Abstract: In this paper we study the nonlinear elliptic problem involving $p(x)$-Laplacian with nonsmooth potential, where the weighted function $\lambda$ may change sign. By using critical point theory for locally Lipschitz functionals due to Chang [5], we obtain conditions which ensure the existence of a solution for our problem.

Keywords: $p(x)$-Laplacian, hemivariational inequality, Palais-Smale condition, mountain pass theorem, variable exponent Sobolev space.

1 Introduction

Let $\Omega \subseteq \mathbb{R}^N$ be a bounded domain with the smooth boundary $\partial \Omega$. In this paper we study the following nonlinear hemivariational inequality with $p(x)$-Laplacian

$$
\begin{cases}
-\Delta_{p(x)} u - \lambda |u(x)|^{p(x)-2} u(x) \in \partial j(x, u(x)) & \text{a.e. on } \Omega, \\
u = 0 & \text{on } \partial \Omega,
\end{cases}
$$

(1.1)

where $p : \Omega \to \mathbb{R}$ is a continuous function satisfying

$$1 < p^- \leq p(x) \leq p^+ \leq \hat{p}^* < \infty$$

(1.2)

where $p^- := \inf_{x \in \Omega} p(x)$, $p^+ := \sup_{x \in \Omega} p(x)$ and $\hat{p}^* := \frac{Np^-}{N-p^-}$. The operator

$$\Delta_{p(x)} u := \text{div}(|\nabla u(x)|^{p(x)-2} \nabla u(x))$$

is the so-called $p(x)$-Laplacian. The function $j(x, t)$ is locally Lipschitz in the $t$-variable and measurable in the $x$-variable and by $\partial j(x, t)$ we denote the subdifferential with respect to the $t$-variable in the sense of Clarke [6].

Recently, hemivariational inequalities have attracted more and more attention. The study of such problems arises in nonlinear elasticity theory and in
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

physical phenomena, in which we dealt with nonconvex and nonsmooth energy functionals. We can find such functions for example in fluid mechanics, in image restoration and in the calculus of variations. Several applications in the electrorheological fluids problems involving $p(x)$-growth conditions, can be found in the books of Naniewicz-Panagiotopoulos \[18\] and Růžička \[21\].

The starting point for hemivariational inequalities with $p(x)$-Laplacian were this with constant exponent, it means with $p(x) \equiv p$. For example, the following differential inclusion problem was considered

\[
\begin{cases}
-\Delta_p u - \lambda |u(x)|^{p-2}u(x) \in \partial j(x, u(x)) & \text{a.e. on } \Omega, \\
u = 0 & \text{on } \partial \Omega,
\end{cases}
\]

(1.3)

where $\lambda > 0$ is a first eigenvalue of $p$-Laplacian. For instance, the existence of nontrivial solution for Dirichlet problem \[13\] at resonance under different type of conditions was proved in papers of Gasiński-Papageorgiou \[11, 12, 13\]. Their methods are based on the critical point theory for Locally Lipschitz functionals and on the Ekeland variational principle. Bisci-Motreanu in \[17\] proved the existence of multiple solutions for \[16\] by the use of Struwe techniques and the saddle point theory. There are also many others authors who studied hemivariational inequalities with Dirichlet or Neumann boundary conditions.

Partial differential equations involving variable exponents and nonstandard growth conditions were also studied by many authors. In the paper of Ge-Xue-Zhou \[15\] the existence of radial solutions for problem \[11\] was proved. The authors required that $\lambda > 0$ and used a key assumption on the exponent that $p^+ < N$. The problem with $p(x)$-Laplacian and with Neumann boundary condition was considered by Qian-Shen-Yang \[19\]. They refused the assumption about positivity of $\lambda$ but still needed assumption on the variable exponent, it means $\sqrt{2}p^- > N$.

In this paper we have the situation that $\lambda \in \mathbb{R}$ and we have no restriction on $\lambda$ like in Barnaš \[2, 3\] and the papers of many authors. It is an extension of the theory considered in the above mentioned papers. Moreover, we abandon the restriction on $p(x)$. Our approach is is based on the critical point theory for nonsmooth Lipschitz functionals due to Chang \[5\].

In the next section we briefly present the basic properties of the generalized Lebesgue space and the generalized Lebesgue-Sobolev space. Moreover, we present the basic notions and facts from the theory, which will be used in the study of problem \[1.1\].

2 Mathematical preliminaries

In order to discuss problem \[1.1\], we need to state some properties of the spaces $L^{p(x)}(\Omega)$ and $W^{1,p(x)}(\Omega)$, which we call correspondingly generalized Lebesgue space and generalized Lebesgue-Sobolev space (see Fan-Zhao \[9, 10\]).

Denote by $E(\Omega)$ the set of all measurable real functions defined on $\Omega$. Two functions in $E(\Omega)$ are considered to be one element of $E(\Omega)$, when they are
equal almost everywhere. The generalized Lebesgue space is defined as
\[ L^{p(x)}(\Omega) = \{ u \in E(\Omega) : \int_{\Omega} |u(x)|^{p(x)} dx < \infty \}, \]
equipped with the norm
\[ \|u\|_{p(x)} = \|u\|_{L^{p(x)}(\Omega)} = \inf \left\{ \lambda > 0 : \int_{\Omega} \frac{|u(x)|^{p(x)}}{\lambda} dx \leq 1 \right\}. \]
Next, we define the generalized Lebesgue-Sobolev space \( W^{1,p(x)}(\Omega) \) by
\[ W^{1,p(x)}(\Omega) = \{ u \in L^{p(x)}(\Omega) : |\nabla u| \in L^{p(x)}(\Omega; \mathbb{R}^N) \} \]
with the norm
\[ \|u\|_{W^{1,p(x)}(\Omega)} = \|u\|_{p(x)} + \|\nabla u\|_{p(x)}. \]
Then \( L^{p(x)}(\Omega) \) and \( W^{1,p(x)}(\Omega) \) are separable and reflexive Banach spaces. By \( W^{1,p(x)}_0(\Omega) \) we denote the closure of \( C_0^\infty(\Omega) \) in \( W^{1,p(x)}(\Omega) \).

**Lemma 2.1** (Fan-Zhao [9]). If \( \Omega \subset \mathbb{R}^N \) is an open domain, then
(a) if \( 1 \leq q(x) \in C(\overline{\Omega}) \) and \( q(x) \leq p^*(x) \) (respectively \( q(x) < p^*(x) \)) for any \( x \in \overline{\Omega} \), where
\[ p^*(x) = \begin{cases} \frac{N p(x)}{N - p(x)} & p(x) < N \\ \infty & p(x) \geq N \end{cases}, \]
then \( W^{1,p(x)}(\Omega) \) is embedded continuously (respectively compactly) in \( L^{q(x)}(\Omega) \);
(b) Poincaré inequality in \( W^{1,p(x)}_0(\Omega) \) holds i.e., there exists a positive constant \( c \) such that
\[ \|u\|_{p(x)} \leq c \|\nabla u\|_{p(x)} \quad \text{for all } u \in W^{1,p(x)}_0(\Omega); \]
(c) \( (L^{p(x)}(\Omega))^* = L^{p'(x)}(\Omega) \), where \( \frac{1}{p(x)} + \frac{1}{p'(x)} = 1 \) and for all \( u \in L^{p(x)}(\Omega) \) and \( v \in L^{p'(x)}(\Omega) \), we have
\[ \int_{\Omega} |uv| dx \leq \left( \frac{1}{p^-} + \frac{1}{p'^-} \right) \|u\|_{p(x)} \|v\|_{p'(x)}. \]

**Lemma 2.2** (Fan-Zhao [9]). Let \( \varphi(u) = \int_{\Omega} |u(x)|^{p(x)} dx \) for \( u \in L^{p(x)}(\Omega) \) and let \( \{u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega) \).
(a) for \( u \neq 0 \), we have
\[ \|u\|_{p(x)} = a \iff \varphi(u) = 1; \]
(b) we have
\[ \|u\|_{p(x)} < 1 \iff \varphi(u) < 1; \]
\[ \|u\|_{p(x)} = 1 \iff \varphi(u) = 1; \]
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

\[
\|u\|_{p(x)} > 1 \iff \varphi(u) > 1;
\]

(c) if $\|u\|_{p(x)} > 1$, then

\[
\|u\|_{p(x)}^{-} \leq \varphi(u) \leq \|u\|_{p(x)}^{+};
\]

(d) if $\|u\|_{p(x)} < 1$, then

\[
\|u\|_{p(x)}^{+} \leq \varphi(u) \leq \|u\|_{p(x)}^{-};
\]

(e) we have

\[
\lim_{n \to \infty} \|u_n\|_{p(x)} = 0 \iff \lim_{n \to \infty} \varphi(u_n) = 0;
\]

(f) we have

\[
\lim_{n \to \infty} \|u_n\|_{p(x)} = \infty \iff \lim_{n \to \infty} \varphi(u_n) = \infty.
\]

Similarly to Lemma 2.2, we have the following result.

**Lemma 2.3 (Fan-Zhao [9])**. Let $\Phi(u) = \int_{\Omega} (|\nabla u(x)|^{p(x)} + |u(x)|^{p(x)}) \, dx$ for $u \in W^{1,p(x)}(\Omega)$ and let $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}(\Omega)$. Then

(a) for $u \neq 0$, we have

\[
\|u\| = a \iff \Phi\left(\frac{u}{a}\right) = 1;
\]

(b) we have

\[
\|u\| < 1 \iff \Phi(u) < 1;
\]

\[
\|u\| = 1 \iff \Phi(u) = 1;
\]

\[
\|u\| > 1 \iff \Phi(u) > 1;
\]

(c) if $\|u\| > 1$, then

\[
\|u\|^{p(x)} \leq \Phi(u) \leq \|u\|^{p(x)};
\]

(d) if $\|u\| < 1$, then

\[
\|u\|^{p(x)} \leq \Phi(u) \leq \|u\|^{p(x)};
\]

(e) we have

\[
\lim_{n \to \infty} \|u_n\| = 0 \iff \lim_{n \to \infty} \Phi(u_n) = 0;
\]

(f) we have

\[
\lim_{n \to \infty} \|u_n\| = \infty \iff \lim_{n \to \infty} \Phi(u_n) = \infty.
\]
Consider the following function
\[ J(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u|^{p(x)} \, dx, \quad \text{for all } u \in W^{1,p(x)}_0(\Omega). \]

We know that \( J \in C^1(\Omega) \) and \(-\text{div}(|\nabla u|^{p(x)-2} \nabla u)\) is the derivative operator of \( J \) in the weak sense (see Chang [4]). We denote
\[ A = J': W^{1,p(x)}_0(\Omega) \to (W^{1,p(x)}_0(\Omega))^*, \]
then
\[ \langle Au, v \rangle = \int_{\Omega} |\nabla u(x)|^{p(x)-2} (\nabla u(x), \nabla v(x)) \, dx \] (2.1)
for all \( u, v \in W^{1,p(x)}_0(\Omega) \).

**Lemma 2.4** (Fan-Zhang [7]). If \( A \) is the operator defined above, then \( A \) is a continuous, bounded and strictly monotone operator of type \((S_+)\) i.e., if \( u_n \to u \) weak in \( W^{1,p(x)}_0(\Omega) \) and \( \limsup_{n \to \infty} \langle Au_n, u_n - u \rangle \leq 0 \), implies that \( u_n \to u \) in \( W^{1,p(x)}_0(\Omega) \).

Let \( (X, \| \cdot \|) \) be a Banach space and \( X^* \) its topological dual. A function \( f : X \to \mathbb{R} \) is said to be locally Lipschitz, if for every \( x \in X \) there exists a neighbourhood \( U \) of \( x \) and a constant \( K > 0 \) depending on \( U \) such that \( |f(y) - f(z)| \leq K \|y - z\| \) for all \( y, z \in U \). From convex analysis it is well known that a proper, convex and lower semicontinuous function \( g : X \to \mathbb{R} = \mathbb{R} \cup \{+\infty\} \) is locally Lipschitz in the interior of its domain \( \text{dom}g = \{ x \in X : g(x) < \infty \} \).

In analogy with the directional derivative of a convex function, we introduce the notion of the generalized directional derivative of a locally Lipschitz function \( f \) at \( x \in X \) in the direction \( h \in X \) by
\[ f^0(x; h) = \limsup_{y \to x, \lambda \to 0} \frac{f(y + \lambda h) - f(y)}{\lambda}. \]
The function \( h \mapsto f^0(x, h) \in \mathbb{R} \) is sublinear and continuous so it is the support function of a nonempty, \( w^* \)-compact and convex set
\[ \partial f(x) = \{ x^* \in X^*: \langle x^*, h \rangle \leq f^0(x, h) \text{ for all } h \in X \}. \]
The set \( \partial f(x) \) is known as generalized or Clarke subdifferential of \( f \) at \( x \). If \( f \) is convex, the subdifferential in the sense of convex analysis coincides with the generalized subdifferential introduced above. If \( f, g : X \to \mathbb{R} \) are two locally Lipschitz functions, then \( \partial (f + g)(x) \subseteq \partial f(x) + \partial g(x) \) and \( \partial (tf)(x) = t\partial f(x) \) for all \( t \in \mathbb{R} \).

The critical point theory for smooth functions uses a compactness condition known as "Palais-Smale condition" (PS-condition for short). In our present nonsmooth setting, the condition takes the following form:
A locally Lipschitz function \( f : X \to \mathbb{R} \) satisfies the "nonsmooth Palais-Smale condition" (nonsmooth PS-condition for short), if any sequence \( \{x_n\}_{n \geq 1} \subseteq X \) such that \( \{f(x_n)\}_{n \geq 1} \) is bounded and \( m(x_n) = \min\{\|x^*\|_* : x^* \in \partial f(x_n)\} \to 0 \) as \( n \to \infty \), has a strongly convergent subsequence.

The first theorem is due to Chang [5] and extends to a nonsmooth setting the well known mountain pass theorem due to Ambrosetti-Rabinowitz [1].

**Theorem 2.5.** If \( X \) is a reflexive Banach space, \( R : X \to \mathbb{R} \) is a locally Lipschitz functional satisfying PS-condition and for some \( \rho > 0 \) and \( y \in X \) such that \( \|y\| > \rho \), we have

\[
\max\{R(0), R(y)\} < \inf_{\|x\| = \rho} \{R(x)\} =: \eta,
\]

then \( R \) has a nontrivial critical point \( x \in X \) such that the critical value \( c = R(x) \geq \eta \) is characterized by the following minimax principle

\[
c = \inf_{\gamma \in \Gamma} \max_{0 \leq \tau \leq 1} \{R(\gamma(\tau))\},
\]

where \( \Gamma = \{\gamma \in C([0, 1], X) : \gamma(0) = 0, \gamma(1) = y\} \).

The second theory is an other nonsmooth version of mountain pass theorem.

**Theorem 2.6.** If \( X \) is a reflexive Banach space and \( R : X \to \mathbb{R} \) is a bounded below and locally Lipschitz functional which satisfies nonsmooth PS-condition, then \( c = \inf\{R(x) : x \in X\} \) is a critical value of \( R \).

### 3 Existence of Solutions

We start by introducing our assumptions for the nonsmooth potential \( j(x, t) \).

- \( H(j) \) is a function such that \( j(x, t) \) satisfies \( j(x, 0) = 0 \) almost everywhere on \( \Omega \) and
- (i) for all \( t \in \mathbb{R} \), the function \( \Omega \ni x \mapsto j(x, t) \in \mathbb{R} \) is measurable;
- (ii) for almost all \( x \in \Omega \), the function \( \mathbb{R} \ni t \to j(x, t) \in \mathbb{R} \) is locally Lipschitz;
- (iii) for almost all \( x \in \Omega \) and all \( v \in \partial j(x, t) \), we have \( |v| \leq c_1 t|^{r(x)-1} \) with \( r \in C(\Omega) \), such that \( p^+ \leq r^- := \min_{x \in \Omega} r(x) < p^- := \frac{Np}{N-p} \) and \( c_1 > 0 \);
- (iv) there exists \( c > 2c_1 \) such that

\[
\limsup_{|t| \to \infty} \frac{v^*(x)t - j(x, t)}{|t|^{r(x)}} \leq -c,
\]

uniformly for almost all \( x \in \Omega \) and all \( v^*(x) \in \partial j(x, t) \);

**Remark 3.1.** The existence of a nontrivial solution for problem (1.1) was also considered in the paper of Baruas [2]. In contrast to the last paper, we have no restriction on \( \lambda \), it means \( \lambda \in \mathbb{R} \). Moreover, we make the hypotheses as simple as possible. In hypothesis \( H(j)(iv) \), we assume a Tang-type condition which is more general than Landesman-Lazer or Ambrosetti-Rabinowitz condition.
We introduce locally Lipschitz functional $R : W^{1,p(x)}_0(\Omega) \to \mathbb{R}$ defined by
\[
R(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u(x)|^{p(x)} \, dx - \int_{\Omega} \frac{\lambda}{p(x)} |u(x)|^{p(x)} \, dx - \int_{\Omega} j(x,u(x)) \, dx,
\] for all $u \in W^{1,p(x)}_0(\Omega)$.

**Lemma 3.2.** If hypotheses $H(j)$ hold, then $R$ satisfies the nonsmooth PS-condition.

**Proof.** Let $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}_0(\Omega)$ be a sequence such that $\{R(u_n)\}_{n \geq 1}$ is bounded and $m(u_n) \to 0$ as $n \to \infty$. We will show that $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}_0(\Omega)$ is bounded.

Because $|R(u_n)| \leq M$ for all $n \geq 1$, we have
\[
-M \leq \int_{\Omega} \frac{1}{p(x)} |\nabla u_n(x)|^{p(x)} \, dx - \int_{\Omega} \frac{\lambda}{p(x)} |u_n(x)|^{p(x)} \, dx - \int_{\Omega} j(x,u_n(x)) \, dx. \tag{3.1}
\]

Since $\partial R(u_n) \subseteq (W^{1,p(x)}_0(\Omega))^*$ is weakly compact, nonempty and the norm functional is weakly lower semicontinuous in a Banach space, then we can find $u^*_n \in \partial R(u_n)$ such that $\|u^*_n\|_*=m(u_n)$, for $n \geq 1$.

Consider the operator $A : W^{1,p(x)}_0(\Omega) \to (W^{1,p(x)}_0(\Omega))^*$ defined by (2.1).

Then, for every $n \geq 1$, we have
\[
u^*_n = Au_n - \lambda|u_n|^{p(x)-2}u_n - v^*_n, \tag{3.2}
\]
where $v^*_n \in \partial \psi(u_n) \subseteq L^{p(x)}(\Omega)$, for $n \geq 1$, with $\frac{1}{p(x)} + \frac{1}{p^*(x)} = 1$ and $\psi : W^{1,p(x)}_0(\Omega) \to \mathbb{R}$ is defined by $\psi(u_n) = \int_{\Omega} j(x,u_n(x)) \, dx$. We know that, if $v^*_n \in \partial \psi(u_n)$, then $v^*_n(x) \in \partial j(x,u_n(x))$ (see Clarke [6]).

From the choice of the sequence $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}_0(\Omega)$, at least for a subsequence, we have
\[
|\langle u^*_n, w \rangle| \leq \varepsilon_n \quad \text{for all } w \in W^{1,p(x)}_0(\Omega), \tag{3.3}
\]
with $\varepsilon_n \searrow 0$.

Putting $w = u_n$ in (3.2) and using (3.3), we obtain
\[
-\varepsilon_n \leq - \int_{\Omega} |\nabla u_n(x)|^{p(x)} \, dx + \lambda \int_{\Omega} |u_n(x)|^{p(x)} \, dx + \int_{\Omega} v^*_n(x)u_n(x) \, dx. \tag{3.4}
\]

Now, let us consider two cases.

**Case 1.**

Let $\lambda \leq 0$.

Adding (3.1) and (3.4), we have
\[
-M - \varepsilon_n \leq \left( \frac{1}{p^*(x)} - 1 \right) \int_{\Omega} |\nabla u_n(x)|^{p(x)} \, dx + |\lambda| \left( \frac{1}{p^*(x)} - 1 \right) \int_{\Omega} |u_n(x)|^{p(x)} \, dx \\
+ \int_{\Omega} v^*_n(x)u_n(x) \, dx - \int_{\Omega} j(x,u_n(x)) \, dx. \tag{3.5}
\]
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

So we obtain that

$$|\lambda| \left(1 - \frac{1}{p^-}\right) \int_{\Omega} |u_n(x)|^{p(x)} \, dx \leq M + \varepsilon_n + \int_{\Omega} v^*_n(x) u_n(x) \, dx - \int_{\Omega} j(x, u_n(x)) \, dx. \quad (3.6)$$

By virtue of hypotheses $H(j)_1(iv)$, we know that there exist constant $c > 2c_1$, such that

$$\limsup_{|t| \to \infty} \frac{v^*(x)t - j(x, t)}{|t|^{r(x)}} \leq -c,$$

uniformly for almost all $x \in \Omega$ and all $v^* \in \partial j(x, t)$ with $p^+ < r^- \leq r(x) < \bar{p}^*$ for all $x \in \Omega$. So in particularly, there exists $L > 0$ such that for almost all $x \in \Omega$ and all $|t| \geq L$, we have

$$v^*(x)t - j(x, t) \leq -\frac{c}{2} |t|^{r(x)}.$$

(3.7)

On the other hand, from the Lebourg mean value theorem (see Clarke [6]), for almost all $x \in \Omega$ and all $t \in \mathbb{R}$, we can find $v(x) \in \partial j(x, ku(x))$ with $0 < k < 1$, such that

$$|j(x, t) - j(x, 0)| \leq |v(x)||t|.$$

So from hypothesis $H(j)(iii)$, for almost all $x \in \Omega$, we have

$$|j(x, t)| \leq |j(x, 0)| + c_1 |t|^{r(x)} \leq c_1 |t|^{r^+}.$$

Then for almost all $x \in \Omega$ and all $t$ such that $|t| < L$, it follows that

$$|j(x, t)| \leq c_2,$$

(3.8)

for some $c_2 > 0$. Therefore, from (3.7) and (3.8) it follows that for almost all $x \in \Omega$ and all $t \in \mathbb{R}$, we have

$$v^*(x)t - j(x, t) \leq -\frac{c}{2} |t|^{r(x)} + \beta,$$

(3.9)

for some $\beta > 0$, $c > 2c_1$ and $p^+ < r^- \leq r(x) < \bar{p}^*$ for all $x \in \Omega$.

We use (3.6) in (3.9) and obtain

$$|\lambda| \left(1 - \frac{1}{p^-}\right) \int_{\Omega} |u_n(x)|^{p(x)} \, dx \leq M + \varepsilon_n - \frac{c}{2} \int_{\Omega} |u_n(x)|^{r(x)} \, dx + \int_{\Omega} \beta \, dx,$$

for all $n \geq 1$, which leads to

$$|\lambda| \left(1 - \frac{1}{p^-}\right) \int_{\Omega} |u_n(x)|^{p(x)} \, dx \leq M_1,$$

for some $M_1 > 0$. 

Nontrivial solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

We know that $|\lambda\left(1 - \frac{1}{p}\right)| > 0$, so

the sequence $\{u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega)$ is bounded. \hspace{1cm} (3.10)

Now, consider again (3.5). We obtain

$$
\left(1 - \frac{1}{p}\right) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx \leq M + \varepsilon_n + \int_{\Omega} v_n^*(x) u_n(x) dx - \int_{\Omega} j(x, u_n(x)) dx.
$$

In a similar way, by using (3.9) we have

$$
\left(1 - \frac{1}{p}\right) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx \leq M + \varepsilon_n - \frac{c}{2} \int_{\Omega} |u_n(x)|^r dx + \int_{\Omega} \beta dx,
$$

for all $n \geq 1$ with $p^+ < r - \leq r(x) < \hat{p}^*$ for all $x \in \Omega$.

So we obtain

$$
\left(1 - \frac{1}{p^-}\right) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx \leq M_2,
$$

for some $M_2 > 0$. So, we have that

the sequence $\{\nabla u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega; \mathbb{R}^N)$ is bounded. \hspace{1cm} (3.11)

From (3.10) and (3.11), we have that

the sequence $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}_0(\Omega)$ is bounded. \hspace{1cm} (3.12)

Case 2.

Now, let $\lambda > 0$.

Again from (3.10) and (3.11), we have

$$
-M - \varepsilon_n \leq \left(1 - \frac{1}{p^-}\right) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx + \lambda \left(1 - \frac{1}{p^+}\right) \int_{\Omega} |u_n(x)|^{p(x)} dx
$$

$$
+ \int_{\Omega} v_n^*(x) u_n(x) dx - \int_{\Omega} j(x, u_n(x)) dx.
$$

(3.13)

Since $\left(\frac{1}{p^-} - 1\right) < 0$ and using (3.9), we have

$$
-M - \varepsilon_n \leq \lambda \left(1 - \frac{1}{p^+}\right) \int_{\Omega} |u_n(x)|^{p(x)} dx
$$

$$
- \frac{c}{2} \int_{\Omega} |u_n(x)|^r dx + \int_{\Omega} \beta dx.
$$

(3.14)

for all $n \geq 1$ and $p^+ < r^+ \leq r(x) < \hat{p}^*$ for all $x \in \Omega$.

Hence, we have

$$
\frac{c}{2} \int_{\Omega} |u_n(x)|^r dx \leq \lambda \left(1 - \frac{1}{p^+}\right) \int_{\Omega} |u_n(x)|^{p(x)} dx + K,
$$

(3.15)
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

for some $K > 0$.

Since $p(x) \leq p^+ < r^- \leq r(x)$ for all $x \in \Omega$, we have

the sequence $\{u_n\}_{n \geq 1} \subseteq L^{r(x)}(\Omega)$ is bounded. \hfill (3.16)

For any $n \geq 1$ such that $\|u_n\|_{p(x)} \leq 1$ we have

$$
\|u_n\|_{p(x)}^{p^+} < \int_{\Omega} |u_n(x)|^{p(x)} dx < \int_{\Omega} |u_n(x)|^{p^-} dx \leq K_1,
$$

for some $K_1 > 0$ (see Lemma 2.2).

On the other hand, for any $n \geq 1$ such that $\|u_n\|_{p(x)} > 1$, we have

$$
\|u_n\|_{p(x)}^{p^-} < \int_{\Omega} |u_n(x)|^{p(x)} dx < \int_{\Omega} |u_n(x)|^{p^-} dx < \|u_n\|_{r(x)}^{r(x)} \leq K_2.
$$

Thus

the sequence $\{u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega)$ is bounded. \hfill (3.17)

Now, again from (3.13), we have

$$
(1 - \frac{1}{p^-}) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx \leq M + \varepsilon_n + \lambda \left(1 - \frac{1}{p^-}\right) \int_{\Omega} |u_n(x)|^{p(x)} dx
$$

$$
+ \int_{\Omega} v^*_n(x) u_n(x) dx - \int_{\Omega} j(x, u_n(x)) dx. \hfill (3.18)
$$

Using (3.9) and (3.17) in (3.18), we obtain

$$
(1 - \frac{1}{p^-}) \int_{\Omega} |\nabla u_n(x)|^{p(x)} dx \leq M_3,
$$

for some $M_3 > 0$.

Since $\left(1 - \frac{1}{p^-}\right) > 0$, we have that

the sequence $\{\nabla u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega; \mathbb{R}^N)$ is bounded. \hfill (3.19)

From (3.17) and (3.19), we have that

the sequence $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}(\Omega)$ is bounded.

From Cases 1 and 2, we have that

the sequence $\{u_n\}_{n \geq 1} \subseteq W^{1,p(x)}_0(\Omega)$ is bounded. \hfill (3.20)

Hence, by passing to a subsequence if necessary, we may assume that

$$
\begin{align*}
   u_n &\to u \quad \text{weakly in } W^{1,p(x)}_0(\Omega), \\
   u_n &\to u \quad \text{in } L^{r(x)}(\Omega).
\end{align*}
$$

\hfill (3.21)
Nontrivial solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

for any $r \in C(\Omega)$, with $r^+ = \max_{x \in \Omega} r(x) < \hat{p}^* := \frac{Np^-}{N-p^-}$. 

Putting $w = u_n - u$ in (3.3) and using (3.2), we obtain

$$\left| \langle Au_n, u_n - u \rangle - \lambda \int_{\Omega} |u_n(x)|^{p(x)-2} u_n(x)(u_n - u)(x)dx - \int_{\Omega} v_n^*(x)(u_n - u)(x)dx \right| \leq \varepsilon_n,$$

(3.22)

with $\varepsilon_n \searrow 0$.

Using Lemma 2.1(c), we see that

$$\lambda \int_{\Omega} |u_n(x)|^{p(x)-2} u_n(x)(u_n - u)(x)dx \leq \lambda \left( \frac{1}{p^-} + \frac{1}{p'^-} \right) \| |u_n|^{p(x)-1} \|_{p'(x)} \| u_n - u \|_{p(x)},$$

where $\frac{1}{p(x)} + \frac{1}{p'(x)} = 1$.

We know that the sequence $\{u_n\}_{n \geq 1} \subseteq L^{p(x)}(\Omega)$ is bounded, so using (3.21), we can conclude that

$$\lambda \int_{\Omega} |u_n(x)|^{p(x)-2} u_n(x)(u_n - u)(x)dx \to 0 \quad \text{as } n \to \infty$$

and

$$\int_{\Omega} v_n^*(x)(u_n - u)(x)dx \to 0 \quad \text{as } n \to \infty.$$

If we pass to the limit as $n \to \infty$ in (3.22), we have

$$\limsup_{n \to \infty} \langle Au_n, u_n - u \rangle \leq 0.$$  (3.23)

So from Lemma 2.4, we have that $u_n \to u$ in $W^{1,p(x)}_0(\Omega)$ as $n \to \infty$. Thus $R$ satisfies the (PS)-condition.

For the first existence theorem, we will need an additional assumption:

$H(j)_1$ there exists $\nu > 0$ such that

$$\limsup_{|t| \to 0} \frac{j(x,t)}{|t|^p(x)} \leq -\nu,$$  (3.24)

uniformly for almost all $x \in \Omega$ and for some $h(x) \in C(\Omega)$ with $1 < h(x) \leq h^+ < p^- < \hat{p}^*$ for all $x \in \Omega$.

**Theorem 3.3.** If hypotheses $H(j)$ and $H(j)_1$ hold then problem (1.1) has a nontrivial solution for all $\lambda \in (-\infty, \nu p^-)$.

**Proof.** Claim 1. There exists $\rho \in (0, 1)$ small enough such that, we have $R(u) \geq L > 0$, for all $u \in W^{1,p(x)}_0(\Omega)$, with $\|u\| = \rho$ and some $L > 0$. Indeed by using
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

hypothesis $H(j)_1$, we can find $\delta > 0$, such that for almost all $x \in \Omega$ and all $t$ such that $|t| \leq \delta$, we have

$$j(x, t) \leq -\nu|t|^{h(x)}; \quad \text{where} \quad 1 < h(x) \leq h^+ < p^-.$$

On the other hand, from hypothesis $H(j)(iii)$, we know that for almost all $x \in \Omega$ and all $t$ such that $|t| > \delta$, we have

$$|j(x, t)| \leq c_1|t|^{r(x)},$$

for some $c_1 > 0$ and $p^+ < r(x) < \hat{p}^*$. Thus for almost all $x \in \Omega$ and all $t \in \mathbb{R}$ we have

$$j(x, t) \leq -\nu|t|^{h(x)} + d_1|t|^{r(x)}, \quad (3.25)$$

with some $d_1 > 0$, $1 < h(x) \leq h^+ < p^- \leq p(x) \leq p^+ < r^- < r(x) < \hat{p}^*$ for all $x \in \Omega$.

Moreover, since $W^{1,p(x)}_0(\Omega)$ is embedded continuously into $L^{p(x)}(\Omega)$, $L^{h(x)}(\Omega)$ and $L^{r(x)}(\Omega)$ (see Lemma 2.1), so for $\beta(x) := p(x)$ (respectively $h(x)$ or $r(x)$), we have that

$$\|u\|_{p(x)} \leq K_3\|u\|; \quad (3.26)$$

for all $u \in W^{1,p(x)}_0(\Omega)$ and some $K_3 > 0$.

If we fix $\rho \in (0, 1)$ such that $\rho < \min\{1, \frac{1}{K_3}\}$, then for all $u \in W^{1,p(x)}_0(\Omega)$, with $\|u\| = \rho$, from (3.26) we can deduce that

$$\|u\|_{p(x)} \leq 1 \quad \text{where} \quad \beta = p(x) \quad \text{(respectively} \quad h(x) \quad \text{or} \quad r(x)).$$

Furthermore, using Lemma 2.2 and (3.26), we obtain

$$\int_\Omega |u(x)|^{\beta(x)}dx \leq \|u(x)\|^{\beta_{-}}_{\beta(x)} \leq K_3\|u\|^{\beta_{-}}, \quad (3.27)$$

for $\beta = p(x)$ (respectively $h(x)$ or $r(x)$).

Moreover, since $1 < h(x) \leq h^+ < p(x) \leq p^+ < r^- \leq r(x)$ for all $u \in W^{1,p(x)}_0(\Omega)$, with $\|u\| = \rho$, we have that

$$\|u\|_{r(x)} \leq \|u\|_{p(x)} \leq \|u\|_{h(x)}; \quad (3.28)$$

Let us consider two cases.

Case 1. Let $\lambda \leq 0$.

By using (3.27), (3.28), and Lemma 2.4, we obtain that

$$R(u) = \int_\Omega \frac{1}{p(x)}|\nabla u(x)|^{p(x)}dx - \int_\Omega \frac{\lambda}{p(x)}|u(x)|^{p(x)}dx - \int_\Omega j(x, u(x))dx$$

$$\geq \frac{1}{p^+} \int_\Omega |\nabla u(x)|^{p(x)}dx + \frac{|\lambda|}{p^+} \int_\Omega |u(x)|^{p(x)}dx$$

$$+ \nu \int_\Omega |u(x)|^{h(x)}dx - d_1 \int_\Omega |u(x)|^{r(x)}dx$$

$$\geq c_5\|u\|^{p^+} - d_1 \int_\Omega |u(x)|^{r(x)}dx \geq c_5\|u\|^{p^+} - d_1\|u\|^{r^-},$$
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

where $c_5 = \min\{\frac{1}{p^+}, \frac{1}{p^-}\}$ and $\nu > 0$.

Since $p^+ < r^- < r(x)$ for all $x \in \Omega$, we have $R(u) \geq L > 0$, for all $u \in W_0^{1,p(x)}(\Omega)$, with $\|u\| = \rho$ and some $L > 0$.

Case 2. Let $\lambda > 0$.

Using (3.25) and (3.28), we obtain that

$$R(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u(x)|^{p(x)} dx - \int_{\Omega} \frac{\lambda}{p(x)} |u(x)|^{p(x)} dx - \int_{\Omega} j(x, u(x)) dx$$

$$\geq \frac{1}{p^+} \int_{\Omega} |\nabla u(x)|^{p(x)} dx - \frac{\lambda}{p^-} \int_{\Omega} |u(x)|^{p(x)} dx$$

$$+ \nu \int_{\Omega} |u(x)|^{h(x)} dx - d_1 \int_{\Omega} |u(x)|^{r(x)} dx$$

$$\geq \frac{1}{p^+} \int_{\Omega} |\nabla u(x)|^{p(x)} dx + \left( \nu - \frac{\lambda}{p^-} \right) \int_{\Omega} |u(x)|^{p(x)} dx - d_1 \int_{\Omega} |u(x)|^{r(x)} dx.$$  

From hypothesis, we know that $\nu - \frac{\lambda}{p^-} > 0$ and by using (3.27), we have

$$R(u) \geq c_6 \|u\|^{p^+} - d_1 \|u\|^{r^-},$$

where $c_6 = \min\{\frac{1}{p^+}, \nu - \frac{\lambda}{p^-}\}$.

So again, we have that $R(u) \geq L > 0$, for all $u \in W_0^{1,p(x)}(\Omega)$, with $\|u\| = \rho$ and some $L > 0$.

Claim 2. $R(u)$ is anticoercive, i.e. $R(u) \rightarrow -\infty$ as $\|u\| \rightarrow \infty$.

We assume that $\|u\| > 1$. Again using hypothesis $H(j)(iv)$, for almost all $x \in \Omega$ and all $t$ such that $t > M$, we have

$$j(x, t) \geq v^*(x)t + \frac{c}{2} |t|^{r(x)} - \beta, \quad (3.29)$$

for some $\beta > 0$, $c > 2c_1$ and $p^+ < r^- \leq r(x) < \tilde{p}^+$ for all $x \in \Omega$ (see (3.8)).

On the other hand, from $H(j)(iii)$, we see that for almost all $x \in \Omega$ we have $|v^*(x)t| \leq c_1 |t|^{r(x)}$, where $c_1 > 0$. So from (3.29) and this inequality, we obtain

$$j(x, t) \geq \frac{c}{2} |t|^{r(x)} - c_1 |t|^{r(x)} - \beta = c_3 |t|^{r(x)} - \beta, \quad (3.30)$$

where $c_3 > 0$ (since $c > 2c_1$) with $p(x) \leq p^+ < r(x) \leq r^+ < \tilde{p}^+$.

Using (3.30) and Lemma 2.2 for any $u \in W_0^{1,p(x)}(\Omega) \setminus \{0\}$ and $s > 1$, we
Nontrivial solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

have

$$R(su) = \int_\Omega \frac{1}{p(x)} |\nabla su(x)|^{p(x)} dx - \int_\Omega \frac{\lambda}{p(x)} |su(x)|^{p(x)} dx - \int_\Omega j(x, su(x)) dx$$

$$\leq s^{p^+} \left( \frac{1}{p^+} \int_\Omega |\nabla u(x)|^{p^+} dx + \frac{\lambda}{p^+} \int_\Omega |u(x)|^{p^+} dx \right) - \int_\Omega j(x, su(x)) dx$$

$$\leq \overline{\tau} \cdot s^{p^+} \left( \int_\Omega (|\nabla u(x)|^{p(x)} + |u(x)|^{p(x)} dx) - c_3 \int_\Omega |su(x)|^{r(x)} dx + \int_\Omega \beta dx \right)$$

$$\leq \overline{\tau} \cdot s^{p^+} \|u\|^{p^+} - c_3 \cdot s^{r^-} \int_\Omega |u(x)|^{r(x)} dx + \int_\Omega \beta dx,$$

where $\overline{\tau} = \max\{\frac{1}{p^+}, \frac{\lambda}{p^+}\}$ and $p^+ < r^- \leq r(x) < \overline{p}^*.$

Because $r^- > p^+,$ we get that $R(su) \to -\infty$ when $s \to \infty.$ This permits the use of Theorem $2.5$ which gives us $u \in W_0^{1,p(x)}(\Omega)$ such that $R(u) > 0 = R(0)$ and $0 \in \partial R(u)$.

From the last inclusion we obtain

$$0 = Au - \lambda |u|^{p(x)-2}u - v^*,$$

where $v^* \in \partial \psi(u).$ Hence

$$Au = \lambda |u|^{p(x)-2}u + v^*,$$

so for all $v \in C_0^\infty(\Omega),$ we have $\langle Au, v \rangle = \lambda \langle |u|^{p(x)-2}u, v \rangle + \langle v^*, v \rangle.$

So we have

$$\int_\Omega |\nabla u(x)|^{p(x)-2}(\nabla u(x), \nabla v(x)) dx = \int_\Omega \lambda |u(x)|^{p(x)-2}u(x)v(x) dx + \int_\Omega v^*(x)v(x) dx,$$

for all $v \in C_0^\infty(\Omega)$.

From the definition of the distributional derivative we have

$$\begin{cases} 
-\text{div}(|\nabla u(x)|^{p(x)-2}\nabla u(x)) = \lambda |u(x)|^{p(x)-2}u(x) + v(x) & \text{in } \Omega, \\
u = 0 & \text{on } \partial \Omega,
\end{cases} \quad (3.31)$$

so

$$\begin{cases} 
-\Delta_{p(x)} u - \lambda |u(x)|^{p(x)-2}u(x) \in \partial j(x, u(x)) & \text{in } \Omega, \\
u = 0 & \text{on } \partial \Omega.
\end{cases} \quad (3.32)$$

Therefore $u \in W_0^{1,p(x)}(\Omega)$ is a nontrivial solution of $(1.1).$ \qed

**Remark 3.4.** A nonsmooth potential satisfying hypothesis $H(j)$ and $H(j)_1$ is for example the one given by the following function:

$$j_1(x, t) = \begin{cases} 
-|t|^{b(x)} & \text{if } |t| \leq 1, \\
-|t|^{r^+} - \nu + 1 & \text{if } |t| > 1,
\end{cases}$$
Nontrival solution for nonlinear $p(x)$-Laplacian Dirichlet problem with the changing sign weight

with $\nu > 0$ and continuous functions $h, r : \overline{\Omega} \to \mathbb{R}$ which satisfy $1 < h(x) \leq h^+ < p^- \leq p(x) \leq p^+ < r^- \leq r(x) \leq r^+ < \tilde{p}^*$.

Instead of hypothesis $H(j)_1$ we can take additional assumption about behaviour in infinity and also obtain existence of nontrival solution.

$H(j)_2$ there exists $\mu > 2c_1$ such that

$$\limsup_{|t| \to \infty} \frac{j(x,t)}{|t|^{r(x)}} \leq -\mu,$$  \hspace{1cm} (3.33)

uniformly for almost all $x \in \Omega$ with $1 < p(x) \leq p^+ < r^- \leq r(x) < \tilde{p}^*$ for all $x \in \Omega$.

**Theorem 3.5.** If hypothesis $H(j)$ and $H(j)_2$ hold then problem \([1.1]\) has a nontrival solution for any $\lambda \in \mathbb{R}$.

**Proof.** We claim that $R(u)$ is bounded below. We assume that $||u|| > 1$.

By virtue of hypotheses $H(j)_2$, we know that there exist constants $\mu > 2c_1$ and $L > 0$ such that for almost all $x \in \Omega$ and all $|t| \geq L$, we have

$$j(x,t) \leq -\frac{\mu}{2} |t|^{r(x)}.$$  \hspace{1cm} (3.34)

On the other hand, from the hypothesis $H(j)(iii)$, for almost all $x \in \Omega$ and all $t < L$, we have

$$|j(x,t)| \leq c_1 |t|^{r(x)},$$  \hspace{1cm} (3.35)

with $p^+ < r^- \leq r(x)$. Therefore, from \((3.34)\) and \((3.35)\) it follows that for almost all $x \in \Omega$ and all $t \in \mathbb{R}$, we have

$$j(x,t) \leq (c_1 - \frac{\mu}{2}) |t|^{r(x)} \leq -k |t|^{r(x)},$$  \hspace{1cm} (3.36)

for some $k > 0$ (since $\mu > 2c_1$) and $p^+ < r^- \leq r(x) < \tilde{p}^*$ for all $x \in \Omega$.

Therefore, we have

$$R(u) = \int_{\Omega} \frac{1}{p(x)} |\nabla u(x)|^{p(x)} dx - \int_{\Omega} \frac{\lambda}{p(x)} |u(x)|^{p(x)} dx - \int_{\Omega} j(x,u(x)) dx \geq \frac{1}{p^+} \int_{\Omega} |\nabla u(x)|^{p(x)} dx - \frac{\lambda_+}{p^-} \int_{\Omega} |u(x)|^{p(x)} dx + k \int_{\Omega} |u(x)|^{r(x)} dx \geq k \int_{\Omega} |u(x)|^{r(x)} dx - \frac{\lambda_+}{p^-} \int_{\Omega} |u(x)|^{p(x)} dx,$$

where $\lambda_+ := \max\{0, \lambda\}$.

Since $r^- > p^+$ so $R(u) > L > 0$ for all $u \in W^{1,p(x)}_0(\Omega)$ with $||u|| > 1$.

We know that $R$ satisfies PS-condition. So we apply Theorem 2.6 and obtain $u_0 \in W^{1,p(x)}_0(\Omega)$ such that $R(u_0) = \inf\{R(u) : u \in W^{1,p(x)}_0(\Omega)\}$. This implies that $u_0$ is a critical point of $R$, and so it is a solution of \([1.1]\). \qed
