Abstract

Background: Hereditary recurrent fevers (HRF) are a group of rare monogenic diseases leading to recurrent inflammatory flares. A large number of variants has been described for the four genes associated with the best known HRF, namely MEFV, NLRP3, MVK, TNFRSF1A. The Infevers database (http://fmf.igh.cnrs.fr/ISSAID/infevers) is a large international registry collecting variants reported in these genes. However, no genotype-phenotype associations are provided, but only the clinical phenotype of the first patient(s) described for each mutation. The aim of this study is to develop a registry of genotype-phenotype associations observed in patients with HRF, enrolled and validated in the Eurofever registry.

Results: Genotype-phenotype associations observed in all the patients with HRF enrolled in the Eurofever registry were retrospectively analyzed. For autosomal dominant diseases (CAPS and TRAPS), all mutations were individually analyzed. For autosomal recessive diseases (FMF and MKD), homozygous and heterozygous combinations were described. Mean age of onset, disease course (recurrent or chronic), mean duration of fever episodes, clinical manifestations associated with fever episodes, atypical manifestations, complications and response to treatment were also studied.

Data observed in 751 patients (346 FMF, 133 CAPS, 114 MKD, 158 TRAPS) included in the Eurofever registry and validated by experts were summarized in Tables. A total of 149 variants were described: 46 TNFRSF1A and 27 NLRP3 variants, as well as various combinations of 48 MVK and 28 MEFV variants were available.

Conclusions: We provide a potentially useful tool for physicians dealing with HRF, namely a registry of genotype-phenotype associations for patients enrolled in the Eurofever registry. This tool is complementary to the Infevers database and will be available at the Eurofever and Infevers websites.

Keywords: Hereditary recurrent fevers, FMF, Caps, Traps, MKD, Infevers, Eurofever, Genotype-phenotype associations
Background
Hereditary recurrent fevers (HRF) are a group of autoinflammatory diseases characterized by recurrent fever episodes of variable duration, associated with elevation of acute phase reactants and a number of systemic inflammatory manifestations, mainly involving skin, joints and serosal surfaces [1]. The best known HRF are Familial Mediterranean Fever (FMF), Cryopyrin-Associated Periodic Syndrome (CAPS), TNF-receptor associated periodic fever syndrome (TRAPS) and Mevalonate-Kinase Deficiency (MKD), caused by mutations in MEFV, NLRP3, TNFRSF1A and MVK genes, respectively.

The large number of common variants or polymorphisms in these genes makes assessment of genotype-phenotype association difficult. Furthermore, the possible extent of clinical manifestations associated with fever in HRF is still largely unknown and atypical symptoms may be present. The Infevers database (available at http://fmf.igh.cnrs.fr/ISSAID/infevers/) collects all the reported variants of these genes [2]. Infevers provides a concise description of the clinical picture of first patient(s) reported for each given mutation, but no further genotype-phenotype association. The Eurofever project, supported by the European Agency for Health and Consumers, aims at increasing the knowledge on autoinflammatory diseases [3]. One of the main purposes of the project was to establish an international registry collecting complete demographic, genetic and clinical data of all monogenic autoimmune inflammatory diseases. The aim of the present study is to develop an open web-based registry of genotype-phenotype associations derived from all the patients with HRF enrolled and validated in the Eurofever registry.

Methods
All patient data were extracted from the Eurofever registry, which has been enrolling patients since November 2009. Independent ethical approval for entering patients in the registry was obtained in the participating countries, in accordance with local requirements. Detailed epidemiological, demographic, molecular and clinical data were collected anonymously. The clinical characteristics included the disease pattern (defined by either recurrent acute episodes, chronic disease or chronic with acute exacerbations), disease manifestations and response to treatment. The Eurofever steering committee has appointed a group of experienced clinicians (SÖ & HÖ for FMF; JF & AS for MKD; HL, MG & PW for TRAPS; BN & JKD for CAPS) for the diagnosis adjudication process. In brief, each adjudication committee had the task to review all anonymized demographic, clinical and genetic information available to confirm/modify/request further information/reject the diagnosis attribution by the enrolling physician. We created a table for each HRF describing the genotype-phenotype associations observed in all the patients enrolled in the Eurofever registry from November 2009 to November 2014 and validated by the experts. The general features of each cohort of patients have been already described in separate papers [4–7]. For autosomal dominant diseases (CAPS and TRAPS), all mutations were reported individually. For autosomal recessive diseases (FMF and MKD), homozygous and all combinations of heterozygous variants were described. As complex alleles could not be excluded, combinations presented do not imply in any case compound heterozygous conditions.

A separate table was devoted to the description of the clinical phenotype of patients with an incomplete genotype, such as heterozygous patients with autosomal recessive diseases or patients carrying low-penetrance mutations or variants/polymorphisms of uncertain pathogenic significance. In particular, according to the recent literature, we considered of unknown significance the p.E148Q and p.P369S variants of the MEFV gene; the p.R202Q and intronic variants, except c.193-14G > A, of the TNFRSF1A gene; the p.V198 M and p.Q703K of the NLRP3 gene. The p.R202Q of the MEFV gene was also included in Table 6, despite this variant is considered a common and neutral polymorphism that should not be even reported [8–14].

Patients with heterozygous mutations of the MVK gene were included in the study only after the demonstration of a reduced mevalonate kinase enzyme activity in leukocytes or fibroblasts, or elevated urinary mevalonic acid excretion [15]. For each variant or genotype, the following items were shown: number of patients, mean age of onset, disease course (recurrent or chronic), mean duration and frequency of fever episodes, prevalent clinical manifestations associated with fever episodes, less common manifestations, complications and response to treatments. Less common manifestations were defined as symptoms present in less than 30% of patients carrying a given genotype.

Treatment response was defined as either complete (absence of clinical manifestations with normalization of inflammatory markers), partial (general amelioration of the clinical picture according to the judgement of the enrolling physician without a complete normalization of the clinical manifestations and/or systemic inflammation), or failure (lack of response according the judgment of the enrolling physician). The distinction between on demand and continuous treatment was also possible.

Results
A total of 751 patients (346 FMF, 114 MKD, 158 TRAPS, 133 CAPS) were enrolled in the analysis
(Table 1). In total, 149 variants of the four genes associated with HRF are reported.

A summary of the main clinical features associated with homozygous or more than one heterozygous variants combinations of 19 MEFV and 47 MVK mutations are described in Tables 2 and 3. Tables 4 and 5 show the main clinical features of patients carrying 44 TNFRSF1A and 25 NLRP3 mutations, respectively. In Table 6, data of 210 patients with an incomplete or not confirmatory genotype are also reported. In case of autosomal recessive diseases, we reported as first mutation the variant nearest to the proximal end of the coding sequence.

Among 346 FMF patients, 238 were collected in the Table 2, 112 of which were homozygous and 126 carried more than one heterozygous variant. Unfortunately, in these cases, as we did not know the phasing of the alleles, no confirmatory genotype could be assessed. The most frequent mutations are p.M694 V (192 patients), p.V726A (48), p.M680I GC (43), and p.E148Q (31). One hundred eight patients were classified as FMF despite an incomplete (heterozygous) or not confirmatory (p.R202Q or variants of unknown significance) genotype. The clinical features of these patients are reported in Table 6.

Forty-six variants were reported in 158 TRAPS patients. Of these, 4 variants are in intronic regions, 18 involved cysteine domains and 3 are deletions. The most frequent mutations are p.T50 M (16 patients) and p.C33Y (12). The clinical characteristics of 62 patients carrying variants of unknown significance, namely p.R92Q (53) and p.P46L (5), or intronic variants (4), except c.193-14G > A, are reported in Table 6.

Among the 133 CAPS patients analyzed, 27 different variants were reported in Table 3. With the exception of the variant p.L1016F, that is located in exon 9, all the other variants are on exon 3. The most frequent variants are p.R260W (32 patients) and p.T348 M (21). The patients carrying variants of unknown significance, namely p.V198 M and p.Q703K, are reported in Table 6.

Finally, 114 MKD patients were reported. Seventeen patients were homozygous and 83 heterozygous for more than one variant, showing 47 different combinations of mutations/deletions (Table 2). The most frequent variants were p.V377I (98 patients) and p.I268T (28). Three deletions are described. The clinical features of 14 patients harbouring one MVK mutation (heterozygous) in combination with an abnormal metabolic test are reported in Table 6.

### Discussion

In the present paper we report the largest collection of data related to genotype-phenotype associations of inherited recurrent fevers. The aim of the present work was to provide clinicians and geneticists, working in the field of autoinflammatory diseases, with a practical tool for the interpretation of the results coming from the genetic analysis and to verify the phenotypes already described with a given genotype.

So far, the Infevers database has been the most commonly used tool for the orientation on the clinical relevance of a given variant detected in HRF genes. Infevers is a registry of all the variants identified in association with Autoinflammatory diseases. At present 1523 variants associated with 30 autoinflammatory diseases are reported. Among them, 317 variants for MEFV, 204 for MVK, 150 for TNFRSF1A and 182 for NLRP3. For each variant a number of input dtais provided (i.e. location, sequence and protein name of Human Genome Variation Society). In addition, a rough description of the clinical phenotype described in the first patient(s) in which a given variant has been identified is also provided. Due to this limitation, Infevers recommends not to use the database as a tool for genotype-phenotype associations.

A number of other web-based instruments provide information concerning the in-silico prediction of the functional impact of each known variant and its frequency in different populations (e.i. https://varsome.com/, http://www.ensembl.org/index.html, ec.). In some cases, references to published data concerning the clinical phenotype can be also retrieved. However, these instruments are mainly targeted to geneticists and are not of immediate use for the clinicians in the everyday clinical practice. With the present work, we would like to provide an easy instrument for the evaluation of the genotype-phenotype associations, possibly related to different variants associated with HRF.

One important caveat is that this data set only includes patients with a verified diagnosis of an inherited fever syndrome. Some of these patients carry known low penetrance variants such as p.E148Q and p.P369S in MEFV; p.R92Q and p.P46L in TNFRSF1A; p.V198 M and p.Q703K in NLRP3. These genetic variants are frequent in the healthy population although they are usually over represented in patients referred for

### Table 1: Demographic characteristics of the patients

| Disease | Fmf | Mkd | Traps | Caps |
|---------|-----|-----|-------|------|
| N° of patients | 346 | 114 | 158 | 133 |
| N° of countries | 28 | 12 | 18 | 16 |
| N° of variants | 28 | 48 | 46 | 27 |
| N° of variants of unknown significance | 2 | - | 5 | 2 |
| N° of combinations | 33 | 50 | - | - |
| - Heterozygous | 26 | 46 | - | - |
| - Homozygous | 7 | 4 | - | - |
| Age at onset (years: median, range) | 3 (0–67) | 0.5 (0–11) | 4.3 (0–63) | 0.8 (0–45) |
| Gene region | First mutation | Second mutation | N° pt | Age at onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------------|-----------------|-------|--------------------------------------|---------------------------------|-------------------------------------------------|------------------------------------------|----------------------------------|-----------------------------|
| Exon 2      | S108R          | V726A           | 1     | 0                                    | Recurrent                        | Fever or low fever episodes of 4 days, 12 episodes/year, with exudative and erythematos pharyngitis, arthralgia, myalgia, enlarged bilateral and painful cervical lymphnodes, periorbital pain and conjunctivitis, vomiting, oligoarthritis, chest pain, headache in the morning or anytime, constipation and abdominal pain. | Vomiting, headache (4), diarhoea, erythematos pharyngitis, aphthous stomatitis (3), monoarthritis, erysipelas-like erythema, costipation, myalgia (2), general or cervical bilateral enlarged lymphnodes, oligoarthritis, maculopapular rash, pseudofolliculitis, oral herpetic-like lesions, myositis, fascitis, tenosynovitis, bone pain, aseptic peritonitis, pleurisy, urethritis/cystitis and hydrocephalus (1). Episodes induced by stress (2), menstruation, fatigue, cold and vaccins (1) | Partial response to steroids. Complete response to colchicine. |
|             |                |                 |       |                                      |                                 |                                                 |                                          |                                  |                             |
| E148Q       | M680 L         |                 | 1     | 6                                    | Recurrent                        | Fever or low fever episodes, 3/year, with erythematos pharyngitis, arthralgia, abdominal pain and headache. |                                          | Complete response to colchicine. |
| M694 V      | 15             | 5 (0–27)        |       | Recurrent                            | Fever episodes of 2–3 days, 13/year, with regular pattern, chills at onset (6), associated with abdominal pain (12), arthralgia (10) and chest pain (5). |                                          |                                           | Partial response to NSAIDs (3). Partial response (5) or complete (6) to colchicine. One patient responded partially to adalimumab. One patient presented complete response to steroids but developed a fulminant hepatitis A and vertebral collapse as side effect. After liver transplantation, he started cyclosporine and micophenolatemofetil with complete response. |
| V726A       | 5              | 3 (2–7)         |       | Recurrent                            | Fever (4) or low fever (2) episodes of 2 days, 21/year, with abdominal pain (4) and arthralgia (2). | Chest pain, hepatomegaly, splenomegaly and macro-papular rash (1). |                                          | Partial response to NSAIDs, steroids, colchicine (2) and cimetidine (1). Complete response(1) or failure (1) with colchicine. |
| A744S       | 4              | 35 (14–51)      |       | Recurrent                            | Low fever (2) or fever (1) of 3–4 days, 9/year, with abdominal pain, arthralgia (3), erysipelas-like erythema, myalgia (2), monoarthritis, conjunctivitis and chest pain (1). |                                          |                                           | Partial response to NSAIDs (2) or steroids (1)on-demand. Complete response to colchicine (2). |
| Gene region | First mutation | Second mutation | N° pt | Age at onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------------|-----------------|-------|------------------------------------|-----------------------------|-----------------------------------------------|-----------------------------------------------|---------------------------------|-------------------------------|
| R761H       | 4              | 5 (1–16)        | Recurrent | Low fever of 3 days, 16/year, induced by exercise (2), with arthralgia (4), chills, myalgia, vomiting, abdominal and chest pain (3), pleurisy and diarrhea (2). | Enlarged cervical lymphonodes, headache in the morning or anytime, polyarthritides and dysmenorrea (1). | Complete response to colchicine (4). |
| E167D       | M694 V         | 1               | 1     | Recurrent | Fever episodes of 2 days, 18/year, induced by infections, with conjunctivitis and abdominal pain. | | Complete response to colchicine. |

Episodes induced by cold (8), stress (3), exercise, food (2), hunger, trauma, travel, infection (1). | Complete (15) or partial (11) response to colchicine. Partial (6) or complete (2) response to NSAIDs. Partial response to steroids, methotrexate (3), sulphasalazine (1). One patient responded completely to allopurinol. | Flexion contractures, osteoporosis (5), bone alteration, spondiloarthropathy, renal amyloidosis (2), bone deformity, atrophy of the muscles of the lower extremities, cataract, cranial neuropathy, macrophage activation syndrome (1). |
| V726A       | 4             | 5              | (1–12) | Recurrent |                          |                              |                              |                              |                             |
| Gene region | First mutation | Second mutation | N° pt | Age at onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------------|-----------------|-------|-------------------------------------|-------------------------------|-----------------------------------------------|---------------------------------|---------------------------------|-------------------------------|
| R761H       | 2              | 17 (4–30)       | Recurrent | Fever episodes of 2–3 days, 9/year, with chest pain (2), pleurisy, arthralgia, myalgia, abdominal pain (1). | Arthralgia, oligaartthritis, vomiting, constipation, gastrointestinal ulcers, aseptic peritonitis, pleuritis, pneumonia, headache, urethritis/cistitis (1). | Complete (3) response to colchicine, that failed in one patient. Partial response to NSAIDs (1). Complete response to steroids (1) or anakinra (1). | Fever episodes of 6 days, 10/year, with regular pattern and chills at fever onset, associated with arthralgia, oligaartthritis, vomiting and diarrhea, abdominal pain. |
| M680 L      | M680 L         | 1,5             | Recurrent | Fever episodes of 6 days, 10/year, with regular pattern and chills at fever onset, associated with arthralgia, oligaartthritis, vomiting and diarrhea, abdominal pain. | | | Partial response to NSAIDs; complete response to tocolchicine as maintenance therapy. Bilateral sacro-iliac joints steroid injection and tonsillectomy. |
| K692del     | M694 V         | 1, 2            | Recurrent | Fever or low fever episodes of 2 days, 18/year, with abdominal pain. | | | Complete response to colchicine as maintenance therapy. |
| M694I       | M694I          | 4               | Recurrent | Fever episodes of 8 days, 9/year, with vomiting and costipations, arthralgia, chest pain (2) and abdominal pain (4). | | | Partial response to NSAIDs (1) or colchicine (2). One patient with complete response to colchicine (1). |
| M694 V      | M694 V         | 6               | Recurrent | Fever episodes of 2–3 days, 18/year, with abdominal pain, arthralgia (5), chest pain (4), myalgia, headache (3) and vomiting, diarrhea, pleurisy (2). | | | Only two patients respond completely to colchicines maintenance therapy. Response to NSAIDs partial (1) or failed (1). Steroids failed (1). One patient responds completely to anakinra, with urticarial rash at start, disappeared. |
| M694 V      | M694 V         | 96              | Recurrent | Fever episodes of 2 days, 14/year, with abdominal pain (86), arthralgia (79), myalgia (57), chest pain (52), oligaartthritis (34), vomiting (32), chills at fever onset and diarrhea (30). | | | Response to NSAIDs partial (27), complete (8) or failed (4). Response to steroids partial (7), complete (4) or failed (6). Response to colchicine partial (38), complete (38) or failed (3). Response to sulphasalazine |

### Table 3: Genotype-phenotype associations in patients with MKD (Continued)

| Gene region | First mutation | Second mutation | N° pt | Age of onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------------|-----------------|-------|---------------------------------------|-------------------------------|-----------------------------------|------------------------------------------|---------------------------------|-------------------------------|
| W188*       | V337I          | 1 0.5           | Recurrent | Fever episodes of 6 days, 24/year with vomiting, abdominal pain, diarrhea, cervical painful lymphadenopathy and occasional maculo-papular rash, erythematous pharyngitis, arthritis, myalgia. Persistence of fatigue and malaise. Since about 12 years of age just gastrointestinal symptoms during attacks. | Partial response to NSAIDs or steroids on demand. Partial response to tonsillectomy. |
| Exon 6      |                |                 |        |                                       |                               |                                   |                                          |                                 |
| Q190fs      | V377I          | 1 11            | Recurrent | Fever episodes, 13/year, with lymphadenopathy, vomiting, abdominal pain, erythematous pharyngitis and occasional aphthous stomatitis and arthritis. | Partial response to NSAIDs on-demand. Partial response to colchicine as maintenance therapy. |
| V203fs      | V377I          | 2 0.3           | Recurrent | Fever episodes of 3 days, 16/year, with urticarial rash, arthritis, myalgia, abdominal pain, malaise and occasional lymphadenopathy (2), diarrhea, aphthous stomatitis, exudative and erythematous pharyngitis, maculo-papular or migratory rash, fatigue, mood disorders, palpable purpura, pleurisy, pneumonia, hepatomegaly, splenomegaly (1). Moreover presence of occasional conjunctivitis, vomiting, diarrhea, persistent cough and headache with or without fever (1). | Partial response (1) or failure (1) to NSAIDs and partial to steroids (2) or colchicine (1) on-demand. Cyclosporine and statins (1) failed as maintenance therapy. Cataract, cerebral nerve palsy and mental retardation (1). |
| V203A       | I268T          | 1 At birth and recurrent | Continuous and recurrent | Fever episodes of 7 days, 12/year, with aphthous stomatitis, erythematous rash, erysipelas, arthritis, diarrhea, generalized and painful lymphadenopathy, | Partial response to NSAIDs or steroids on demand. Partial response to steroid as maintenance therapy. |
|             |                |                 |        |                                       |                               |                                   |                                          |                                 | Peritoneal adhesions. |
| Gene region | First mutation | Second mutation | N° pt | Age of onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------------|-----------------|-------|-------------------------------------|--------------------------------|-------------------------------------------------|-------------------------------------|-----------------------------|-----------------------------|
| N205D       | V312A          | 1               | At birth | Recurrent                           | Fever episodes of 5 days, 6/year, triggered by stress, with erythematous pharyngitis, arthralgia, myalgia, abdominal pain and sometimes aphthous stomatitis, ulcers at genitalia, vomiting, diarrhea, generalized lymphadenopathy, fatigue and malaise. Headache and conjunctivitis with our without fever. | Partial response to NSAIDs on-demand. Steroids failed. |
| Exon 7      | G211E          | V337I           | 1 0.7  | Recurrent                           | Fever episodes of 6 days, 14/year, with palpable purpura. Occasional maculo-papular or urticarial or vasculitic rash, abdominal pain, vomiting, diarrhea, enlarged and painful lymphadenopathy, aphthous stomatitis, arthralgia, myalgia, fatigue and malaise with or without fever. | Periorbital edema. Complete response to NSAIDs or steroids on-demand. Azathioprine failed. |
| R215Q       | V377I          | 3               | At birth | Recurrent                           | Fever episodes of 6 days, 12/year, with abdominal pain, diarrhea, enlarged lymphadenopathy (3), headache, erythematous pharyngitis, painful lymphadenopathy, vomiting, arthralgia (2), maculo-papular rash, splenomegaly, pneumonia, urticarial rash, myalgia, fatigue, malaise (1). | Aphthous stomatitis and gastrointestinal ulcers during fever episodes (1). | Partial response to NSAIDs (2) on-demand. Complete (1) or partial (1) response to steroids. Partial response to rilonacept (1) as maintenance therapy. No response to tonsillectomy (1). |
| c.632-1G > C| V377I          | 1 2             | Recurrent | Fever episodes of 5 days, 14/year, with aphthous stomatitis, pseudofolliculitis, ulcers at genitalia, arthralgia, myalgia, anterior uveitis, episcleritis, vomiting, diarrhea, abdominal pain, painful cervical lymphadenopathy, splenomegaly, fatigue, malaise and mood disorders. | | | On-demand NSAIDs or steroids failed. Partial response to anakinra and etanercept as maintenance therapy. Macrophage activation syndrome. |
| Exon 8      | P228P          | V377I           | 1 2   | Recurrent                           | Fever episodes of 6 days, 7/year, sometimes with enlarged cervical lymphadenopathy, abdominal pain, diarrhea, urticarial rash, fatigue and headache, | | | Partial response to etanercept as maintenance therapy. Renal failure. |

Failure with colchicine as maintenance. Tonsillectomy partially effective. |                               |
| Exon 2      | D12E     | 3     | 31 (12–33)                          | Recurrent      | Fever or low fever episodes of 5–15 days, 10/year, with arthralgia, myalgia, conjunctivitis and chest pain with pleurisy. One patient with a mutation in the MEFV gene presented pericarditis. |               | Partial response to NSAIDs on demand (1). Partial response (1) or deterioration (1) with colchicine. Complete response to steroids, except the patient with a MEFV mutation that responded partially. Complete response to etanercept (1). |                               |
| H22Q        |          | 2     | 0                                   | Continuous and recurrent | Fever episodes of 8 days, 10–16/year, with arthralgia, myalgia, periorbital edema and general malaise. Chronic weight loss. |               | Partial response to steroids on-demand. Colchicine failed. Complete response to anakinra as maintenance therapy (2). |                               |
| H22R        |          | 3     | 6 (1–8)                             | Recurrent      | Fever episodes of 12 days, 10/year, with urticarial rash, myalgia, and conjunctivitis. |               | Complete response to steroids on-demand. Complete response to anakinra as maintenance therapy. |                               |
| C29F        |          | 1     | 10                                  | Recurrent      | Fever episodes of 7 days, 3/year, induced by stress and fatigue, with urticarial rash, arthralgia and myalgia. |               | NSAIDs failed. |                               |
| C29Y        |          | 1     | 0                                   | Recurrent      | Febrile episodes of 10 days, 4/year, with chills at the onset, erythematous pharyngitis and painful bilateral cervical lymphadenopathy. |               | NSAIDs failed. Partial response to steroids on-demand. Complete response to canakinumab and anakinra. |                               |
| C30F        |          | 1     | 36                                  | Recurrent      | Fever episodes of 8 days > 24/year, with aphthous stomatitis, myalgia, abdominal pain and mono/oligo/polyarthritis. |               | Partial response to maintenance with Colchicine. |                               |
| C30R        |          | 4     | 1 (0–1)                             | Recurrent      | Febrile episodes regions of 2–20 days, 1–4/year, sometimes induced by infections, with abdominal pain (4), arthralgia, myalgia, diarrhea and maculo-papular rash(3). |               | Partial response to steroids (3), colchicine (2) or etanercept (3). Complete response to anakinra (1) or steroids (1). |                               |
| C30Y        |          | 1     | 2                                   | Continuous and recurrent | Low grade fever with fatigue, malaise and weight loss. Fever episodes of 10–15 days, 6/year, induced by stress and travel, with chills at the onset, with maculo-papular rash, arthralgia, myalgia, oligoarthritis and abdominal pain. |               | Partial response to steroids. Failure with colchicine as maintenance therapy. |                               |
| Gene region | Mutation | N° pt | Age at onset (years; average, range) | Disease course | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-------------------------------------|----------------|--------------------------------------------------|---------------------------------------------|-----------------------------------|-------------------------------|
| C33G        | 1        | 1     | Recurrent                           |                | Episodes of arthralgia, myalgia, periorbital edema and pain, abdominal pain, and fever episodes of 16–20 days, 4/year, with regular frequency. | A patient with two mutations in the MEFV gene: E148Q and M694 V. | Partial response to colchicine and complete response to steroids as maintenance therapy. | Renal amyloidosis after 40 years of age (3). Fatal sepsis and renal failure at the age of 60 years (1). |
| C33Y        | 12       | 7     | Recurrent                           | Fever episodes of 7 days, from 2 to more than 24 episodes/year, with myalgia (9) and abdominal pain (10). In 50–30% were also present urticarial rash (6), chest pain, conjunctivitis and weight loss (4). | Partial response to steroids on-demand (6), failed in one patient. Partial response to thalidomide on-demand (1). Partial responses (2) or failure (2) to NSAIDs. Partial response (4) or complete (1) to etanercept. Complete response to anakinra as maintenance therapy (2). | Partial response to colchicine on-demand (6), failed in one patient. Partial response to thalidomide on-demand (1). Partial responses (2) or failure (2) to NSAIDs. Partial response (4) or complete (1) to etanercept. Complete response to anakinra as maintenance therapy (2). | Renal amyloidosis after 40 years of age (3). Fatal sepsis and renal failure at the age of 60 years (1). |
| Exon 3      | T37I     | 2     | Recurrent                           | Fever episodes of 5 days, 10/year, with maculopapular or urticarial rash, arthralgia, myalgia, abdominal pain, chest pain with pericarditis, pleurisy, pneumonia and persistent cough. | Complete response to steroid (1). Complete response to anakinra (1) with compliance problems. Initial response to Etanercept then failed (2). Partial response with NSAIDs (1) or colchicine (1). | Patient with V198 M mutation in the NALP3 gene. | Complete response to steroid (1). Complete response to anakinra (1) with compliance problems. Initial response to Etanercept then failed (2). Partial response with NSAIDs (1) or colchicine (1). | Persistence of elevated serum amyloid type A (2). Renal amyloidosis at the age of 28 years (1). |
| Y38S        | 1        | 0     | Continuous and recurrent            | Fever episodes of >20 days, 3/year, with chills at the onset, induced by fatigue, infections, stress and traveling, with maculopapular or migratory rash, arthralgia, myalgia, periorbital edema with conjunctivitis and diarrhea. Chronic low fever with fatigue, malaise and weight loss. | Patient with V198 M mutation in the NALP3 gene. | Partial response to steroids on-demand. Complete response to Anakinra as maintenance therapy. | Renal amyloidosis at the age of 76 years. |
| L39F        | 1        | 6     | Recurrent                           | Fever episodes, 12/year, with arthralgia, myalgia, polyarthitis, abdominal pain with aseptic peritonitis. | Colchicine failed. | | | |
| D42del      | 4        | 5     | Continuous and recurrent            | Fever episodes of 15 days, 10/year, with abdominal pain (5). In 50–30% of patients fever episodes with chills at the onset, maculopapular or migratory or urticarial rash, arthralgia, pleuritis with chest pain, headache and periorbital edema, malaise, fatigue and chronic weight loss (2). | Partial response to NSAIDs on-demand (1). Colchicine failed (3). Complete response to Anakinra as maintenance therapy (2). Partial response to steroids, azathioprine or Etanercept (1). | Partial response to NSAIDs or steroids on-demand. Methotrexate and colchicine failed. Complete response to Canakinumab. | Renal amyloidosis after the age of 40 years (3). Fatal renal failure (1). |
| C43G        | 1        | 2     | Recurrent                           | Fever episodes of >20 days, 1/year, with chills at the onset, sometimes induced by exercise, with myalgia, myositis, fasciitis, oligoarthritis, periorbital edema, abdominal pain with aseptic peritonitis, Seizures. | Partial response to NSAIDs or steroids on-demand. Methotrexate and colchicine failed. Complete response to Canakinumab. | | Laparotomy for peritoneal adhesions at the age of 12 years. |
| Gene region | Mutation | N° pt | Age at onset (years; average, range) | Disease course | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-------------------------------------|---------------|---------------------------------------------------|---------------------------------------------|---------------------------------|-----------------------------|
| C43R        | C43R     | 3     | 1 (0–1)                             | Recurrent     | Fever episodes of 10 days, 2/year, with chills at the onset, induced by stress, infections, fatigue, exercise, with arthralgia, myalgia, painful periorbital edema and conjunctivitis, abdominal pain, constipation and chest pain. Painful bilateral cervical lymphadenopathy, scrotal pain and maculo-papular rash. | Ptosis, perianal ulcers (1). Chronic disease course with low grade fever, fatigue, malaise, mood disorders and weight loss (1). Cataract and visual changes at the age of 31. | Partial response to NSAIDs or steroids on-demand. Complete response to Anakinra. | Renal amyloidosis (1). |
| C43S        | C43S     | 1     | 1                                   | Recurrent     | Febrile episodes of 20 days, 4/year, sometimes induced by infections, with urticarial rash, migratory rash, arthralgia, myalgia, abdominal and chest pain. | | | | |
| C43Y        | C43Y     | 1     | 4                                   | Recurrent     | Episodes of maculo-papular or migratory rash, arthralgia, myalgia, abdominal pain with constipation, sometimes fever of 8 days, 3/year with aseptic peritonitis. | | | | |
| T50 K       | T50 K    | 2     | 2 (Continuous and recurrent)        | Fever episodes of 10 days, 4 or >24/year, with arthralgia and myalgia. Chronic low grade fever, fatigue and malaise. | | | | |
| T50 M       | T50 M    | 16    | 6 (0–41)                            | Recurrent     | Fever episodes of 10 days, 5/year, with myalgia (12), arthralgia (11), abdominal pain (11). 50–30% of patients presented bilateral cervical lymphadenopathy (7) and chest pain (6). | Chronic fatigue and malaise (1). | Partial response to steroids or NSAIDs on-demand (5). NSAIDs failed (2). Complete response to steroids (3). Complete response to anakinra (3) or canakinumab (1) as maintenance therapy. Complete (2) or partial (2) response to etanercept. Tonsillectomy failed (2). | Renal amyloidosis at the age of 35 years. Renal amyloidosis at the age of 41 years. Renal failure at the age of 52 years. |
| C52Y        | C52Y     | 5     | 3 (0–11)                            | Recurrent     | Fever episodes of 11 days, 7/year, with painful periorbital edema with conjunctivitis (4), arthralgia, myalgia and abdominal pain (3). Two patients presented chills at the onset and constipation. | NSAIDs fail (1). Partial (2) or complete (1) response to steroids as maintenance therapy. Complete response to anakinra (2) or canakinumab (1) as maintenance therapy. Colchicine (3) and methotrexate (1) failed as maintenance therapy. | Renal amyloidosis with organ failure after 33 years (2). In a patient paroxysmal atrial fibrillation at age 45. |
| Gene region | Mutation | N° pt | Age at onset (years; average, range) | Disease course | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |

| Exon 4      | C88Y     | 1     | 7                                 | Recurrent      | Fever episodes, 2/year, with chills at the onset and abdominal pain. | | | |
|             | R92P     | 1     | 19                                | Recurrent      | Fever episodes of >20 days with arthralgia, myalgia, abdominal pain with constipation, and chest pain with pleurisy. | Abscesses in the groin, armpits, vulva and back after the age of 50 years. | | Renal amyloidosis. |
| V95 M       | 2        | 31 (30–32) | Recurrent | Fever episodes of 11 days, 6/year. A patient presented aphthous stomatitis, maculo-papular rash, arthralgia, myalgia, fasciitis, conjunctivitis and abdominal pain. A patient presented chest pain, peri carditis, pleurisy. | | | |
| C96Y        | 1        | 30    | Recurrent                         | Episodes of conjunctivitis, fever, oligoarthritis and pleurisy. | | | Partial response to colchicine as maintenance therapy. |
|             | Y103_R104del | 1     | 25                                | Recurrent      | Fever episodes of 7 days, 4/year, with chest pain and pericarditis. | | | Partial response to NSAIDs, steroids or colchicine. Complete response to etanercept. |
| E109A       | 2        | 42 e | Recurrent                         | The patient with the pediatric onset presented fever episodes of 3 days, 17/year, with erythematous pharyngitis, cervical lymphadenopathy and periorbital edema. The patient with the adult onset presented headache and myalgia associated with fever episodes induced by stress. | | | The patient with pediatric onset presented partial response to colchicineas maintenance therapy. |
| C114W       | 1        | 38    | Recurrent                         | Fever episodes of 8 days, 4/year, induced by menstruation, with erythematous or exudative pharyngitis, vomiting, abdominal pain and constipation. | The patient presented the E148Q and P369S mutations in the MEFV gene. | | |
| N116S       | 1        | 21    | Recurrent                         | Prevalent clinical manifestations | | | Partial response to NSAIDs on-demand. |

*Table 4 Genotype-phenotype associations in patients with TRAPS (Continued)*
| Gene region | Mutation | N° pt | Age at onset (years; average, range) | Disease course | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-------------------------------------|----------------|------------------------------------------------|------------------------------------------|-----------------------------------|-----------------------------|
| Exon 6      | L167_G175del 1 | 6     | Recurrent                           | Fever episodes of 5 days, 3/year, induced by stress, arthralgia, myalgia, abdominal pain and diarrhea. | | | Complete response to steroids on-demand. Partial response to anakinra as maintenance therapy. | Renal amyloidosis at the age of 18 years. Renal transplantation at the age of 24 years with an increased number of the fever episodes. |
| Gene region | Mutation | N° pz | Age of onset (years; average, range) | Disease course (n. of patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-------------------------------------|---------------------------------|-----------------------------------------------------|------------------------------------------|------------------------------------|-------------------------------|
| Exon 3      | R260L    | 1     | 8 m                                 | Continuous (n. of patients)     | Presence of persistent urticarial rash, arthralgia, monoarthritis and morning headache. Occasional fever episodes associated with fatigue. | Sometimes presence of abdominal pain. | Colchicina failed. Complete response to anakinra as maintenance therapy. | Hearing loss.                  |
|             | R260W    | 32    | 2 (0–24)                            | Continuous (12)                 | Presence of persistent urticarial rash (12), associated with arthralgia (7), myalgia (5), conjunctivitis (7), malaise and fatigue (4) and headache (4). Sometimes presence of fever (4). | Occasional episodes of maculo-papular rash, arthritis (2), aphthous stomatitis, scleritis, papiledema and abdominal pain, conjunctivitis, pleurisy (1). | Partial response to NSAIDson-demand (2) and NSAIDs (1) or steroids (2) as maintenance therapy. Complete (6) or partial (4) response to anakinra or complete (4) or partial (1) response to canakinumab as maintenance therapy. | Clubbing (1), amyloidosis (1), hearing loss (2), infertility (1). |
| Recurrent   | (16)     |       |                                      | Continuous (1)                 | Fever episodes of variable length (from 12 h to 5 days), 2 to more than 24/year, characterized by urticarial rash, conjunctivitis (16), arthralgia (14), myalgia (12), headache, fatigue (11), arthritis (8), malaise and livedo reticularis (5). | Occasional papilledema (2), aphthous stomatitis, feet oedema, acanthosis nigricans, bone pain, periorbital oedema, lymphadenopathy, seizures and cystitis/urethritis (1). | Complete (2) or partial (1) response to NSAIDson-demand and partial (2) or failure (1) as maintenance therapy. Partial response to colchicine (2). Cyclophosphamide and cyclosporine failed (1). Complete (2) or partial (1) response to anakinra. Complete response to canakinumab (11). | Clubbing (4) and amyloidosis (2), Hearing loss (5), Infertility (5), Delay in language acquisition (1), facial nerve palsy (1), stammering (1), delayed puberty (1). |
| Continuous  | and recurrent (4) | |                                      |                                | Presence of persistent urticarial rash, associated with episodes of fever with arthralgia (4), livedo reticularis, myalgia, conjunctivitis and headache (3). | Xerophthalmia (2), papilledema, aseptic meningitis (1), telangectasia (1). | NSAIDs (2), steroids (1) and colchicine (1) failed. Complete (1) or partial (1) response to anakinra. Complete response to canakinumab (3) as maintenance therapy. | Clubbing (3), hearing loss (3), cerebellar syndrome with white matter lesions (1), arterial hypertension (1), infertility (1). |
| D303N       | 5        | 1 (0–2) | Continuous (1)                      |                                | Presence of constant fever associated with fatigue, urticarial rash, monoarthritis, tenosynovitis and sometimes presence of hyperpyrexia, malaise, mood alterations, aphthous stomatitis, arthralgia, oligoarthritis, conjunctivitis and papilledema. | Occasional episodes of anterior uveitis with or without fever. | Partial response to NSAIDson-demand. Partial response to methotrexate, etanercept or adalimumab as maintenance therapy, but worsening of the uveitis. Complete response to anakinra. | Severe impaired vision. |
Table 5  Genotype-phenotype associations in patients with CAPS (Continued)

| Gene region | Mutation | Age of onset (years; average, range) | Disease course (n. patients) | Prevalent clinical manifestations (n. of patients) | Less common manifestations (n. of patients) | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|--------------------------------------|-------------------------------|----------------------------------------------------|-------------------------------------------|-----------------------------------|-----------------------------|
|             |          |                                      |                               | Fever episodes of 8 days. Chronic papilledema (1) and sometimes urticarial (3) and maculo-papular (2) rash, arthralgia (3), oligoarthritis (2), generalized lymphadenopathy (2), headache (2) and aseptic meningitis (2). | Occasional episodes of pseudo folliculitis, bone pain, vaginitis, abdominal pain and diarrhoeas (1) with or without fever. | Partial response to NSAIDS and steroids on-demand (1). Complete response to anakinra (2) as maintenance therapy. Complete (1) and partial (1) response to canakinumab. | Bone alterations and frontal bossing (1), development of hydrocephalus (1) and hearing loss (2). |
|             |          |                                      |                               | Continuous and recurrent fever episodes of 12–24 h, associated with occasional arthralgia. Moreover, constant presence of urticarial rash and sometimes of fatigue, erythematous pharyngitis, oligoarthritis, conjunctivitis, keratitis, headache, aseptic meningitis and papilledema with or without fever. | Recurrent fever episodes of variable length, 3/year. Occasional presence of urticarial rash, arthralgia, oligoarthritis, papilledema and headache, with or without fever. | Partial response to NSAIDS on-demand. Complete response to anakinra as maintenance therapy. | Hearing loss. |
| G307 V      | 2        | 6 m                                  | Continuous                    | Persistence of urticarial rash, arthralgia, myalgia, bone pain, arthritis, papilledema, headache, aseptic meningitis. | Episodes of palpable purpura with or without fever. | NSAIDs or steroids failed. Complete response to anakinra or canakinumab. | Patellar overgrowth and hypertrophy of tibia metaphysis. |
| E311K       | 9        | 3 (0–5)                              | Continuous and recurrent      | Occasional presence of urticarial rash (4), aphthous stomatitis (3), arthralgia (4), myalgia (1), bone pain (1), monoarthritis (2), oligoarthritis (1), conjunctivitis (4), headache (3) and fatigue (2). | No fever episodes. Presence of persistent arthralgia (4) and occasional urticarial rash (2), headache (2) and vertigo (1). Persistent (2) and occasional (2) conjunctivitis. | Partial response to anakinra (3). Partial (2) or complete (2) response to canakinumab (2). | Hydrocephalus and ventricular dilatation. |
| I334V       | 1        | At birth                              | Continuous and recurrent      | Fever episodes of 2 days. Presence of occasional urticarial rash, aphthous stomatitis, arthralgia, oligo-polyarthritis, conjunctivitis, malaise, fatigue and mood alterations with or without fever. | Fever episodes of 7 days, associated with urticarial rash, arthritis, uveitis anterior, papilledema, vomiting, headache, aseptic meningitis. | Occasional episodes of thoracic pain and pericarditis (1). | Hearing loss (2). |
|             |          |                                      |                               | Continuous and recurrent fever episodes of 12–24 h, associated with occasional arthralgia. Moreover, constant presence of urticarial rash and sometimes of fatigue, erythematous pharyngitis, oligoarthritis, conjunctivitis, keratitis, headache, aseptic meningitis and papilledema with or without fever. | Fever episodes of 2 days. Presence of occasional urticarial rash, aphthous stomatitis, arthralgia, oligo-polyarthritis, conjunctivitis, malaise, fatigue and mood alterations with or without fever. | Occasional episodes of thoracic pain and pericarditis (1). | Complete response to steroids (1)on-demand. Complete (3) or partial (1) response to anakinra and partial response to canakinumab (1) as maintenance therapy. | Hearing loss (3). |
|             |          |                                      |                               | Continuous and recurrent fever episodes of 12–24 h, associated with occasional arthralgia. Moreover, constant presence of urticarial rash and sometimes of fatigue, erythematous pharyngitis, oligoarthritis, conjunctivitis, keratitis, headache, aseptic meningitis and papilledema with or without fever. | Fever episodes of 2 days. Presence of occasional urticarial rash, aphthous stomatitis, arthralgia, oligo-polyarthritis, conjunctivitis, malaise, fatigue and mood alterations with or without fever. | Occasional episodes of thoracic pain and pericarditis (1). | Complete response to steroids (1)on-demand. Complete (3) or partial (1) response to anakinra and partial response to canakinumab (1) as maintenance therapy. | Hearing loss (3). |
|             |          |                                      |                               | Continuous and recurrent fever episodes of 12–24 h, associated with occasional arthralgia. Moreover, constant presence of urticarial rash and sometimes of fatigue, erythematous pharyngitis, oligoarthritis, conjunctivitis, keratitis, headache, aseptic meningitis and papilledema with or without fever. | Fever episodes of 2 days. Presence of occasional urticarial rash, aphthous stomatitis, arthralgia, oligo-polyarthritis, conjunctivitis, malaise, fatigue and mood alterations with or without fever. | Occasional episodes of thoracic pain and pericarditis (1). | Complete response to steroids (1)on-demand. Complete (3) or partial (1) response to anakinra and partial response to canakinumab (1) as maintenance therapy. | Hearing loss (3). |
| Gene region | Mutation | N° pz | Age of onset (years; average, range) | Disease course | Prevalent clinical manifestations | Less common manifestations | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-------------------------------------|----------------|----------------------------------|---------------------------|----------------------------------|-------------------------------|
| T348 M      | 21       | Continuous (0–2) | Presence of urticarial rash (11), conjunctivitis (10) and headache (6). Sometimes presence of fever (7). | Occasional presence of aphthous stomatitis (1), maculo-papular rash (3), arthralgia (3), myalgia (2), bone pain (1), arthritis (4), anterior uveitis (1), papilledema (3), abdominal pain and gastrointestinal bleeding (1), lymphadenopathy (1), splenomegaly (1), hepatomegaly (1), aseptic meningitis (3). | Complete (5) or partial (1) response to anakinra and complete response to canakinumab (10). | Hearing loss (8). |
|            |          |       | Recurrent (4) | Episodes with fever (3), urticarial rash (4), aphthous stomatitis (3), maculo-papular rash (2), arthralgia (4), myalgia (1), arthritis (3), conjunctivitis (2), papilledema (3), lymphadenopathy (1), splenomegaly (1), hepatomegaly (1), headache (3), aseptic meningitis (2), fatigue (2), mood alterations (1) and malaise (1). | Presence of occasional livedo reticularis (1). | Partial response to NSAID on-demand and complete response to steroids (1). Complete response to anakinra (3) or canakinumab (2) as maintenance therapy. | Bone alterations and frontal bossing (2), hearing loss (2). |
|            |          |       | Continuous and recurrent (5) | Presence of urticarial rash (5), arthralgia (3), myalgia (4) and headache (3). Some patients present fever (3). | Occasional presence of maculo-papular rash, livedo reticularis, conjunctivitis, episcleritis, papilledema, abdominal pain and vomiting, aseptic meningitis, hypotonia and vertigo (1). | Colchicine (1) failed. Complete response to anakinra (2). Complete (4) or partial (1) response to canakinumab. Adenotonsillectomy failed (1). | Presence of bone alterations (2), frontal bossing (2), clubbing (1), cataract (1), glaucoma (1) and hearing loss (2). |
| P350L      | 21       | Continuous | Persistent urticarial rash, arthralgia, fatigue and weight loss (2). | Aphthous stomatitis, erythematous pharyngitis, acne, erythema nodosum, oligoarthritis, conjunctivitis, headache, uveitis, scleritis, papilledema, abdominal and chest pain with diarrhea (1). | NSAIDs or methotrexate failed (1). Partial response to anakinra (1) as maintenance therapy. | Hearing loss (2), impaired vision (1), delayed puberty and bone age (1). |
| V351 M      | 21       | Continuous and recurrent | Fever episodes of 12–24 h. Persistent urticarial rash, with or without fever, and occasional arthralgia, conjunctivitis, papilledema, vomiting, headache and aseptic meningitis. | | | Partial response to anakinra as maintenance therapy. | Presence of bone alterations and frontal bossing, hearing loss, hydrocephalus and severe mental delay. |
| A352V      | 21       | Continuous and recurrent | Fever episodes of 2 days, 2/year, with fatigue and malaise. Occasional presence of urticarial rash, conjunctivitis and fatigue, with or without fever. | | Complete response to canakinumab as maintenance therapy. | | | |
| Gene region | Mutation | N° pz | Age of onset (years; average, range) | Disease course | Prevalent clinical manifestations | Less common manifestations | Treatment response (n. of patients) | Complications (n. of patients) |
|-------------|----------|-------|-----------------------------------|----------------|---------------------------------|--------------------------|-----------------------------------|---------------------------------|
| H358R       |          | 1     | At birth                          | Continuous and recurrent | Fever episodes of 16–20 days, 8/year. Constant presence of maculo-papular rash, sometimes associated with aphthous stomatitis and aseptic meningitis, with or without fever. | Vomiting and diarrhea without fever. | Complete response to anakinra or canakinumab as maintenance therapy. | Hearing loss and severe mental retardation. |
| K375E       |          | 1     | 9 m                               | Recurrent         | Fever episode of 2 days, >24/year, with urticarial rash, aphthous stomatitis, arthro-myalgia, periorbital oedema, conjunctivitis, headache and fatigue. | Partial response to steroids or anakinra on-demand. Complete response to canakinumab as maintenance therapy. | Bone alterations and frontal bossing. Moderate mental retardation. Delayed puberty. |
| M406I       |          | 1     | 5 m                               | Recurrent         | Fever episode of 3 days, >24/year. Occasional presence of urticarial and maculo-papular rash, erythematous pharyngitis, aphthous stomatitis, arthro-myalgia, papilledema, generalized lymphadenopathy, fatigue, malaise, mood alterations and headache. | Complete response to canakinumab as maintenance therapy. | Bone alterations and frontal bossing. Moderate mental retardation. Delayed puberty. |
| T436A       |          | 1     | At birth                          | Continuous         | Persistent presence of urticarial rash, arthralgia, headache and optic neuritis. Sometimes conjunctivitis. | Partial response to steroids. Complete response to anakinra. | Hearing loss, infertility and bone age delayed. |
| T436I       |          | 1     | At birth                          | Continuous and recurrent | Fever episodes of 12–24 h, >24/year, with fatigue, mood alterations, malaise and occasional urticarial rash, conjunctivitis, periorbital pain and morning headache. Occasional aphthous stomatitis, exudative and erythematous pharyngitis, maculo-papular rash, arthralgia, myalgia, papilledema, headache and persistent polyarthritis, with or without fever. | Severe cutaneous involvement with pathergia. | Partial response to NSAIIDson-demand and to canakinumab as maintenance therapy. | Flexion contractures, cataract, optic neuritis and optic nerve atrophy, band keratopathy and impaired vision. Hearing loss. |
| A439V       | 14       |       | 5 (0–20)                          | Continuous (5)     | Persistent presence of urticarial rash (4), arthralgia (3), myalgia (1), oligoarthritis (1). Sometimes presence of aphthous stomatitis (3), headache (2) and fever (1). Persistent (1) and episodic (2) conjunctivitis. | Presence of xerophthalmia and xerostomia, diarrhea (1). | Complete response to anakinra (4) or canakinumab (1) as maintenance therapy. | Tinnitus (1), renal amyloidosis (1). |
|             |          |       | Recurrent (8)                     |                  | Two patients present persistent fever. Presence of urticarial rash (8), in some patients only with fever, arthralgia (7), myalgia (3), arthritis (3), conjunctivitis (6), fatigue and malaise (3) and headache (5). Fever episodes of 5 days, 12/year. Occasional presence of urticarial and maculo-papular rash, | Presence of anterior uveitis and periorbital pain, episodes of urethritis and frequent episodes of urinary tract infections (1). | Partial (1) or complete (2) response to anakinra as maintenance therapy. Partial (1) or complete (6) response to canakinumab. | Clubbing (2), bone alterations and frontal bossing (1). Diverticulitis (1). |
| Gene region | Mutation | N°pz mutation | Age of onset (years; average, range) | Disease course | Prevalent clinical manifestations | Less common manifestations | Treatment response | Complications |
|-------------|----------|---------------|-------------------------------------|---------------|----------------------------------|---------------------------|-------------------|-------------|
| N477 K      | 1 2      | Recurrent     | Fever episodes of less than 12 h, >24/year. Occasional urticarial rash, arthralgia, papilledema, generalized lymphadenopathy, hepatomegaly, headache, failure, malaise and mood alterations with or without fever. | Occasional thoracic pain without fever. | Complete response to anakinra as maintenance therapy. | Cataract, glaucoma, hearing loss and peripheric polyneuropathy. |                  |
| Y572F       | 1 At birth | Recurrent     | Fever episodes, >24/year, with urticarial rash, mood disorders and weight loss. | Partial response to NSAIDson-demand. Complete response to anakinra as maintenance therapy. | | Flexion contractures, hydrocephalus. |                  |
| F523C       | 1 1      | Continuous and recurrent | Fever episodes of 12–24 h, >24/year, with conjunctivitis, headache, fatigue and malaise. Occasional urticarial rash, arthralgia and myalgia. | Partial response to NSAIDson-demand. Complete response to canakinumab as maintenance therapy. | Frontal bossing and clubbing. | |                  |
| G569R       | 1 m      | Recurrent     | Fever episodes of less than <12 h, >24/year, with malaise and fatigue. Occasional migratory urticarial and maculo-papular rash, arthralgia, conjunctivitis, lymphadenopathy and aseptic meningitis. | Occasional anterior and posterior uveitis. | On-demand NSAIDs failed. Complete response to anakinra as maintenance therapy. | Hydrocephalus and hearing loss. |                  |
| Y570F       | 1 1 m    | Continuous    | Persistent migratory maculo-papular rash, arthralgia, fatigue, malaise, oligoarthritis, conjunctivitis, papilledema, hepatomegaly and splenomegaly. | Occasional episodes of vomiting. | Partial response to NSAIDson-demand. Partial response to steroids, methotrexate, biphosphonates, cimetidine, rhGH, acetazolamide, anakinra and canakinumab as maintenance therapy. | Optic nerve atrophy and impaired vision. Hearing loss and delayed neuromotor development. |                  |
| I572F       | 1 At birth | Continuous and recurrent | Fever episodes of > 20 days. Occasional urticarial rash, arthralgia, oligoarthritis, papilledema, hepatomegaly, splenomegaly and headache. | Occasional seizures with or without fever. | Complete response to anakinra or canakinumab as maintenance therapy. | Bone alterations with frontal bossing, optic nerve atrophy with severe vision impairment, hydrocephalus and hearing loss. Severe mental retardation. Delayed puberty and bone age. |                  |
| E627G       | 1 3 m    | Recurrent     | Occasional urticarial rash, arthralgia, myalgia, abdominal pain, constipation with and without fever. | Complete response to anakinra as maintenance therapy. | | |                  |
| M662 T      | 2 6 m    | Continuous and recurrent | Fever episodes of 5 days, >24 per year, with urticarial rash, aseptic meningitis and | Partial response to NSAIDs or steroids on-demand (1). Partial | Bone alterations and frontal bossing, hearing loss (2). | |                  |
| Gene region | Mutation N° pz | Age of onset (years; average, range) | Disease course | Prevalent clinical manifestations of patients | Less common manifestations | Complications | Treatment response in of patients | Hearing loss |

Complete response to steroids (1). |                                 |                                 |

*pR202Q of the MEFV gene is considered a common and neutral polymorphism that should not be even reported*
investigation of systemic inflammatory symptoms. As these patients enrolled into Eurofever represent only a minority of carriers of these genetics variants, the data presented should not be extrapolated to a description of the phenotype in unselected patients who have undergone genetic testing. Moreover, it should be emphasized that only a limited proportion of the Eurofever patients carrying these low penetrance variants were selected in the process of validation, mainly because their clinical manifestations and response to treatment were consistent with the related disease.

The tables presented here will be available online, with links to the Eurofever (www.printo.it.eurofever) and Infevers websites. Moreover, a continuous updating of the tables will be performed for any new variant associated with patients enrolled in the Eurofever registry.

Conclusions
We provide a potentially useful tool for physicians dealing with HRF, namely a registry of genotype-phenotype associations for patients enrolled in the Eurofever registry. This tool is complementary to the Infevers database and will be available at the Eurofever and Infevers websites.

Abbreviations
CAPS: Cryopyrin-Associated Periodic Syndrome; FMF: Familial Mediterranean Fever; HRF: Hereditary recurrent fever; MKD: Mevalonate-Kinase Deficiency; TRAPS: TNF-receptor associated periodic fever syndrome

Acknowledgements
The Authors would like to thank Dr. E. Mosci and E. Patrone for their precious secretariat assistance.

Funding
The Eurofever registry was sponsored by the Autoinflammatory Diseases’ Working Group of the Paediatric Rheumatology European Society (PReS) and supported by the Executive Agency For Health and Consumers (EAHC, Project No 2007332). Novartis and SOBI have granted unrestricted educational grants.

Availability of data and materials
If you are not a member of the PRINTO network (www.printo.it) and wish to have more information on the Eurofever registry or other initiatives linked to the Eurofever Project, please write to marco.gattorno@gaslini.org (Disease PI: Marco Gattorno) or to printo@gaslini.org (Research Assistant: Eugenia Mosci).

Authors’ contributions
RP, MD: participated in the design of the study, collected the data and drafted the manuscript. HJL, SO, JF, AS, BN, JKD, HO: participated in the design of the study, collected the data and helped to draft the manuscript. RC, SF, MF, MT, JB, LB, MCPP, MCM, ET, WAS, GE, AS, GA: collected the data and helped to draft the manuscript. NR, AM, IC, MG: conceived of the study, and participated in its design and coordination and helped to draft the manuscript. All authors read and approved the final manuscript.

Ethics approval and consent to participate
Independent ethical approval for entering patients in the Eurofever registry and consent for participate was obtained in the participating countries, in accordance with local requirements.

Consent for publication
Independent consent for publication was obtained in the participating countries, in accordance with local requirements.

Competing interests
The authors declare that they have no competing interests.

Publisher’s Note
Springer Nature remains neutral with regard to jurisdictional claims in published maps and institutional affiliations.
