stace Smith, ex fungus, (UBC, 1); same locality, 1.vi.1952, G. Stace Smith, ex fungus, (UBC, 1); same locality, 25.vi.1953, G. Stace Smith, evening flight, (UBC, 1); same locality, 18.v.1951, G. Stace Smith, ex Populus trichocarpa, (UBC, 1); same locality, 6.vi.1948, G. Stace Smith, from fungus, (UBC, 1); same locality, 22.vii.1948, G. Stace Smith, from fungus, (UBC, 1); Creston, 1900 ft., 25.v.1933, G. Stace Smith, surface of pond, (UBC, 1); Creston, 2000 ft., 20.ii.1932, G. Stace Smith, in bark Larix occidentalis, (UBC, 1). Gabriola, 29.iv.1993, Carrs, lot 1, (CARR, 5).

MANITOBA
Winnipeg, Univ. of Manitoba campus, forest along Red River, 5–8.vii.1985, D.A. Pollock, suction trap, (DAPC, 1).

NOVA SCOTIA
Guysborough Co., Borneo, 28.vi.1995, C. Corkum, (NSMC, 1); Halifax Co., Big St. Margarets Bay, 29.vii-13.viii.1997, D.J. Bishop, in old red spruce habitat, (NSMC, 1); Queens Co., Tobeatic Lake, 3.vi.2003, P. Dollin, red spruce habitat (80–120 yrs.), (NSMC, 2).

ONTARIO
no other data, (MCZ, 1). Arnprior, 26.v.1935, W.J. Brown, (CNC, 1); same locality, 9.vi.1935, W.J. Brown, (CNC, 1); Bell’s Corners, 17.x.1962, D.D. Munroe, (CNC, 3); same locality, 10.vii.1963, D.D. Munroe, (CNC, 1); Chaffeys Locks Biol. Stn., 6.vi.1986, A. Davies, berlese fleshy fungi on tree, (CNC, 1); Constance Lake, 10.vi.1989, G. Hilchie, ex mushroom, (CARR, 1); DeCew Falls, 6.v.1942, S.D. Hicks, (CNC, 1); Hamilton, 15.vi.1982, M. Sanborne, (CNC, 1); same locality, 28.vi-14.vii.1982, M. Sanborne, (CNC, 2); same
locality, 30.vi-8.vii.1981, M. Sanborne, (CNC, 1); same locality, 23.vii.1980, M. Sanborne, Malaise trap, (CNC, 1); Lambton Co., Pinery Prov. Park, 15–20.vi.1994, J. Skevington, Malaise Cedar trail oak savanna meadow, (DEBU, 2); same locality, 22.vi.1995, G. Vogg, Visitor Centre, (DEBU, 1); Lanark, 17.ix.1977, S.A. Marshall, (JBWM, 3); Leamington, 18.viii.1940, W.J. Brown, (CNC, 1); Merivale, 4.vi.1935, W.J. Brown, (CNC, 1); Ottawa, 14.vii.1912, Beaulieu, (CNC, 2); same locality, (CNC, 4); same locality, 17.v, under bk. of pine, (CNC, 3); same locality, 14.vii.1912, Beaulieu, (MCZ, 2); Prince Edward Co., 15.vi.1947, Brimley, (CARR, 3); same locality, 23.iv.1922, Brimley, (CNC, 1); same locality, 21.vii.1918, Brimley, (CNC, 1); same locality, 20.vi.1938, Brimley, (CNC, 1); same locality, 13.vi.1940, Brimley, (CNC, 1); same locality, 16.ix.1923, Brimley, (CNC, 1); same locality, 21.vi.1918, Brimley, (CNC, 1); same locality, Brimley, (UAIC, 3); same locality, Brimley, (UAIC, 3). Rondeau Pk., 2–6.vi.1985, L. LeSage & A. Smetana, flight intercept in white pine stand, (CNC, 3); Rondeau Pk., 2–6.vi.1985, L. LeSage & A. Smetana, int. trap in maple-beech forest, (CNC, 1); same locality, 14.vi-2.vii.1985, L. LeSage & D.M. Wood, (CNC, 1); Rondeau Pr. Pk., Black Oak Trail, 5.vi.1985, A. Davies & J.M. Campbell, under wet moldy bk. on dead tree, (CNC, 1); Toronto, R.J. Crew, (CUIC, 2); same locality, 2.i.1895, R.J. Crew, (CUIC, 4); same locality, iii, Crew, (WIRC, 1); Trenton, 25.v.1899, Evans, (CNC, 1); no other data, (DEBU, 2); Ariss, 18.vii.1976, S.A. Marshall, (DEBU, 1); Gananque, 22.vi.1963, C.J. Edwards, (DEBU, 1); Grimsby, 14.vi.1977, W.A. Attwater, (DEBU, 2); Guelph, 17.vi.1976, S.A. Marshall, (DEBU, 5); same locality, 27.iii.1977, Kevin Barber, (DEBU, 10); Lanark, 2.viii.1976, M.J. Sharkey, (DEBU, 1); London, W. Saunders, (DEBU, 3); same locality, 28.vi.1976, W.A. Attwater, (DEBU, 1); Oakville, 21.vi.1977, W.A. Attwater, (DEBU, 1); Port Credit, 16.v.1993, C. Krupke, rotting wood, (DEBU, 1); Pr. Edw. Co., Brimley, 2.vi.1940, (AMNH, 1); Primrose, 27.vii.1977, W.A. Attwater, (DEBU, 1); Ridgeway, (DEBU, 1); Whitby, 21.iv.1974, G.J. Umphrey, (DEBU, 1).

QUEBEC

Aylmer, 12.v.1932, W.J. Brown, (CNC, 1); Gatineau Pk., 24.v.1970, J.M. Campbell, (CNC, 1); Montreal, 4.v.1969, E.J. Kiteley, elm, (CNC, 1); same locality, 27.viii.1973, E.J. Kiteley, uv light trap, (CNC, 1); same locality, 27.vii.1974, E.J. Kiteley, uv light trap, (CNC, 1); same locality, 25.vi.1980, E.J. Kiteley, cut surface stump, (CNC, 1); same locality, 25.vi.1980, E.J. Kiteley, uv light trap, (CNC, 1); Old Chelsea, NCC woodpile, 27.v-5.vi.1987, L. Masner, pans, (CNC, 1); Riviera Touraine, 12.iv.1974, R. Sexton, Ulmus americana, (CNC, 15); same locality, 14.vi.1974, R. Sexton, Ulmus americana, (CNC, 19); Terrebonne, Saint-Hippolyte, 27.v.1978, S. Laplanche, uv light, (SLC, 1). LOCALITY UNKNOWN. no other data, (CUIC, 1); Ulke collection, (CMNH, 1); no other data, (USNM, 1).
UNITED STATES OF AMERICA.

ALABAMA

Lee Co.: Auburn, 3.iv.1969, E.J. Kiteley, under loose bark of pine, (CNC, 1); same locality, 26.iv.1966, E.J. Kiteley, under bark, (CNC, 1); same locality, 26.iii.1972, E.J. Kiteley, under bark of dead pine, (CNC, 1).

Madison Co.: Monte Sano St. Pk., 3–4.ix.1983, N.M. Downie, (FMNH, 1).

Marion Co.: 1.8 mi. SW. Hackleburg, Clifty Creek, 6.vi.1983, S.C. Harris, (PKLC, 1).

Mobile Co.: Mobile, 22.vi.1919, G.W. Bock, (UMRM, 1); same locality, 25.x, H. Soltau, (USNM, 1).

ARIZONA

no other data, (INHS, 1).

Coconino Co.: Tusayan District, Kaibab Nat. Forest, 22.viii.1976, Carrs, lot 5, (CARR, 1); 1.5 mi. S. Hwy 40 & 3.8 mi. W. Flagstaff (off FSR 151), 35.1795, -111.7553, 17–19.vii.2007, D. & G. Pollock, coll. at night on ground or on dead pine logs, 7350 ft. elev., (DAPC, 4).

Pima Co.: Santa Catalina Mts. , 15.vi.1940, O. Bryant, lot 23, (CAS, 1); Tucson, 5.viii.1935, O. Bryant, lot 20, (CAS, 1); same locality, Wickham, (USNM, 1).

ARKANSAS

no other data, (CUIC, 3); no other data, (INHS, 1).

Crawford Co.: Ozark Nat’il Forest, 1.5 mi. S. of Natural Dam off Hwy 59, 31.viii.1986, R. Leschen, Spongipellis unicolor, (RLC, 1).

Faulkner Co.: Bell Slough Wildlife Management Area, Mayflower nr. Lake Conway Spillway, 24.viii.1986, R. Leschen, Climacodes septentrionale, (RLC, 2).

Fulton Co.: mammoth Spring, 28.v.1983, J.R. Heitzman, decid. forest & lowland flora, (FSCA, 2).

Logan Co.: Mt. Magazine, Brown spgns., 12.v.1986, R. Leschen, Trametes versicolor, (RLC, 1).

Polk Co.: Mena, 19.ix.2007, U.V. light traps, B. Baldwin, (BBC, 2).

Pulaski Co.: Little Rock, 30.iii.1997, Brian Baldwin, flight intercept trap, (UGAC, 1); same locality, 7.ix.1998, B. Baldwin, Malaise trap, (BBC, 1); same locality, 10.viii.1999, B. Baldwin, black light trap, (BBC, 1); same locality, 7.ix.2000, B. Baldwin, malaise trap, (BBC, 1); same locality, 22.vi.1997, B. Baldwin, flight intercept trap, (BBC, 1); same locality, 21.vi.1996, B. Baldwin, hanging sugar traps, (BBC, 1); same locality, 3.ix.1998, B. Baldwin, flight intercept trap, (BBC, 2); same locality, 29.v.2003, B. Baldwin, blacklight trap, (BBC, 1); same locality, 6.vii.1998, B. Baldwin, flight intercept trap, (BBC, 1); same locality, 17.viii.2000, B. Baldwin, black light trap, (BBC, 1); same locality, 8.v.1999, B. Baldwin, hanging sugar traps, (BBC, 1); same locality, 24.iv.2002, B. Baldwin, flight intercept, (BBC, 2); same locality, 3.ix.1998, B.
Baldwin, flight intercept trap, (BBC, 2). *Counts unknown*: South West, Chas Palm, (AMNH, 2).

**CALIFORNIA**

no other data, (FMNH, 2).

Butte Co.: 5 mi. N. Forest Ranch, 5/9.1971, under pine bark, (UCRC, 3).

Calaveras Co.: 4.8 km S. West Point, 26.vii.1980, S.C. Williams, (CAS, 1).

El Dorado Co.: 1 mi. E. Pacific House, 9.v.1992, W.D. Shepard, carrion traps, (CAS, 1); Blodgett Forest, 22.xi.1986, K. Hobson, (UCBC, 1); same locality, 17–21.iv.1989, K. Hobson, (UCBC, 1); Blodgett FRS, 2.vi.1986, Hobson / Atkinson, Lindgren trap turpentine bait, logged area, (UCBC, 1); Somerset, 19.vi.1969, R. Wharton, (TAMU, 1); El Dorado Natl. For.; nr. Jct. of Hwy 50 & Icehouse Rd., 38°46’N, 120°26’W; el. ~3200’, 2.iv.2005, A.R. Cline, ex. berleseate, (DAPC, 2).

Placer Co.: Gold Run, 20.iii.1964, W.F. Barr & O.O. Fillmore, (WFBM, 2).

Yuba Co.: Challenge, 6.iv.1981, R.S. Miller, (MTEC, 1). Sierra Foothill Field Sta., 6 mi. N. Smartville, 1500–1900’, 4.v.1980, J.A. Powell, on *Pinus ponderosa*, (UCBC, 1).

**COLORADO**

Wickham, (USNM, 1).

**CONNECTICUT**

Litchfield Co.: Cornwall, 13.viii.1920, Chamberlain, (CUIC, 2).

**DELAWARE**

Sussex Co.: Ellendale Forest, 1.ii.1970, M. Drunkenbrod, under bark, (USNM, 1).

**DISTRICT OF COLUMBIA**

Ulke collection, (CMNH, 2); Washington, 22.ii.1886, (CUIC, 1).

**FLORIDA**

Dixie Co.: Suwanee R. St. Pk., Suwanee, 15.vi.1981, S. Peck, UV light, (CNC, 1).

Monroe Co.: Key West, (CUIC, 1). Dixie Co.: US 27 W. of Shamrock, 7.v.1981, J.K. Liebherr, ex Polyporus fungus, (UCBC, 1).

**GEORGIA**

Bartow Co.: Cartersville, 26.iii.1939, P. W. Fattig, (UGAC, 1).

Clarke Co.: 1.1 mi. SW Winterville, 18–22.iv.1994, C.L. Smith, ex: malaise trap, (UGAC, 2); 3 mi. N. Athens, 14.iv.1974, R. Turnbow, b.l. trap, (FSCA, 1); same locality, 2.vi.1974, R. Turnbow, b.l. trap, (FSCA, 1); 5 mi. W. Athens, 7.viii.1977, C. L. Smith, under oak bark, (UGAC, 3); Athens, 12.iii.1938, P. W. Fattig, (UGAC, 1); same locality, 8–14.v.1976, J. F. MacDonald &
R. W. Matthews, malaise trap, (UGAC, 1); same locality, 12.iii.1938, P. W. Fattig, (UGAC, 1); Athens, 12.i.1964, L.J. Bayer, (WIRC, 4); same locality, 12.3.1922, P.W. Fattig, (MCZ, 1).

_Echols Co._: Mayday, at Alapaha River, 25.ii.1991, W. Steiner & J. Hill, (USNM, 2). _Lamar Co._: Barnsville, 1.v.1923, T.L. Bissell, tanglefoot Trap Posts, (USNM, 1).

**IOWA**

_Johnson Co._: Iowa City, 11.x.1914, J.J. Stoner, (USNM, 2); same locality, 16.v.1896, Wickham, (USNM, 3).

_Keokuk Co._: Atwood, B. Shivek, (USNM, 1).

_Story Co._: Ames, 3.v.1941, L. Potter, (NDSU, 1); same locality, 22.v.1932, Louise Haas, (DENH, 1); same locality, 2.v.1932, Floyd Andre, (USNM, 2); same locality, 22.iv.1955, A.H. Barnum, (BYUC, 2); same locality, 1.vii.1989, M.E. Rice, UV light in oak-maple forest, (WFBM, 1). _Counties unknown:_ Burl, (MCZ, 1).

**IDAHO**

_Boundary Co._: N. of Bonners Ferry, 20.vi.1948, L.R. Gillogly, fungus on dead pine, (CAS, 1).

_Clearwater Co._: 5 mi NW Pierce, 2.viii.1972, (USNM, 1).

_Latah Co._: Moscow, 2560 ft., 5.vii.1930, P. Rice, (WFBM, 1). same locality, 12.vii.1930, P. Rice, (WFBM, 1).

**ILLINOIS**

_Bond Co._: Lagrange, 25.v.1920, (UMMZ, 1).

_Champaign Co._: Urbana, 20.iv.1907, (INHS, 3); no other data, 11.iv.1926, K.F. Auden, (INHS, 1); no other data, 20.iii.1960, J.M. Campbell, under bark, (CNC, 1).

_Clark Co._: Rocky Branch, 30.vii-8.viii.1991, M.A. Goodrich, Malaise trap, (DAPC, 1); same locality, 1–7.ix.1988, M.A. Goodrich, (DAPC, 1).
