**L^p- Maximal Regularity of Nonlocal Parabolic Equation and Applications**

XICHENG ZHANG

**Abstract.** By using Fourier’s transform and Fefferman-Stein’s theorem, we investigate the $L^p$-maximal regularity of nonlocal parabolic and elliptic equations with singular and non-symmetric Lévy operators, and obtain the unique strong solvability of the corresponding nonlocal parabolic and elliptic equations, where the probabilistic representation plays an important role. As a consequence, a characterization for the domain of pseudo-differential operators of Lévy type with singular kernels is given in terms of the Bessel potential spaces. As a byproduct, we also show that a large class of non-symmetric Lévy operators generates an analytic semigroup in $L^p$-space. Moreover, as applications, we prove a Krylov’s estimate for stochastic differential equation driven by Cauchy processes (i.e. critical diffusion processes), and also obtain the global well-posedness to a class of quasi-linear first order parabolic system with critical diffusion. In particular, critical Hamilton-Jacobi equation and multidimensional critical Burger’s equation are uniquely solvable and the smooth solutions are obtained.

1. Introduction

Consider the following Cauchy problem of fractional Laplacian heat equation in the domain $[0, \infty) \times \mathbb{R}^d$ with $\alpha \in (0, 2)$ and $\lambda \geq 0$:

$$\partial_t u + (-\Delta)^\alpha u + b \cdot \nabla u + \lambda u = f, \quad u(0) = \varphi,$$

where $b : [0, \infty) \times \mathbb{R}^d \to \mathbb{R}^d$ is a measurable vector field, $f : [0, \infty) \times \mathbb{R}^d \to \mathbb{R}$ and $\varphi : \mathbb{R}^d \to \mathbb{R}$ are two measurable functions, and $(-\Delta)^\alpha$ is the fractional Laplacian (also called Lévy operator) defined by

$$(-\Delta)^\alpha u = \mathcal{F}^{-1}(|\cdot|^\alpha \mathcal{F}(u)), \quad u \in \mathcal{S}(\mathbb{R}^d),$$

where $\mathcal{F}$ (resp. $\mathcal{F}^{-1}$) denotes the Fourier (resp. inverse) transform, $\mathcal{S}(\mathbb{R}^d)$ is the Schwartz class of smooth real or complex-valued rapidly decreasing functions.

Let $(L_t)_{t \geq 0}$ be a symmetric and rotationally invariant $\alpha$-stable process. Let $b, f \in C_b^\infty([0, \infty) \times \mathbb{R}^d)$ and $X_{t,s}(x)$ solve the following stochastic differential equation (SDE):

$$X_{t,s}(x) = x + \int_t^s b(r, X_{t,r}(x))dr + \int_t^s \text{d}L_r, \quad t \leq s \leq 0, \quad x \in \mathbb{R}^d.$$ 

It is well-known that for $\varphi \in C_b^\infty(\mathbb{R}^d)$, the unique solution of equation (1.1) can be represented by Feyman-Kac formula as (see Theorem 5.2 below):

$$u(t, x) = \mathbb{E}\varphi(X_{t,0}(x)) + \mathbb{E} \left( \int_0^t e^{-\lambda(s-r)} f(-s, X_{t-r, s}(x))\text{d}s \right), \quad t \geq 0. \quad (1.3)$$

In connection with this representation, the first order term $b \cdot \nabla u$ is also called the drift term, and the fractional Laplacian term $(-\Delta)^\alpha u$ is also called the diffusion term.

Let now $u(t, x)$ satisfy (1.1). For $r > 0$ and $(t, x) \in [0, \infty) \times \mathbb{R}^d$, define

$$u'(t, x) := r^{-\alpha}u(r^\alpha t, r x), \quad b'(t, x) := b(r^\alpha t, r x), \quad f'(t, x) := f(r^\alpha t, r x),$$

**Keywords:** $L^p$-regularity, Lévy process, Krylov’s estimate, sharp function, critical Burger’s equation.

*This work is supported by NSFs of China (No. 10971076).
If one lets $r \to 0$, this scaling property leads to the following classification:

- (Subcritical case: $\alpha \in (1, 2)$) The drift term is controlled by the diffusion term at small scales.
- (Critical case: $\alpha = 1$) The fractional Laplacian has the same order as the first order term.
- (Supercritical case: $\alpha \in (0, 1)$) The effect of the drift term is stronger than the diffusion term at small scales.

In recent years there are great interests to study the above nonlocal equation, since it has appeared in numerous disciplines, such as quasi-geostrophic fluid dynamics (cf. [10, 9]), stochastic control problems (cf. [34]), nonlinear filtering with jump (cf. [28]), mathematical finance (cf. [5]), anomalous diffusion in semiconductor growth (cf. [38]), etc. In [12], Droniou and Imbert studied the first order Hamilton-Jacobi equation with fractional diffusion $(-\Delta)^{\frac{\alpha}{2}}$ basing upon a “reverse maximal principle”. Therein, when $\alpha \in (1, 2)$, the classical solution was obtained; when $\alpha \in (0, 2)$, the existence and uniqueness of viscosity solutions in the class of Lipschitz functions were also established. In [9], Caffarelli and Vasseur established the global well-posedness of critical dissipative quasi-geostrophic equation (see also [21] for a simple proof in the periodic and two dimensional case). On the other hand, Hölder regularity theory for the viscosity solutions of fully non-linear and nonlocal elliptic equations are also developed by Caffarelli and Silvestre [8], and Barles, Chasseigne and Imbert [4], see also the series of works of Silvestre [30, 31, 33, 32], etc. We emphasize that the arguments in [8] and [4] are different: the former is based on the Alexandorff-Backelman-Pucci’s (ABP) estimate, and the latter is based on the Ishii-Lions’ simple method.

The purpose of this paper is an attempt to develop an $L^p$-regularity theory for nonlocal equations with general Lévy operators. We describe it as follows. Let $\nu$ be a Lévy measure in $\mathbb{R}^d$, i.e., a $\sigma$-finite measure satisfying $\nu([0]) = 0$ and

$$\int_{\mathbb{R}^d} \min(1, |y|^2)\nu(dy) < +\infty.$$  

For $\alpha \in (0, 2)$, we write

$$y^{(\alpha)} := 1_{\alpha \in (1, 2)}y + 1_{\alpha = 1}y 1_{|y| \leq 1}.$$  

In this article we are mainly concerned with the following pseudo-differential operator of Lévy type:

$$\mathcal{L}^\nu f(x) := \int_{\mathbb{R}^d} [f(x+y) - f(x) - y^{(\alpha)} \cdot \nabla f(x)]\nu(dy), \quad f \in \mathcal{S}(\mathbb{R}^d),$$  

where $\nu$ satisfies

$$\nu^{(\alpha)}_1(B) \leq \nu(B) \leq \nu^{(\alpha)}_2(B), \quad B \in \mathcal{B}(\mathbb{R}^d),$$  

and

$$1_{\alpha = 1} \int_{r \leq |y| \leq R} \nu(dy) = 0, \quad 0 < r < R < +\infty.$$  

Here, $\nu^{(\alpha)}_i, i = 1, 2$ are the Lévy measures of two $\alpha$-stable processes taking the form

$$\nu^{(\alpha)}_i(B) := \int_{\mathbb{S}^{d-1}} \left( \int_0^\infty 1_{[r \theta \in B]} \frac{d\theta}{r^{d+\alpha}} \right) \Sigma_i(d\theta),$$  

where $\mathbb{S}^{d-1} = \{ \theta \in \mathbb{R}^d : |\theta| = 1 \}$ is the unit sphere in $\mathbb{R}^d$, and $\Sigma_i$ called the spherical part of $\nu^{(\alpha)}_i$ is a finite measure on $\mathbb{S}^{d-1}$. We remark that condition (1.7) is a common assumption in the critical case (see [27, 11]), and is clearly satisfied when $\nu$ is symmetric.
In a diﬀerence estimate for equation (1.1) and then use the classical method of freezing coeﬃcients in 1-D supercritical Burger’s equation. The idea here is to establish some apriori Hölder term. In fact, Kiselev, Nazarov and Schterenberg [20] have showed the existence of blow up so-
not to be applicable; on the other hand, the first order term has the same order as the di-
two aspects: on one hand, there is no energy inequality and thus, the variational method seems
sional case, the local well-posedness of Burger’s equation is relatively easy (cf. [18, 40]).

One of the aims of the present paper is to determine \( \mathcal{D}^p(\mathcal{L}^\nu) \), the domain of the Lévy operator \( \mathcal{L}^\nu \) in \( L^p \)-space. We shall prove that under (1.6) and (1.7), if \( \nu_1^{(a)} \) is nondegenerate (see Definition 2.6 below), then for any \( p \in (1, \infty) 
\begin{align*}
\mathcal{D}^p(\mathcal{L}^\nu) = \mathbb{H}^{1+\alpha,p},
\end{align*}
where \( \mathbb{H}^{1+\alpha,p} \) is the \( \alpha \)-order Bessel potential space. When \( \nu(dy) = a(y)dy/|y|^{d+\alpha} \) with \( c_1 \leq |a(y)| \leq c_2 \), this characterization was obtained recently by Dong and Kim [11]. It is remarked that the technique in [4] was used by Dong and Kim to derive some local Hölder estimate for nonlocal elliptic equation in order to prove their characterization. However, the following sum of nonlocal operators is not covered by [11]:

\begin{align*}
\mathcal{L}f(x) = \sum_{i=1}^{d} \int_{\mathbb{R}} \frac{f(x_1, \ldots, x_{i-1}, x_i + y_i, x_{i+1}, \ldots, x_d) - f(x) - y_i^{(a)} \cdot \partial_i f(x)}{|y|^{1+\alpha}} dy_i,
\end{align*}

since in this case, the Lévy measure (or the Lévy symbol) is very singular (or non-smooth) (see Remark 2.7). Notice that if the Lévy symbol is smooth and its derivatives satisfy suitable conditions, the above characterization falls into the classical multiplier theorems about pseudo-differential operators (cf. [36, 17]). We also mention that Farkas, Jacob and Schilling [13] Theorem 2.1.15] gave another characterization for \( \mathcal{D}^p(\mathcal{L}^\nu) \) in terms of the so called \( \psi \)-Bessel potential space, where \( \psi \) is the symbol of \( \mathcal{L}^\nu \).

The strategy for proving the above characterization is to prove the following Littlewood-Paley type inequality: for any \( p \in (1, \infty) \), there exists a \( C > 0 \) such that for any \( \lambda \geq 0 \), \( f \in L^p(\mathbb{R}^\ast \times \mathbb{R}^d) \),

\begin{align*}
\int_0^\infty \left\| \mathcal{L}^{\nu_2} \int_0^t e^{-\lambda(t-s)} P^{\nu_1}_{t-s} f(s, \cdot) ds \right\|_p^p dt 
\leq C \int_0^\infty \| f(t, \cdot) \|_p^p dt,
\end{align*}

where \( \nu_1, \nu_2 \) are two Lévy measures satisfying (1.6) and (1.7), and \((P^{\nu_1}_{t})_{t \geq 0}\) is the semigroup associated with \( \mathcal{L}^{\nu_1} \). Indeed, this estimate is the key ingredient in \( L^p \)-theory of PDE (see [26, 24]), and corresponds to the optimal regularity of nonlocal parabolic equation. Likewise [11], when \( \nu(dy) = a(y)dy/|y|^{d+\alpha} \) with smooth and 0-homogeneous \( a(y) \) and \( c_1 \leq |a(y)| \leq c_2 \), Mikulevicius and Pragarauskas [27] proved this type of estimate by showing some weak \((1,1)\)-type estimate. In a different way, the proof given here is based on Fourier’s transform and Fefferman-Stein’s theorem about sharp functions (cf. [22, 24]). We stress that probabilistic representation (1.3) will play an important role in reducing the general nonhomogeneous operator to homogeneous operator (see Step 1 in the proof of Theorem 4.2).

Another aim of this paper is to solve the linear and quasi-linear ﬁrst order nonlocal parabolic equation with critical diﬀusions in the \( L^p \)-sense rather than the viscosity sense [12]. The critical case is especially interesting not only because it appears naturally in quasi-geostrophic ﬂows, but also it is an attractive object in mathematics. In particular, we care about the following multidimensional critical Burger’s equation:

\begin{align*}
\partial_t u + (-\Delta)^{\frac{1}{2}} u + u \cdot \nabla u = 0, \quad u(0) = \varphi.
\end{align*}

In one dimensional case, this equation has a natural variational formulation and admits a unique global smooth solution (see [7, 20]) under some regularity assumption on \( \varphi \). In multidimensional case, the local well-posedness of Burger’s equation is relatively easy (cf. [18, 40]). However, the global well-posedness of equation (1.9) is a challenge problem. The reason lies in two aspects: on one hand, there is no energy inequality and thus, the variational method seems not to be applicable; on the other hand, the ﬁrst order term has the same order as the diﬀusion term. In fact, Kiselev, Nazarov and Schterenberg [20] have showed the existence of blow up solutions for 1-D supercritical Burger’s equation. The idea here is to establish some apriori Hölder estimate for equation (1.1) and then use the classical method of freezing coeﬃcients in [32].
Silvestre proved an apriori Hölder estimate for equation (1.1) with only bounded measurable $b$. This is the key point for us. However, the assumption of scale invariance on Lévy operators seems to be crucial in [32] since the proof is by the iteration of the diminish of oscillation at all scales. As above, we shall use probabilistic representation (1.3) like a perturbation argument to extend Silvestre’s estimate to the more general non-homogeneous Lévy operator (see Corollary 6.2).

This paper is organized as follows. In Section 2, we prepare some lemmas and recall some facts for later use. In Section 3, the basic maximum principles for nonlocal parabolic and elliptic equation are proved. In Section 4, we prove the main Theorem 4.2 and give a comparison result between two Lévy operators. In particular, we show that $(P^v_t)_{t \geq 0}$ forms an analytic semigroup in $L^p$-space. In Section 5, we prove the existence of a unique strong solution for the first order nonlocal parabolic equation with critical diffusion and various coefficients. As an application, we also prove a Krylov’s estimate for critical diffusion processes. We mention that in one dimensional and subcritical case, such type of estimate was firstly proved by Kurenok [25]; and in multidimensional and subcritical case, it was proved in [39]. In Section 6, we investigate quasi-linear first order nonlocal parabolic system, and get the existence of smooth solutions and strong solutions. In particular, the global solvability of equation (1.9) is obtained.

**Notations:** We collect some frequently used notations below for the reader’s convenience.

- $\mathbb{R}^+ := (0, \infty)$, $\mathbb{R}^+_0 := [0, \infty)$. For a complex number $z$, $\text{Re}(z)$ ($\text{Im}(z)$): real (image) part of $z$.
- $S(\mathbb{R}^d)$: the Schwartz class of smooth real or complex-valued rapidly decreasing functions.
- $C^\infty_b(\mathbb{R})$ (resp. $C^k_b(\mathbb{R}^d)$): the space of all bounded smooth functions with bounded derivatives of all orders (resp. up to $k$-order, with compact support).
- $\mathcal{F}$ and $\mathcal{F}^{-1}$: Fourier’s transform and Fourier’s inverse transform.
- $\nu$: Lévy measure; $\nu^{(\alpha)}$: the Lévy measure of $\alpha$-stable process; $\Sigma$: a finite measure on $\mathbb{S}^{d-1}$, called the spherical part of $\nu^{(\alpha)}$.
- $L^\mu_\nu$: the Lévy process associated with Lévy measure $\nu$; $P^\mu_\nu$: the semigroup associated with $L^\mu_\nu$.
- $L^\mu_\Sigma$: the generator of $L^\mu_\nu$, $L^\nu_{\Sigma^*}$: the adjoint operator of $L^\nu$; $P^\mu_\Sigma$: the heat kernel of $L^\nu$.
- $B_r(x_0) := \{ x \in \mathbb{R}^d : |x - x_0| \leq r \}$, $B_r := B_r(0)$, $B_r^c$: the complement of $B_r$.
- $\mathbb{H}^{\alpha,p}$: Bessel potential space; $\mathbb{W}^{\alpha,p}$: Sobolev-Slobodeckij space; $\mathbb{W}^{\alpha,\infty} := \bigcap_{k,p} \mathbb{W}^{k,p}$.
- $\omega$: the continuous modulus of $b$, i.e., $\omega_t(s) := \sup_{|x-y| \leq s} |b(x) - b(y)|$.
- $\mathcal{H}^\beta$: the space of Hölder continuous functions with the norm $\sum_{k=0}^{[\beta]} \| \nabla^k f \|_{\infty} + \| \nabla^{[\beta]} f \|_{\mathcal{H}^\beta}$, where $[\beta]$ denotes the integer part of $\beta$, and $\| \nabla^{[\beta]} f \|_{\mathcal{H}^\beta} := \sup_{|x-y| \leq 1} |\nabla^{[\beta]} f(x) - \nabla^{[\beta]} f(y)|/|x-y|^\beta$.
- $(\rho_\varepsilon)_{\varepsilon \in (0,1)}$: a family of mollifiers in $\mathbb{R}^d$ with $\rho_\varepsilon(x) = e^{-\varepsilon^{-1} |x|}$, where $\rho$ is a nonnegative smooth function with support in $B_1$ and satisfies $\int_{\mathbb{R}^d} \rho(x)dx = 1$.

**Convention:** The letter $C$ with or without subscripts will denote an unimportant constant. The inner product in Euclidean space is denoted by “$\cdot$”.

2. Preliminaries

For $\alpha \in (0,2)$, let $\nu$ be a Lévy measure in $\mathbb{R}^d$ and satisfy (1.6) and (1.7). Let $(L^\nu_\tau)_{\tau \geq 0}$ be the $d$-dimensional Lévy process, a stationary and independent increment process defined on some probability space $(\Omega, \mathcal{F}, P)$, with characteristic function

$$\mathbb{E} e^{i\xi L^\nu_\tau} = e^{-\psi_\nu(\xi)}, \quad \xi \in \mathbb{R}^d,$$

where $\psi_\nu$ is the Lévy exponent with the form by Lévy-Khintchine’s formula (cf. [29]),

$$\psi_\nu(\xi) := \int_{\mathbb{R}^d} (1 + i\xi \cdot \nu^{(\alpha)} - e^{i\xi y})\nu(dy).$$

(2.2)
Let \( \nu^{(\alpha)} \) take the form (1.8) and satisfy (1.7). It is well-known that \((L^{\nu^{(\alpha)}}_t)_{t \geq 0}\) is a \(d\)-dimensional \(\alpha\)-stable process and has the following self-similarity (cf. [29, Proposition 13.5 and Theorem 14.7]):

\[
(L^{\nu^{(\alpha)}}_t)_{t \geq 0} \stackrel{(d)}{=} (r^{1/\alpha}L^{\nu^{(\alpha)}}_t)_{t \geq 0}, \quad \forall r > 0,
\]

(2.3)

where \(\stackrel{(d)}{=}\) means that the two processes have the same laws. Moreover, from expression (1.8), it is easy to see that for any \(\beta \in (0, \alpha)\),

\[
\int_{\mathbb{R}^d} \min(|y|^\beta, |y|^2) \nu^{(\alpha)}(dy) < +\infty,
\]

(2.4)

and

\[
\Re(\psi_{\nu^{(\alpha)}}(\xi)) = \left( \int_0^\infty (1 - \cos r) \frac{dr}{r^{1+\alpha}} \right) \int_{S^{d-1}} |\xi| \cdot \theta^{\alpha} \Sigma(d\theta).
\]

(2.5)

The Feller semigroup associated with \((L^\nu_t)_{t \geq 0}\) is defined by

\[
\mathcal{P}_t^\nu f(x) := \mathbb{E} f(L^\nu_t + x), \quad f \in \mathcal{S}(\mathbb{R}^d).
\]

The generator of \((\mathcal{P}_t^\nu)_{t \geq 0}\) is then given by (cf. [2, Theorem 3.3.3])

\[
\mathcal{L}^\nu f(x) = \int_{\mathbb{R}^d} [f(x + y) - f(x) - y^{(\alpha)} \cdot \nabla f(x)] \nu(dy),
\]

(2.6)

i.e.,

\[
\partial_t \mathcal{P}_t^\nu f(x) = \mathcal{L}^\nu \mathcal{P}_t^\nu f(x) = \mathcal{P}_t^\nu \mathcal{L}^\nu f(x), \quad t > 0.
\]

(2.7)

Moreover,

\[
\mathcal{F}(\mathcal{L}^\nu f)(\xi) = -\psi_f (\xi) \cdot \mathcal{F}(f)(\xi),
\]

and \(\psi_f\) is also called the Lévy symbol of the operator \(\mathcal{L}^\nu\). From (2.5), one sees that if the spherical part \(\Sigma\) of \(\nu^{(\alpha)}\) is the uniform distribution (equivalently, rotationally invariant) on \(S^{d-1}\), then \(\psi_{\nu^{(\alpha)}}(\xi) = c_{d,\alpha} |\xi|^\alpha\) for some constant \(c_{d,\alpha} > 0\), and thus, by (1.2),

\[
-\mathcal{L}^\nu f(x) = c_{d,\alpha} (-\Delta)^{\frac{\alpha}{2}} f(x).
\]

(2.8)

On the other hand, from expression (2.6) and assumption (1.7), it is easy to see that \(\mathcal{L}^\nu\) has the following invariance:

- For \(z \in \mathbb{R}^d\), define \(f_z(x) := f(z + x)\), then

\[
\mathcal{L}^\nu f_z(x) = \mathcal{L}^\nu f_z(z), \quad \|\mathcal{L}^\nu f_z\|_p = \|\mathcal{L}^\nu f\|_p,
\]

(2.9)

where \(p \geq 1\) and \(\| \cdot \|_p\) denotes the usual \(L^p\)-norm in \(\mathbb{R}^d\).

- For \(r > 0\), define \(f_r(x) := f(rx)\), then

\[
\mathcal{L}^\nu f_r(x) = \mathcal{L}^{\nu(r)} f_r(x) = r^{-\alpha} \mathcal{L}^{\nu(r)} f_r(x).
\]

(2.10)

We remark that \(r^\alpha \nu^{(\alpha)}(r) = \nu^{(\alpha)}\) by (1.8).

- \(\mathcal{L}^\nu(C^\infty_b(\mathbb{R}^d)) \subset C^\infty_b(\mathbb{R}^d)\), and for any \(k \geq 2\), \(\mathcal{L}^\nu : C^k_b(\mathbb{R}^d) \to C^{k-2}_b(\mathbb{R}^d)\) is a continuous linear operator, where \(C^\infty_b(\mathbb{R}^d)\) (resp. \(C^k_b(\mathbb{R}^d)\)) is the space of all bounded smooth functions with bounded derivatives of all orders (resp. up to \(k\)-order).

The adjoint operator of \(\mathcal{L}^\nu\) is given by

\[
\mathcal{L}^{\nu^*} f(x) = \int_{\mathbb{R}^d} [f(x - y) - f(x) + y^{(\alpha)} \cdot \nabla f(x)] \nu(dy),
\]

(2.11)

i.e.,

\[
\int_{\mathbb{R}^d} \mathcal{L}^\nu f(x) \cdot g(x) dx = \int_{\mathbb{R}^d} f(x) \cdot \mathcal{L}^{\nu^*} g(x) dx, \quad f, g \in \mathcal{S}(\mathbb{R}^d).
\]
Clearly, $\mathcal{L}^{\nu} = \mathcal{L}^{\nu(-)}$, where $\nu(-)$ denotes the Lévy measure $\nu(-dy)$.

**Definition 2.1.** Let $\nu_1$ and $\nu_2$ be two Borel measures. We say that $\nu_1$ is less than $\nu_2$ if

$$\nu_1(B) \leq \nu_2(B), \ B \in \mathcal{B}(\mathbb{R}^d),$$

and we simply write $\nu_1 \leq \nu_2$ in this case.

**Lemma 2.2.** Let $\nu$ be a Lévy measure less than $\nu^{(\alpha)}$ for some $\alpha \in (0, 2)$, where $\nu^{(\alpha)}$ takes the form (1.7). We also assume (1.7) for $\nu$. Then for some $\kappa_0 > 0$,

$$|\psi_\nu(\xi)| \leq \kappa_0|\xi|^\alpha, \ \xi \in \mathbb{R}^d.$$ (2.12)

**Proof.** Write $\hat{\xi} := \xi/|\xi|$. For $\alpha \in (1, 2)$, by the definitions of $\psi_\nu$ and $\nu^{(\alpha)}$, we have

$$|\text{Im}(\psi_\nu(\xi))| \leq \left|\int_{\mathbb{R}^d} (\xi \cdot y - \sin(\xi \cdot y))\nu(dy)\right| \leq \int_{\mathbb{R}^d} |\xi \cdot y - \sin(\xi \cdot y)|\nu^{(\alpha)}(dy)$$

$$= \left|\int_{\mathbb{R}^d} |\xi \cdot y - \sin(\xi \cdot y)|\nu^{(\alpha)}(dy)\right|$$

$$\leq \left|\int_{\mathbb{R}^d} |\xi \cdot y - \sin(\xi \cdot y)|\nu^{(1)}(dy)\right|$$

$$= \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} |\xi \cdot y - \sin(\xi \cdot y)|\nu^{(1)}(dy)\right)|\nu^{(\alpha)}(\xi)\right|$$

$$= |\xi|^\alpha \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} |\xi \cdot r\theta - \sin(\hat{\xi} \cdot r\theta)|\nu^{(\alpha)}(\xi)\right)\nu^{(\alpha)}(dy)\right|$$

$$= |\xi|^\alpha \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} |\frac{\xi \cdot r\theta - \sin(\hat{\xi} \cdot r\theta)}{r^2}|\nu^{(\alpha)}(\xi)\right)\nu^{(\alpha)}(dy)\right|$$

$$= |\xi|^\alpha \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} \frac{|\xi \cdot r\theta|}{r^2}\nu^{(\alpha)}(\xi)\right)\nu^{(\alpha)}(dy)\right|$$

$$= |\xi|^\alpha \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} \frac{\sin(\hat{\xi} \cdot r\theta)}{r^2}\nu^{(\alpha)}(\xi)\right)\nu^{(\alpha)}(dy)\right|$$

$$= |\xi|^\alpha \left|\int_{\mathbb{R}^d} \left(\int_{|\xi| \leq 1} \frac{\sin(\hat{\xi} \cdot r\theta)}{r^2}\nu^{(\alpha)}(\xi)\right)\nu^{(\alpha)}(dy)\right|$$

Thus, combining with (2.3), we obtain (2.12). \hfill \Box

For $k \in \mathbb{N}$ and $p \in [1, \infty]$, let $\mathcal{W}^{k,p}$ be the usual Sobolev space with the norm

$$\|f\|_{k,p} := \sum_{j=0}^{k} \|\nabla^j f\|_p,$$

where $\nabla^j$ denotes the $j$-order gradient.

We need the following simple interpolation result.

**Lemma 2.3.** Let $p \in [1, \infty]$ and $\beta \in [0, 1]$. For any $f \in \mathcal{W}^{1,p}$ and $y \in \mathbb{R}^d$, we have

$$\|f(\cdot + y) - f(\cdot)\|_p \leq (2\|f\|_p)^{1-\beta}(\|\nabla f\|_p|y|)^\beta.$$ (2.13)
Proof. Observing that for $f \in S(\mathbb{R}^d)$,
\[
|f(x + y) - f(x)| \leq |y| \int_0^1 |\nabla f|(x + sy)\,ds,
\]
by a density argument, we have for any $f \in \mathcal{W}^{1,p}$,
\[
\|f(\cdot + y) - f(\cdot)\|_p \leq \|\nabla f\|_p|y|.
\]
Thus, for any $\beta \in [0, 1]$,
\[
\|f(\cdot + y) - f(\cdot)\|_p \leq (2\|f\|_p) \land (\|\nabla f\|_p|y|) \leq (2\|f\|_p)^{1-\beta}(\|\nabla f\|_p|y|)^\beta.
\]
The result follows. \hfill \square

The following lemma will be used to derive some asymptotic estimate of large time for the heat kernel of Lévy operator (see Corollary \ref{7} below).

Lemma 2.4. Assume that Lévy measure $\nu$ is less than $\nu^{(\alpha)}$ for some $\alpha \in (0, 2)$, where $\nu^{(\alpha)}$ takes the form \eqref{1.3}. Then for any $p \in [1, \infty]$ and $f \in \mathcal{W}^{2,p}$, we have
\[
\|L^\nu f\|_p \leq C \left\{ \begin{array}{ll}
\|\nabla f\|_p^{-\gamma}\|\nabla^2 f\|_p^\alpha + \|\nabla f\|_p^{1-\beta}\|\nabla^2 f\|_p^\beta, & \alpha \in (1, 2), \quad \gamma \in (\alpha - 1, 1), \quad \beta \in [0, \alpha - 1), \\
\|\nabla f\|_p^{-\gamma}\|\nabla^2 f\|_p^\alpha + |f|_p^{1-\beta}\|\nabla^2 f\|_p^\beta, & \alpha = 1, \quad \gamma \in (0, 1), \quad \beta \in [0, 1), \\
|f|_p^{-\gamma}\|\nabla^2 f\|_p^\alpha + |f|_p^{1-\beta}\|\nabla^2 f\|_p^\beta, & \alpha \in (0, 1), \quad \gamma \in (0, 1), \quad \beta \in [0, \alpha),
\end{array} \right.
\]
where the constant $C$ depends only on $\alpha, \beta, \gamma$ and the Lévy measure $\nu^{(\alpha)}$.

Proof. Let us first look at the case of $\alpha \in (1, 2)$. In this case, we have
\[
L^\nu f(x) = \int_{\mathbb{R}^d} y \cdot \left( \int_0^1 [\nabla f(x + sy) - \nabla f(x)]\,ds \right) \nu(dy).
\]
Since $\nu$ is bounded by $\nu^{(\alpha)}$, by Minkowski’s inequality and Lemma \ref{2.3} we have for $\gamma \in (\alpha - 1, 1)$ and $\beta \in [0, \alpha - 1)$,
\[
\|L^\nu f\|_p \leq (2\|\nabla f\|_p)^{1-\gamma}\|\nabla^2 f\|_p \int_{|y|<1} |y|^{1-\gamma}\nu^{(\alpha)}(dy) + (2\|\nabla f\|_p)^{1-\beta}\|\nabla^2 f\|_p \int_{|y|>1} |y|^{1-\beta}\nu^{(\alpha)}(dy).
\]
In the case of $\alpha = 1$, we similarly have for $\gamma \in (0, 1)$ and $\beta \in [0, 1)$,
\[
\|L^\nu f\|_p \leq (2\|\nabla f\|_p)^{-\gamma}\|\nabla^2 f\|_p \int_{|y|<1} |y|^{1-\gamma}\nu^{(1)}(dy) + (2\|\nabla f\|_p)^{1-\beta}\|\nabla^2 f\|_p \int_{|y|>1} |y|^{1-\beta}\nu^{(1)}(dy).
\]
In the case of $\alpha \in (0, 1)$, we have for $\gamma \in (\alpha, 1)$ and $\beta \in [0, \alpha)$,
\[
\|L^\nu f\|_p \leq (2\|\nabla f\|_p)^{1-\gamma}\|\nabla^2 f\|_p \int_{|y|<1} |y|^{\gamma}\nu^{(\alpha)}(dy) + (2\|\nabla f\|_p)^{1-\beta}\|\nabla^2 f\|_p \int_{|y|>1} |y|^{\beta}\nu^{(\alpha)}(dy).
\]
The proof is complete by \eqref{2.4}. \hfill \square

We also need the following estimate, which will be used frequently in localizing the nonlocal equation.

Lemma 2.5. Assume that Lévy measure $\nu$ is less than $\nu^{(\alpha)}$ for some $\alpha \in (0, 2)$, where $\nu^{(\alpha)}$ takes the form \eqref{1.3}. Let $\xi \in S(\mathbb{R}^d)$ and set $\xi_z(x) := \xi(x - z)$ for $z \in \mathbb{R}^d$.

(i) For any $\beta \in (0 \lor (\alpha - 1), 1)$ and $p \in [1, \infty)$, there exists a constant $C = C(\nu^{(\alpha)}, \beta, p, d) > 0$ such that for all $f \in \mathcal{W}^{1,p}$,
\[
\left( \int_{\mathbb{R}^d} \|L^\nu f\xi_z\|_p^p \,dz \right)^{1/p} \leq C\|\xi\|_{L^2,p}\|f\|_p^{1-\beta}\|f\|_p^\beta.
\]
(ii) For any $\beta \in (0 \lor (\alpha - 1), 1)$ and $\gamma \in [0, \alpha)$, there exists a constant $C = C(\nu(\alpha), \beta, \gamma, d) > 0$ such that for any $p \in [1, \infty]$ and $f \in \mathbb{H}^p$,
\begin{equation}
\| \mathcal{L}'(f \nu) - (\mathcal{L}' f \nu)(x) \|_p \leq C \left( \| \mathcal{L}' \nu \|_p + \| \nu \|_p^{1-\gamma} \| \nabla \nu \|_p \| f \|_{\mathbb{H}^p} + \| \nabla \nu \|_p \| f \|_{\mathbb{H}^p} \right),
\end{equation}
where $\| f \|_{\mathbb{H}^p} := \sup_{x, y, |x - y| < 1} |f(x) - f(y)| / |x - y|^\beta$, and for any $p \in [1, \infty]$ and $f \in \mathbb{H}^{1:p}$,
\begin{equation}
\| \mathcal{L}'(f \nu) - (\mathcal{L}' f \nu)(x) \|_p \leq C \left( \| \mathcal{L}' \nu \|_\infty + \| \nu \|_\infty^{1-\gamma} \| \nabla \nu \|_\infty \| f \|_p + \| \nabla \nu \|_\infty \| f \|_p^{1-\beta} \| \nabla f \|_p^\beta \right).
\end{equation}

Proof. (i). By formula (2.6), we have
\begin{equation}
\mathcal{L}'(f \nu)(x) - \mathcal{L}' f \nu(x) \cdot \zeta(x) - f(x) \cdot \mathcal{L}' \zeta(x) = \int_{\mathbb{R}^d} \left[ f(x + y) - f(x) \right] [\zeta(x + y) - \zeta(x)] \nu(dy)
\end{equation}
\begin{equation}
= \int_{|y| < 1} \left[ f(x + y) - f(x) \right] [\zeta(x + y) - \zeta(x)] \nu(dy)
\end{equation}
\begin{equation}
+ \int_{|y| > 1} \left[ f(x + y) - f(x) \right] [\zeta(x + y) - \zeta(x)] \nu(dy) =: I_1^{(1)}(x) + I_2^{(1)}(x).
\end{equation}

For $I_1^{(1)}(x)$, by Fubini's theorem, Minkowski's inequality and Lemma 2.3, we have
\begin{equation}
\int_{\mathbb{R}^d} \| I_1^{(1)} \|_p^p dx \leq \int_{\mathbb{R}^d} \left\| \int_{|y| < 1} \left| f(\cdot + y) - f(\cdot) \right| \left( \int_0^1 \left| \nabla \nu(\cdot + sy) \right| ds \right) \left| y \nu(dy) \right| \right\|^p_p dy \leq \| \nabla \nu \|^p_p \int_{\mathbb{R}^d} \left( \int_{|y| < 1} \left| f(\cdot + y) - f(\cdot) \right| \left| y \nu(dy) \right| \right)^p dx
\end{equation}
\begin{equation}
\leq \| \nabla \nu \|^p_p \left( \int_{|y| < 1} \left| f(\cdot + y) - f(\cdot) \right| \| y \nu(dy) \right)^p
\end{equation}
\begin{equation}
\leq \| \nabla \nu \|^p_p (2\| f \|_p)^p \| \nabla f \|_p^\beta \left( \int_{|y| < 1} |y|^{1+\beta} \nu(dy) \right)^p.
\end{equation}

For $I_2^{(1)}(x)$, we similarly have
\begin{equation}
\int_{\mathbb{R}^d} \| I_2^{(1)} \|_p^p dx \leq 4^p (\nu(\alpha)(B_1)) \| \nabla \nu \|^p_p \| f \|^p_p.
\end{equation}

Moreover, by (2.9) and Lemma 2.4, we also have
\begin{equation}
\int_{\mathbb{R}^d} \| f \mathcal{L}' \zeta \|_p^p dx = \| f \mathcal{L}' \zeta \|_p^p \leq C \| f \|_2 \| f \|_p
\end{equation}
Combining the above calculations, we obtain (2.14).

(ii). We have
\begin{equation}
\| I_0^{(1)} \|_p \leq \| f \|_{\mathbb{H}^p} \| \nabla \nu \|_p \int_{|y| < 1} |y|^{1+\beta} \nu(dy) \leq \| f \|_{\mathbb{H}^p} \| \nabla \nu \|_p \int_{|y| < 1} |y|^{1+\beta} \nu(dy),
\end{equation}
and by Lemma 2.3
\begin{equation}
\| I_0^{(2)} \|_p \leq \| f \|_\infty (2\| \zeta \|_p)^{1-\gamma} \| \nabla \zeta \|_p \int_{|y| < 1} |y|^\gamma \nu(dy) \leq \| f \|_\infty (2\| \zeta \|_p)^{1-\gamma} \| \nabla \zeta \|_p \int_{|y| < 1} |y|^\gamma \nu(dy).
\end{equation}

Estimate (2.15) follows by (2.17) and $\| f \mathcal{L}' \zeta \|_p \leq \| f \|_{\mathbb{H}^p} \| f \mathcal{L}' \zeta \|_p$. As for (2.16), it is similar. □
Definition 2.6. Let $\nu^{(\alpha)}$ be a Lévy measure with the form (1.8). We say that $\nu^{(\alpha)}$ is nondegenerate if the spherical part $\Sigma$ of $\nu^{(\alpha)}$ satisfies

$$\int_{S^{d-1}} |\theta_0 \cdot \theta|^{\alpha} \Sigma(\theta) \neq 0, \quad \forall \theta_0 \in S^{d-1}. \quad (2.18)$$

By the compactness of $S^{d-1}$ and (2.18), the above condition is equivalent that for some constant $\kappa_1 > 0$,

$$\text{Re}(\psi_{\nu^{(\alpha)}}(\xi)) \geq \kappa_1 |\xi|^\alpha, \quad \xi \in \mathbb{R}^d. \quad (2.19)$$

Remark 2.7. Let $L_1^n, \ldots, L_n^n$ be $n$-independent copies of Lévy process $L_1^n$. Write

$L_t = (L_1^n, \ldots, L_n^n)$.

Then $L_t$ is an nd-dimensional Lévy process and the characteristic function of $L_1$ is given by $\psi(\xi) = \psi_1(\xi^1) + \cdots + \psi_n(\xi^n)$, where $\xi = (\xi^1, \cdots, \xi^n) \in \mathbb{R}^n$ with $\xi^i \in \mathbb{R}^d$. Clearly, if

$$\text{Re}(\psi_{\nu}(\xi)) \geq \kappa_1 |\xi|^\alpha, \quad \xi \in \mathbb{R}^d,$$

then

$$\text{Re}(\psi_{\xi_1}(\xi)) \geq \kappa_1 |\xi_1|^\alpha, \quad \xi, \xi_1 \in \mathbb{R}^d.$$

It should be noticed that the Lévy measure $\nu$ of $L_t$ is very singular and has the expression

$$\nu(dx) = \nu(dx^1) \epsilon_0(dx^2, \cdots, dx^n) + \cdots + \epsilon_0(dx^1, \cdots, dx^{n-1})\nu(dx^n),$$

where $\bar{x} = (x^1, \cdots, x^n) \in \mathbb{R}^n$ with $x^i \in \mathbb{R}^d$, $\epsilon_0$ denotes the Dirac measure in $\mathbb{R}^{(n-1)d}$, and the generator of $L_t$ is given by

$$L_f(\bar{x}) = \sum_{i=1}^n \int_{\mathbb{R}^d} [f(x^1, \cdots, x^i + y, \cdots, x^n) - f(\bar{x}) - y^i \cdot \nabla_{x^i} f(\bar{x})] \nu(dy). \quad (2.20)$$

We need the following simple result about the smoothness of the distribution density of Lévy process (see [16] Lemma 3.1 for the symmetric case).

Proposition 2.8. Let $\psi_i$ be defined by (2.2) and satisfy

$$\text{Re}(\psi_{\nu}(\xi)) \geq \kappa_1 |\xi|^\alpha, \quad \xi \in \mathbb{R}^d. \quad (2.21)$$

Then for each $t > 0$, the law of $L_t^\nu$ in $\mathbb{R}^d$ has a smooth density $p_t^\nu$ with respect to the Lebesgue measure, and $p_t^\nu \in C^{1}_{\Sigma} \cap L^{1}(\mathbb{R}^{d})$. In particular, by (2.7),

$$\partial_t p_t^\nu(x) = L^\nu p_t^\nu(x), \quad (t, x) \in \mathbb{R}^+ \times \mathbb{R}^d, \quad (2.22)$$

where $L^\nu$ is defined by (2.17), and $p_t^\nu(x)$ is also called the heat kernel of $L^\nu$.

Proof. By (2.21) and [29] p.190, Proposition 28.1, $L_t^\nu$ has a smooth density $p_t^\nu$. Let us now prove that for each $n \in \mathbb{N}$, $\nabla^\alpha p_t^\nu \in L^1(\mathbb{R}^d)$. By Fourier’s transform (2.1), one sees that

$$p_t^\nu(x) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot x} e^{-t\psi(\xi)} d\xi.$$ 

Set

$$\phi(\xi) := \int_{|y| \leq 1} (1 + i\xi \cdot y - e^{i\xi \cdot y}) \nu(dy).$$

It is easy to see that $\phi$ is a smooth complex-valued function, and by (2.21), for any $n \in \mathbb{N}$ and $j_1, \cdots, j_n \in \{1, \cdots, d\}$,

$$\xi \rightarrow \xi_{j_1} \cdots \xi_{j_n} e^{-i\phi(\xi)} \in \mathcal{S}(\mathbb{R}^d),$$
where \( \xi = (\xi_1, \cdots, \xi_d) \). Since Fourier’s transform \( \mathcal{F} \) is a bijective and continuous linear operator from \( \mathcal{S}(\mathbb{R}^d) \) onto itself, there is a function \( f \in \mathcal{S}(\mathbb{R}^d) \) such that

\[
\hat{f}(\xi) := \mathcal{F}(f)(\xi) = \xi_{j_1} \cdots \xi_{j_n} e^{-i\theta(\xi)}.
\]

On the other hand, by Lévy-Khintchine’s representation theorem (cf. \cite[Theorem 1.2.14]{levy}), there is a probability measure \( \mu \) on \( \mathbb{R}^d \) such that

\[
\hat{\mu}(\xi) := \int_{\mathbb{R}^d} e^{i\xi \cdot y} \mu(dy) = e^{-i\theta(\xi)}.
\]

Thus, by the property of Fourier’s transform, we have

\[
\partial_{x_{j_1}} \cdots \partial_{x_{j_n}} \hat{p}^\alpha_t(x) = \frac{(-i)^n}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot x} (\xi_{j_1} \cdots \xi_{j_n} e^{-i\theta(\xi)}) e^{-i\theta(\xi)} d\xi
\]

\[
= \frac{(-i)^n}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot x} \hat{\mu}(\xi) d\xi = (-i)^n \int_{\mathbb{R}^d} f(x-y) \mu(dy).
\]

From this, we immediately deduce that \( \nabla^n p_t^\alpha \in L^1(\mathbb{R}^d) \).

Using Proposition \ref{prop:heatkernel} and Lemma \ref{lem:heatkernel} we have the following useful estimates about the heat kernel.

**Corollary 2.9.** Let \( \nu_i^{(\alpha)} \), \( i = 1, 2 \) be two Lévy measures with the form \( \nu_i \), where \( \nu_i^{(\alpha)} \) is nondegenerate. Let \( \nu \) be another Lévy measure less than \( \nu_2^{(\alpha)} \). Then, there are two indices \( \delta_1, \delta_2 > 1 \) (depending only on \( \alpha \)) and constants \( C_1, C_2 > 0 \) (depending only on \( \alpha, \nu_i^{(\alpha)} \) and not on \( \nu \)) such that for all \( t \geq 1 \),

\[
\|\nabla \mathcal{L}^\nu p_{t_i}^{\nu_i^{(\alpha)}} \|_1 \leq C_1 t^{-\delta_1},
\]

\[
\|
\partial_t \mathcal{L}^\nu p_{t_i}^{\nu_i^{(\alpha)}} \|_1 \leq C_2 t^{-\delta_2}.
\]

**Proof.** First of all, by the scaling property \( \mathcal{L}^\nu \) and Proposition \ref{prop:heatkernel} we have

\[
p_{t_i}^{\nu_i^{(\alpha)}}(x) = t^{-d/\alpha} p_1^{\nu_i^{(\alpha)}}(t^{-1/\alpha} x),
\]

and for each \( n \in \mathbb{N} \),

\[
\int_{\mathbb{R}^d} |\nabla^n p_{t_i}^{\nu_i^{(\alpha)}}|(x) dx = t^{-n/\alpha} \int_{\mathbb{R}^d} |\nabla^n p_1^{\nu_i^{(\alpha)}}|(x) dx \leq C t^{-n/\alpha}.
\]

Estimate \( \mathcal{L}^\nu p_{t_i}^{\nu_i^{(\alpha)}} \) follows from Lemma \ref{lem:heatkernel} by suitable choices of \( \beta \) and \( \gamma \). Notice that by \( \mathcal{L}^\nu p_{t_1}^{\nu_1^{(\alpha)}} \),

\[
\partial_t \mathcal{L}^\nu p_{t_i}^{\nu_i^{(\alpha)}}(x) = \mathcal{L}^{\nu} \mathcal{L}^{\nu_i^{(\alpha)}} p_{t_i}^{\nu_i^{(\alpha)}}(x).
\]

Estimate \( \mathcal{L}^{\nu_i^{(\alpha)}} \) follows by using Lemma \ref{lem:heatkernel} twice.

Now we turn to recall the classical Fefferman-Stein’s theorem. Fix \( \alpha \in (0, 2) \). Let \( Q_\gamma^{(\alpha)} \) be the collection of all parabolic cylinders

\[
Q_r := (t_0, t_0 + r^\gamma) \times \{ x \in \mathbb{R}^d : |x - x_0| \leq r \}.
\]

For \( f \in L^1_{\text{loc}}(\mathbb{R}^{d+1}) \), define the Hardy-Littlewood maximal function by

\[
\mathcal{M} f(t, x) := \sup_{Q \in Q_\gamma^{(\alpha)}, (t, x) \in Q} \int_Q |f(s, y)| dy ds,
\]

and the sharp function by

\[
f^s(t, x) := \sup_{Q \in Q_\gamma^{(\alpha)}, (t, x) \in Q} \int_Q |f(s, y) - f_Q| dy ds,
\]
where \( f_Q := \int_Q f(s,y)dyds = \frac{1}{|Q|} \int_Q f(s,y)dyds \) and \( |Q| \) is the Lebesgue measure of \( Q \). One says that \( f \in BMO(\mathbb{R}^{d+1}) \) if \( f^2 \in L^\infty(\mathbb{R}^{d+1}) \). Clearly, \( f \in BMO(\mathbb{R}^{d+1}) \) if and only if there exists a constant \( C > 0 \) such that for any \( Q \in \mathbb{Q}(\alpha) \), and for some \( a_Q \in \mathbb{R} \),

\[
\int_Q |f(s,y) - a_Q|dyds \leq C.
\]

The following theorem is taken from [24, Chapter 3] (see also [36, p.148 Theorem 2]).

**Theorem 2.10.** *(Fefferman-Stein’s theorem)* For \( p \in (1, \infty) \), there exists a constant \( C = C(p, d, \alpha) \) such that for all \( f \in L^p(\mathbb{R}^{d+1}) \),

\[
\|f\|_p \leq C\|f^2\|_p. \tag{2.26}
\]

Using this theorem, we have

**Theorem 2.11.** For \( q \in (1, \infty) \), let \( \mathcal{T} \) be a bounded linear operator from \( L^q(\mathbb{R}^{d+1}) \) to \( L^q(\mathbb{R}^{d+1}) \) and also from \( L^{\infty}(\mathbb{R}^{d+1}) \) to \( BMO(\mathbb{R}^{d+1}) \). Then for any \( p \in [q, \infty) \) and \( f \in L^p(\mathbb{R}^{d+1}) \),

\[
\|\mathcal{T}f\|_p \leq C\|f\|_p,
\]

where the constant \( C \) depends only on \( d, p, q, \alpha \) and the norms of \( \|\mathcal{T}\|_{L^q \to L^q} \) and \( \|\mathcal{T}\|_{L^\infty \to BMO} \).

**Proof.** Since by [35, p.13, Theorem 1],

\[
\|(\mathcal{T} f)^\sharp\|_q \leq 2\|M \mathcal{T} f\|_q \leq C\|\mathcal{T} f\|_q \leq C\|\mathcal{T}\|_{L^q \to L^q}\|f\|_q
\]

and

\[
\|(\mathcal{T} f)^\sharp\|_\infty \leq \|\mathcal{T}\|_{L^\infty \to BMO}\|f\|_\infty,
\]

by the classical Marcinkiewicz’s interpolation theorem (cf. [35]), we have

\[
\|\mathcal{T} f\|_p \leq C\|(\mathcal{T} f)^\sharp\|_p \leq C\|f\|_p,
\]

where \( p \in [q, \infty) \). \( \square \)

3. **A Maximum Principle of Nonlocal Parabolic Equation**

In this section we fix a Lévy measure \( \nu \) less than \( \nu^{(\alpha)} \) for some \( \alpha \in (0, 2) \), where \( \nu^{(\alpha)} \) takes the form \( \nu \), and prove basic maximum principles for nonlocal parabolic and elliptic equations for later use.

**Lemma 3.1.** *(Maximum principle)* For \( T > -\infty \), let \( b(t,x) \) be a bounded measurable vector field on \( [T, \infty) \times \mathbb{R}^d \) and \( u \in C([T, \infty); C^2_b(\mathbb{R}^d)) \). Assume that for all \( (t,x) \in [T, \infty) \times \mathbb{R}^d \), \( u \) satisfies

\[
u(t,x) = u(T,x) + \int_T^\infty \mathcal{L}^\nu u(s,x)ds + \int_T^\infty (b \cdot \nabla u)(s,x)ds + \int_T^\infty f(s,x)ds. \tag{3.1}
\]

If \( f \equiv 0 \), then

\[
\sup_{t \geq T} \sup_{x \in \mathbb{R}^d} u(t,x) \leq \sup_{x \in \mathbb{R}^d} u(T,x).
\]

In particular, the above equation admits at most one solution \( u \in C([T, \infty); C^2_b(\mathbb{R}^d)) \).

**Proof.** Let \( \chi(x) \in [0, 1] \) be a nonnegative smooth function with \( \chi(x) = 1 \) for \( |x| \leq 1 \), and \( \chi(x) = 0 \) for \( |x| \geq 2 \). Set for \( R > 0 \),

\[
\chi_R(x) := \chi(R^{-1}x),
\]

and for \( \delta > 0 \),

\[
w^\delta_R(t,x) := \chi_R(x)u(t,x) - \delta(t-T).
\]
By (3.1), one sees that for all \((t, x) \in [T, \infty) \times \mathbb{R}^d\),

\[
w^R_\ast(t, x) = w_R^\ast(T, x) + \int_T^t \mathcal{L}^r w_R^\ast(s, x)ds + \int_T^t (b \cdot \nabla w_R^\ast)(s, x)ds + \int_T^t g_R(s, x)ds - \delta(t - T),
\]

where

\[
g_R := \chi_R \mathcal{L}^r u - \mathcal{L}^r w_R - ub \cdot \nabla \chi_R + f \chi_R. \quad \tag{3.2}
\]

For fixed \(S > T\) and \(\delta > 0\), we want to show that for large \(R\),

\[
\sup_{t \in [T, S]} \sup_{x \in \mathbb{R}^d} w^R_\ast(t, x) \leq \sup_{t \in \mathbb{R}^d} w^R_\ast(T, x) \leq \sup_{x \in \mathbb{R}^d} u(T, x). \quad \tag{3.3}
\]

If this is proven, then the result follows by firstly letting \(R \to \infty\) and then \(\delta \to 0\).

Below, for simplicity of notation, we drop the indexes \(R\) and \(\delta\). Suppose that (3.3) does not hold, then there exists a time \(t_0 \in (T, S]\) and \(x_0 \in \mathbb{R}^d\) such that \(w\) achieves its maximum at point \((t_0, x_0)\). Thus,

\[
\nabla w(t_0, x_0) = 0, \quad \tag{3.4}
\]

and

\[
0 \leq \lim_{h \downarrow 0} \frac{1}{h}(w(t_0, x_0) - w(t_0 - h, x_0)) \\
\leq \lim_{h \downarrow 0} \frac{1}{h} \int_{t_0-h}^{t_0} \mathcal{L}^r w(s, x_0)ds + \lim_{h \downarrow 0} \frac{1}{h} \int_{t_0-h}^{t_0} (b \cdot \nabla w)(s, x_0)ds \\
+ \lim_{h \downarrow 0} \frac{1}{h} \int_{t_0-h}^{t_0} g(s, x_0)ds - \delta =: I_1 + I_2 + I_3 - \delta. \quad \tag{3.5}
\]

Since for all \(y \in \mathbb{R}^d\),

\[
w(t_0, x_0 + y) \leq w(t_0, x_0),
\]

in view of \(w \in C([T, S]; C^2_b(\mathbb{R}^d))\) and by (3.4), we have

\[
I_1 = \lim_{h \downarrow 0} \frac{1}{h} \int_{t_0-h}^{t_0} [\mathcal{L}^r w(s, x_0) - \mathcal{L}^r w(t_0, x_0)]ds + \mathcal{L}^r w(t_0, x_0) \leq 0.
\]

Similarly, for \(I_2\), we have

\[
I_2 = \lim_{h \downarrow 0} \frac{1}{h} \int_{t_0-h}^{t_0} b(s, x_0) \cdot (\nabla w(s, x_0) - \nabla w(t_0, x_0))ds = 0.
\]

For \(I_3\), recalling (3.2) and \(f \leq 0\), by (ii) of Lemma 2.5 and Lemma 2.4, we have for some \(\gamma \in (0, 1)\),

\[
I_3 \leq \|\chi_R \mathcal{L}^r u - \mathcal{L}^r (\chi_R u)\|_\infty + \frac{\|u\|_\infty \|b\|_\infty \|\nabla \chi\|_\infty}{R} \\
\leq \frac{C(\|u\|_\infty + \|\nabla u\|_\infty) + \|u\|_\infty \|b\|_\infty \|\nabla \chi\|_\infty}{R^\gamma},
\]

where \(C\) is independent of \(R\). Choosing \(R\) being sufficiently large, we obtain

\[
I_1 + I_2 + I_3 - \delta < 0,
\]

a contradiction with (3.5). Thus, we conclude the proof of (3.3).

Similarly, we also have the following maximum principle.
**Lemma 3.2.** (Maximum principle) Assume \( \lambda > 0 \) and \( b \) is a bounded measurable vector field. Let \( u \in C^2_b(\mathbb{R}^{d+1}) \) (resp. \( u \in C^2_b(\mathbb{R}^d) \)) satisfy
\[
\mathcal{L}^\nu_{b,1} u := \partial_t u - \mathcal{L}^\nu u + (b \cdot \nabla) u + \lambda u \leq 0, \quad \text{(resp. } (\lambda - \mathcal{L}^\nu) u \leq 0). \]
Then \( u \leq 0 \). In particular, \( \mathcal{L}^\nu_{b,1} u = 0 \) (resp. \( (\lambda - \mathcal{L}^\nu) u = 0 \)) admits at most one solution in \( C^2_b(\mathbb{R}^{d+1}) \) (resp. \( C^2_b(\mathbb{R}^d) \)).

**Corollary 3.3.** Let \( \theta \in \mathbb{R}^d \) and \( \lambda > 0 \). Then for any \( p > 1 \), \((\partial_t - \mathcal{L}^\nu + \theta \cdot \nabla + \lambda)(C_0^\infty(\mathbb{R}^{d+1})) \) (resp. \((\lambda - \mathcal{L}^\nu)(C_0^\infty(\mathbb{R}^d)) \)) is dense in \( L^p(\mathbb{R}^{d+1}) \) (resp. \( L^p(\mathbb{R}^d) \)).

**Proof.** Let \( g \in L^{p/(p-1)}(\mathbb{R}^{d+1}) \). By Hahn-Banach’s theorem, it is enough to prove that if for all \( u \in C_0^\infty(\mathbb{R}^{d+1}) \),
\[
\int_{\mathbb{R}^{d+1}} g(t, x) \cdot (\partial_t - \mathcal{L}^\nu + \theta \cdot \nabla + \lambda) u(t, x) \, dx \, dt = 0,
\]
then \( g = 0 \). Since for any \((s, y) \in \mathbb{R}^{d+1}, \) the mapping \((t, x) \mapsto u(s + t, y + x) \) belongs to \( C_0^\infty(\mathbb{R}^{d+1}) \). Thus, we have
\[
(\partial_t - \mathcal{L}^\nu + \theta \cdot \nabla + \lambda)(g \star u) = 0,
\]
where \( g \star u \) stands for \((s, y) \mapsto \int_{\mathbb{R}^{d+1}} g(t, x) u(s + t, y + x) \, dx \, dy \). By Lemma 3.2, \( g \star u = 0 \) for all \( u \in C_0^\infty(\mathbb{R}^{d+1}) \), which yields that \( g = 0 \). \( \square \)

4. \( L^p(\mathbb{R}; L^q(\mathbb{R}^d)) \)-maximal regularity for nonlocal parabolic equation

Let \( \theta \in C_0^\infty(\mathbb{R}; \mathbb{R}^d) \) be a time dependent vector field. For \( s < t \), set
\[
\Theta_{t,s} := \int_s^t \theta(r) \, dr.
\]
Let \( \nu \) be a Lévy measure and satisfy (2.21). For \( f \in \mathcal{S}(\mathbb{R}^d) \), define
\[
\mathcal{T}^\nu_{t,s} f(x) := \mathbb{E} f(x - \Theta_{t,s} + L^\nu_{t-s}) = \mathcal{P}^\nu_{t-s} f(x - \Theta_{t,s}) = \int_{\mathbb{R}^d} f(y) p^\nu_{t-s}(y - x + \Theta_{t,s}) \, dy. \quad (4.1)
\]
By (2.22), one has
\[
\partial_t \mathcal{T}^\nu_{t,s} f(x) = \int_{\mathbb{R}^d} f(y) \partial_t p^\nu_{t-s}(y - x + \Theta_{t,s}) \, dy + \int_{\mathbb{R}^d} f(y) (\partial_t \cdot \nabla) p^\nu_{t-s}(y - x + \Theta_{t,s}) \, dy
\]
\[
= \int_{\mathbb{R}^d} f(y) (\mathcal{L}^\nu p^\nu_{t-s})(y - x + \Theta_{t,s}) \, dy - \partial_t \cdot \nabla \int_{\mathbb{R}^d} f(y) p^\nu_{t-s}(y - x + \Theta_{t,s}) \, dy
\]
\[
= \mathcal{L}^\nu \mathcal{T}^\nu_{t,s} f(x) - \partial_t \cdot \nabla \mathcal{T}^\nu_{t,s} f(x). \quad (4.2)
\]
For \( \lambda \geq 0 \) and \( f \in \mathcal{S}(\mathbb{R}^{d+1}) \), define
\[
u(t, x) := \int_{-\infty}^t e^{-\lambda(t-s)} \mathcal{T}^\nu_{t,s} f(s, x) ds,
\]
then it is easy to check by (4.2) that \( u \in C^\infty_0(\mathbb{R}^{d+1}) \) and uniquely solves
\[
\partial_t u - \mathcal{L}^\nu u + \theta \cdot \nabla u + \lambda u = f. \quad (4.3)
\]

**Remark 4.1.** Let \( \nu_1 \) and \( \nu_2 \) be two Lévy measures. Let \( (L^\nu_{t,s})_{t,s \in \mathbb{R}} \) and \( (L^\nu_{t,s})_{t,s \in \mathbb{R}} \) be two independent Lévy processes associated with \( \nu_1 \) and \( \nu_2 \) respectively. Then it is clear that
\[
(L^\nu_{t,s})_{t,s \in \mathbb{R}} \overset{d}{=} (L^\nu_{t,s})_{t,s \in \mathbb{R}}.
\]
Thus, we have
\[
\mathcal{T}^\nu_{t,s} f(x) = \mathcal{P}^\nu_{t-s} \mathcal{T}^\nu_{t,s} f(x - \Theta_{t,s}) = \mathbb{E} \left( \mathcal{P}^\nu_{t-s} f(x + (L^\nu_{t,s} - \Theta_{t,s}) - (L^\nu_{s,t} - \Theta_{s,t}) \right). \quad (4.4)
\]
Hence, we need only to prove (4.6) for equality, we have for
\[
\sup_{\alpha} (4.6) \text{ has been proven for } \alpha, \nu_2. \]
and for all } 0 < r < R < +\infty,
\[
1_{\alpha = 1} \int_{|y| < R} \nu_2(dy) = 0.
\]
Let } \theta : \mathbb{R} \rightarrow \mathbb{R}^d \text{ be a bounded measurable function, and } \mathcal{T}^{\nu_1}_{t,s} \text{ be defined by (4.1). Then for any } p, q \in (1, \infty), \text{ there exists a constant } C = C(\nu_1, \nu_2, \alpha, p, q, d) > 0 \text{ such that for any } -\infty < T < S < \infty, f \in L^q(T, S; L^p(\mathbb{R}^d)) \text{ and } \lambda \geq 0,
\[
\int_T^S \left\| \mathcal{L}^\nu f(s, \cdot) \right\|_p^q ds \leq C \int_T^S \| f(t, \cdot) \|_p^q dt. \tag{4.5}
\]
Proof. By replacing } f(t, x) \text{ by } f(t, x)1_{(T,S)}(t), \text{ it is enough to prove that
\[
\int_{-\infty}^\infty \left\| \mathcal{L}^\nu f(s, \cdot) \right\|_p^q ds \leq C \int_{-\infty}^\infty \| f(t, \cdot) \|_p^q dt. \tag{4.6}
\]
We divide the proof into seven steps.

(Step 1) Let } (\mathcal{L}^{\nu_1}_{t,s})_{t,s} \text{ be a } d\text{-dimensional Lévy process associated with the Lévy measure } \nu_1 - \nu_1. \text{ By (4.4), we have
\[
\int_{-\infty}^t e^{-\lambda(t-s)} \mathcal{P}^{\nu_1}_{t,s} f(s, x)ds = \int_{-\infty}^s e^{-\lambda(t-s)} \mathcal{P}^{\nu_1}_{s,s} f(s, x)ds = \mathbb{E}u(t, x + L^{\nu_1}_{t-s} - \Theta_{s,0}),
\]
where
\[
u(t, x) := \int_{-\infty}^s e^{-\lambda(t-s)} \mathcal{P}^{\nu_1}_{t,s} f(s, x - L^{\nu_1}_{t-s} + \Theta_{s,0})ds.
\]
Suppose that (4.6) has been proven for } \nu_1 = \nu_1. \text{ By Fubini’s theorem and Minkowski’s inequality, we have for } f \in S(\mathbb{R}^{d+1}),
\[
\int_{-\infty}^\infty \left\| \mathcal{L}^\nu f(s, \cdot) \right\|_p^q ds \leq \int_{-\infty}^\infty \| \mathbb{E} \mathcal{L}^\nu f(t, \cdot + L^{\nu_1}_{t-s} - \Theta_{s,0}) \|_p^q dt
\]
\[
\leq \int_{-\infty}^\infty \mathbb{E} \left\| \mathcal{L}^\nu f(t, \cdot + L^{\nu_1}_{t-s} - \Theta_{s,0}) \right\|_p^q dt \leq \mathbb{E} \int_{-\infty}^\infty \| f(s, \cdot - L^{\nu_1}_{s} + \Theta_{s,0}) \|_p^q ds = C \int_{-\infty}^\infty \| f(s, \cdot) \|_p^q ds.
\]
Hence, we need only to prove (4.6) for } \nu_1 = \nu_1 \text{ and } \theta_s = 0. \text{ Below, for simplicity of notation, we write
\[
\mathcal{L} := \mathcal{L}^\nu, \quad \mathcal{L} := \mathcal{L}^{\nu_1}_{t,s}, \quad \mathcal{P} : = \mathcal{P}^{\nu_1}_{t,s}, \quad \psi_1 := \psi^{\nu_1}_{t,s}, \quad \psi_2 := \psi^{\nu_2}_{t,s}.
\]
(Step 2) Let us firstly prove (4.6) for } p = q = 2. \text{ For } f \in S(\mathbb{R}^{d+1}), \text{ let } \hat{f}(s, \cdot) = \mathcal{F} f(s, \cdot). \text{ By (2.1), the Fourier’s transform of } \mathcal{P} f \text{ is clearly given by
\[
\hat{\mathcal{P}_f}(\xi) = e^{-\psi_1(\xi)} \hat{f}(\xi).
\]
By Parseval’s identity and Minkowski’s inequality, we have

\[
\begin{align*}
\int_{-\infty}^{\infty} \left\| \mathcal{L} \int_{-\infty}^{\infty} e^{-\lambda(t-s)} \mathcal{P}_{t-s} f(s, \cdot) ds \right\|_2^2 dt & = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \left| \psi_2(\xi) \int_{-\infty}^{\infty} e^{-\lambda(t-s)} \hat{\psi}(s) \hat{f}(s, \xi) ds \right|^2 d\xi dt \\
& \leq \kappa_0^2 \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \left( \int_{-\infty}^{\infty} \left| e^{-\lambda s} \hat{f}(s, \xi) \right|^2 ds \right) d\xi dt \\
& = \kappa_0^2 \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \left( \int_{-\infty}^{\infty} \left| e^{-\lambda s} \hat{f}(t-s, \xi) \right|^2 ds \right) d\xi dt \\
& \leq \frac{\kappa_0^2}{\kappa_1^2} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} |\hat{f}(t, \xi)|^2 d\xi dt = \frac{\kappa_0^2}{\kappa_1^2} \int_{-\infty}^{\infty} \|f(t)\|^2_2 dt.
\end{align*}
\]

Since \( S(\mathbb{R}^{d+1}) \) is dense in \( L^2(\mathbb{R}^{d+1}) \), (4.6) follows for \( p = q = 2 \).

(Step 3). For \( f \in L^\infty(\mathbb{R}^{d+1}) \), define

\[
\mathcal{T} f(t, x) := \left( \mathcal{L} \int_{-\infty}^{t} e^{-\lambda(t-s)} \mathcal{P}_{t-s} f(s, \cdot) ds \right)(x).
\]

We want to show that

\[
\mathcal{T} : L^\infty(\mathbb{R}^{d+1}) \to BMO(\mathbb{R}^{d+1}) \text{ is a bounded linear operator.}
\]

(4.7)

More precisely, we want to prove that there is a constant \( C > 0 \) independent of \( \lambda \) such that for any \( f \in L^\infty(\mathbb{R}^{d+1}) \) with \( \|f\|_\infty \leq 1 \), and any parabolic cylinder \( Q = (t_0, t_0 + r^2) \times B_r(x_0) \),

\[
\frac{1}{|Q|} \int_Q |\mathcal{T} f(t, x) - a_Q|^2 dxdt \leq C,
\]

(4.8)

where \( a_Q \) is a constant depending on \( Q \).

By shifting the origin, we may assume \( t_0 = 0, x_0 = 0 \). On the other hand, by the scaling properties (1.4) and (2.10), if one makes the following change in (4.8):

\[
\nu_2(B) \to r^\omega \nu_2(rB), \quad f(t, x) \to f(r^\alpha t, r x), \quad \lambda \to \lambda r^\alpha,
\]

then we may further assume \( r = 1 \). Thus, it suffices to prove that for any \( f \in L^\infty(\mathbb{R}^{d+1}) \) with \( \|f\|_\infty \leq 1 \),

\[
\int_{Q_1} |\mathcal{T} f(t, x) - a_{Q_1}|^2 dxdt \leq C,
\]

where \( Q_1 = (0, 1) \times B_1 \) and \( C = C(\nu_1^{(a)}, \nu_2^{(a)}, \alpha, d) \) is independent of \( \nu_2 \) and \( \lambda \).

Following Krylov [22], we now split \( \mathcal{T} f \) into two parts:

\[
\mathcal{T} f(t, x) = \mathcal{T}_1 f(t, x) + \mathcal{T}_2 f(t, x),
\]

where for \( (t, x) \in (0, 1) \times B_1 \),

\[
\mathcal{T}_1 f(t, x) := \mathcal{L} \left( \int_{-1}^{t} e^{-\lambda(t-s)} \mathcal{P}_{t-s} f(s, \cdot) ds \right)(x),
\]

\[
\mathcal{T}_2 f(t, x) := \mathcal{L} \left( \int_{1}^{t} e^{-\lambda(t-s)} \mathcal{P}_{t-s} f(s, \cdot) ds \right)(x).
\]

We shall prove that \( \mathcal{T}_1 f \) is bounded in \( BMO(\mathbb{R}^{d+1}) \).
\[ T_2 f(t, x) := \mathcal{L} \left( \int_{-\infty}^{t} e^{-\beta(t-s)} P_{t-s} f(s, \cdot) ds \right)(x). \]

**Step 4.** In this step, we treat \( T_1 f \). Let \( f_\varepsilon(t, x) := f * \rho_\varepsilon(t, x) \) be the mollifying approximation of \( f \), where \( \rho_\varepsilon \) is the usual mollifier in \( \mathbb{R}^{d+1} \). Define

\[
    u_\varepsilon(t, x) := \int_{-\infty}^{t} e^{-\beta(t-s)} P_{t-s} f_\varepsilon(s, x) ds,
    \]

\[
    u(t, x) := \int_{-\infty}^{t} e^{-\beta(t-s)} P_{t-s} f(s, x) ds.
\]

By definition (4.1) and \( \|f\|_\infty \leq 1 \), we have

\[
    |u_\varepsilon(t, x)| \leq 2, \quad \forall (t, x) \in [-1, 1] \times \mathbb{R}^d, \quad (4.9)
\]

and by the dominated convergence theorem,

\[
    \lim_{\varepsilon \to 0} \int_0^1 \int_{B_1} |u_\varepsilon(t, x) - u(t, x)|^2 dx dt = 0. \quad (4.10)
\]

On the other hand, by Lemma 2.3 for any \( \beta \in [0, \alpha \wedge 1) \), we have for all \( t \in [-1, 1], x, x' \in \mathbb{R}^d, \)

\[
    |u_\varepsilon(t, x) - u_\varepsilon(t, x')| \leq \int_{-1}^{t} \int_{\mathbb{R}^d} |P_{t-s}(y - x) - P_{t-s}(y - x')| dy ds \leq 2^{1-\beta} \int_{-1}^{t} \left| x - x' \right| \left( \int_{\mathbb{R}^d} |\nabla P_{t-s}(y)| dy \right)^{\beta} ds \leq C|x - x'|^{\beta} \quad (4.11)
\]

Moreover, as in the beginning of this section, since \( f_\varepsilon \in C^\infty_b(\mathbb{R}^{d+1}) \), by (4.2) and Lemma 3.1 one sees that \( u_\varepsilon \in C^\infty_b([-1, \infty) \times \mathbb{R}^{d+1}) \) uniquely solves

\[
    \partial_t u_\varepsilon - \mathcal{L} u_\varepsilon + \lambda u_\varepsilon = f_\varepsilon, \quad u_\varepsilon(-1, x) = 0.
\]

Let \( \chi \) be a nonnegative smooth function with \( \chi(x) = 1 \) for \( |x| \leq 1 \) and \( \chi(x) = 0 \) for \( |x| \geq 2 \). Multiplying the above equation by \( \chi \), we obtain

\[
    \partial_t (u_\varepsilon \chi) = (\mathcal{L} u_\varepsilon) \chi - \lambda u_\varepsilon \chi + f_\varepsilon \chi = \mathcal{L}(u_\varepsilon \chi) - \lambda (u_\varepsilon \chi) + g^\chi_\varepsilon,
\]

where

\[
    g^\chi_\varepsilon := \chi \mathcal{L} u_\varepsilon - \mathcal{L}(u_\varepsilon \chi) + f_\varepsilon \chi.
\]

Since \( \chi \) has compact support, we have for each \( t \in [0, 1], \)

\[
    g^\chi_\varepsilon(t, \cdot) \in C^\infty_b(\mathbb{R}^d).
\]

Thus, by Lemma 3.1 again, one has the representation

\[
    (u_\varepsilon \chi)(t, x) = \int_{-1}^{t} e^{-\beta(t-s)} P_{t-s} g^\chi_\varepsilon(s, x) ds.
\]

Moreover, by (4.9), (4.11) and (ii) of Lemma 2.5

\[
    \int_{-1}^{1} \|g^\chi_\varepsilon(t, \cdot)\|_2^2 dt \leq C \left( \int_{-1}^{1} \|\chi \mathcal{L} u_\varepsilon(t) - \mathcal{L}(u_\varepsilon(t) \chi)\|_2^2 dt + \|\chi\|_2^2 \right) \leq C.
\]

Here and below, the constant \( C \) is independent of \( \varepsilon \) and \( \lambda \).
As in Step 2, by Fourier’s transform again, we have
\[\int_0^1 \int_{\mathbb{R}^d} |\mathcal{L}(u_{\varepsilon} \chi)(t, x)|^2 \, dx \, dt \leq \kappa_0^2 \int_0^1 \int_{\mathbb{R}^d} \left| \int_0^{n+1} \xi |\xi|^\alpha e^{-|\xi|^2} |\hat{g}_\varepsilon^{L}(t - s, \xi)| \, ds \right|^2 \, d\xi \, dr \leq \kappa_0^2 \int_{\mathbb{R}^d} \left( \int_0^{n+1} \xi |\xi|^\alpha e^{-|\xi|^2} \left( \int_0^{n+1} |\hat{g}_\varepsilon^{L}(t - s, \xi)|^2 \, dr \right)^{1/2} \, ds \right)^2 \, d\xi \leq C \int_{\mathbb{R}^d} \int_{-1}^1 |\hat{g}_\varepsilon^{L}(t, \xi)|^2 \, d\xi \leq C.\]
Thus, by (4.9), (4.10), (4.11) and (ii) of Lemma 2.5 again, we arrive at
\[\int_{Q_t} |\mathcal{T}_2 f(t, x)|^2 \, dx \, dt = \int_{Q_t} |\mathcal{L} u(t, x)|^2 \, dx \, dt \leq \sup_{\varepsilon \in (0, 1)} \int_0^1 \int_{B_1} |\mathcal{L} u(t, x)|^2 \, dx \, dt \leq \sup_{\varepsilon \in (0, 1)} \int_0^1 \int_{\mathbb{R}^d} |\mathcal{L} u(t, x) \cdot \chi(x)|^2 \, dx \, dt \leq C.\]

**Step 5.** In this step, we treat $\mathcal{T}_2 f$ and prove that for some $a_{Q_t} \in \mathbb{R}$ and some constant $C > 0$ independent of $\lambda$,
\[\int_{Q_t} |\mathcal{T}_2 f(t, x) - a_{Q_t}|^2 \, dx \, dt \leq C. \tag{4.12}\]
Note that by (4.1),
\[e^{\lambda t} \mathcal{T}_2 f(t, x) = \int_{-\infty}^{-1} e^{\lambda s} \int_{\mathbb{R}^d} f(s, y) \mathcal{L}^* p_{t-s}(y - x) \, dy \, ds =: \mathcal{T}_3 f(t, x).\]
In view of $\lambda \geq 0$ and $\|f\|_\infty \leq 1$, by (2.23), we have for some $\delta_1 > 1$ and any $(t, x) \in [0, 1] \times \mathbb{R}^d$,
\[|\nabla \mathcal{T}_3 f(t, x)| \leq \int_{-\infty}^{-1} \int_{\mathbb{R}^d} |\nabla \mathcal{L}^* p_{t-s}(y)| \, dy \, ds \leq C \int_{-\infty}^{-1} (t - s)^{-\delta_1} \, ds \leq C,\]
and by (2.24), for some $\delta_2 > 1$ and any $t \in [0, 1]$,
\[|\mathcal{T}_3 f(t, 0) - \mathcal{T}_3 f(0, 0)| \leq \int_{-\infty}^{-1} \int_{\mathbb{R}^d} |\mathcal{L}^* p_{t-s}(y) - \mathcal{L}^* p_{t-s}(y)| \, dy \, ds \leq \int_{-\infty}^{-1} \int_{\mathbb{R}^d} |\partial_r \mathcal{L}^* p_{t-r}(y)| \, dr \, dy \, ds \leq C \int_{-\infty}^{-1} \int_0^d (r - s)^{-\delta_2} \, dr \, ds \leq C.\]
Hence,
\[|\mathcal{T}_3 f(t, x) - \mathcal{T}_3 f(0, 0)| \leq C, \quad \forall (t, x) \in [0, 1] \times B_1,\]
and
\[\int_{Q_t} |\mathcal{T}_2 f(t, x) - e^{-\lambda t} \mathcal{T}_3 f(0, 0)|^2 \, dx \, dt \leq C.\]
If $\lambda = 0$, we immediately have (4.12). Now let us assume $\lambda > 0$. In this case, by Lemma 2.4 and (2.25), we have
\[|\mathcal{T}_3 f(0, 0)| \leq \int_{-\infty}^{-1} e^{\lambda s} \left( \int_{\mathbb{R}^d} |\mathcal{L}^* p_{t-s}(y)| \, dy \right) \, ds \leq C \int_{-\infty}^{-1} e^{\lambda s} \, ds = Ce^{-\lambda}/\lambda,\]
where $C$ is independent of $\lambda$ and $f$. So,

$$\int_{Q_1} |(1 - e^{-\lambda t}) T_t f(0,0)|^2 \, dx \, dt \leq \frac{C}{\lambda^2} \int_0^1 (1 - e^{-\lambda t})^2 \, dt \leq \frac{C}{3},$$

where we have used that $1 - e^{-s} \leq s$ for all $s \geq 0$. Thus, we obtain (4.12) with $a_{Q_1} = T_t f(0,0)$.

(Step 6). Combining the above steps 3-5, we have proven (4.7). By Step 2 and Theorem 2.11 we get (4.6) for $p = q \in [2, \infty)$. As for $p = q \in (1, 2)$, it follows by the following duality: Let $g \in C_0^\infty(\mathbb{R}^{d+1})$. By the integration by parts formula and the change of variables, we have

$$\int_{-\infty}^{\infty} \int_{\mathbb{R}^d} \mathcal{L} \int_{-\infty}^{t} e^{-\lambda(s-t)} P_{t-s} f(s, \cdot) ds \, g(x) \, dx \, dt$$

$$= \int_{-\infty}^{\infty} \int_{\mathbb{R}^d} f(t, x) \left( \mathcal{L}^* \int_{-\infty}^{t} e^{-\lambda(t-s)} P_{t-s} g(s, \cdot) ds \right) (x) \, dx \, dt,$$

where $\mathcal{L}^*$ is the adjoint operator of $\mathcal{L}$ and $P_{t}^* g(s, x) := E g(s, x - L_{t}^{(w)})$.

(Step 7). For $q \neq p \in (1, \infty)$, we use a trick due to Krylov [23]. Clearly, it suffices to prove that for any $T > -\infty$ and $f \in C_0^\infty([T, \infty) \times \mathbb{R}^d)$,

$$\int_{T}^{\infty} \left\| \mathcal{L} \int_{T}^{t} e^{-\lambda(t-s)} P_{t-s} f(s, \cdot) ds \right\|_p^q \, dt \leq C \int_{T}^{\infty} \| f(t, \cdot) \|_p^q \, dt,$$

(4.13)

where $C$ is independent of $T$.

Set

$$u(t, x) := \int_{T}^{t} e^{-\lambda(t-s)} P_{t-s} f(s, x) \, ds, \quad w(t, x) := \mathcal{L} u(t, x).$$

By (4.2), one can verify that $w \in C([T, \infty); C_b^\infty(\mathbb{R}^d))$ and uniquely solves

$$\partial_t w - \mathcal{L} w + \lambda w = \mathcal{L} f, \quad w(T, x) = 0.$$

For $\tilde{x} = (x^1, \cdots, x^n) \in \mathbb{R}^{nd}$ with $x^i = (x_{t}^{1}, \cdots, x_{t}^{i}) \in \mathbb{R}^d$, define

$$U(t, \tilde{x}) := w(t, x^1) \cdots w(t, x^n).$$

Then

$$\partial_t U - \mathcal{L} U + n\lambda U = F, \quad U(T, \tilde{x}) = 0,$$

where $\mathcal{L}$ is defined by (2.20) and

$$F(t, \tilde{x}) = \sum_{i=1}^{n} \mathcal{L}_{x^i} G'(t, \tilde{x}), \quad G'(t, \tilde{x}) = f(t, x) \prod_{k \neq i} w(t, x^k).$$

Here $\mathcal{L}_{x^i}$ means that $\mathcal{L}$ acts on the component $x^i$ of $\tilde{x}$. By the maximum principle, the unique solution $U$ can be represented by

$$U(t, \tilde{x}) = \int_{T}^{t} e^{-n\lambda(t-s)} P_{t-s} F(s, \tilde{x}) \, ds = \sum_{i=1}^{n} \mathcal{L}_{x^i} \int_{T}^{t} e^{-n\lambda(t-s)} P_{t-s} G'(s, \tilde{x}) \, ds,$$

where $(P_t)_{t \geq 0}$ is the semigroup associated with $\mathcal{L}$.

Thus, by Step 6 and Minkowski’s inequality, we have

$$\int_{T}^{\infty} \| \mathcal{L} u(t) \|_p^p \, dt \leq \int_{T}^{\infty} \| w(t) \|_p^p \, dt \leq \int_{\mathbb{R}^{nd}} \int_{T}^{\infty} |U(t, \tilde{x})|^p \, d\tilde{x} \, dt$$

$$\leq \left( \sum_{i=1}^{n} \int_{T}^{\infty} \int_{\mathbb{R}^d} \left| \mathcal{L}_{x^i} \int_{T}^{t} e^{-n\lambda(t-s)} P_{t-s} G'(s, \tilde{x}) ds \right|^p \, d\tilde{x} \, dt \right)^{\frac{1}{p}}.$$
In view of

Then

Thus, by Marcinkiewicz’s interpolation theorem (cf. [35]), we get (4.13) for any $p$. From this, we get that for any $p$

On the other hand, by (4.5) we have

Proof. For $u \in \mathcal{S}(\mathbb{R}^d)$, set

Define

By Fourier’s transform, it is easy to see that

Define

Then

In view of $\|\mathcal{P}_t\|_p \leq \|f\|_p$, we have

On the other hand, by (4.5) we have

We have the following important comparison result between two different Lévy operators.

**Theorem 4.3.** Keep the same assumptions as in Theorem 4.2. For any $p \in (1, \infty)$, there exists a constant $C > 0$ such that for all $u \in \mathcal{S}(\mathbb{R}^d)$ and $\lambda_1, \lambda_2 > 0$,

$$\|(\mathcal{L}^{\nu_2} - \lambda_2)u\|_p \leq C \left(1 + \frac{\lambda_2}{\lambda_1}\right) \|(\mathcal{L}^{\nu_1} - \lambda_1)u\|_p.$$  \hspace{1cm} (4.14)

In particular,

$$\|\mathcal{L}^{\nu_2}u\|_p \leq C \|\mathcal{L}^{\nu_1}u\|_p.$$  \hspace{1cm} (4.15)

**Proof.** For $u \in \mathcal{S}(\mathbb{R}^d)$, set

$$f := (\mathcal{L}^{\nu_1} - \lambda_1)u.$$  

By Fourier’s transform, it is easy to see that

$$u(x) = \int_0^\infty e^{-\lambda_1 t} \mathcal{P}_t^{\nu_1} f(x) dt.$$  

Define

Define

Then

In view of $\|\mathcal{P}_t^{\nu_1} f\|_p \leq \|f\|_p$, we have

On the other hand, by (4.5) we have

\begin{align*}
\|(\mathcal{L}^{\nu_2} - \lambda_2)u_T\|_p^p & \leq \frac{1}{T} \int_0^T \left\|(\mathcal{L}^{\nu_2} - \lambda_2) \int_0^t e^{-\lambda_1(s-t)} \mathcal{P}_{t-s}^{\nu_1} f(s) ds \right\|_p^p dt \\
& \leq C \|f\|_p^p + \frac{2p-1}{T} \int_0^T \lambda_2 \left(\int_0^t e^{-\lambda_1(s-t)} \|f\|_p ds\right) dt \\
& \leq C \left(1 + \frac{\lambda_2}{\lambda_1}\right) \|f\|_p^p = C \left(1 + \frac{\lambda_2}{\lambda_1}\right) \|(\mathcal{L}^{\nu_1} - \lambda_1)u\|_p^p.
\end{align*}
which together with (4.16) yields (4.14). As for (4.15), it follows by firstly letting \( \lambda_2 \downarrow 0 \) and then \( \lambda_1 \downarrow 0 \).

In the remaining part of this paper, we make the following assumption:

\( (H^{(\alpha)}_v) \) Let \( \nu_i^{(\alpha)}, i = 1, 2 \) be two Lévy measures with the form (1.8), where \( \nu_i^{(\alpha)} \) is nondegenerate in the sense of Definition 2.6. Let \( \nu \) be a Lévy measure satisfying (1.7) and \( \nu_1^{(\alpha)} \leq \nu \leq \nu_2^{(\alpha)} \).

Let \( \mathcal{D}^p(\mathcal{L}^\nu) \) be the domain of \( \mathcal{L}^\nu \) in \( L^p \)-space, i.e.,

\[
\mathcal{D}^p(\mathcal{L}^\nu) := \{ u \in L^p(\mathbb{R}^d) : \| \mathcal{L}^\nu u \|_p < +\infty \}.
\]

For \( \alpha \geq 0 \) and \( p \geq 1 \), the Bessel potential space \( \mathbb{H}^{\alpha,p} \) is defined as the completion of \( \mathcal{S}(\mathbb{R}^d) \) with respect to the norm:

\[
\| f \|_{\alpha,p} := \| (I - \Delta)^{\frac{\alpha}{2}} f \|_p = \| f \|_p + \| (\Delta)^{\frac{\alpha}{2}} f \|_p.
\]

Notice that for \( k \in \mathbb{N} \) and \( p > 1 \), \( \mathbb{H}^{k,p} = \mathcal{W}^{k,p} \) (see [35], p135, Theorem 3).

**Corollary 4.4.** Assume \((H^{(\alpha)}_v)\) with \( \alpha \in (0,2) \). For any \( p > 1 \), \( f \in L^p(\mathbb{R}^d) \) and \( \lambda > 0 \), the equation \( (\mathcal{L}^\nu - \lambda)u = f \) admits a unique strong solution \( u \in \mathbb{H}^{\alpha,p} \). In particular, for any \( p > 1 \), \( \mathcal{D}^p(\mathcal{L}^\nu) = \mathbb{H}^{\alpha,p} \) and

\[
\| \mathcal{L}^\nu u \|_p \approx \| (\Delta)^{\frac{\alpha}{2}} u \|_p,
\]

and if \( \alpha = 1 \), then

\[
\| \mathcal{L}^\nu u \|_p \approx \| \nabla u \|_p.
\]

**Proof.** Let \( \nu_0^{(\alpha)} \) be the Lévy measure associated with \( (\Delta)^{\frac{\alpha}{2}} \) (see (2.8)). In Theorem 4.3, let us take \( \nu_1 = \nu_0^{(\alpha)}, \nu_2 = \nu \) and \( \nu_1 = \nu, \nu_2 = \nu_0^{(\alpha)} \) respectively, then there exist \( C_1, C_2 > 0 \) such that for any \( u \in \mathcal{S}(\mathbb{R}^d) \) and \( \lambda_1, \lambda_2 > 0 \),

\[
\| (\Delta)^{\frac{\alpha}{2}} + \lambda_2 \|_p \leq C_1 \left( 1 + \frac{\lambda_2}{\lambda_1} \right) \| (\mathcal{L}^\nu - \lambda_1)u \|_p, \tag{4.19}
\]

\[
\| (\mathcal{L}^\nu - \lambda_1)u \|_p \leq C_2 \left( 1 + \frac{\lambda_1}{\lambda_2} \right) \| (\Delta)^{\frac{\alpha}{2}} + \lambda_2 \|_p. \tag{4.20}
\]

For \( \lambda > 0 \) and \( f \in L^p(\mathbb{R}^d) \), by Corollary 3.3, there exists a sequence \( u_n \in C_0^\infty(\mathbb{R}^d) \) such that

\[
(\mathcal{L}^\nu - \lambda)u_n \xrightarrow{L^p} f.
\]

By (4.19), \( u_n \) is a Cauchy sequence in \( \mathbb{H}^{\alpha,p} \). Let \( u \in \mathbb{H}^{\alpha,p} \) be the limit point. By (4.20), one finds that \( (\mathcal{L}^\nu - \lambda)u = f \). As for (4.17), it follows by (4.15), and (4.18) follows by the boundedness of Riesz transform in \( L^p \)-space (cf. [35], Chapter III)).

**Corollary 4.5.** Assume \((H^{(\alpha)}_v)\) with \( \alpha \in (0,2) \). Then for any \( p > 1 \), \( (\mathcal{P}^\nu_t)_{t \geq 0} \) forms an analytic semigroup in \( L^p \)-space.

**Proof.** By [15] Theorem 5.2, it suffices to prove that

\[
\| \mathcal{L}^\nu \mathcal{P}^\nu_t f \|_p \leq Ct^{-\frac{\alpha}{2}} \| f \|_p, \quad t > 0, \quad f \in L^p(\mathbb{R}^d).
\]

By (4.4), we have for any \( f \in \mathcal{S}(\mathbb{R}^d) \),

\[
\mathcal{P}^\nu_t f = \mathcal{P}^{\nu_1^{(\alpha)}}_t \mathcal{P}^{\nu_2^{(\alpha)} - \nu_1^{(\alpha)}}_t f.
\]

Thus, by (2.25), we have

\[
\| \Delta \mathcal{P}^\nu_t f \|_p \leq Ct^{-\frac{\alpha}{2}} \| \mathcal{P}^{\nu_2^{(\alpha)} - \nu_1^{(\alpha)}}_t f \|_p \leq Ct^{-\frac{\alpha}{2}} \| f \|_p.
\]
Since $S(\mathbb{R}^d)$ is dense in $L^p(\mathbb{R}^d)$, we further have for any $f \in L^p(\mathbb{R}^d)$,
$$\|\Delta \mathcal{P}_t f\|_p \leq Ct^{-\frac{2}{p}}\|f\|_p.$$ 

Now, by (4.18) and the Gargliado-Nirenberge’s inequality (cf. [6, p.168]), we have
$$\|L^\alpha \mathcal{P}_t f\|_p \leq C\|(-\Delta)^\frac{\alpha}{2}\mathcal{P}_t f\|_p \leq C\|\mathcal{P}_t f\|_p \lesssim \|\Delta \mathcal{P}_t f\|_p^\frac{q}{2} \leq Ct^{-1}\|f\|_p,$$
where $C$ is independent of $t$ and $f$. □

5. Critical nonlocal parabolic equation with various coefficients

In this section we assume $(\mathcal{H}_i^{1})$ with critical index $\alpha = 1$. For simplicity of notation, we write
$$\mathcal{L} = \mathcal{L}'.\,$$

Consider the following Cauchy problem of the first order critical parabolic system:
$$\partial_t u = \mathcal{L} u + b \cdot \nabla u + f, \quad u(0) = \varphi, \quad (5.1)$$
where $u = (u^1, \ldots, u^m)$, $f : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}^m$, $\varphi : \mathbb{R}^d \to \mathbb{R}^m$ are measurable functions, and $b : \mathbb{R}^+ \times \mathbb{R}^d \to \mathbb{R}^d$ is a bounded measurable vector field and satisfies
$$|b(t,x) - b(t,y)| \leq \omega_b(|x-y|), \quad (5.2)$$
where $\omega_b : \mathbb{R}^+ \to \mathbb{R}^+$ is an increasing function with $\lim_{s \to 0} \omega_b(s) = 0$.

For obtaining the optimal regularity about the initial value, we need the following real interpolation space: for $p > 1$ and $\beta \in (0,1)$, let $\mathcal{H}^{\beta,p}$ be the real interpolation space (called Sobolev-Slobodeckij space) between $L^p$ and $\mathcal{H}^{1,p}$. By [37, p.190,(15)], an equivalent norm in $\mathcal{H}^{\beta,p}$ is given by
$$\|f\|_{\beta,p} := \|f\|_p + \left( \int_{\mathbb{R}^d} \int_{\mathbb{R}^d} \frac{|f(x) - f(y)|^p}{|x-y|^{d+\beta p}} \, dx \, dy \right)^{1/p}. \quad (5.3)$$

We remark that for $p \geq 2$, $\mathcal{H}^{\beta,p} \subset \mathcal{H}^{\beta,p}_{\mathcal{L}}$, and for $p \leq 2$, $\mathcal{H}^{\beta,p} \subset \mathcal{H}^{\beta,p}_{\mathcal{L}}$ (cf. [35, p.155, Theorem 5 (A) and (C)]). Moreover, by Sobolev’s embedding theorem (see [37, p.203, (5)]), if $\beta p > d$ and $\beta - \frac{d}{p}$ is not an integer, then
$$\mathcal{H}^{\beta,p} \hookrightarrow \mathcal{H}^{\beta-\frac{d}{p}}, \quad (5.4)$$
where for $\gamma > 0$, $\mathcal{H}^{\gamma}$ is the usual Hölder space.

Let us first prove the following important apriori estimate by using the classical method of freezing coefficients (cf. [24]).

**Lemma 5.1.** For given $p \in (1, \infty)$, let $f \in L^{p}_{\text{loc}}(\mathbb{R}_{0}^{+}; L^{p}(\mathbb{R}^{d}; \mathbb{R}^{m}))$ and
$$u \in C(\mathbb{R}_{0}^{+}; \mathcal{W}^{1-\frac{d}{p};p}(\mathbb{R}^{d}; \mathbb{R}^{m})) \cap L^{p}_{\text{loc}}(\mathbb{R}_{0}^{+}; \mathcal{W}^{1,p}(\mathbb{R}^{d}; \mathbb{R}^{m})).$$

Assume that $(\mathcal{H}_i^{1})$ and (5.2) hold, and $u$ satisfies
$$\partial_t u(t,x) = \mathcal{L} u(t,x) + b(t,x) \cdot \nabla u(t,x) + f(t,x), \quad a.e. \ (t,x) \in \mathbb{R}^{+} \times \mathbb{R}^{d}. \quad (5.5)$$

Then for any $T > 0$,
$$\sup_{t \in [0,T]} \|u(t)\|_{1-\frac{d}{p},p} + \int_{0}^{T} \|\nabla u(t)\|_{p} dt \leq C(1 + T^{p})e^{CT^{p-1}} \left( \|u(0)\|_{1-\frac{d}{p},p} + \int_{0}^{T} \|f(t)\|_{p} dt \right), \quad (5.6)$$
where the constant $C$ depends only on $p, d, \|b\|_\infty$, the modulus function $\omega_b$ and the Lévy measures $\nu_i^{(1)}, i = 1, 2$. Moreover, $u$ also satisfies the following integral equation:

$$u(t, x) = \mathcal{P}_tu(0, x) + \int_0^t \mathcal{P}_{t-s}(b(s) \cdot \nabla u(s))(x)ds + \int_0^t \mathcal{P}_{t-s}f(s, x)ds,$$

where $\mathcal{P}_t$ is the heat semigroup associated with $L$.

**Proof.** Let $(\rho_\varepsilon)_{\varepsilon \in (0,1)}$ be a family of mollifiers in $\mathbb{R}^d$. Define

$$u_\varepsilon(t) := u(t) * \rho_\varepsilon, \quad b_\varepsilon(t) := b(t) * \rho_\varepsilon, \quad f_\varepsilon(t) := f(t) * \rho_\varepsilon.$$ 

Taking convolutions for both sides of (5.5), we obtain

$$\partial_t u_\varepsilon(t, x) = Lu_\varepsilon(t, x) + b_\varepsilon(t, x) \cdot \nabla u_\varepsilon(t, x) + F_\varepsilon(t, x),$$

where

$$F_\varepsilon(t, x) := [(b(t) \cdot \nabla u(t)) * \rho_\varepsilon](x) - b_\varepsilon(t, x) \cdot \nabla u_\varepsilon(t, x) + f_\varepsilon(t, x).$$

Moreover, by Duhamel’s formula, one sees that

$$u_\varepsilon(t, x) = \mathcal{P}_t u_\varepsilon(0, x) + \int_0^t \mathcal{P}_{t-s}(b_\varepsilon(s) \cdot \nabla u_\varepsilon(s))(x)ds + \int_0^t \mathcal{P}_{t-s}F_\varepsilon(s, x)ds.$$ 

By the assumptions, it is easy to see that for all $\varepsilon \in (0, 1)$,

$$|b_\varepsilon(t, x) - b_\varepsilon(t, y)| \leq \omega_b(|x - y|), \quad |b_\varepsilon(t, x) - b(t, x)| \leq \omega_b(\varepsilon),$$

and

$$\lim_{\varepsilon \to 0} \int_0^T \|F_\varepsilon(t) - f(t)\|_p^p dt = 0.$$ 

Taking limits for both sides of (5.9), one finds that (5.7) holds. Below, we use the method of freezing the coefficients to prove

$$\sup_{t \in [0, T]} \|u_\varepsilon(t)\|_p^p + \int_0^T \|\nabla u_\varepsilon(t)\|_p^p dt \leq C(1 + T^p)e^{CT^{p-1}} \left(\|u_\varepsilon(0)\|_{1-\frac{1}{p}, p}^p + C \int_0^T \|F_\varepsilon(t)\|_p^p dt\right),$$

where the constant $C$ is independent of $\varepsilon$ and $T$.

For simplicity of notation, we drop the subscript $\varepsilon$ below. Fix $\delta > 0$ being small enough, whose value will be determined below. Let $\zeta$ be a smooth function with support in $B_\delta$ and $\|\zeta\|_p = 1$. For $z \in \mathbb{R}^d$, set

$$\zeta_z(x) := \zeta(x - z).$$

Multiplying both sides of (5.8) by $\zeta_z$, we obtain

$$\partial_t (u_\zeta_z) = (Lu)\zeta_z + (b \cdot \nabla u)\zeta_z + F\zeta_z = L(u\zeta_z) + \theta^b \cdot \nabla (u\zeta_z) + g^\zeta_z,$$

where $\theta^b_t := b(t, z)$ and

$$g^\zeta_z := (b - \theta^b) \cdot \nabla (u\zeta_z) - ub \cdot \nabla \zeta_z + (Lu)\zeta_z - L(u\zeta_z) + F\zeta_z.$$ 

By Lemma 3.1 $u\zeta_z$ can be uniquely written as

$$u\zeta_z(t, x) = \mathcal{T}^{\theta^b}_{t, 0}(u(0)\zeta_z)(x) + \int_0^t \mathcal{T}^{\theta^b}_{t, s} g^\zeta_z(s, x)ds,$$

where $\mathcal{T}^{\theta^b}_{t, s}$ is defined by (4.1) through $\theta^b_t$. Thus, we have

$$\int_0^T \|\nabla (u\zeta_z)(t, \cdot)\|_p^p dt \leq 2^{p-1} \int_0^T \|\nabla \mathcal{T}^{\theta^b}_{t, 0}(u(0)\zeta_z)\|_p^p dt + 2^{p-1} \int_0^T \left\|\nabla \mathcal{T}^{\theta^b}_{t, s} g^\zeta_z(s, \cdot)\right\|_p^p dt =: I_1(T, z) + I_2(T, z).$$
For $I_1(T, z)$, by Corollary [4.5] and [37] p.96 Theorem 1.14.5, we have
\[
\int_0^T \|\nabla T_{\theta}^{0,0} (u(0)z)\|_p^p \, dt \leq C \int_0^T \left\| \mathcal{L}^\ast (u(0)z) \right\|_p^p \, dt \leq C \|u(0)z\|_{L^p}^p.
\]

Here and below, $C$ is independent of $T$. Thus, by definition (5.3), it is easy to see that
\[
\int \mathbb{R}^d I_1(T, z) \, dz \leq C \int \mathbb{R}^d \|u(0)z\|_{L^p}^p \, dz \leq C \left\| \left( \|u(0)\|_{L^p}^p \right) \right\|_{L^p}^p + \|u(0)\|_{L^p}^p \|z\|_{L^p}^p.
\]

For $I_2(T, z)$, by (4.18) and Theorem 4.2, we have
\[
I_2(T, z) \leq C \int_0^T \left\| b \cdot \nabla z \right\|_p^p \, dt \leq C \int_0^T \left\| \left( b - \theta \right) \cdot \nabla (u z) \right\|_p^p \, dt + C \int_0^T \left\| F(z) \cdot \nabla \right\|_p^p \, dt + C \int_0^T \left\| \left( \mathcal{L} u \right) \cdot \mathcal{L} (u z) \right\|_p^p \, dt
\]
\[
= I_{21}(T, z) + I_{22}(T, z) + I_{23}(T, z) + I_{24}(T, z).
\]

For $I_{21}(T, z)$, by (5.2) and $\|z\|_p = 1$, we have
\[
\int \mathbb{R}^d I_{21}(T, z) \, dz \leq C \omega_p \left( \right) \int_0^T \left\| \nabla (u z) \right\|_p^p \, dt \leq C \omega_p \left( \right) \int_0^T \left\| \nabla u \right\|_p^p \, dt + C \omega_p \left( \right) \left\| \nabla \right\|_p^p \left\| u \right\|_p^p \int_0^T \left\| u \right\|_p^p \, dt.
\]

For $I_{24}(T, z)$, by (i) of Lemma 2.5, we have
\[
\int \mathbb{R}^d I_{24}(T, z) \, dz \leq C \int_0^T \left\| u \right\|_p^p \, dt + C \int_0^T \left\| u \right\|_p^{p/2} \left\| \nabla u \right\|_p^{p/2} \, dt.
\]

Moreover, it is easy to see that
\[
\int \mathbb{R}^d I_{22}(T, z) \, dz \leq C \left\| b \right\|_\infty \left\| \nabla \right\|_p \int_0^T \left\| u \right\|_p^p \, dt,
\]
\[
\int \mathbb{R}^d I_{23}(T, z) \, dz \leq C \int_0^T \left\| F \right\|_p^p \, dt.
\]

Combining the above calculations, we get
\[
\int_0^T \left\| \nabla u \right\|_p^p \, dt = \int_0^T \int \mathbb{R}^d \left\| \nabla u \right\|_p^p \, dz \, dt
\]
\[
\leq 2^{p-1} \int_0^T \int \mathbb{R}^d \left\| \nabla (u z) \right\|_p^p \, dz \, dt + 2^{p-1} \left\| \nabla \right\|_p \int_0^T \left\| u \right\|_p^p \, dt
\]
\[
\leq C \left\| u(0) \right\|_{L^p}^p + C \omega_p \left( \right) \int_0^T \left\| \nabla u \right\|_p^p \, dt + C \int_0^T \left\| u \right\|_p^p \, dt
\]
\[
+ C \int_0^T \left\| u \right\|_p^{p/2} \left\| \nabla u \right\|_p^{p/2} \, dt + C \int_0^T \left\| F \right\|_p^p \, dt.
\]
Using Young's inequality and letting $\delta$ be small enough so that $C_\omega^p(\delta) \leq \frac{1}{4}$, we arrive at
\[
\int_0^T \|\nabla u(s)\|_p^p ds \leq C\|u(0)\|_{p,\frac{1}{p}-1}^p + C \int_0^T \|u(s)\|_p^p ds + C \int_0^T \|F(s)\|_p^p ds.
\] (5.12)

On the other hand, by (5.9), it is easy to see that
\[
\|u(t)\|_p^p \leq C\|u(0)\|_{p,\frac{1}{p}-1}^p + C_\rho^{-1} \|b\|_{\infty}^p \int_0^t \|\nabla u(z)\|_p^p dz + C \|r(t)\|_p^p\]
which together with (5.12) and Gronwall's inequality yields that for any $T > 0$,
\[
\sup_{t \in [0,T]} \|u(t)\|_p^p + \int_0^T \|\nabla u(s)\|_p^p ds \leq C(1 + T^p) e^{cT^{p-1}} \left(\|u(0)\|_{p,\frac{1}{p}-1}^p + \int_0^T \|F(s)\|_p^p ds\right).
\] (5.13)

Thus, we conclude the proof of (5.10), and therefore,
\[
\int_0^T \|\nabla u(s)\|_p^p ds \leq C(1 + T^p) e^{cT^{p-1}} \left(\|u(0)\|_{p,\frac{1}{p}-1}^p + \int_0^T \|F(s)\|_p^p ds\right).
\] (5.14)

Lastly, we show (5.6). From equation (5.5) and using estimate (5.13), we have
\[
\int_0^T \|\partial_t u(t)\|_p^p dt \leq C \left(\int_0^T \|L u(t)\|_p^p dt + \|b\|_{\infty}^p \int_0^T \|\nabla u(t)\|_p^p dt + \int_0^T \|f(t)\|_p^p dt\right)
\leq C \left(1 + \|b\|_{\infty}^p \int_0^T \|\nabla u(t)\|_p^p dt + \int_0^T \|f(t)\|_p^p dt\right)
\leq C(1 + T^p) e^{cT^{p-1}} \left(\|u(0)\|_{p,\frac{1}{p}-1}^p + \int_0^T \|f(s)\|_p^p ds\right).
\] (5.15)

Noticing the following embedding relation (cf. [11, p.180, Theorem III 4.10.2])
\[
L^p([0, T], \mathbb{W}^{1,p}) \cap \mathbb{W}^{1,p}([0, T], L^p) \hookrightarrow C([0, T]; \mathbb{W}^{1-\frac{1}{p},p}),
\]
we have
\[
\sup_{t \in [0,T]} \|u(t)\|_{p,\frac{1}{p}-1}^p \leq C \left(\int_0^T \|\partial_t u(t)\|_p^p dt + \int_0^T \|u(t)\|_{p,\frac{1}{p}-1}^p dt\right)
\leq C(1 + T^p) e^{cT^{p-1}} \left(\|u(0)\|_{p,\frac{1}{p}-1}^p + \int_0^T \|f(s)\|_p^p ds\right),
\] (5.16)
which together with (5.13) yields (5.6). □

Before proving the existence of strong solutions to equation (5.1), we recall a well-known fact (cf. [14], [40]).

**Theorem 5.2. (Feynman-Kac formula) Let $\nu$ be a Lévy measure and $b \in L^\infty_{loc}(\mathbb{R}^+; C_b^\infty(\mathbb{R}^d; \mathbb{R}^d))$, $f \in L^1_{loc}(\mathbb{R}^+; \mathbb{W}^\infty(\mathbb{R}^d; \mathbb{R}^m))$. For any $\varphi \in \mathbb{W}^\infty(\mathbb{R}^d; \mathbb{R}^m)$, there exists a unique $u \in C(\mathbb{R}^+; \mathbb{W}^\infty(\mathbb{R}^d; \mathbb{R}^m))$ satisfying
\[
u u(t, x) = \varphi(x) + \int_0^t \mathcal{L}u(s, x) ds + \int_0^t (b \cdot \nabla u)(s, x) ds + \int_0^t f(s, x) ds.
\] Moreover, $u(t, x)$ can be represented by
\[
u u(t, x) := \mathbb{E}\varphi(X_{t,0}(x)) + \mathbb{E}\left(\int_0^t f(-s, X_{t-s}(x)) ds\right), \quad t \geq 0,
\] (5.17)
where \( \{X_{t,s}(x), t \leq s \leq 0, x \in \mathbb{R}^d \} \) is defined by the following SDE:

\[
X_{t,s}(x) = x + \int_t^s b(-r, X_{t,r}(x))dr + \int_t^s dL_r', \quad t \leq s \leq 0.
\]

We are now in a position to prove

**Theorem 5.3.** Assume \((H^{(1)}_\nu)\) and \((\ref{5.2})\). Let \( p \in (1, \infty) \) and

\[
\varphi \in W^{1, 1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^d), \quad f \in L^p_{\text{loc}}(\mathbb{R}_0^+; L^p(\mathbb{R}^d; \mathbb{R}^m)).
\]

Then there exists a unique \( u \in C(\mathbb{R}_0^+; W^{1,1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \cap L^p_{\text{loc}}(\mathbb{R}_0^+; W^{1,1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \) satisfying equation \((\ref{5.5})\).

**Proof.** Let \( b_\varepsilon, f_\varepsilon \) and \( \varphi_\varepsilon \) be the mollifying approximations of \( b, f \) and \( \varphi \):

\[
b_\varepsilon(t, x) := b(t) \ast \rho_\varepsilon(x), \quad f_\varepsilon(t, x) := f(t) \ast \rho_\varepsilon(x), \quad \varphi_\varepsilon(x) := \varphi \ast \rho_\varepsilon(x).
\]

By Theorem \((5.2)\), there exists a unique \( u_\varepsilon \in C(\mathbb{R}_0^+; W^{1,1, p}(\mathbb{R}^d; \mathbb{R}^m)) \) satisfying the following equation:

\[
u_e(t, x) = \varphi_\varepsilon(x) + \int_0^t L u_\varepsilon(s, x)ds + \int_0^t b_\varepsilon(s, x) \cdot \nabla u_\varepsilon(s, x)ds + \int_0^t f_\varepsilon(s, x)ds. \tag{5.15}
\]

First of all, by Lemma \((5.1)\) we have the following uniform estimate: for any \( T > 0 \),

\[
\sup_{t \in [0, T]} \|u_\varepsilon(t)\|_{1, 1-\frac{1}{p}, p} + \int_0^T \|\nabla u_\varepsilon(t)\|_{p} dt \leq C \left( \|\varphi\|_{1, 1-\frac{1}{p}, p} + \int_0^T \|f(t)\|_{p} dt \right),
\]

where \( C \) is independent of \( \varepsilon \).

Noticing that \( w_{\varepsilon, \varepsilon'} := u_\varepsilon - u_{\varepsilon'} \) satisfies

\[
\partial_t w_{\varepsilon, \varepsilon'} = L w_{\varepsilon, \varepsilon'} + b_\varepsilon \cdot \nabla w_{\varepsilon, \varepsilon'} + (b_\varepsilon - b_{\varepsilon'}) \cdot \nabla u_\varepsilon + f_\varepsilon - f_{\varepsilon'}, \quad w_{\varepsilon, \varepsilon'}(0) = \varphi_\varepsilon - \varphi_{\varepsilon'},
\]

by Lemma \((5.1)\), again, we also have

\[
\sup_{t \in [0, T]} \|w_{\varepsilon, \varepsilon'}(t)\|_{1, 1-\frac{1}{p}, p} + \int_0^T \|\nabla w_{\varepsilon, \varepsilon'}(s)\|_{p} ds \leq C \|\varphi_\varepsilon - \varphi_{\varepsilon'}\|_{1, 1-\frac{1}{p}, p} + C \int_0^T \|f_\varepsilon(s) - f_{\varepsilon'}(s)\|_{p} ds
\]

\[
+ C \sup_{s \in [0, T]} \|b_\varepsilon(s) - b_{\varepsilon'}(s)\|_{\infty} \int_0^T \|\nabla u_\varepsilon(s)\|_{p} ds.
\]

On the other hand, by \((\ref{5.2})\), it is easy to see that

\[
\sup_{s \geq 0} \|b_\varepsilon(s) - b_{\varepsilon'}(s)\|_{\infty} \leq \omega_b(\varepsilon) + \omega_b(\varepsilon').
\]

So, for any \( T > 0 \),

\[
\lim_{\varepsilon, \varepsilon' \to 0} \left( \sup_{t \in [0, T]} \|w_{\varepsilon, \varepsilon'}(t)\|_{1, 1-\frac{1}{p}, p} + \int_0^T \|\nabla w_{\varepsilon, \varepsilon'}(s)\|_{p} ds \right) = 0,
\]

and there exists a \( u \in C(\mathbb{R}_0^+; W^{1,1, 1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \cap L^p_{\text{loc}}(\mathbb{R}_0^+; W^{1,1, 1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \) such that for any \( T > 0 \),

\[
\lim_{\varepsilon \to 0} \left( \sup_{t \in [0, T]} \|u_\varepsilon(t) - u(t)\|_{1, 1-\frac{1}{p}, p} + \int_0^T \|\nabla u_\varepsilon(s) - \nabla u(s)\|_{p} ds \right) = 0.
\]

By taking limits in \( L^p \)-space for \((\ref{5.15})\), one finds that for all \( t \geq 0 \) and almost all \( x \in \mathbb{R}^d \),

\[
u(t, x) = \varphi(x) + \int_0^t L u(s, x)ds + \int_0^t b(s, x) \cdot \nabla u(s, x)ds + \int_0^t f(s, x)ds.
\]

The existence follows. As for the uniqueness, it follows from Lemma \((5.1)\). \( \square \)
Let \( \epsilon > 0 \) be small. Let \( \epsilon \) be the mollifying approximation of \( f \) and \( L \). We define \( \tilde{X}_t = \int_0^t b(s, X_s^\epsilon) ds + L_t \).

**Theorem 5.4.** Assume \((H^1_\nu)\) and (5.2). Then there exists a solution to SDE (5.16) such that for fixed \( T_0 > 0 \) and any \( p > d + 1 \), stopping time \( \tau \), \( 0 \leq \tau \leq T_0 \) and \( f \in L^p([T, S] \times \mathbb{R}^d) \),

\[
\mathbb{E} \left( \int_{T \wedge \tau}^{S \wedge \tau} f(s, X_s) ds \bigg| \mathcal{F}_{T \wedge \tau} \right) \leq C \| f \|_{L^p([T, S] \times \mathbb{R}^d)},
\]

where \( C \) is independent of \( f \) and \( \tau \). Here, a solution to equation (5.16) means that there exists a probability space \((\Omega, \mathcal{F}, \mathbb{P})\) and two càdlàg stochastic processes \( X_t \) and \( L_t \) defined on it such that (5.16) is satisfied, and \( L_t \) is a Lévy process with respect to the completed filtration \( \mathcal{F}_t := \sigma^p(X_s, L_s, s \leq t) \), and whose Lévy measure is given by \( \nu \).

**Proof.** Let \( b_\epsilon(t, x) := b(t) * \rho_\epsilon(x) \) be the mollifying approximation of \( b \) and let \( X_t^\epsilon \) solve the following SDE:

\[
X_t^\epsilon = X_0 + \int_0^t b_\epsilon(s, X_s^\epsilon) ds + L_t.
\]

By taking limits for equation (5.18), it is easy to see that \( (X_t, L_t) \) is a solution of SDE (5.16).

Fix \( f \in C^\infty_0(\mathbb{R}^+ \times \mathbb{R}^d) \) and \( T_0 > 0 \). Let \( u_\epsilon(t, x) \in C(\mathbb{R}^+; C_b^\infty(\mathbb{R}^d)) \) solve the following PDE

\[
\partial_t u_\epsilon - Lu_\epsilon - b_\epsilon(T_0 - \cdot, \cdot) \cdot \nabla u_\epsilon = -f(T_0 - \cdot, \cdot), \quad u_\epsilon(0) = 0.
\]

Set

\[
w_\epsilon(t, x) = u_\epsilon(T_0 - t, x).
\]

Then

\[
\partial_t w_\epsilon + Lw_\epsilon + b \cdot \nabla w_\epsilon = f, \quad w(T_0, x) = 0.
\]

Let \( \tau \) be any stopping time. By Ito’s formula (cf. [2], Theorem 4.4.7)), we have

\[
w_\epsilon(t, X_t^\epsilon) = w(T \wedge \tau, X^{\epsilon}_{T \wedge \tau}) + \int_{T \wedge \tau}^t (\partial_s w_\epsilon(s) + Lw_\epsilon(s) + b_\epsilon(s) \cdot \nabla w_\epsilon(s))(X_s^\epsilon) ds + \text{ a martingale}
\]

\[
= w(T \wedge \tau, X^{\epsilon}_{T \wedge \tau}) + \int_{T \wedge \tau}^t f(s, X_s^\epsilon) ds + \text{ a martingale}.
\]

Taking the conditional expectations with respect to \( \mathcal{F}_{T \wedge \tau} \) and by the optional theorem (cf. [19], Theorem 6.12), we obtain

\[
\mathbb{E} \left( \int_{T \wedge \tau}^{S \wedge \tau} f(s, X_s^\epsilon) ds \bigg| \mathcal{F}_{T \wedge \tau} \right) = \mathbb{E}\left( w(S \wedge \tau, X_{S \wedge \tau}^\epsilon) \bigg| \mathcal{F}_{T \wedge \tau} \right) - w(T \wedge \tau, X^{\epsilon}_{T \wedge \tau}).
\]

On the other hand, since

\[
|b_\epsilon(t, x) - b_\epsilon(t, y)| \leq \omega_\rho(|x - y|),
\]

by (5.4) and (5.6), we have

\[
\sup_{t \in [T, S]} \| u_\epsilon \|_{L^\rho} \leq C \sup_{t \in [T, S]} \| u_\epsilon(t) \|_{L^{p-1} \rho} \leq C \| f \|_{L^p([T, S] \times \mathbb{R}^d)},
\]

where \( C \) is independent of \( f \) and \( \epsilon \).
where the constant $C$ is independent of $\varepsilon$. Hence,
\[
\mathbb{E} \left( \int_{T_0}^{T_T} f(s, X^\varepsilon_s) \, ds \right)_{T_{T^\varepsilon}} \leq C\|f\|_{L^p([T,T] \times \mathbb{R}^d)}.
\]
Since $f \in C^0_0(\mathbb{R}^+ \times \mathbb{R}^d)$, estimate (5.17) now follows by taking limit $\varepsilon \to 0$. For general $f \in L^p([T,S] \times \mathbb{R}^d)$, it follows by a standard density argument. \hfill \Box

6. Quasi-linear first order parabolic system with critical diffusion

In this section we study the solvability of quasi-linear first order parabolic system with critical diffusions. Let us firstly recall and extend a result of Silvestre [32] about the H"older estimate of advection fractional diffusion equations.

**Theorem 6.1.** (Silvestre [32]) Assume that $b \in L^\infty((0,1]; C_b^0(\mathbb{R}^d; \mathbb{R}^d))$ and $f \in L^\infty((0,1]; C_b^0(\mathbb{R}^d))$. For given $a > 0$, let $u \in C([0,1]; C_b^0(\mathbb{R}^d))$ satisfy that for all $(t, x) \in [0,1] \times \mathbb{R}^d$,
\[
\frac{\partial u}{\partial t} = \mathcal{A} u + fb \quad \text{in} \quad [0,1] \times \mathbb{R}^d,
\]

Then for any $\gamma \in (0,1)$, there exist $a, C, \gamma$ and $\|b\|_\infty$ such that
\[
\sup_{t \in [0,1]} \|u(t)\|_H^\gamma \leq C(\|u\|_\infty + \|f\|_\infty + \|u(0)\|_H^\gamma),
\]
where $\|u\|_H^\gamma := \sup_{|x-y|\leq 1} |u(x) - u(y)|/|x-y|^\gamma$.

**Proof.** By [32] Theorem 1.1, there exist $a_0, C, \gamma$ and $\|b\|_\infty$ such that
\[
\|u(t)\|_{H^{a_0}} \leq C t^{-a_0}(\|u\|_\infty + \|f\|_\infty), \quad t \in (0,1].
\]
Recall the following probabilistic representation of $u(t, x)$ (see Theorem 5.2):
\[
u(t, x) = \mathbb{E} u(0, X_{-t,0}(x)) + \mathbb{E} \left( \int_{-t}^{0} f(-s, X_{-s,t}(x)) \, ds \right), \quad t \in [0,1],
\]
where $\{X_{s,t}(x), -1 \leq s \leq 0, x \in \mathbb{R}^d\}$ is defined by the following SDE:
\[
X_{s,t}(x) = x + \int_{-t}^{s} b(-r, X_{-r,t}(x)) \, dr + \int_{-t}^{s} dL_r, \quad -1 \leq s \leq 0,
\]
where $(L_t)_{t\geq 0}$ is the Lévy process associated with $(-\Delta)^{1/2}$.

By (6.4) and (6.5), we have
\[
|u(t, x) - u(0, x)| \leq \|u(0)\|_{H^\gamma} |X_{-t,0}(x) - x| + t\|f\|_\infty \leq \|u(t)\|_{H^\gamma} (t^\gamma |b|_\infty + \mathbb{E}||L_1||^\gamma) + t\|f\|_\infty \leq t^\gamma \left( \|u(0)\|_{H^\gamma} (|b|_\infty + \mathbb{E}||L_1||^\gamma) + \|f\|_\infty \right).
\]

For given $x, y \in \mathbb{R}^d$ and $t \in (0,1)$, if $t > |x-y|^{1/2}$, then by (6.3) we have
\[
|u(t, x) - u(t, y)| \leq C |x-y|^{\beta_0/2} (\|u\|_\infty + \|f\|_\infty);
\]
if $t \leq |x-y|^{1/2}$, then by (6.6) we have
\[
|u(t, x) - u(t, y)| \leq |u(t, x) - u(0, x)| + |u(t, y) - u(0, y)| + |u(0, x) - u(0, y)| \leq 2|x-y|^{\gamma/2} (\|u(0)\|_{H^\gamma} (|b|_\infty + \mathbb{E}||L_1||^\gamma) + \|f\|_\infty) + |x-y|^{\gamma} \|u(0)\|_{H^\gamma}.
\]
Estimate (6.2) now follows by taking \( \beta = \min(\gamma, \beta_0)/2 \).

Notice that the proof of Silvestre \([32]\) seems strongly depend on the scale invariance of \((-\Delta)^{\frac{1}{2}}\). Below, we use probabilistic representation (6.4) again to extend Silvestre’s H¨older estimate to the more general Lévy operator (not necessary homogeneous). Consider the following Lévy measure

\[ v(dy) = \frac{a(y)}{|y|^{d+1}} dy, \]

where \( a(y) \) is a measurable function on \( \mathbb{R}^d \) and satisfies that

\[ c_1 \leq a(y) \leq c_2, \]

and for all \( 0 < r < R < +\infty \),

\[ \int_{r \leq |y| \leq R} \frac{ya(y)}{|y|^{d+1}} dy = 0. \]

Let \( \mathcal{L}^\nu \) be the Lévy operator associated to \( \nu \). We have

**Corollary 6.2.** Assume that \( b \in L^\infty([0, 1]; C^0_b(\mathbb{R}^d; \mathbb{R}^d)) \) and \( f \in L^\infty([0, 1]; C^0_b(\mathbb{R}^d)) \). For given \( \varphi \in C^0_b(\mathbb{R}^d) \), let \( u \in C([0, 1]; C_b^0(\mathbb{R}^d)) \) satisfy that for all \( (t, x) \in [0, 1] \times \mathbb{R}^d \),

\[ u(t, x) = \varphi(x) + \int_0^t \mathcal{L}^\nu u(s, x)ds + \int_0^t b(s, x) \cdot \nabla u(s, x)ds + \int_0^t f(s, x)ds. \]  

(6.7)

Then for any \( \gamma \in (0, 1) \), there exist a \( \beta \in (0, 1) \) and \( C \) depending only on \( d, c_1, \gamma \) and \( \|b\|_{\infty} \) such that

\[ \sup_{t \in [0, 1]} \|u(t)\|_{H^\beta} \leq C(\|f\|_{\infty} + \|\varphi\|_{H^\gamma} + \|\varphi\|_{H^\gamma}). \]  

(6.8)

**Proof.** Define

\[ \nu_0(dy) := c_1 dy/|y|^{d+1}, \quad \nu_1(dy) := \nu(dy) - \nu_0(dy) = (a(y) - c_1) dy/|y|^{d+1}. \]

Let \( (L_{t_0}^\nu)_{t_0 \in \mathbb{R}} \) and \( (L_t^\nu)_{t \in \mathbb{R}} \) be two independent \( d \)-dimensional Lévy processes with the Lévy measures \( \nu_0 \) and \( \nu_1 \). Then we have

\[ (L_t^\nu)_{t \geq 0} \overset{(d)}{=} (L_t^\nu + L_{-t_0}^\nu)_{t \geq 0}. \]

Recall the probabilistic representation (6.4) of \( u(t, x) \), where \( \{X_{t,s}(x), -1 \leq t \leq s \leq 0, x \in \mathbb{R}^d \} \) is defined by the following SDE:

\[ X_{t,s}(x) = x + \int_t^s b(-r, X_{t,s}(x))dr + \int_t^s dL_t^\nu + \int_t^s dL_t^\nu, \quad -1 \leq t \leq s \leq 0. \]

Let \( \mathbb{D}([-1, 0]) \) be the space of all càdlàg functions \( \ell : [-1, 0] \to \mathbb{R}^d \). Below, we fix \( t_0 \in [0, 1] \) and a path \( \ell \in \mathbb{D}([-1, 0]) \). Let \( Y_{t,s}(x, \ell) \) solve the following SDE:

\[ Y_{t,s}(x, \ell) = x + \int_t^s b(-r, Y_{t,s}(x, \ell) + \ell_r - \ell_{-t_0})dr + \int_t^s dL_t^\nu, \quad -1 \leq t \leq s \leq 0. \]

By the uniqueness of solutions to SDEs, it is easy to see that

\[ X_{-t_0,0}(x) = Y_{-t_0,0}(x, L^\nu_t) + L^\nu_t - L^\nu_{-t_0}, \quad -t_0 \leq s \leq 0. \]

Substituting this into (6.4), we get

\[ u(t_0, x) = \mathbb{E}\varphi(Y_{-t_0,0}(x, L^\nu_t) + L^\nu_t - L^\nu_{-t_0}) + \mathbb{E}\left( \int_{-t_0}^0 f(-s, Y_{-t_0,0}(x, L^\nu_t) + L^\nu_t - L^\nu_{-t_0})ds \right). \]  

(6.9)

Now let us define

\[ w(t, x, \ell) := \mathbb{E}\varphi(Y_{-t,0}(x, \ell) + \ell_0 - \ell_{-t_0}) + \mathbb{E}\left( \int_{-t}^0 f(-s, Y_{-t,0}(x, \ell) + \ell_s - \ell_{-t_0})ds \right). \]  

(6.10)
Using Theorem 5.2 again, one sees that \( w(t, x, \ell) \) satisfies
\[
\begin{align*}
  w(t, x, \ell) &= \varphi(x + \ell_0 - \ell_{-h_0}) + \int_0^t \mathcal{L}w(s, x, \ell)ds \\
  &+ \int_0^t b(s, x + \ell_s - \ell_{-h_0}) \cdot \nabla w(s, x, \ell)ds \\
  &+ \int_0^t f(s, x + \ell_s - \ell_{-h_0})ds,
\end{align*}
\]
where for some \( a > 0 \), \( \mathcal{L} = -a(-\Delta)^{\frac{\alpha}{2}} \) is the Lévy operator associated with \( \nu_0 \) (see (2.8)). Thus, by Theorem 6.1, there exist a \( \beta \in (0, 1) \) and \( C \) depending only on \( d, a, \gamma \) and \( \|b\|_\infty \) such that
\[
\sup_{t \in [0, 1]} \|w(t, \cdot, \ell)\|_{\mathcal{H}^\beta} \leq C(\|w\|_\infty + \|f\|_\infty + \|\varphi\|_{\mathcal{H}^\beta}) \tag{6.10}
\]
\[
\leq C(\|f\|_\infty + \|\varphi\|_\infty + \|\varphi\|_{\mathcal{H}^\beta}). \tag{6.11}
\]
On the other hand, since \((L_r^\nu)_{r \in \mathbb{C}}\) and \((L_r^\nu)_{r \in \mathbb{C}}\) are independent, by (6.9) and (6.10), we have
\[
u(t_0, x) = \mathbb{E}w(t_0, x, L_r^\nu).
\]
Estimate 6.8 now follows by 6.11. \( \square \)

Below, for the sake of simplicity, we write
\[
\mathcal{L} = \mathcal{L}^\nu.
\]
Consider the following Cauchy problem of semi-linear first order parabolic system:
\[
\partial_t u = \mathcal{L}u + b(u) \cdot \nabla u + f(u), \quad u(0) = \varphi, \tag{6.12}
\]
where \( u(t, x) = (u^1(t, x), \ldots, u^m(t, x)) \), and \( \varphi(x) : \mathbb{R}^d \rightarrow \mathbb{R}^m \),
\[
b(t, x, u) : [0, 1] \times \mathbb{R}^d \times \mathbb{R}^m \rightarrow \mathbb{R}^d, \\
f(t, x, u) : [0, 1] \times \mathbb{R}^d \times \mathbb{R}^m \rightarrow \mathbb{R}^m
\]
are Borel measurable functions.

We introduce the following notion about the strong solution for equation (6.12).

**Definition 6.3.** Let \( p > 1 \) and \( \varphi \in \mathbb{W}^{1-\frac{\beta}{p}}(\mathbb{R}^d; \mathbb{R}^m) \). A function
\[
u \in C([0, 1]; \mathbb{W}^{1-\frac{\beta}{p}}(\mathbb{R}^d; \mathbb{R}^m)) \cap L^p([0, 1]; \mathbb{W}^{1-\frac{\beta}{p}}(\mathbb{R}^d; \mathbb{R}^m))
\]
is called a strong solution of equation (6.12) if for all \( t \in [0, 1] \) and almost all \( x \in \mathbb{R}^d \),
\[
u(t, x) = \varphi(x) + \int_0^t \mathcal{L}u(s, x)ds + \int_0^t b(s, x, u(s, x)) \cdot \nabla u(s, x)ds + \int_0^t f(s, x, u(s, x))ds.
\]

We firstly prove the following uniqueness of strong solutions to equation (6.12).

**Lemma 6.4.** Suppose that for any \( R > 0 \), there are two constants \( C_{f,R}, C_{b,R} > 0 \) such that for all \( t \in [0, 1] \), \( x, y \in \mathbb{R}^d \) and \( u, u' \in \mathbb{R}^m \) with \( |u|, |u'| \leq R \),
\[
|f(t, x, u) - f(t, x, u')| \leq C_{f,R}|u - u'|,
\]
\[
|b(t, x, u) - b(t, y, u')| \leq \omega_{b,R}(|x - y|) + C_{b,R}|u - u'|,
\]
where \( \omega_{b,R} : \mathbb{R}^+ \rightarrow \mathbb{R}^+ \) is an increasing function with \( \lim_{|s| \rightarrow 0} \omega_{b,R}(s) = 0 \). Then there exists at most one strong solution in the sense of Definition 6.3 provided \( p > d + 1 \).
Proof. Let \( \varphi \in W^{1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m) \) and

\[
\begin{align*}
  u, \bar{u} & \in C([0, 1]; W^{1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \cap L^p([0, 1]; W^{1, p}(\mathbb{R}^d; \mathbb{R}^m)) \\

eq & \text{ two strong solutions of equation (6.12) with the same initial value } \varphi. \text{ Let }
  w(t, x) := u(t, x) - \bar{u}(t, x).
\end{align*}
\]

Then for all \( t \in [0, 1] \) and almost all \( x \in \mathbb{R}^d \),

\[
w(t, x) = \int_0^t Lw(s, x)ds + \int_0^t b(s, x, u(s, x)) \cdot \nabla w(s, x)ds + \int_0^t g(s, x)ds,
\]

where

\[
g(t, x) := (b(t, x, u(t, x)) - b(t, x, \bar{u}(t, x))) \cdot \nabla \bar{u}(t, x) + f(t, x, u(t, x)) - f(t, x, \bar{u}(t, x)).
\]

Since \( u, \bar{u} \in C([0, 1]; W^{1-\frac{1}{p}, p}(\mathbb{R}^d; \mathbb{R}^m)) \), by Sobolev’s embedding (5.4), for some \( C > 0 \),

\[
\sup_{t \in [0, 1]} \| u(t) \|_\infty \leq C \sup_{t \in [0, 1]} \| u(t) \|_{1-\frac{1}{p}, p}, \quad \sup_{t \in [0, 1]} \| \bar{u}(t) \|_\infty \leq C \sup_{t \in [0, 1]} \| \bar{u}(t) \|_{1-\frac{1}{p}, p}.
\]

Let

\[
R := C \sup_{t \in [0, 1]} \| u(t) \|_{1-\frac{1}{p}, p} + C \sup_{t \in [0, 1]} \| \bar{u}(t) \|_{1-\frac{1}{p}, p},
\]

then by the assumptions, we have for all \( t \in [0, 1] \) and \( x, y \in \mathbb{R}^d \),

\[
\left| b(t, x, u(t, x)) - b(t, y, u(t, y)) \right| \leq \omega_{b,R} |x - y| + C_{b,R} |u(t, x) - u(t, y)|
\]

\[
\leq \omega_{b,R} |x - y| + C \sup_{t \in [0, 1]} \| u(t) \|_{1-\frac{1}{p}, p} |x - y|^{1-\frac{d+1}{p}}.
\]

Thus, by Lemma 5.1 and the assumptions, for all \( t \in [0, 1] \), we have

\[
\begin{align*}
  \| w(t) \|_{1-\frac{1}{p}, p}^p & \leq C \int_0^t \| g(s) \|_p^p ds + C \int_0^t \left( C_{\bar{u}}^p \| \nabla \bar{u}(s) \|_p^p + C_{f,\bar{u}}^p \| w(s) \|_\infty^p \right) ds \\
  & \leq C \int_0^t \left( \| \nabla \bar{u}(s) \|_p^p + 1 \right) \| w(s) \|_{1-\frac{1}{p}, p}^p ds.
\end{align*}
\]  

(6.13)

The uniqueness follows by Gronwall’s inequality. \( \square \)

We have the following existence and uniqueness of smooth solutions for equation (6.12).

**Theorem 6.5.** Suppose that for all \( R > 0 \) and \( j, k = 0, 1, 2, \ldots \), there exist \( C_{b,j,k,R}, C_{f,j,k,R} > 0 \) such that for all \( (t, x) \in [0, 1] \times \mathbb{R}^d \) and \( u \in \mathbb{R}^m \) with \( |u| \leq R \),

\[
|\nabla_x^j \nabla_u^k b(t, x, u)| \leq C_{b,j,k,R}, \quad |\nabla_x^j \nabla_u^k f(t, x, u)| \leq C_{f,j,k,R},
\]

and there exist \( \gamma_j \in \mathbb{N}, C_{f,j} > 0 \) and \( h_j \in (L^1 \cap L^\infty)(\mathbb{R}^d) \) such that for all \( (t, x, u) \in [0, 1] \times \mathbb{R}^d \times \mathbb{R}^m \),

\[
|\nabla_x^j f(t, x, u)| \leq C_{f,j} |u|^{\gamma_j} + h_j(x),
\]

where \( \gamma_0 = 1 \). Then for any \( \varphi \in \mathbb{W}^{\gamma_0}(\mathbb{R}^d; \mathbb{R}^m) \), there exists a unique solution

\[
u \in C([0, 1]; \mathbb{W}^{\gamma_0}(\mathbb{R}^d; \mathbb{R}^m))
\]

to equation (6.12) with initial value \( \varphi \). Moreover,

\[
\sup_{t \in [0, 1]} \| u(t) \|_\infty \leq e^{C_{\varphi}} (\| \varphi \|_\infty + \| h_0 \|_\infty),
\]

and for any \( p > d + 1 \),

\[
\sup_{t \in [0, 1]} \| u(t) \|_{1-\frac{1}{p}, p}^p + \int_0^1 \| \nabla u(t) \|_p^p dt \leq K_p,
\]

(6.17)
where the constant $K_p$ depends only on $p, d, \nu$ and $\|\varphi\|_{1, \frac{1}{p}, d, \nu}, C_{f,0}, \|h_0\|_{\infty}, \|h_0\|_{\nu}, C_{b,0,0,K_0}, C_{b,0,1,K_0}$ and the function
\[
\omega_{b,R}(s) := \sup_{t \in [0, R]} \sup_{\|x\| \leq \|y\| \leq s} |b(t, x, u) - b(t, y, u)|, \quad s > 0.
\] (6.18)

**Proof.** We construct the Picard’s approximation for equation (6.12) as follows. Set $u_0(t, x) \equiv 0$. Since for any $u \in C([0, 1]; \mathbb{W}^\infty_d, \mathbb{R}^m)$, by (6.14), (6.15) and the chain rules,
\[
(t, x) \mapsto b(t, x, u(t, x)) \in L^\infty([0, 1]; C^\nu_b(\mathbb{R}^d; \mathbb{R}^m)),
\]
\[
(t, x) \mapsto f(t, x, u(t, x)) \in L^\infty([0, 1]; \mathbb{W}^\infty_d, \mathbb{R}^m),
\]
by Theorem [5.2] for each $n \in \mathbb{N}$, there exists a unique $u_n \in C([0, 1]; \mathbb{W}^\infty_d, \mathbb{R}^m)$ solving the following linear equation:
\[
\partial_t u_n = \mathcal{L} u_n + b(u_{n-1}) \cdot \nabla u_n + f(u_{n-1}), \quad u_n(0) = \varphi.
\] (6.19)

Set
\[
\tilde{u}_n(t, x) := u_n(t, x) - \int_0^t \|f(s, \cdot, u_{n-1}(s, \cdot))\|_{\infty} ds,
\]
then for each $j = 1, 2, \ldots, m,$
\[
\partial_t \tilde{u}_n^j - \mathcal{L} \tilde{u}_n^j - b(u_{n-1}) \cdot \nabla \tilde{u}_n^j = f^j(u_{n-1}) - \|f_n(u_{n-1})\|_{\infty} \leq 0.
\]
By Lemma [3.1] and (6.15), in view of $\gamma_0 = 1$, we have
\[
\|u_n(t)\|_{\infty} \leq \|\tilde{u}_n(t)\|_{\infty} + \int_0^t \|f(s, \cdot, u_{n-1}(s, \cdot))\|_{\infty} ds \\
\leq \|\tilde{u}_n(0)\|_{\infty} + \int_0^t (C_f0 \|u_{n-1}(s)\|_{\infty} + \|h_0\|_{\infty}) ds \\
\leq \|\varphi\|_{\infty} + \|h_0\|_{\infty} + C_{f,0} \int_0^t \|u_{n-1}(s)\|_{\infty} ds,
\]
which yields by Gronwall’s inequality that
\[
\sup_{t \in [0, 1]} \|u_n(t)\|_{\infty} \leq e^{C_{f,0}}(\|\varphi\|_{\infty} + \|h_0\|_{\infty}) =: K_0.
\] (6.20)
We mention that this $L^\infty$-estimate can be also derived by representation formula (5.14).

Since
\[
|b(t, x, u_{n-1}(t, x))| \leq C_{b,0,0,K_0} =: K_1,
\]
by Corollary [6.2] there exist a $\beta \in (0, 1)$ and $C$ depending only on $d, \nu, p$ and $K_1$ such that
\[
\sup_{t \in [0, 1]} \|u_n(t)\|_{\mathcal{H}^\beta} \leq C(\|f(u_{n-1})\|_{\infty} + \|\varphi\|_{\infty} + \|\varphi\|_{1, \frac{1}{p}, d, \nu})
\]
ø(6.15), (6.20), (5.4)
\[\leq C \left( C_{f,0} K_0 + \|h_0\|_{\infty} + \|\varphi\|_{\infty} + \|\varphi\|_{1, \frac{1}{p}, d, \nu} \right) =: K_2.
\] (6.21)
Thus, letting $\omega_{b,K_0}$ be defined by (6.18) with $R = K_0$ and using (6.14), (6.20), we have
\[
|b(t, x, u_{n-1}(t, x)) - b(t, y, u_{n-1}(t, y))| \leq \omega_{b,K_0}(|x - y|) + C_{b,0,1,K_0} K_2 |x - y|^\beta.
\] (6.22)
Hence, we can use Lemma [5.1] to derive that for any $p > 1,$
\[
\|u_n(t)\|_{1, \frac{1}{p}, d, \nu}^p + \int_0^t \|\nabla u_n(s)\|_{\nu}^p ds \leq C \left( \|\varphi\|_{1, \frac{1}{p}, d, \nu}^p + \int_0^t \|f(s, u_{n-1}(s))\|_{\nu}^p ds \right) \\
\leq C_1 \left( \|\varphi\|_{1, \frac{1}{p}, d, \nu}^p + \int_0^t \left( C_{f,0} \|u_{n-1}(s)\|_{\nu}^p + \|h_0\|_{\nu}^p \right) ds \right),
\] (6.23)
where \( C_1 \geq 1 \) depends only on \( p, d, \nu, K_1, K_2, \omega_{b,K_0} \) and \( C_{b,0,1,K_0} \). In particular, for any \( t \in [0, 1] \),
\[
\|u_n(t)\|_p^p \leq C_1 \left( \|\varphi\|_{1-\frac{1}{p}, p}^p + \|h_0\|_p^p \right) + C_1 C_{f,0}^p \int_0^t \|u_{n-1}(s)\|_p^p ds
\]
and by Gronwall’s inequality,
\[
\sup_{t \in [0, 1]} \|u_n(t)\|_p^p \leq C_1 \left( \|\varphi\|_{1-\frac{1}{p}, p}^p + \|h_0\|_p^p \right) e^{C_1 C_{f,0}^p t}.
\]
Substituting this into (6.23), we obtain
\[
\sup_{t \in [0, 1]} \|u_n(t)\|_p^p \leq C_1 \left( \|\varphi\|_{1-\frac{1}{p}, p}^p + \|h_0\|_p^p \right) e^{C_1 C_{f,0}^p t}.
\]
By (6.22) and Lemma 5.1, for any \( \nu \),
\[
\begin{align*}
\|\partial_t \omega(t)\|_p & \leq C_1 \left( \|\varphi\|_{1-\frac{1}{p}, p}^p + \|h_0\|_p^p \right) e^{C_1 C_{f,0}^p t}.
\end{align*}
\]
where \( K_3 \) depends only on \( p, C_1, \|\varphi\|_{1-\frac{1}{p}, p}, C_{f,0}, \|h_0\|_p \).

Let us now estimate the higher order derivatives of \( u_n \). For given \( k \in \mathbb{N} \), set
\[
w^{(k)}_n(t, x) := \nabla^k u_n(t, x).
\]
By equation (6.19) and the chain rules, one sees that
\[
\partial_{ij} w^{(k)}_n = \mathcal{L} w^{(k)}_n + b(u_{n-1}) \cdot \nabla w^{(k)}_n + g^{(k)}_n,
\]
where
\[
g^{(k)}_n(t, x) := \nabla^k (f(t, \cdot, u_{n-1}(t, \cdot))) + \sum_{j=1}^k \frac{k!}{(k-j)! j!} \nabla^j (b(t, \cdot, u_{n-1}(t, \cdot))) \cdot \nabla^{k-j} \nabla u_n(t, x).
\]
By (6.22) and Lemma 5.1 for any \( p > 1 \), we have
\[
\sup_{t \in [0, 1]} \left\| w^{(k)}_n(t) \right\|_{1-\frac{1}{p}, p}^p + \int_0^1 \left\| \nabla w^{(k)}_n(s) \right\|_p^p ds \leq C \left( \|\nabla^k \varphi\|_{1-\frac{1}{p}, p}^p + \int_0^1 \left\| g^{(k)}_n(s) \right\|_p^p ds \right).
\]
Since \( g^{(k)}_n(s) \) contains at most \( k \)-order derivatives of \( u_n(s) \) and the powers of lower order derivatives of \( u_n(s) \), by induction method, it is easy to see that for any \( k \in \mathbb{N} \) and \( p > 1 \),
\[
\sup_{t \in [0, 1]} \left\| w^{(k)}_n(t) \right\|_{1-\frac{1}{p}, p}^p + \int_0^1 \left\| \nabla w^{(k)}_n(s) \right\|_p^p ds \leq K_{p,k},
\]
where \( K_{p,k} \) is independent of \( n \).

Define
\[
w_{n,m}(t, x) := u_n(t, x) - u_m(t, x).
\]
Then
\[
\partial_{ij} w_{n,m} = \mathcal{L} w_{n,m} + b(u_{n-1}) \cdot \nabla w_{n,m} + (G_{1,n,m} + G_{2,n,m}) w_{n-1,m-1},
\]
subject to \( w_{n,m}(0) = 0 \), where
\[
G_{1,n,m}^{(k)}(t, x) := \sum_j \int_0^1 \partial_{ij} b^j(t, x, u_{n-1}(t, x) + r(u_{n-1} - u_{m-1})(t, x)) dr \cdot \partial_{ji} u_n(t, x),
\]
\[
G_{2,n,m}^{(k)}(t, x) := \int_0^1 \partial_{ij} f^k(t, x, u_{n-1}(t, x) + r(u_{n-1} - u_{m-1})(t, x)) dr.
\]
By (6.22) and Lemma 5.1 again, we have
\[
\left\| w_{n,m}(t) \right\|_{1-\frac{1}{p}, p}^p \leq C \int_0^1 \left\| (G_{1,n,m}(s) + G_{2,n,m}(s)) w_{n-1,m-1}(s) \right\|_p^p ds.
\]
By (6.14) and as in estimating (6.13), we further have
\[ \|w_{n,m}(t)\|_{L^p} \leq C \int_0^t (\|\nabla u_m(s)\|_{L^p} + 1) \|w_{n-1,m-1}(s)\|_{L^p} \, ds \]
and for any \( R \)
which together with (6.25) and the interpolation inequality yields that for any
\( x \in \mathbb{R}^d \), there exists a unique strong solution \( u \) in the sense of Definition 6.3. Moreover,
\[ \lim_{n,m \to \infty} \sup_{t \in [0,1]} \|w_{n,m}(t)\|_{L^p} = 0, \]
which together with (6.25) and the interpolation inequality yields that for any \( k \in \mathbb{N} \),
\[ \lim_{n,m \to \infty} \sup_{t \in [0,1]} \|u_n(t) - u_m(t)\|_{L^k} = 0. \]
Thus, by Gronwall’s inequality, we get
\[ \lim_{n,m \to \infty} \sup_{t \in [0,1]} \|w_{n,m}(t)\|_{L^p} = 0, \]
which proves the theorem.

Next, we show the well-posedness of equation (6.12) under less regularity conditions on \( b, f \).

**Theorem 6.6.** Let \( p > d + 1 \). Suppose that there exist \( C_f > 0 \) and \( h \in (L^p \cap L^\infty)(\mathbb{R}^d) \) such that for all \( (t, x, u) \in [0, 1] \times \mathbb{R}^d \times \mathbb{R}^m \),
\[ |f(t, x, u)| \leq C_f |u| + h(x), \]
and for any \( R > 0 \), there are three constants \( C_{f,R}, C_{b,R}, C_{b,1,R} > 0 \) such that for all \( t \in [0, 1], x, y \in \mathbb{R}^d \) and \( u, u' \in \mathbb{R}^m \) with \( |u|, |u'| \leq R \),
\[ \begin{align*}
    |f(t, x, u) - f(t, x, u')| &\leq C_{f,R} |u - u'|, \\
    |b(t, x, u)| &\leq C_{b,R}, \\
    |b(t, x, u) - b(t, y, u')| &\leq \omega_{b,R}(|x - y|) + C_{b,1,R} |u - u'|,
\end{align*} \tag{6.27} 
\]
where \( \omega_{b,R} : \mathbb{R}^+ \to \mathbb{R}^+ \) is an increasing function with \( \lim_{s \to 0} \omega_{b,R}(s) = 0 \). Then for any \( \phi \in \mathcal{W}^{1,\frac{p}{p-1}}(\mathbb{R}^d \times \mathbb{R}^m) \), there exists a unique strong solution \( u \) in the sense of Definition 6.3. Moreover,
\[ \sup_{t \in [0,1]} \|u(t)\|_{L^\infty} \leq e^{C_f} (\|\phi\|_{L^\infty} + \|h\|_{L^\infty}). \tag{6.28} \]

**Proof.** We divide the proof into three steps.

**Step 1.** Let \( \chi(x) \in [0, 1] \) be a nonnegative smooth function with \( \chi(x) = 1 \) for \( |x| \leq 1 \) and \( \chi(x) = 0 \) for \( |x| > 2 \). Let \( \rho^*_e(x) \) and \( \rho^u_e(x) \) be the mollifiers in \( \mathbb{R}^d \) and \( \mathbb{R}^m \). Define
\[ b_{\epsilon}(t, x, u) := b(t, \cdot, \cdot)^{\rho^*_e}(x, u), \quad \phi_{\epsilon}(x) := \phi \ast \rho^*_e(x), \]
and
\[ f_{\epsilon}(t, x, u) := f(t, \cdot, \cdot)^{\rho^*_e}(x, u) \chi(\epsilon x). \]
By (6.26) and (6.27), one sees that (6.14) and (6.15) are satisfied for \( b_{\epsilon} \) and \( f_{\epsilon} \), and
\[ |f_{\epsilon}(t, x, u)| \leq \left( C_f |u| + \epsilon \right) + h \ast \rho^*_e(x) \chi(\epsilon x) \]
\[ \leq C_f |u| + C_f \epsilon \chi(\epsilon x) + h \ast \rho^*_e(x), \tag{6.29} \]
33
and for any $R > 0$ and all $t \in [0, 1]$, $x, y \in \mathbb{R}^d$ and $u, u' \in \mathbb{R}^m$ with $|u|, |u'| \leq R$,

\[
\begin{align*}
|f_\varepsilon(t, x, u) - f_\varepsilon(t, x, u')| &\leq C_{f,R+1}|u - u'|, \\
|b_\varepsilon(t, x, u)| &\leq C_{b,R+1}, \\
|b_\varepsilon(t, y, u) - b_\varepsilon(t, y, u')| &\leq \omega_{b,R+1}(|x - y|) + C_{b,R+1}|u - u'|. \\
\end{align*}
\]  

(6.30)

Moreover, by definition (5.3),

\[
\|\varphi_\varepsilon\|_{1-\frac{1}{p},p} \leq |\varphi_\varepsilon|_{1-\frac{1}{p},p}.
\]  

(6.31)

By Theorem 6.5 let $u_\varepsilon \in C([0, 1]; \mathcal{W}^{\infty}(\mathbb{R}^d; \mathbb{R}^m))$ solve the following equation

\[
\partial_t u_\varepsilon = \mathcal{L}u_\varepsilon + b_\varepsilon(u_\varepsilon) \cdot \nabla u_\varepsilon + f_\varepsilon(u_\varepsilon), \quad u_\varepsilon(0) = \varphi_\varepsilon.
\]  

(6.32)

By (6.16) and (6.29), we have

\[
\sup_{t \in [0,1]} \|u_\varepsilon(t)\|_\infty \leq e^{C_f\|\varphi\|_\infty + C_f\varepsilon + \|h\|_\infty},
\]  

(6.33)

and by (6.29), (6.30), (6.31) and (6.17),

\[
\sup_{t \in [0,1]} \left( \sup_{r \in [0,1]} \|u_\varepsilon(t)\|_p^{1-\frac{1}{p}} + \int_0^1 \|\nabla u_\varepsilon(t)\|_p^p \right) \leq K,
\]  

(6.34)

where we have particularly used that for $p > d + 1$,

\[
\|C_f \chi &\varepsilon|<\varepsilon|\chi|p + \|h\|p \leq C_f \|\chi\|p + \|h\|p.
\]  

(Step 2). In this step we want to show that

\[
\lim_{N \to \infty} \sup_{t \in [0,1]} \sup_{r \in [0,1]} \int_{|x| > N} |u_\varepsilon(t, x)|^p dx = 0.
\]  

(6.35)

Let $\zeta_N(x) := 1 - \chi(N^{-1}x)$. Multiplying both sides of equation (6.32) by $\zeta_N(x)$, we have

\[
\partial_t (u_\varepsilon \zeta_N) = \mathcal{L}(u_\varepsilon \zeta_N) + b_\varepsilon(u_\varepsilon) \cdot \nabla (u_\varepsilon \zeta_N) + g_{N,\varepsilon},
\]

where

\[
g_{N,\varepsilon} := \zeta_N \mathcal{L}u_\varepsilon - \mathcal{L}(u_\varepsilon \zeta_N) - u_\varepsilon b_\varepsilon(u_\varepsilon) \cdot \nabla \zeta_N + f_\varepsilon(u_\varepsilon) \zeta_N.
\]

Let

\[
R := e^{C_f\|\varphi\|_\infty + C_f + \|h\|_\infty}.
\]

Since

\[
|b_\varepsilon(t, x, u_\varepsilon(t, x)) - b_\varepsilon(t, y, u_\varepsilon(t, y))| \leq \omega_{b,R+1}(|x - y|) + C_{b,R+1}|u_\varepsilon(t, x) - u_\varepsilon(t, y)|
\]  

(5.4)

\[
\leq \omega_{b,R+1}(|x - y|) + C \sup_{r \in [0,1]} \|u_\varepsilon(t)\|_{1-\frac{1}{p},p} |x - y|^{1-\frac{1}{p}}
\]  

(6.34)

\[
\leq \omega_{b,R+1}(|x - y|) + CK^{\frac{1}{p}} |x - y|^{1-\frac{1}{p}},
\]  

(6.36)

here and below, the constant $C$ is independent of $N$ and $\varepsilon$, by Lemma 5.1 we have

\[
\|u_\varepsilon(t) \zeta_N\|_{1-\frac{1}{p},p} \leq C\|\varphi_\varepsilon \zeta_N\|_{1-\frac{1}{p},p} + C\int_0^t \|g_{N,\varepsilon}(s)\|_p^p ds.
\]  

(6.37)

Clearly,

\[
\|\varphi_\varepsilon \zeta_N\|_{1-\frac{1}{p},p} \leq C\|\varphi_\varepsilon \zeta_N\|_{1-\frac{1}{p},p} \leq C\|\varphi_\varepsilon \zeta_N\|_p^p + C\|\nabla \varphi_\varepsilon \zeta_N\|_p^p + C\|\varphi \nabla \zeta_N\|_p^p \to 0, \quad N \to \infty.
\]

By (2.16) and (6.29), we have

\[
\|g_{N,\varepsilon}\|_p \leq \|\zeta_N \mathcal{L}u_\varepsilon - \mathcal{L}(u_\varepsilon \zeta_N)\|_p + \|u_\varepsilon b_\varepsilon(u_\varepsilon) \cdot \nabla \zeta_N\|_p + |f_\varepsilon(u_\varepsilon)\zeta_N|_p
\]  

\[
\leq C\left( (||\mathcal{L}\zeta_N||_\infty + ||\zeta_N||_\infty^\frac{1}{p}||\nabla \zeta_N||_\infty^\frac{1}{p}) ||u_\varepsilon||_p + ||\nabla \zeta_N||_\infty ||u_\varepsilon||_p^\frac{1}{p} ||\nabla u_\varepsilon||_p^\frac{1}{p} \right)
\]  

34
+ \|u_e\|_p b_e(u_e) \|\nabla \zeta_N\|_\infty + C_f \|u_e \zeta_N\|_p + C_f \|\zeta\|_p \|\chi\|_p \|\zeta\|_p + \|(h \ast \rho_\epsilon)\|_p.

Noticing that

\[ \epsilon^p \|\chi(\epsilon)\|_p^p = \epsilon^{p-d} \int_{\mathbb{R}^d} |\chi(x)(1 - \chi(N^{-1} \epsilon^{-1} x))|^{p-1} \mathrm{d}x \leq \left(\frac{2}{N}\right)^{p-d} \int_{\mathbb{R}^d} |\chi(x)|^{p-1} \mathrm{d}x \]

and

\[ \|(h \ast \rho_\epsilon^\prime)\|_p \leq \int_{B_{R}^{-1}} |h(x)|^{p} \mathrm{d}x, \]

by Lemma 2.4 and (6.34), we have

\[ \int_{0}^{\infty} \|g_{N,e}(s)\|_p^{p-1} \mathrm{d}s \leq \frac{C}{N^p} + C \int_{0}^{\infty} \|u_e(s)\|_p^{p-1} \mathrm{d}s + \frac{C}{N^{p-d}} \int_{\mathbb{R}^d} |\chi(x)|^{p-1} \mathrm{d}x + C \int_{B_{R}^{-1}} |h(x)|^{p} \mathrm{d}x. \]

Substituting this into (6.37) and using Gronwall’s inequality, we obtain

\[ \lim_{N \to \infty} \sup_{\epsilon \in (0,1)} \sup_{\epsilon' \in [0,1]} \|u_e(t)\|_p = 0. \]

This clearly implies (6.35).

(Step 3). For fixed \(\epsilon, \epsilon' \in (0,1)\), let us define

\[ w_{\epsilon,\epsilon'}(t, x) := u_e(t, x) - u_{\epsilon'}(t, x). \]

Then

\[ \partial_t w_{\epsilon,\epsilon'} = \mathcal{L} w_{\epsilon,\epsilon'} + b_e(u_e) \cdot \nabla w_{\epsilon,\epsilon'} + (G_{1,\epsilon,\epsilon'} + G_{2,\epsilon,\epsilon'}) w_{\epsilon,\epsilon'} + F_{1,\epsilon,\epsilon'} + F_{2,\epsilon,\epsilon'}, \]

subject to \( w_{\epsilon,\epsilon'}(0) = \varphi_\epsilon - \varphi_{\epsilon'} \), where

\[
G_{1,\epsilon,\epsilon'}(t, x) := \sum_{i,j} \int_{0}^{t} \partial_{t} b_{ij}(t, u_e(t, x)) \partial t \mu_{ij}(t, x), \\
G_{2,\epsilon,\epsilon'}(t, x) := \int_{0}^{t} \partial_{t} f_{ij}(t, u_e(t, x)) \partial t \mu_{ij}(t, x), \\
F_{1,\epsilon,\epsilon'}(t, x) := (b_{ij}(t, u_e(t, x)) - b_{ij}(t, u_{\epsilon'}(t, x))) \cdot \nabla u_{\epsilon'}(t, x), \\
F_{2,\epsilon,\epsilon'}(t, x) := f_{ij}(t, u_e(t, x)) - f_{ij}(t, u_{\epsilon'}(t, x)).
\]

By (6.36) and Lemma 5.1 again, we have

\[ \|w_{\epsilon,\epsilon'}(t)\|_{1-\frac{1}{p}, p}^p + \int_{0}^{t} \|\nabla w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s \leq h_{\epsilon,\epsilon'} + C \int_{0}^{t} \|(G_{1,\epsilon,\epsilon'}(s) + G_{2,\epsilon,\epsilon'}(s)) w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s, \]

where

\[ h_{\epsilon,\epsilon'} := C \|w_{\epsilon,\epsilon'}(0)\|_{1-\frac{1}{p}, p}^p + C \int_{0}^{1} \|F_{1,\epsilon,\epsilon'}(s) + F_{2,\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s. \]

By (6.30) and as in estimating (6.13), we further have

\[ \|w_{\epsilon,\epsilon'}(t)\|_{1-\frac{1}{p}, p}^p + \int_{0}^{t} \|\nabla w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s \leq h_{\epsilon,\epsilon'} + C \int_{0}^{t} \|(\nabla u_{\epsilon'}(s))\|_{1-\frac{1}{p}, p}^p + 1 \|w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s. \]

By Gronwall’s inequality and (6.34), one sees that

\[ \sup_{s \in [0,1]} \|w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p + \int_{0}^{1} \|\nabla w_{\epsilon,\epsilon'}(s)\|_{1-\frac{1}{p}, p}^p \mathrm{d}s \leq C h_{\epsilon,\epsilon'}. \]

Now it is standard to show that

\[ \lim_{\epsilon,\epsilon' \to 0} \|w_{\epsilon,\epsilon'}(0)\|_{1-\frac{1}{p}, p}^p \leq C \lim_{\epsilon,\epsilon' \to 0} \|w_{\epsilon,\epsilon'}(0)\|_{1, p}^p = 0, \]
and by (6.27) and (6.34),
\[
\lim_{\epsilon, \epsilon' \to 0} \int_0^1 \|F_{1, \epsilon, \epsilon'}(s)\|^p \, ds \leq K \lim_{\epsilon, \epsilon' \to 0} \left( \omega_{b,R+1}(\epsilon) + C_{b,1,R+1}\epsilon + \omega_{b,R+1}(\epsilon') + C_{b,1,R+1}\epsilon' \right)^p = 0.
\]

We now look at \(F_{2, \epsilon, \epsilon'}\). For any \(N > 0\), we write
\[
\int_0^1 \int_{\mathbb{R}^d} |F_{1, \epsilon, \epsilon'}(s, x)|^p \, dx \, ds = \int_0^1 \int_{B_N^c} |F_{1, \epsilon, \epsilon'}(s, x)|^p \, dx \, ds + \int_0^1 \int_{B_N} |F_{1, \epsilon, \epsilon'}(s, x)|^p \, dx \, ds =: I_1 + I_2.
\]

For \(I_1\), by (6.29) we have
\[
I_1 \leq \int_0^1 \int_{B_N^c} \left( 2C_f |u_{\epsilon'}(s, x)| + \epsilon \chi(\epsilon x) + h * \rho_{\epsilon'}(x) + \epsilon' \chi(x) + h * \rho_{\epsilon'}(x) \right)^p \, dx \, ds
\]
\[
\leq C \sup_{s \in [0,1]} \int_{B_N} |u_{\epsilon'}(s, x)|^p \, dx + C \int_{\mathbb{R}^d} |\chi(x)|^p \, dx + C \int_{B_N^{c}} |h(x)|^p \, dx,
\]
which converges to zero uniformly in \(\epsilon' \in (0, 1)\) by (6.35) as \(N \to \infty\).

For \(I_2\) and for fixed \(N > 0\), by the dominated convergence theorem, (6.30) and the approximation of the identity (cf. [36, p.23, (16)]), we have
\[
I_2 \leq \int_0^1 \sup_{x \in \mathbb{R}^d} |f_{\epsilon'}(t, x, u) - f_{\epsilon'}(t, x, u)|^p \, dx \, dt \to 0, \quad \epsilon, \epsilon' \to 0.
\]

Combining the above calculations and letting \(\epsilon, \epsilon' \to 0\) for (6.38), we obtain
\[
\lim_{\epsilon, \epsilon' \to 0} \sup_{s \in [0,1]} \|w_{\epsilon, \epsilon'}(s)\|^p_{L^p} = 0, \quad \lim_{\epsilon, \epsilon' \to 0} \int_0^1 \|\nabla w_{\epsilon, \epsilon'}(s)\|^p \, ds = 0.
\]

Hence, there exists a \(u \in C([0, 1]; \mathbb{W}^{1, 1-p}(\mathbb{R}^d; \mathbb{R}^m)) \cap L^p([0, 1]; \mathbb{W}^{1, p}(\mathbb{R}^d; \mathbb{R}^m))\) such that
\[
\lim_{\epsilon \to 0} \sup_{s \in [0,1]} \|u_{\epsilon}(s) - u(s)\|^p_{L^p} = 0, \quad \lim_{\epsilon \to 0} \int_0^1 \|\nabla u_{\epsilon}(s) - \nabla u(s)\|^p \, ds = 0.
\]

Taking limits in \(L^p\)-space for equation (6.32), it is easy to see that \(u\) solves equation (6.12). \(\square\)

**Remark 6.7.** In this remark, we explain how to use the above results to the critical Hamilton-Jacobi equation (cf. [12, 31]). Let
\[
H(t, x, u, q) : [0, 1] \times \mathbb{R}^d \times \mathbb{R}^m \times \mathbb{M}_{m \times d} \to \mathbb{R}^m
\]
be a measurable and smooth function in \(x, u, q\), where \(\mathbb{M}_{m \times d}\) denotes the set of all real valued \(m \times d\)-matrices. Consider the following Hamilton-Jacobi equation
\[
\partial_t u = \mathcal{L} u + H(t, x, u, \nabla u), \quad u(0) = \varphi.
\]

Formally, taking the gradient we obtain
\[
\partial_t \nabla u = \mathcal{L} \nabla u + \nabla_x H(t, x, u, \nabla u) + \nabla u H(t, x, u, \nabla u) \cdot \nabla u + \nabla q H(t, x, u, \nabla u) \cdot \nabla \nabla u.
\]
If we let
\[
w(t, x) := (u(t, x), \nabla u(t, x))^t,
\]
then
\[
\partial_t w = \mathcal{L} w + b(w) \cdot \nabla w + f(w), \quad w(0) = (\varphi, \nabla \varphi)^t,
\]
where for \(w = (u, q)\),
\[
b(t, x, w) := (0, \nabla q H(t, x, u, q))
\]
and
\[
f(t, x, w) := (H(t, x, u, q), \nabla_x H(t, x, u, q) + \nabla u H(t, x, u, q) \cdot q)^t.
\]
Thus, we can use Theorems 6.5 and 6.6 to uniquely solve equation (6.39) under some assumptions on $H$ and $\varphi$.
