**Abstract**

The present study was carried out to elucidate the effect of different sowing dates and temperature on growth, yield and quality of two important cultivars of *Gladiolus grandiflorus* L. Rose supreme and White prosperity. The results showed that different planting dates have significant effect on number of days taken by gladiolus corm to germinate. A significant superiority of T₁, 5.5 days over T₂ with 9.10 days on all the treatments was observed. Among the treatments maximum sprouting percentage was recorded in T₂ with 94.66% followed by T₃ 82.19% on all the treatments. The days to 6-leaves stage depict highly significant difference in variance of treatments, interactive effect of treatments and cultivars. The maximum plant height (115.33cm) was recorded in T₂ followed by T₃ with 111.04cm. Mean values of number of leaves indicated significant superiority of T₂ with 8.02 leaves and T₃ with 7.93 leaves on all other treatments. The maximum chlorophyll contents 71.60 were recorded in T₂ followed by T₃ with 67.65 on all the treatments. Spike length showed highly significant difference in variance of treatments, interactive effect of treatments and cultivars. The maximum number of florets (17.16) was recorded in T₂ followed by T₃ with 15.83 florets. Among the treatments maximum corm diameter (6.19 cm) was recorded on T₂ and T₆ showed maximum number of cormels (5.96 cm). It is suggested that proper planting date reduce the production cost by reducing the crop time and also produce elite flowers with increased market value.
Effect of planting dates on *Gladiolus grandiflorus*

**Keywords:** Planting dates, *Gladiolus grandiflorus*, temperature, yield

**Introduction**

Floriculture has emerged as a potential business in Pakistan. The most important floricultural crops in the Pakistan cut flowers trade are Roses, Gladiolus, Tuberoses, Iris, Narcissus, Lilies, Freesia, Statice and Gerbera. Production of cut flowers in Pakistan is estimated at about 10-12 thousand tons per annum and floriculture is fast emerging as a profitable venture for small farmers. Gladiolus (*Gladiolus grandiflorus*) is an ornamental plant native to South Africa. It belongs to monocot family Iridaceae, having approximately one hundred and fifty known species. This plant is commercially used for cut flowers and occasionally used for landscape purpose. Gladiolus is one of the few plants which produce pleasant cut flowers with long spikes. It is cultivated in most of the tropical and subtropical countries of the world.

Varied agro-climatic conditions in Punjab could allow commercial cultivation of all varieties of Gladiolus either in open field or under green house conditions. However, the commercial cultivation of Gladiolus in the country has so far been restricted to limited areas of the province mainly due to domestic market for these flowers. Comprehensive survey indicates that Gladiolus is next to roses in preference by the consumers in various cities of the Punjab. The total area under flower in Punjab Province is estimated around 9000 acres, under flower farming such as Roses, Gladiolus, tuberoses and jasmine. Over 450 acres are under the cultivation of Gladiolus in Punjab. Pakistan has export potential in the global markets like UAE, Saudi Arabia, Russian Federation and European Union.

Date of planting plays an important role in regulating growth and quality of gladiolus. Vegetative growth and quality of gladiolus is improved by proper planting times which also satisfy the consumer's demands. Different planting schedule supply gladiolus steadily to the market as well as it adds to the beauty of the landscape longer. The timing of flowering from various planting dates is quite predictable under ideal environmental conditions. The growth and yield of Gladiolus like other plants depend upon planting time e.g., number of florets/spike, spike length, floret diameter, floret length was best with earliest planting.

Light, temperature and water are all important in flowering of gladiolus. Planting schedule vary because of differences in photoperiods, temperatures and light intensity. Light is the major contributor to growth and development of Gladiolus. Two assimilate sinks exist; the
Effect of planting dates on *Gladiolus grandiflorus*

inflorescence and corms, and these are greatly affected by photoperiod. Gladiolus as most common flowering plant, prefer a growing location in full sun for most of the day. Both the presence and absence of light greatly affects flower development. Flowering of gladiolus is controlled partially by day length provided temperatures are in the proper range.

The present research work was planned to investigate the growth and flowering of gladiolus in early and late growing season and to study its correlation with temperature under agro-ecological conditions of Faisalabad Pakistan and to establish a protocol for off-seasoning which is commercially feasible and easily adoptable with minimum capital investment.

**Materials and Methods**

Present study was conducted at Floriculture Research Area, Institute of Horticultural Sciences, University of Agriculture, Faisalabad, Pakistan, during 2010-11. The study was carried out to elucidate the effect of different sowing dates and temperature on growth, yield of two important cultivars of *Gladiolus grandiflorus* L. Rose supreme and White prosperity in field under the Agro-Ecological conditions of Faisalabad, Punjab, Pakistan.

Growth parameters such as, days to germination, sprouting percentage, days to 6-leaves stage, plant height (cm), number of leaves and chlorophyll content (spad value) were determined. Flowering parameters such as, days to spiking, length of spike (cm), diameter of spike (cm), diameter of florets (mm), number of floret spike per plant, fresh weight of spike (g), dry weight of spike (g), corms parameters, diameter of corms (mm), weight of corms (g), number of cormels and weight of cormels (g) were computed.

**Statistical Analysis**

The data was analyzed statistically by using analysis of variance technique and treatment means were compared in two factorial RCBD at 5% level of significance. The relation of the different growth parameters and temperature were assessed through regression, co-relation analysis.

**Results and discussion**

**Soil analysis**

Soil analysis showed that soil has normal electrical conductivity (EC) 2.05 dS m⁻¹ and high pH (8.08). The amount of organic matter was also low (0.505 %). Potassium contents (195 mg kg⁻¹) were in normal range while phosphorus contents (8.2 mg kg⁻¹) were in critical ranges. The concentrations of zinc (1.2 mg kg⁻¹) were in adequate amount while the content of nitrogen (10.12 %) was low (Table 1).
Effect of planting dates on *Gladiolus grandiflorus*

Table 1. chemical analysis of the soil

| Soil properties      | Soil depth (6-12 inch) mg kg⁻¹ | Adequate ranges mg kg⁻¹ |
|----------------------|-------------------------------|-------------------------|
| Organic matter %     | 0.505                         | >1.29%                  |
| pH                   | 8.0                           | 7                       |
| EC dS m⁻¹            | 2.05                          | 3                       |
| Zn mg kg⁻¹           | 1.2                           | >1                      |

| Phosphorus mg kg⁻¹   | 8.2                           | >15                     |
| Potassium mg kg⁻¹    | 195                           | >150                    |

Growth parameters

Days to Germination

The treatments comprising of different planting dates have a significant effect on number of days taken by gladiolus corm to germinate. The results indicated significant superiority of T₁ with only 5.5 days followed by T₂ with 9.10 days on all the treatments. T₆ occupy the bottom position with 20.80 days in the ranked order of treatments. T₁ plantation vanished after germination due to severe environmental conditions therefore only five treatments are discussed in following text (Table 2). Early germination at high temperature is also reported that elevated temperature within the appropriate range results in early sprouting of corms. A strong correlation was observed between temperature and days to sprouting as shown in Fig 1.

Germination Percentage (%)

Among the treatments maximum sprouting percentage was recorded in T₂ with 94.66 % germination followed by T₃ 82.19 % germination on all the treatments. T₆ occupy the bottom position with only 64.68 % germination in the ranked order of treatments. The correlation value (0.971) shows strong positive relation between sprouting percentage and temperature as shown in Fig 1. The results are in line with the findings of who reported that temperature between 20°C to 25°C promoted germination to 97% in gladiolus.

Days to 6-Leaves Stage

Collected data regarding days to 6-leaves stage was subjected to statistical analysis and results obtained depict highly significant difference in variance of treatments, interactive effect of treatments and cultivars. Means indicated significant superiority of T₂ with only 32.167 days followed by T₃ with 33.70 days on all the treatments. T₆ occupy the bottom position with 75.66 days in the ranked order of treatments. A strong correlation between days to six leaves stage and temperature was observed that are in

Adil et al., IJAVMS, Vol. 7, Issue 3, 2013: 94-107
conformity with the findings of 11 that plantings at higher temperature will take 37 to 45 days to reach 6-leaves stage while low temperature would take 52 to 59 days (Fig 1).

**Plant Height (cm)**
Among the treatments, maximum plant height (115.33cm) was recorded in T₂ followed by T₃ with 111.04cm. T₆ occupy the bottom position with 88 cm in the ranked order of treatments. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35°C and 25.08°C respectively while lowest temperature 15.85°C was recorded during 10th Nov. plantation. The increase in plant height of gladiolus at high temperature is also reported by 12 that plant height of gladiolus under warm temperatures was 113cm as compared to 77cm panted under lower temperatures. The increase in plant height of gladiolus at high temperature is also reported by 12 that plant height of gladiolus under warm temperatures was 113cm as compared to 77cm panted under lower temperatures. In this experiment a strong correlation was observed between the plant height and temperature (Fig 1).

**Number of Leaves**
All the observations were processed statistically and results obtained depict highly significant effects in variance of treatments whereas cultivars and variety x treatments interaction was found non-significant. Means indicated significant superiority of T₂ with 8.02 leaves and T₃ with 7.93 leaves on all other treatments. Minimum leaves (6.53) were recorded in T₆. Maximum leaves were observed at 26.35°C and 25.08°C respectively. In fact, more number of leaves was produced in plants with greater height and well developed structure. A strong correlation was observed between number of leaves and temperature (Fig 1). The results are in line with the findings of 13 who reported maximum number of leaves in plants grown under warmer temperature and long day lengths.

**Chlorophyll content**
Among the treatments, maximum chlorophyll contents 71.60 were recorded in T₂ followed by T₃ with 67.65 on all the treatments. T₆ occupy bottom position with 50.69 in the ranked order of treatments. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35°C and 25.08°C respectively while lowest temperature 15.85°C was recorded during 10th Nov. plantation. Chlorophyll contents are one of the most important criteria to determine the health of the plant, because chlorophyll contents are directly related to physiological activities to manufacture food. The results are in line with the findings of 14 who reported increase in chlorophyll and photosynthetic activity at high temperature. In this experiment highly positive correlation was observed between temperature and chlorophyll contents (Fig 1).
Effect of planting dates on *Gladiolus grandiflorus*

Flowering parameters

**Days to Spiking**

Means indicated significant superiority of T₂ with 40.50 days and T₃ with 58.33 days on all the treatments. T₆ occupy bottom position with 95.83 days in the ranked order of treatments. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35˚C and 25.08˚C respectively while lowest temperature 15.85˚C was recorded during 10th Nov. plantation. Early spiking at high temperature is also reported by ¹¹ who stated that gladiolus flowered more rapidly under warm temperatures regardless of photoperiod. In this experiment a strong correlation was observed between temperature and days to sprouting (Fig 2). The results are in line to the finding of ¹⁵ who reported increase in the number of days to inflorescence formation in gladiolus under lower temperatures.

**Spike Length (cm)**

Spike length showed highly significant difference in variance of treatments, interactive effect of treatments and cultivars. Among the treatments, maximum spike length 55.66 cm was recorded in T₂ followed by T₃ with 55.36 cm on all the treatments. T₆ occupy bottom position with 43.91 cm in the ranked order of treatments. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35˚C and 25.08˚C respectively while lowest temperature 15.85˚C was recorded during 10th Nov. plantation. Shortening of gladiolus spike at low temperature is also reported by ¹⁵. In this experiment highly positive correlation was observed between temperature and spike length (Fig 2).

**Number of Florets spike⁻¹**

Among the treatments, maximum number of florets (17.16) was recorded in T₂ followed by T₃ with 15.83 florets. Least number of florets (12.74) was noticed in T₆. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35˚C and 25.08˚C respectively while lowest temperature 15.85˚C was recorded during 10th Nov. plantation.

The Increase in number of florets at high temperature is also reported by ¹⁶ who found more number of florets per plant, when planting was done during hot summer months. A strong correlation between temperature and number of florets was observed (Fig 2).

**Fresh Weight of Spike (g)**

The results revealed highly significant differences in fresh weight of spike among two cultivars of gladiolus. Variety × treatments interaction was found non-Significant and the effect of treatments was found significant. Means indicated superiority of T₁ in fresh weight of spike with 88.5 g followed by T₃ which got second best position with 87.5 g over rest of the treatments whereas, T₆ occupy bottom position with 67.5 g in the ranked order of treatments. Maximum temperature was recorded during plantation on 10th Sep. and 25th Sep. with 26.35˚C and 25.08˚C respectively while lowest temperature 15.85˚C was

Adil et al., IJAVMS, Vol. 7, Issue 3, 2013: 94-107
Effect of planting dates on *Gladiolus grandiflorus*

recorded during 10\(^{th}\) Nov. plantation. A positive correlation between temperature and fresh weight of spike was observed (Fig 2). The results are in line with the findings of\(^{17}\) who reported increased fresh weight of chrysanthemum flower at 17°C as compared to 21°C in a winter greenhouse experiment.

**Dry Weight of Spike (g)**

The results regarding effect of different planting dates on dry weight of spike of two cultivars of gladiolus indicated superiority of T\(_2\) (10\(^{th}\) Sep.) in dry weight of spike with 28 g followed by T\(_3\) (25\(^{th}\) Sep.) which got second best position with 27 g over rest of the treatments whereas, T\(_6\) occupy bottom position with 17.5 g in the ranked order of treatments. Maximum temperature was recorded during plantation on 10\(^{th}\) Sep. and 25\(^{th}\) Sep. with 26.35°C and 25.08°C respectively while lowest temperature 15.85°C was recorded during 10\(^{th}\) Nov. plantation. A positive correlation between temperature and dry weight of spike was observed (Fig 2). The results are in line with the findings of\(^{18}\) who reported increased dry matter production at high temperature may be attributed to greater accumulation of photosynthates by vegetative parts in gladiolus.

**Corm Diameter (cm)**

Among the treatments maximum corm diameter (6.19 cm) was recorded on T\(_2\) followed by T\(_6\) with (5.96 cm). T\(_3\) got the bottom position with 5.21 cm in the ranked order of treatments. Maximum temperature 21.6°C was recorded during plantation done on 10\(^{th}\) Nov. followed by 10\(^{th}\) Sep. plantation with 19.4°C while lowest temperature 14.75°C was recorded during 25\(^{th}\) Sep. plantation. A positive correlation between temperature and corm diameter was also observed (Fig 2). The results are in line with the findings of\(^{19}\) who reported increase in corm diameter at high temperature in part to the production of more photosynthates.

**Corm weight (g)**

The results of different planting dates on corm weight of two cultivars of gladiolus indicated significant superiority of T\(_2\) with 63.82 g followed by T\(_6\) with 59.99 g on other treatments. T\(_3\) occupy the bottom position with 48.38 g in the ranked order of treatments. Maximum temperature 21.6°C was recorded during plantation done on 10\(^{th}\) Nov. followed by 10\(^{th}\) Sep. plantation with 19.4°C while lowest temperature 14.75°C was recorded during 25\(^{th}\) Sep. plantation. A positive correlation between temperature and corm weight was also observed (Fig 2). The results are in line with the findings of\(^{20}\) who reported increase in corm weight at high temperature and long day lengths.

**Number of Cormels**

Among the treatments maximum number of cormels (33.83) was recorded in T\(_6\) followed by T\(_5\) with (33.16). T\(_3\) got the bottom position with minimum number of cormels (18.42) in the ranked order of treatments. Maximum temperature 21.6°C was recorded during plantation done on 10\(^{th}\) Nov. followed by 10\(^{th}\) Sep. plantation with 19.4°C while lowest temperature 14.75°C was recorded during 25\(^{th}\) Sep.
Effect of planting dates on *Gladiolus grandiflorus*

plantation. A positive correlation between temperature and number of cormels was also observed (Fig 2). The results are in line with the findings of 21 who reported increase in gladiolus cormel production at slightly high temperature.

Finally it can be concluded that different planting dates and temperatures (weather difference) have a significant effect on the growth of gladiolus. Proper planting date not only reduce the production cost by reducing the crop time and thus increasing cost benefit ratio but also produce elite flowers with increased market value. The results of the experiment can also be used in scheduling and round the season production because all the sowing dates produce marketable size spikes.
