ABSTRACT

This paper reviewed general botanical description of black pepper (Piper nigrum L.) cultivars by previous botanists, based on uniqueness of Malaysian black pepper cultivars characteristics. Ten important cultivars have been verified, i.e. cv. ‘Semongok Aman’, cv. ‘Kuching’, cv. ‘Semongok Emas’, cv. ‘Semongok Perak’, cv. ‘Semongok 1’, cv. ‘Nyerigai’, cv. ‘India’, cv. ‘Lampung Daun Lebar’, cv. ‘Sarikei’, and cv. ‘Yong Petai’. The qualitative and quantitative traits distinctness for each cultivar has been highlighted to assist cultivar identification. Vouchers (dried specimens) for the ten cultivars have also been prepared and deposited at herbarium that located at Universiti Malaysia Sarawak and the duplicates at Malaysian Pepper Board, Kuching. Besides, distribution of each cultivar has also been documented based on information sourced from Malaysian Pepper Board.

Keywords: Black pepper cultivars, botanical description, distribution

INTRODUCTION

The earliest record of description on Piper was in 1678 by Rheede (Rheede, 1678). Linnaeus later included 17 species of Piper in his Species Plantarum (Linnaeus, 1753). Subsequently, the taxonomy of Piper was studied by Roxburgh (1832), Miquel (1848), Wight (1853), Candolle (1869) and Rama Rao (1914) in later years. However, Rahiman et al. (1979), Rahiman (1981), Ravindran et al. (1987), Ravindran et al. (1990), Ravindran (1991), Ravindran et al. (1992), Ravindran and Nirmal Babu (1994), and Ravindran et al. (1997) have more comprehensive study, up to taxonomic key level that enable identification of species.

In Malaysia, the earliest study on Piper taxonomy was by Sim (1979). In the report, she mentioned that the preliminary identification on the collection was based on Ridley’s Floral of the Malay Peninsular (Ridley, 1967). In her study, morphological descriptions were included dioecious and monoecious classification, branching behaviour, leaf, stem, and flower spike. Sim et al. (1996) also studied fruit development of three selected cultivars, cv. ‘Kuching’, cv. ‘Semongok emas’, and cv. ‘Hybrid 10’, while Chen (2011) reported on the floral biology study of P. nigrum, and the apomixis study in 2013, with regard to floral morphology. In 2018, a phenetic analysis on important cultivars in Malaysia has been reported by Chen et al. (2018). The paper enlightened morphological distinctness of each cultivar based on ANOVA test and Principle Component Analysis. Besides, a guideline for the conduct of tests for distinctness, uniformity and stability on black pepper (Piper nigrum L.) has been develop by Sim et al. (2009) but no application to date.

The cultivar of black pepper was believed to derived from wild one through domestication or selection in India (Ravindran et al., 2000). Ravindran et al. (2000) has described 38 cultivars of black pepper with description focused on leaves shape, spike length, percent fruit set, topography suitability, yield performance and etc. The team also listed important cultivars for others countries, like Malaysia (cv. ‘Kuching’, cv. ‘Sarikei’ and cv. ‘Miri’), Indonesia (cv. ‘Bangka’, cv. ‘Banjarmasin’, cv. ‘Belantung’, cv. ‘Beng Kayang’, cv. ‘Chunuk’,
cv. ‘Chunuk Kernuga’, cv. ‘Djambi’, cv. ‘Duantebei’, cv. ‘Kerenci’, cv. ‘Kernuga’, cv. ‘Korintji’, cv. ‘LDK’, cv. ‘LDL’, cv. ‘Palulauta’, cv. ‘Petaling 1’, cv. ‘Petaling 2’, cv. ‘Merefin’, cv. ‘Natar 1’, cv. ‘Natar 2’, cv. ‘LDLN 1’ and cv. ‘LDLN 2’), Sri Lanka (cv. ‘Ceylon’), Madagascar (cv. ‘Sel. IV. 1’ and cv. ‘Sel. IV. 2’) and Thailand (cv. ‘Antique’, cv. ‘Ban Keow’, cv. ‘Prang Thi’ and cv. ‘Prang Thi Bai Vick’). However, these cultivars were only differentiated by yield performance evaluation. The world biggest black pepper producer nowadays, i.e. Vietnam claimed they have five important cultivars called cv. ‘Karimunda’, cv. ‘Panniyur 1’, cv. ‘Belantoeng’, cv. ‘Vinh Linh’ and cv. ‘Tieu Trung’ (Nguyen & Bui, 2011). A manual entitled ‘Pepper production technology in Malaysia’ that was released by Malaysian Pepper Board in 2011, mentioned existence of seven cultivated varieties as common cultivars in Malaysia, including cv. ‘Semongok Aman’, cv. ‘Semongok Emas’, cv. ‘Kuching’, cv. ‘Semongok Perak’, cv. ‘Uthirancotta’, cv. ‘Nyerigai’, and cv. ‘PN129’ (Paulus, 2011). However, Sim (2007) reported the existence of other cultivars, namely cv. ‘Lampung Daun Lebar’ and cv. ‘Lampung Daun Kecil’. In recent phenetic analysis on black pepper cultivar by Chen et al. (2018), ten important cultivars were selected for the study.

Extensive fieldwork was undertaken by the first author since January 2014, to cover all the possible black pepper cultivation areas within Malaysia to come out with a representative botanical description of black pepper cultivar in Malaysia. In this study, description by previous black pepper botanist particularly Ravindran et al. (1997) and Sim (1979) were comprehensively reviewed. Meanwhile, a botanical drawing (Figure 1) and photography documentation (Figure 2) were produced as evidence to the description. Besides, vouchers (dried specimens and spirit material) for the ten cultivars (Figure 3) have also been prepared and deposited at herbarium that located at Universiti Malaysia Sarawak and the duplicates at Malaysia Pepper Board, Kuching.

This paper enlightens general botanical description and diversity of important black pepper cultivars in Malaysia, with key diagnosis for each cultivar. Besides, distributions for each black pepper cultivar were revealed.

**GENERAL BOTANICAL DESCRIPTION OF CULTIVATED BLACK PEPPER**

**Habit** - Woody perennial climber bearing essential oil, with epiphytic ivy-like root emerge from the nodal region of main stem; root adhere to death or living support pole; shoot growing vertically to develop vigorous vine; branching laterally where flowering and fruiting occur.

**Stem** - Nodal stem with internode ranged from 8 cm to 13 cm when mature; old stem rough with filiform cracking bark, young stem with thick cuticle dull dark green; nodes commonly multilacunar, single to multiple branching from node; shoot tip purplish green (anthocyanin present) or whitish green (anthocyanin absent).

**Leaves** - Alternate, petiolate, simple, entire, shape commonly lanceolate-ovate, lanceolate or ovate; size much variable, small to large; base rounded, acute, ovate or oblique; tip commonly obtuse, acute or rounded; leaf margin wavy or even; upper surface dark green to light green, lower surface dull green.

**Inflorescence** - Catkin type, acropetal, length much variable ranged from 6 cm to 13 cm; green, whitish green or light yellow.

**Flower** - Minute, bracteates, naked, bisexual or unisexual, hypogynous, protogynous.

**Perianth** - Absent.

**Androecium** - Stamens 2; anthers dithecous.

**Gynoecium** - Carpels 1; ovary spherical; orthotropous ovule, 1 in each locules; style absent; stigma 2-5 lobed, papillate.

**Fruits** - Drupe; light green when young, dark green at mature, yellow and eventually red on ripening.

**Seeds** - Shape spherical, some slightly pointed at hilum or remains of style region, seed coat with 10-12 whitish thread-like stripes from hilum to remains of style; small, diameter 3-5 mm; embryo minute, near to hilum.

**Floral formula** - P0 A3+3(1-10) G1 or (G) 3,4, superior.

(a) Lateral branch; (b) Terminal stem node; (c) Shoot tip; (d) Inflorescence/early stage of fruit development; (e) Single flower; (f) Mature stage of fruit spike; (g) Cross section of fresh berry; (h) Outer surface of peppercorn (pericarp removed); (i) Cross section of pepper seed
DOCUMENTATION ON MORPHOLOGICAL CHARACTERISTICS OF THE TEN CULTIVARS

Extensive field work that has been conducted managed to verify ten cultivar of black pepper based on morphological uniqueness. The designations of cultivars were confirmed through germplasm of Piper that located at Agricultural Research Center, Semongok Sarawak. The verified cultivars include cv. ‘Semongok Aman’, cv. ‘Kuching’, cv. ‘Semongok Emas’, cv. ‘Semongok Perak’, cv. ‘Semongok 1’, cv. ‘Nyergai’, cv. ‘India’, cv. ‘Lampung Daun Lebar’, cv. ‘Sarikei’, and cv. ‘Yong Petai’. Both qualitative and quantitative traits were included in morphological analysis to enlighten the distinctness and uniqueness of each cultivar. The assessment include leaf part (leaf shape; leaf apex; leaf base; leaf area (cm²); blade width (mm); blade length (mm); blade length-width ratio (Lw⁻¹) and leaf colour), inflorescence part (inflorescence length at stigma withering stage (cm); inflorescence thickness at stigma withering stage (mm); inflorescence colour; number of flower per inflorescence and number of inflorescence per
branch per node), fruit part (fruit spike length (cm); fruit size in diameter (mm); fruit weight (single fresh berry) (g); fruit colour (hard dough stage); percent fruit set (%); conversion rate % (fresh to black pepper); conversion rate % (fresh to white pepper) and pericarp thickness (mm); seed [seed diameter (mm) and seed weight (g)], vigour (branch column type, internode length (cm) and number of node/feet of stem) and shoot tip part (present or absent of anthocyanin colouration).

Table 1 showed result of morphological assessment and key diagnosis for each of the cultivar.

| Cultivars         | Qualitative characteristic                                                                 | Diagnostic characteristics                                                                 |
|-------------------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| ‘Semongok Aman’   | Qualitative characteristic: Leaf shape elliptical; Leaf apex mucronate; Leaf base acute;   | Diagnostic characteristics: Leaf apex mucronate; Percent of fruit set high, ca.71.00%.       |
|                   | Leaf colour- dark yellowish green; Inflorescence colour- strong yellow green; Fruit colour-  |                                                                                           |
|                   | greyish olive green; Branch column type- horizontal; Anthocyanin present at shoot tip.     |                                                                                           |
|                   | Quantitative characteristic: Leaf area 45.40 cm²; Blade width ca.6.36 cm; Blade length     |                                                                                           |
|                   | ca.10.70 cm; Blade length-width ratio, 1.70; Inflorescence length ca.7.84 cm long;          |                                                                                           |
|                   | Inflorescence thickness ca.3.50 mm; Number of flower per inflorescence ca.88.00;           |                                                                                           |
|                   | Number of inflorescence per branch per node ca.12.00; Fruit spike length ca.10.00 cm long;|                                                                                           |
|                   | Fruit size in diameter ca.6.68 mm; Fruit weight (single berry ca.0.20 g; Percent fruit set  |                                                                                           |
|                   | ca.70.68%; Conversion rate (Fresh to dried black) ca.37.35%; Conversion rate (Fresh to    |                                                                                           |
|                   | dried white) ca.30.37%; Pericarp thickness ca.2.00 mm; Seed diameter ca.4.80 mm; Seed      |                                                                                           |
|                   | weight ca.6.11(x10⁻²) g; Internode length ca.11.42 cm; Number of node/feet of stem ca.3.67. |                                                                                           |
|                   | Key diagnosis: Leaf apex mucronate; Percent of fruit set high, ca.71.00%.                   |                                                                                           |
| ‘Kuching’         | Qualitative characteristic: Leaf shape ovate; Leaf apex acute; Leaf base rounded; Leaf     |                                                                                           |

DISTRIBUTION

In Malaysia, 95% of pepper planting areas are in the state of Sarawak, mainly distributed in rural area in Division of Kuching, Serian, Sri Aman, Betong, Sarikei and Sibu (Figure 4 and Table 2) while 5% from Peninsular Malaysia that consist of Johor, Pahang, Negeri Sembilan, Selangor, Terengganu, Kelantan, Perak, Pulau Pinang and Kedah (Figure 5 and Table 2). Pepper cultivation has been initiated in Sabah (Figure 5 and Table 2) however distribution and population is limited. Distribution and population of cultivar ‘Kuching’ and ‘Semongok Emas’ was found most diverse among all the cultivars, made up of estimated 50% and 20% of total planting area, respectively. This is followed by cultivar ‘Semongok Aman’ and ‘India’, with estimated 10% of planting area coverage each, however the distribution restricted to Sarawak only. Cultivar ‘Nyerigai’ was common in Sri Aman and Betong Division, with population estimated 5%, however dissemination of this cultivar is limited. ‘Semongok Perak’, ‘Yong Petai’ and ‘Semongok 1’ were considered rare cultivar, with total planting area estimated less than 5% and distribution only limited to Sarawak region. The least common cultivars were ‘Lampung Daun Lebar’ and ‘Sarikei’, with less than 10 farms reported the existence of this cultivar.

ACKNOWLEDGEMENTS

The authors would like to thank Malaysia Pepper Board and Economic Planning Unit (EPU) of Malaysia for the research grant provided to enable to carry out this project and Universiti Malaysia Sarawak for the facilities provided. Our heartfelt gratitude and appreciation are dedicated to Mr. Kevin Muyang Anak Tawie for assistance in morphological assessment via WinFOLIA image analysis system and to Mr. Wan Ambi and Mr. Juvian Jacob, research assistants of the Malaysian Pepper Board, for their excellent technical assistance in the field.
