Fusion for AdS/CFT boundary S-matrices

Rafael I. Nepomechie \(^1\) and Rodrigo A. Pimenta \(^1,2\)

Abstract

We propose a fusion formula for AdS/CFT worldsheet boundary S-matrices. We show that, starting from the fundamental \(Y = 0\) boundary S-matrix, this formula correctly reproduces the two-particle bound-state boundary S-matrices.

1 Introduction

The formation of bound states (“fusion”) is a ubiquitous phenomenon in quantum field theory. If the theory is integrable [1], then the factorized bulk S-matrices of the bound-state particles can be determined in terms of the corresponding S-matrices of the fundamental particles [2]. This phenomenon was abstracted in [3, 4] into a general “fusion procedure” for constructing higher-dimensional R-matrices (solutions of the Yang-Baxter equation) starting from a fundamental R-matrix. For boundary S-matrices/K-matrices, i.e. solutions of the boundary Yang-Baxter equation [5, 6, 7], an analogous fusion procedure was formulated in [8, 9, 10].

In order to carry out the fusion procedure [3], the fundamental R-matrix should satisfy a certain technical requirement: namely, it must degenerate into a projection operator for some value(s) of the spectral parameter. Many R-matrices fulfill this requirement; and this fusion procedure has proved to be very useful: it not only generates new solutions of the Yang-Baxter equation, but it also leads to a hierarchy of commuting transfer matrices that can be used to solve the corresponding integrable models (see e.g. [11]).

However, the AdS/CFT worldsheet bulk S-matrix [12, 13], which plays a key role in the understanding of integrability in AdS/CFT [14], does not satisfy this requirement. This apparent failure of the fusion procedure has been quite puzzling, since bound states do form in this model [15, 16], and their bulk S-matrices have been determined [17, 18], albeit by other means.

This puzzle was recently resolved by Beisert, de Leeuw and Nag [19], who showed that one can relax the requirement that the R-matrix degenerates into a projector. In particular, they proposed a new bulk fusion formula, which generates a bound-state AdS/CFT bulk S-matrix [17] from the fundamental one. As a bonus, the resulting fused matrix automatically has the correct dimensions - the additional similarity transformation and subsequent elimination of null rows and columns that are implicit in the original approach [3] are not needed. (A similar fusion formula was proposed for the XXX R-matrix in [20].)

Factorized boundary S-matrices also play an interesting role in AdS/CFT (see e.g. [21, 22]); and AdS/CFT boundary S-matrices for bound states have also been determined [23, 24, 25]. (See also [26, 27, 28, 29, 30, 31] and references therein.) The main purpose of this note is to propose a new fusion formula for boundary S-matrices, which generates two-particle bound-state AdS/CFT boundary S-matrices from the fundamental one.

The outline of this paper is as follows. In Section 2 we briefly review the new bulk fusion procedure formulated in [19]. However, we work with different conventions, which we find more convenient. In Section 3 we present the corresponding boundary fusion formula, whose proof is relegated to an appendix. We then show that, starting from the fundamental $Y = 0$ boundary S-matrix [21], this formula correctly reproduces the bound-state boundary S-matrices found in [24] and [23], respectively. We conclude in Section 4 with a brief discussion of our results.
2 Bulk fusion

We begin by briefly reviewing the new fusion procedure proposed in [19]. We consider an R-matrix \( R(z_1, z_2) \)

\[
R(z_1, z_2) : \quad C^n \otimes C^n \mapsto C^n \otimes C^n,
\]
which is a solution of the (graded) Yang-Baxter equation

\[
R_{12}(z_1, z_2) R_{13}(z_1, z_3) R_{23}(z_2, z_3) = R_{23}(z_2, z_3) R_{13}(z_1, z_3) R_{12}(z_1, z_2),
\]

where \( R_{12}(z_1, z_2) = R(z_1, z_2) \otimes \mathbb{I}_n \), \( R_{13}(z_1, z_3) = \mathcal{P}_{23} R_{12}(z_1, z_3) \mathcal{P}_{23} \), \( R_{23}(z_2, z_3) = \mathcal{P}_{12} R_{13}(z_2, z_3) \mathcal{P}_{12} \), and \( \mathcal{P} \) denotes the (graded) permutation matrix

\[
\mathcal{P} = \sum_{a,b=1}^n (-1)^{e_a e_b} e_{ab} \otimes e_{ba}, \quad (e_{ab})_{ij} = \delta_{a,i} \delta_{b,j},
\]

where \( e_a \in \{0, 1\} \) are the gradings.

We further suppose that a bound state forms for certain rapidities \((z_1, z_2)\); and correspondingly, \( R(z_1, z_2) \) drops in rank to \( m < n^2 \), and admits the following important decomposition [19]

\[
R(z_1, z_2) = \mathcal{E}(z_1, z_2) \mathcal{H}(z_1, z_2) \mathcal{F}(z_1, z_2), \quad \mathcal{F}(z_1, z_2) \mathcal{E}(z_1, z_2) = \mathbb{I}_m,
\]

where the matrices act as follows

\[
\mathcal{E}(z_1, z_2) : \quad C^n \mapsto C^n \otimes C^n, \\
\mathcal{H}(z_1, z_2) : \quad C^m \mapsto C^m, \\
\mathcal{F}(z_1, z_2) : \quad C^n \otimes C^n \mapsto C^m.
\]

Note that \( \mathcal{EF} \) is a projector

\[
[\mathcal{E}(z_1, z_2) \mathcal{F}(z_1, z_2)]^2 = \mathcal{E}(z_1, z_2) \mathcal{F}(z_1, z_2),
\]

hence (2.3) means that \( R(z_1, z_2) \) is “almost” (i.e., up to the factor \( \mathcal{H}(z_1, z_2) \)) a projector. It is evident from the decomposition (2.3) that [19]

\[
R(z_1, z_2) \mathcal{E}(z_1, z_2) = \mathcal{E}(z_1, z_2) \mathcal{H}(z_1, z_2),
\]

\[
\mathcal{F}(z_1, z_2) R(z_1, z_2) = \mathcal{H}(z_1, z_2) \mathcal{F}(z_1, z_2),
\]

\[
R(z_1, z_2) \mathcal{E}(z_1, z_2) \mathcal{F}(z_1, z_2) = R(z_1, z_2).
\]

These “fusion identities” can be used to show that the fused R-matrices [19]

\[
R_{(12)3}(z_1, z_2 | z_3) = \mathcal{F}_{(12)}(z_1, z_2) R_{13}(z_1, z_3) R_{23}(z_2, z_3) \mathcal{E}_{(12)}(z_1, z_2),
\]

\[
R_{1(23)}(z_1 | z_2, z_3) = \mathcal{F}_{(23)}(z_2, z_3) R_{13}(z_1, z_3) R_{12}(z_1, z_2) \mathcal{E}_{(23)}(z_2, z_3),
\]
obey corresponding fused (graded) Yang-Baxter equations. Although these R-matrices are generally not symmetric, they can be made so by a similarity transformation [19]

\[ R'_{(12)3}(z_1, z_2|z_3) = W_{(12)}(z_1, z_2) R_{(12)3}(z_1, z_2|z_3) W_{(12)}^{-1}(z_1, z_2), \]  
\[ R'_{(23)}(z_1|z_2, z_3) = W_{(23)}(z_2, z_3) R_{(23)}(z_1|z_2, z_3) W_{(23)}^{-1}(z_2, z_3), \]

where \( W^T(z_1, z_2) W(z_1, z_2) = \mathcal{H}(z_1, z_2) \).

Complementary operators \( \bar{E} \) and \( \bar{F} \) satisfying [19]

\[ \bar{F}(z_1, z_2) \bar{E}(z_1, z_2) = 0, \quad \bar{F}(z_1, z_2) E(z_1, z_2) = 0, \quad \bar{F}(z_1, z_2) \bar{E}(z_1, z_2) = \mathbb{I}_{n^2 - m}, \]

as well as the completeness relation

\[ E(z_1, z_2) F(z_1, z_2) + \bar{E}(z_1, z_2) \bar{F}(z_1, z_2) = \mathbb{I}_{n^2}, \]

can be used to construct corresponding complementary fused R-matrices

\[ R_{(12)3}(z_1, z_2|z_3) = \bar{F}_{(12)}(z_1, z_2) R_{13}(z_1, z_3) R_{23}(z_2, z_3) \bar{E}_{(12)}(z_1, z_2), \]
\[ R_{(23)}(z_1|z_2, z_3) = \bar{F}_{(23)}(z_2, z_3) R_{13}(z_1, z_3) R_{12}(z_1, z_2) \bar{E}_{(23)}(z_2, z_3). \]

### 2.1 AdS/CFT bulk S-matrix: symmetric representation

Let us now apply this formalism to one copy of the fundamental \( su(2|2) \) AdS/CFT bulk S-matrix. To this end, we set

\[ R(z_1, z_2) = S^{AA}(z_1, z_2) \]

as given by Arutyunov and Frolov in [17], which is reproduced in Appendix A for the reader’s convenience. This S-matrix satisfies the graded Yang-Baxter equation (2.1) with the gradings \( \epsilon_1 = \epsilon_2 = 0, \epsilon_3 = \epsilon_4 = 1. \)

We use an elliptic parametrization for the momentum \( p \) and the parameters \( x^\pm \) for \( M \)-particle bound states [16, 17]

\[ p(z) = 2 \text{am}(z, k), \quad x^\pm(z) = \frac{M}{2g} \left( \frac{\text{cn}(z, k)}{\text{sn}(z, k)} \pm i \right) (1 + \text{dn}(z, k)), \quad k = -\frac{4g^2}{M^2}, \]

such that

\[ \frac{x^+}{x^-} = e^{ip}, \]

and

\[ x^+ + \frac{1}{x^+} - x^- - \frac{1}{x^-} = \frac{2Mi}{g}, \]
where $g > 0$ is the coupling constant. However, we henceforth reserve $p$ and $x^\pm$ for the momentum and parameters of the fundamental particles ($M = 1$), and $P$ and $y^\pm$ for the corresponding quantities of the two-particle bound states ($M = 2$).

Consider a pair of fundamental particles with parameters $x_i^\pm = x^\pm(z_i)$, $i = 1, 2$. These particles form a bound state when \[ \text{15, 16} \]

\[
    x_1^- = x_2^+ . \tag{2.20}
\]

Indeed, adding the two constraint equations (2.19)

\[
x_1^+ + \frac{1}{x_1^+} - x_1^- - \frac{1}{x_1^-} = \frac{2i}{g} ,
\]

\[
x_2^+ + \frac{1}{x_2^+} - x_2^- - \frac{1}{x_2^-} = \frac{2i}{g} , \tag{2.21}
\]

imposing the fusion condition (2.20), and making the identifications

\[
y^+ = x_1^+ , \quad y^- = x_2^- , \tag{2.22}
\]

we arrive at the two-particle bound-state constraint

\[
y^+ + \frac{1}{y^+} - y^- - \frac{1}{y^-} = \frac{4i}{g} , \tag{2.23}
\]

Note that the momentum of the bound state is indeed the sum of the momenta of its constituents, since

\[
e^{ip} = \frac{y^+}{y^-} = \frac{x_1^+}{x_2^-} = \frac{x_1^+}{x_1^-} \frac{x_2^+}{x_2^-} = e^{i(p_1 + p_2)} , \tag{2.24}
\]

where $p_i = p(z_i)$. This bound state lies in the 8-dimensional symmetric representation of $su(2|2)$ [32].

When the fusion condition (2.20) is satisfied, the rank of $R(z_1, z_2)$ drops from 16 to 8. By determining the normalized eigenvectors corresponding to the nonzero eigenvalues, we obtain the decomposition (2.3) with

\[
    \mathcal{E}(z_1, z_2) = \tilde{\mathcal{E}}(z_1, z_2) N^{-1}(z_1, z_2) , \tag{2.25}
\]

\footnote{We also assume [16] that $|x_i^\pm| > 1$ and $(x_1^+)^* = x_2^-$.}
where

\[
\tilde{E}(z_1, z_2) = \begin{pmatrix}
0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & \frac{1}{\sqrt{2}} & 0 & -\frac{1}{\sqrt{2}} a_2 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & a_5 & 0 & 0 \\
0 & 0 & 0 & 0 & a_5 & 0 & 0 & 0 \\
0 & \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} a_2 & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & 0 & 0 & a_5 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_5 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_10 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_10 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_10 & 0 \\
0 & 0 & 0 & -\sqrt{2} a_8 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_10 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & a_10 & 0 \\
0 & 0 & 0 & \sqrt{2} a_8 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0
\end{pmatrix},
\]

(2.26)

and \(N(z_1, z_2)\) is the diagonal matrix

\[
N(z_1, z_2) = \text{diag}(1, 1, 1, n_1, n_2, n_2), \quad n_1 = \sqrt{a_2^2 + 4a_8^2}, \quad n_2 = \sqrt{a_5^2 + a_{10}^2},
\]

(2.27)

where the \(a_k = a_k(z_1, z_2)\) are given by (A.3). Moreover,

\[
\mathcal{F}(z_1, z_2) = \mathcal{E}^T(z_1, z_2) = N^{-1}(z_1, z_2) \tilde{E}^T(z_1, z_2) = N^{-1}(z_1, z_2) \tilde{F}(z_1, z_2),
\]

(2.28)

where we have defined \(\tilde{F}(z_1, z_2) = \tilde{E}^T(z_1, z_2)\). Finally,

\[
\mathcal{H}(z_1, z_2) = \text{diag}(1, 1, 1, h_1, h_2, h_2, h_2), \quad h_1 = a_2 + a_4, \quad h_2 = a_5 + a_6.
\]

(2.29)

Performing the similarity transformation (2.11) with the matrix

\[
W(z_1, z_2) = \begin{pmatrix}
0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & w_1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & w_2 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & w_2 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & w_2 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0
\end{pmatrix}, \quad w_1 = \sqrt{a_2 + a_4}, \quad w_2 = \sqrt{a_5 + a_6}
\]

(2.30)

we obtain

\[
R'_{1(23)}(z_1, z_2, z_3) = U_{(23)}(z_2, z_3) \tilde{F}_{(23)}(z_2, z_3) R_{13}(z_1, z_3) R_{12}(z_2, z_2) \tilde{E}_{(23)}(z_2, z_3) V_{(23)}^{-1}(z_2, z_3)
\]

(2.31)

where we have defined the new matrices \(U\) and \(V\), which evidently have the same matrix structure as \(W\), but have different matrix elements

\[
U(z_1, z_2) = W(z_1, z_2) N^{-1}(z_1, z_2) = W(z_1, z_2)_{w_1 \rightarrow a_4},
\]

\[
V(z_1, z_2) = W(z_1, z_2) N(z_1, z_2) = W(z_1, z_2)_{w_1 \rightarrow a_4},
\]

(2.32)
By explicit computation we obtain the following results for these matrix elements

\[
\begin{align*}
  u_1 &= \frac{w_1}{n_1} = \left[2ig \sin(p_1/2) \sin(p_2/2)\right]^{-1}, \\
  u_2 &= \frac{w_2}{n_2} = e^{-ip_1/2} \frac{\eta(z_{12}, 2)}{\eta(z_2, 1)}, \\
  v_1 &= w_1 n_1 = 8ig \frac{\sin^2(p_1/2) \sin^2(p_2/2)}{\sin^2((p_1 + p_2)/2)} (1 - g^2 \sin(p_1/2) \sin(p_2/2) \sin^2((p_1 + p_2)/2)), \\
  v_2 &= w_2 n_2 = \left[ (1 + e^{-i(p_1+p_2)/2})^{-1} + e^{ip_1} (1 + e^{i(p_1+p_2)/2})^{-1} \right] \frac{\eta(z_2, 1)}{\eta(z_{12}, 2)},
\end{align*}
\]

where \( \eta(z, M) \) is defined in (A.5), and the rapidity \( z_{12} \) is defined such that

\[
y^+(z_{12}) = x^+(z_1), \quad y^-(z_{12}) = x^-(z_2),
\]

as in (2.22). Remarkably, the square roots in \( u_i \) and \( v_i \) (recall the definitions of \( n_i \) and \( w_i \) given in (2.27) and (2.30)) have all disappeared.

Using these results to evaluate (2.31), we have verified numerically that this fused R-matrix coincides with \( S^{AB} \) in [17] \(^2\)

\[
S^{AB}(z_1, z_{23}) = R'_{1(23)}(z_1|z_2, z_3).
\]

A similar result was argued in [19].

### 2.2 AdS/CFT bulk S-matrix: antisymmetric representation

We now proceed to construct the complementary fused S-matrix (2.15), which corresponds to the antisymmetric representation of \( su(2|2) \) [32], which is also 8-dimensional. The required complementary operators \( \mathcal{E} \) and \( \mathcal{F} \) can be obtained by considering the “opposite” fusion condition

\[
x^+_1 = x^-_2.
\]

Since all the \( a_k \) (A.3) except \( a_1 \) have a simple pole at this point, it is convenient to introduce rescaled quantities \( \tilde{a}_k(z_1, z_2) = (x^+_1 - x^-_2) a_k(z_1, z_2) \) and \( \tilde{R}(z_1, z_2) = (x^+_1 - x^-_2) S^{AA}(z_1, z_2) \).

When the fusion condition (2.36) is satisfied, the rank of \( \tilde{R}(z_1, z_2) \) indeed drops from 16 to 8, and we obtain the decomposition

\[
\tilde{R}(z_1, z_2) = \mathcal{E}_A(z_1, z_2) \mathcal{H}_A(z_1, z_2) \mathcal{F}_A(z_1, z_2), \quad \mathcal{F}_A(z_1, z_2) \mathcal{E}_A(z_1, z_2) = I_8,
\]

\(^2\)As noted in [24], there are two typos in the coefficients of \( S^{AB} \) listed in Section 6.1.2 of [17]. In \( a_{13} \), the factor in the numerator \( (x^-_1 - y^-_2) \) should be instead \( (x^-_1 - y^-_2) \); i.e., the \( x^-_1 \) should be changed to \( x^+_1 \). And in \( a_{14} \), the factor in the numerator \( (1 - y^-_2 x^+_1) \) should be instead \((1 - y^-_2 x^+_1)\); i.e., the \( x^-_1 \) should be changed to \( x^+_1 \).
with
\[ \mathcal{E}_A(z_1, z_2) = \hat{\mathcal{E}}_A(z_1, z_2) N^{-1}(z_1, z_2), \] (2.38)
where
\[
\hat{\mathcal{E}}_A(z_1, z_2) = \begin{pmatrix}
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -\frac{1}{\sqrt{2}} a_2 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_5 \\
1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\end{pmatrix}, \] (2.39)
and \( N(z_1, z_2) \) is again given by (2.27). (Note that the singular factors in \( N(z_1, z_2) \) and \( \hat{\mathcal{E}}_A(z_1, z_2) \) are canceled in \( \mathcal{E}_A(z_1, z_2) \).) Moreover, \( \mathcal{F}_A(z_1, z_2) = \mathcal{E}^T_A(z_1, z_2) \), and
\[
\mathcal{H}_A(z_1, z_2) = \text{diag}(\hat{a}_3, \hat{a}_3, \hat{a}_3, \hat{h}_1, \hat{h}_2, \hat{h}_2, \hat{h}_2), \quad \hat{h}_1 = \hat{a}_2 + \hat{a}_4, \quad \hat{h}_2 = \hat{a}_5 + \hat{a}_6. \] (2.40)
Finally, the complementary operators are given by [19]
\[ \mathcal{E}(z_1, z_2) = \mathcal{P} \mathcal{E}_A(z_2, z_1), \quad \mathcal{F}(z_1, z_2) = \mathcal{E}^T(z_1, z_2), \] (2.41)
where it is now understood that \( z_1 \) and \( z_2 \) correspond to the original fusion condition (2.20). These complementary operators, together with the original operators (2.25) and (2.28), satisfy the relations (2.12) and (2.13).

We have verified numerically that the complementary fused R-matrix obtained following (2.15), up to a similarity transformation, is proportional to the complex conjugate of \( S^{AB} \) in [17]
\[ \left[ \frac{S^{AB}(z_1, z_2)}{a_3(z_1, z_2) a_3(z_1, z_3)} \right]^* = R_{1(23)}(z_1|z_2, z_3), \] (2.42)

as expected for the antisymmetric representation [32]. Again, a similar result was obtained in [19].
3 Boundary fusion

We now generalize the above discussion to the case of boundary scattering. Let \( K(z) \)
\[
K(z) : \quad \mathbb{C}^n \mapsto \mathbb{C}^n
\]
be a solution of the boundary Yang-Baxter equation [5, 6, 7]
\[
R_{12}(z_1, z_2) K_1(z_1) R_{21}(z_2, -z_1) K_2(z_2) = K_2(z_2) R_{12}(z_1, -z_2) K_1(z_1) R_{21}(-z_2, -z_1), \tag{3.1}
\]
where \( R_{21}(z_1, z_2) = \mathcal{P}_{12} R_{12}(z_1, z_2) \mathcal{P}_{12} \), \( K_1(z) = K(z) \otimes \mathbb{I}_n \) and \( K_2(z) = \mathcal{P}_{12} K_1(z) \mathcal{P}_{12} \).

We propose that the fused K-matrix is given by (cf. Eq. (3.5) in [9])
\[
K_{(12)}(z_1, z_2) = \mathcal{F}_{(12)}(z_1, z_2) K_1(z_1) R_{21}(z_2, -z_1) K_2(z_2) \mathcal{P}_{12} \mathcal{E}_{(12)}(-z_2, -z_1). \tag{3.2}
\]
Indeed, we show in Appendix B that this object satisfies the fused boundary Yang-Baxter equation
\[
R_{(12)3}(z_1, z_2|z_3) K_{(12)}(z_1, z_2) R_{3(12)}(z_3| -z_2, -z_1) K_3(z_3)
= K_3(z_3) R_{(12)3}(z_1, z_2|z_3 - z_2, -z_1) K_{(12)}(z_1, z_2) R_{3(12)}(-z_3| -z_2, -z_1), \tag{3.3}
\]
where \( R_{(12)3} \) and \( R_{1(23)} \) are given by (2.8) and (2.9), respectively. The boundary fusion formula (3.2) is the main result of this paper. Performing a similarity transformation \( \mathcal{E} \to \mathcal{E} W^{-1}, \mathcal{F} \to W \mathcal{F} \) as in (2.10) and (2.11) gives
\[
K'_{(12)}(z_1, z_2) = W_{(12)}(z_1, z_2) K_{(12)}(z_1, z_2) W_{(12)}^{-1}(z_1, z_2). \tag{3.4}
\]
Using the complementary operators \( \tilde{\mathcal{E}} \) and \( \tilde{\mathcal{F}} \) satisfying (2.12) and (2.13), complementary fused boundary K-matrices can be constructed in a similar manner
\[
\tilde{K}_{(12)}(z_1, z_2) = \tilde{\mathcal{F}}_{(12)}(z_1, z_2) K_1(z_1) R_{21}(z_2, -z_1) K_2(z_2) \mathcal{P}_{12} \tilde{\mathcal{E}}_{(12)}(-z_2, -z_1). \tag{3.5}
\]
The proof of this result is sketched in Appendix B.

3.1 AdS/CFT boundary S-matrix: symmetric representation

Let us illustrate the boundary fusion formula (3.4) with the simplest AdS/CFT boundary S-matrix
\[
K(z) = \text{diag}(e^{-ip/2}, -e^{ip/2}, 1, 1), \tag{3.6}
\]
corresponding to a \( Y = 0 \) brane [21]. Using our previous expressions for \( \mathcal{E} \) and \( \mathcal{F} \) (2.25), (2.28), we obtain (cf. (3.1))
\[
K'_{(12)}(z_1, z_2) = U_{(12)}(z_1, z_2) \mathcal{F}_{(12)}(z_1, z_2) K_1(z_1) R_{21}(z_2, -z_1) K_2(z_2) \mathcal{P}_{12} \tilde{\mathcal{E}}_{(12)}(-z_2, -z_1) T^{-1}_{(12)}(z_1, z_2), \tag{3.7}
\]
where $U$ is defined in (2.32), and $T$ is the following new matrix

$$T(z_1, z_2) = W(z_1, z_2) N(-z_2, -z_1) = W(z_1, z_2)_{w_1 \to t_1},$$

(3.8)

which also has the same matrix structure as $W$, but has different matrix elements. We find that these matrix elements are given by

$$t_1 = w_1(z_1, z_2) n_1(-z_2, -z_1) = v_1,$$

$$t_2 = w_2(z_1, z_2) n_2(-z_2, -z_1) = e^{-\eta_1/2} \eta(z_1, 1) \eta(z_2, 1) v_2,$$

(3.9)

where $v_1$ and $v_2$ are given in (2.33). Using these results to evaluate (3.7), we have verified that this fused K-matrix coincides (up to an overall scalar factor) with the bound-state $\mathcal{Y} = 0$ boundary S-matrix $R^B$ in [24],

$$R^B(z_{12}) = e^{iP/2} \mathcal{K}'(z_1, z_2),$$

(3.10)

where \[ r_1 = 1, \quad r_2 = -\frac{1}{y^+ + y^-}, \quad r_3 = e^{iP}, \quad r_4 = \frac{1}{y^+ + y^-}, \]

\[ r_5 = -r_6 = e^{iP/2} \frac{y^- - y^+}{1 + y^- y^+}, \quad r_7 = -r_8 = e^{iP/2}. \]

(3.11)

While the verification of some of the matrix elements is straightforward (e.g., $r_3$ requires just (2.24), and $r_2$ requires use of (2.20) and (2.21)), those involving $\eta$’s are much more complicated. Nevertheless, by using the expression for $\eta$ in terms of a square root (A.5) and using PowerExpand in Mathematica, we managed to explicitly check all of the matrix elements.

### 3.2 AdS/CFT boundary S-matrix: antisymmetric representation

Computing the complementary fused K-matrix (3.5) using the complementary operators (2.41), as well as the fundamental bulk (2.16) and boundary (3.6) S-matrices, we obtain the diagonal matrix

$$\mathcal{K}_{(12)}(z_1, z_2) = \frac{\cos(p_2/2)}{\cos(p_1/2)} \text{diag}(1, 1, 1, -1, -e^{iP/2}, -e^{-iP/2}, e^{iP/2}, e^{-iP/2}),$$

(3.12)
which satisfies the fused boundary Yang-Baxter equation (3.3) with the complementary fused
R-matrices $\hat{R}_{3\{\overline{12}\}}$ and $\hat{R}_{6\{\overline{12}\}}$. The result (3.12) can be related by a similarity transformation,
up to an overall scalar factor, to the antisymmetric representation $M = 2$ bound-state
boundary S-matrix $R_2$ obtained in [23].

4 Discussion

We have found a fusion formula (3.2) that is applicable to AdS/CFT boundary S-matrices,
many examples of which are now known. We have focused on the $Y = 0$ example only for
simplicity. Although we have used the fusion formula to obtain only the $M = 2$ bound-state
$Y = 0$ boundary S-matrices, we expect that a further generalization (along the lines of [10])
is possible for recovering the higher ($M > 2$) bound-state boundary S-matrices found in [23]
and [25] for antisymmetric and symmetric representations, respectively.

We have noticed that the expressions generated by both the bulk and boundary fusion
formulas are generally very complicated, and require considerable effort to simplify, parti-
cularly in the symmetric representation. It would be interesting to find a more efficient way
of writing the basic elements ($R$, $E$ and $F$) that lead directly to simpler results for the fused
quantities.

A Fundamental bulk S-matrix

The graded bulk S-matrix for a pair of particles in the fundamental (4-dimensional) repre-
sentation is given by [17]

$$S^{AA}(z_1, z_2) = \sum_{k=1}^{10} a_k(z_1, z_2)\Lambda_k,$$

(A.1)

where the $16 \times 16$ matrices $\Lambda_1, \ldots, \Lambda_{10}$ are given in terms of quantities $E_{kilj}$ defined by

$$E_{kilj} = e_{ki} \otimes e_{lj},$$

(A.2)

with indices that run from 1 to 4.
Hence, $S^{AA}(z_1, z_2)$ has the following matrix structure

$$
\begin{pmatrix}
    a_1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
    0 & \frac{a_2}{2} + \frac{a_3}{2} & 0 & 0 & \frac{a_2}{2} - \frac{a_3}{2} & 0 & 0 & 0 & 0 & a_7 \\
    0 & 0 & a_5 & 0 & 0 & 0 & a_9 & 0 & 0 & 0 \\
    0 & 0 & 0 & a_5 & 0 & 0 & 0 & 0 & a_9 & 0 \\
    0 & \frac{a_2}{2} - \frac{a_3}{2} & 0 & 0 & \frac{a_2}{2} + \frac{a_3}{2} & 0 & 0 & 0 & 0 & -a_7 \\
    0 & 0 & 0 & 0 & a_1 & 0 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & a_5 & 0 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & a_5 & 0 & 0 & 0 \\
    0 & 0 & a_{10} & 0 & 0 & 0 & a_6 & 0 & 0 & 0 \\
    0 & a_8 & 0 & 0 & -a_8 & 0 & 0 & 0 & 0 & a_3 \\
    0 & 0 & a_{10} & 0 & 0 & 0 & a_6 & 0 & 0 & 0 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_3 & 0 \\
    0 & -a_8 & 0 & 0 & a_8 & 0 & 0 & 0 & 0 & a_3 \\
    0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & a_3
\end{pmatrix}
$$

and the matrix elements $a_k = a_k(z_1, z_2)$ are given by [17]

\[
\begin{align*}
    a_1 &= 1, \\
    a_2 &= 2 \frac{(x_1^+ - x_2^+)(x_1^+ x_2^- - 1)x_2^-}{(x_1^- - x_2^-)(x_1^- x_2^+ - 1)x_2^+} - 1, \\
    a_3 &= \frac{x_2^+ - x_2^-}{x_2^- - x_1^-} \bar{\eta}_1 \bar{\eta}_2, \\
    a_4 &= \frac{(x_1^+ - x_2^+)(x_1^- x_2^- - 1)x_2^-}{(x_2^- - x_1^-) \eta_1 \eta_2} - 2 \frac{(x_2^- x_1^+ - 1)(x_1^+ - x_2^+)x_2^-}{(x_1^- x_2^- - 1)(x_2^- - x_1^+)} \bar{\eta}_1 \bar{\eta}_2, \\
    a_5 &= \frac{x_2^- - x_1^-}{x_2^- - x_1^+} \bar{\eta}_2, \\
    a_6 &= \frac{x_1^+ - x_2^+}{x_1^+ - x_2^-} \bar{\eta}_1, \\
    a_7 &= -\frac{i(x_1^- - x_1^+)(x_2^- - x_2^+)(x_1^+ - x_2^+)}{(x_1^- x_2^- - 1)(x_2^- - x_1^+)} \frac{1}{\eta_1 \eta_2}, \\
    a_8 &= \frac{ix_1^- x_2^- (x_1^+ - x_2^+)}{(x_1^- x_2^- - 1)(x_2^- - x_1^+)} x_1^+ x_2^- \bar{\eta}_1 \bar{\eta}_2, \\
    a_9 &= \frac{x_1^+ - x_1^- \bar{\eta}_2}{x_1^- - x_2^- \bar{\eta}_1}, \\
    a_{10} &= \frac{x_2^- - x_2^+ \bar{\eta}_1}{x_2^- - x_1^+ \bar{\eta}_2}.
\end{align*}
\]
Moreover,
\[ \eta_1 = e^{ip_2/2}\eta(z_1) , \quad \eta_2 = \eta(z_2) , \quad \bar{\eta}_1 = \eta(z_1) , \quad \bar{\eta}_2 = e^{ip_1/2}\eta(z_2) , \] (A.4)

where \( \eta(z) = \eta(z, 1) \), with
\[
\eta(z, M) = e^{ip/4} \sqrt{i(x^- - x^+)} = \sqrt{\frac{2M \, \text{dn} \frac{z}{2}}{g} \left( \frac{\text{cn} \frac{z}{2}}{2} + i \, \text{sn} \frac{z}{2} \, \text{dn} \frac{z}{2} \right)} \quad \text{(A.5)}
\]

## B Proof of the boundary fusion formulas

We first show here that the fused K-matrix (3.2) satisfies the fused boundary Yang-Baxter equation (3.3). We use here the following shorthand notation,
\[
R_{12}(z_1, z_2) = R_{12} , \quad R_{13}(z_1, z_3) = R_{13} , \quad R_{23}(z_2, z_3) = R_{23} ,
\]
\[
\mathcal{E}_{12}(z_1, z_2) = \mathcal{E}_{12} , \quad \mathcal{F}_{12}(z_1, z_2) = \mathcal{F}_{12} , \quad \mathcal{H}_{12}(z_1, z_2) = \mathcal{H}_{12} ,
\]
and
\[
R_{21}(z_2, -z_1) = R_{21} , \quad R_{31}(z_3, -z_1) = R_{31} , \quad R_{32}(z_3, -z_2) = R_{32} ,
\]
\[
K_1(z_1) = K_1 , \quad K_2(z_2) = K_2 , \quad K_3(z_3) = K_3 .
\]

If the arguments of a given matrix do not fit the above notation we write them explicitly.
\[
\mathcal{H}_{12}(z_1, z_2) R_{12} R_{13} R_{23} \mathcal{E}_{12}(z_1, z_2) R_{31} R_{32} \mathcal{E}_{12}(z_3, -z_2, -z_1) K_3(z_3)
\]
\[
= \underbrace{\mathcal{H}_{12} R_{12} R_{13} R_{23} \mathcal{E}_{12}}_{\text{Eq. (2.6)}} K_3(z_3) R_{32} R_{31} \mathcal{E}_{12}(z_1, z_2, z_3) R_{13} R_{12} \mathcal{E}_{12}(z_3, -z_2, -z_1)
\]
\[
\cdots R_{31}(z_3, -z_2) \mathcal{E}_{12}(z_2, -z_1) K_3
\]
\[
= \underbrace{\mathcal{F}_{12}}_{\text{Eq. (2.1)}} R_{12} R_{13} R_{23} \mathcal{E}_{12} K_1 R_{21} R_{2} P_{12} \mathcal{E}_{12}(z_3, -z_2, -z_1) R_{32}(z_3, -z_1) \cdots
\]
\[
\cdots R_{31}(z_3, -z_2) K_3 \mathcal{E}_{12}(z_2, -z_1)
\]
\[
= \underbrace{\mathcal{F}_{12}}_{\text{Eq. (2.7)}} R_{23} R_{13} R_{12} \mathcal{E}_{12} K_1 R_{21} R_{2} P_{12} \mathcal{E}_{12}(z_3, -z_2, -z_1) R_{32}(z_3, -z_1) \cdots
\]
\[
\cdots R_{31}(z_3, -z_2) K_3 \mathcal{E}_{12}(z_2, -z_1)
\]
\[
= \underbrace{\mathcal{F}_{12}}_{\text{Eq. (3.1)}} R_{23} R_{13} R_{12} K_1 R_{21} R_{2} P_{12} \mathcal{E}_{12}(z_3, -z_2, -z_1) R_{32}(z_3, -z_1) \cdots
\]
\[
\cdots R_{31}(z_3, -z_2) K_3 \mathcal{E}_{12}(z_2, -z_1)
\]
\[ F_{(12)} R_{12} R_{12}(z_1, -z_2) K_1 R_{21}(z_2, -z_1) P_{12} E_{(12)} (-z_2, -z_1) F_{(12)} (-z_2, -z_1) \cdots \]

\[ \cdots R_{32}(z_3, -z_1) R_{31}(z_3, -z_2) K_3 E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{12}(z_1, -z_2) K_1 P_{12} R_{12}(-z_2, -z_1) E_{(12)} (-z_2, -z_1) F_{(12)} (-z_2, -z_1) \cdots \]

\[ \cdots R_{32}(z_3, -z_1) R_{31}(z_3, -z_2) K_3 E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{12}(z_1, -z_2) K_1 P_{12} R_{12}(-z_2, -z_1) R_{32}(z_3, -z_1) R_{31}(z_3, -z_2) K_3 \cdots \]

\[ \cdots E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{12}(z_1, -z_2) K_1 P_{12} R_{31}(z_3, -z_2) R_{32}(z_3, -z_1) R_{12}(-z_2, -z_1) K_3 \cdots \]

\[ \cdots E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{12}(z_1, -z_2) K_1 R_{32} R_{31} R_{21}(-z_2, -z_1) P_{12} K_3 E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{12}(z_1, -z_2) K_1 R_{31} K_3 R_{21}(-z_2, -z_1) P_{12} E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{31} K_3 R_{21}(-z_2, -z_1) E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{32} R_{12}(z_1, -z_2) K_3 R_{13}(z_1, -z_3) K_1 R_{31}(-z_3, -z_1) R_{21}(-z_2, -z_1) \cdots \]

\[ \cdots P_{12} E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} R_{23} K_2 R_{32} K_3 R_{12}(z_1, -z_2) R_{13}(z_1, -z_3) K_1 R_{31}(-z_3, -z_1) R_{21}(-z_2, -z_1) \cdots \]

\[ \cdots P_{12} E_{(12)} (-z_2, -z_1) \]

\[ = F_{(12)} K_3 R_{23}(z_2, -z_3) K_2 R_{32}(-z_3, -z_2) R_{12}(z_1, -z_2) R_{13}(z_1, -z_3) K_1 R_{31}(-z_3, -z_1) \cdots \]

\[ \cdots R_{21}(-z_2, -z_1) P_{12} E_{(12)} (-z_2, -z_1) \]

\[ = K_3 F_{(12)} R_{23}(z_2, -z_3) K_2 R_{13}(z_1, -z_3) R_{12}(z_1, -z_2) R_{32}(-z_3, -z_2) K_1 R_{31}(-z_3, -z_1) \cdots \]

\[ \cdots R_{21}(-z_2, -z_1) P_{12} E_{(12)} (-z_2, -z_1) \]

\[ = K_3 F_{(12)} R_{23}(z_2, -z_3) R_{13}(z_1, -z_3) K_2 R_{12}(z_1, -z_2) K_1 \cdots \]
whose proof is as follows:

\[
\cdots R_{32}(-z_3, -z_2) R_{31}(-z_3, -z_1) R_{21}(-z_2, -z_1) \mathcal{P}_{12} \mathcal{E}_{(12)}(-z_2, -z_1)
\]

\[\text{Eq.(2.1)}\]

\[= K_3 \mathcal{F}_{(12)} R_{23}(z_2, -z_3) R_{13}(z_1, -z_3) K_2 R_{12}(z_1, -z_2) K_1 \cdots \]

\[\cdots R_{21}(-z_2, -z_1) R_{31}(-z_3, -z_1) R_{32}(-z_3, -z_2) \mathcal{P}_{12} \mathcal{E}_{(12)}(-z_2, -z_1)\]

\[\text{Eq.(2.7) and } \mathcal{P}_{12}^2 = 1\]

\[= K_3 \mathcal{F}_{(12)} R_{23}(z_2, -z_3) R_{13}(z_1, -z_3) K_2 R_{12}(z_1, -z_2) K_1 \cdots \]

\[\cdots \mathcal{P}_{12} R_{12}(-z_2, -z_1) R_{32}(-z_3, -z_1) R_{31}(-z_3, -z_2) \mathcal{E}_{(12)}(-z_2, -z_1)\]

\[\text{Eq.(3.1)}\]

\[= K_3 \mathcal{F}_{(12)} R_{23}(z_2, -z_3) R_{13}(z_1, -z_3) K_2 R_{12}(z_1, -z_2) K_1 R_{21}(-z_2, -z_1) \mathcal{P}_{12} \mathcal{E}_{(12)}(-z_2, -z_1) \cdots \]

\[\text{Eq.(2.1)}\]

\[= K_3 \mathcal{F}_{(12)} R_{23}(z_2, -z_3) R_{13}(z_1, -z_3) K_2 R_{12}(z_1, -z_2) \mathcal{E}_{(12)} K_{(12)}(z_1, z_2) R_{3(12)}(-z_3; -z_2 - z_1)\]

\[\text{Eq.(2.7)}\]

\[= K_3 \mathcal{F}_{(12)} R_{13}(z_1, -z_3) R_{23}(z_2, -z_3) \mathcal{E}_{(12)} K_{(12)}(z_1, z_2) R_{3(12)}(-z_3; -z_2 - z_1)\]

\[\text{Eq.(2.6)}\]

\[= K_3 \mathcal{H}_{(12)} \mathcal{F}_{(12)} R_{13}(z_1, -z_3) R_{23}(z_2, -z_3) \mathcal{E}_{(12)} K_{(12)}(z_1, z_2) R_{3(12)}(-z_3; -z_2 - z_1)\]

\[\text{commute}\]

\[= \mathcal{H}_{(12)}(z_1, z_2) K_3(z_3) R_{12} R_{3(12)}(z_1, z_2) (-z_3) K_{(12)}(z_1, z_2) R_{3(12)}(-z_3; -z_2 - z_1) \quad \square \quad \text{(B.1)}\]

The proof of the complementary boundary fusion formula (3.5) is similar to the one for the bulk [19]. In particular, one first needs the identity

\[\mathcal{F}_{(12)} K_1 R_{21}(z_2, -z_1) K_2 \mathcal{P}_{12} \mathcal{E}_{(12)}(z_2, -z_1) = 0, \quad \text{(B.2)}\]

whose proof is as follows:

\[\mathcal{H}_{(12)} \mathcal{F}_{(12)} K_1 R_{21}(z_2, -z_1) K_2 \mathcal{P}_{12} \mathcal{E}_{(12)}(z_2, -z_1)\]

\[\text{Eq.(2.6)}\]

\[= \mathcal{F}_{(12)} R_{12} K_2 R_{21}(z_2, -z_1) \mathcal{P}_{12} \mathcal{E}_{(12)}(z_2, -z_1)\]

\[\text{Eq.(3.1)}\]

\[= \mathcal{F}_{(12)} K_2 R_{12}(z_1, -z_2) K_1 R_{21}(z_2, -z_1) \mathcal{P}_{12} \mathcal{E}_{(12)}(z_2, -z_1)\]

\[\mathcal{P}_{12}^2 = 1\]

\[= \mathcal{F}_{(12)} K_2 R_{12}(z_1, -z_2) K_1 \mathcal{P}_{12} R_{12}(z_2, -z_1) \mathcal{E}_{(12)}(z_2, -z_1) = 0. \quad \text{(B.3)}\]
In passing to the final equality, we used the fact $R(z_1, z_2)\tilde{E}(z_1, z_2) = 0$, which is a direct consequence of the decomposition (2.3) and the orthogonality relation $F(z_1, z_2)\tilde{E}(z_1, z_2) = 0$ (2.12).

It follows from (B.2) and the completeness relation (2.13) that

\[
\tilde{E}_{(12)}K_{1}R_{21}(z_2, -z_1)K_{2}\mathcal{P}_{12}\tilde{E}_{(12)}(-z_2, -z_1)
\]

\[=
(1 - E_{(12)}F_{(12)})K_{1}R_{21}(z_2, -z_1)K_{2}\mathcal{P}_{12}\tilde{E}_{(12)}(-z_2, -z_1)
\]

\[=
K_{1}R_{21}(z_2, -z_1)K_{2}\mathcal{P}_{12}\tilde{E}_{(12)}(-z_2, -z_1).
\]

(B.4)

In other words, the projector $\tilde{E}_{(12)}\tilde{F}_{(12)}$ can be inserted or removed in front of

\[
K_{1}R_{21}(z_2, -z_1)K_{2}\mathcal{P}_{12}\tilde{E}_{(12)}(-z_2, -z_1)
\]

as needed. Armed with this fact, together with the corresponding bulk result [19]

\[
\tilde{E}_{(12)}\tilde{F}_{(12)}R_{13}R_{23}\tilde{E}_{(12)} = R_{13}R_{23}\tilde{E}_{(12)},
\]

(B.5)

it is now a somewhat long but straightforward calculation to verify that the complementary fused boundary K-matrix (3.5) obeys the fused boundary Yang-Baxter equation

\[
\tilde{R}_{(12)3}(z_1, z_2|z_3)\tilde{K}_{(12)}(z_1, z_2)\tilde{R}_{3(12)}(z_3|-z_2, -z_1)K_{3}(z_3)
\]

\[=
K_{3}(z_3)\tilde{R}_{(12)3}(z_1, z_2|-z_3)\tilde{K}_{(12)}(z_1, z_2)\tilde{R}_{3(12)}(-z_3|-z_2, -z_1),
\]

(B.6)

where the complementary fused R-matrices are given by (2.14) and (2.15).
