Safety and efficacy of Levucell® SB (*Saccharomyces cerevisiae* CNCM I-1079) as a feed additive for turkeys for fattening

EFSA Panel on Additives and Products or Substances used in Animal Feed (EFSA FEEDAP Panel),

Vasileios Bampidis, Giovanna Azimonti, Maria de Lourdes Bastos, Henrik Christensen, Birgit Dusemund, Maryline Kouba, Mojca Kos Durjava, Marta López-Alonso, Secundino López Puente, Francesca Marcon, Baltasar Mayo, Alena Pechová, Mariana Petkova, Fernando Ramos, Yolanda Sanz, Roberto Edoardo Villa, Ruud Woutersen,Montserrat Anguita, Jaume Galobart, Orsolya Holczknecht, Paola Manini, Jordi Tarrés-Call, Elisa Pettenati and Fabiola Pizzo

Abstract

Following a request from the European Commission, the EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) was asked to deliver a scientific opinion on the safety and efficacy of Levucell® SB when used in feed for turkeys for fattening. The additive is intended for use as a zootechnical additive (functional group: other additives) for the reduction of *Salmonella* contamination on carcasses through its decrease in faeces. In the context of a previous opinion, the identity of the strain was confirmed, and according to the Qualified Presumption of Safety (QPS) approach to safety assessment, it was presumed safe for the target species, consumers and the environment. Since no concerns are expected from other components of the additive, Levucell® SB is also considered safe for the target species, consumers and the environment. The additive is not a skin or eye irritant or a skin sensitiser. Considering the data on the dusting potential, the user can be exposed to the additive by inhalation when handling it. The additive in non-encapsulated form should be considered as a respiratory sensitiser. The coated formulation is not considered to pose a risk by inhalation. The efficacy of Levucell® SB for the same purpose was previously established in chickens for fattening. The FEEDAP Panel concluded that there was some evidence that the addition of Levucell® SB at 2 × 10¹⁰ CFU/kg feed has a potential to aid the reduction of carcass contamination with *Salmonella* spp. Since the mechanism of action of the additive can be reasonably assumed to be same, Levucell® SB can be presumed efficacious in turkeys for fattening at a dose of 2 × 10¹⁰ CFU/kg feed without the need for additional studies.

1. **Introduction**

1.1. **Background and Terms of Reference**

Regulation (EC) No 1831/2003 establishes the rules governing the Community authorisation of additives for use in animal nutrition. In particular, Article 4(1) of that Regulation lays down that any person seeking authorisation for a feed additive or for a new use of a feed additive shall submit an application in accordance with Article 7.

The European Commission received a request from Danstar Ferment AG for authorisation of the product Levucell® SB (Saccharomyces cerevisiae CNCM I-1079), when used as a feed additive for turkeys for fattening (category: zootechnical additives; functional group: other zootechnical additives – reduction of carcass contamination with *Salmonella* spp.).

According to Article 7(1) of Regulation (EC) No 1831/2003, the Commission forwarded the application to the European Food Safety Authority (EFSA) as an application under Article 4(1) (authorisation of a feed additive or new use of a feed additive). The particulars and documents in support of the application were considered valid by EFSA as of 25 November 2018.

According to Article 8 of Regulation (EC) No 1831/2003, EFSA, after verifying the particulars and documents submitted by the applicant, shall undertake an assessment in order to determine whether the feed additive complies with the conditions laid down in Article 5. EFSA shall deliver an opinion on the safety for the target animals, consumer, user and the environment and on the efficacy of the product Levucell® SB (Saccharomyces cerevisiae CNCM I-1079), when used under the proposed conditions of use (see Section 3.1).

1.2. **Additional information**

The additive Levucell® SB is a preparation of *S. cerevisiae* (CNCM I-1079).

Levucell SB® is currently authorised for use as a zootechnical additive in sows and weaned piglets (gut flora stabiliser) and in chickens for fattening and in minor poultry species (other zootechnical additive).

The EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) produced some opinions on the safety and efficacy of Levucell® SB when used as a feed additive for weaned piglets and sows (EFSA FEEDAP Panel, 2016), chickens for fattening and minor poultry species (EFSA FEEDAP Panel, 2017a), and all pigs (EFSA FEEDAP Panel, 2019).

2. **Data and methodologies**

2.1. **Data**

The present assessment is based on data submitted by the applicant in the form of a technical dossier in support of the authorisation request for the use of Levucell® SB as a feed additive.

The FEEDAP Panel used the data provided by the applicant together with data from other sources, such as previous risk assessments by EFSA, to deliver the present output.

The European Union Reference Laboratory (EURL) considered that the conclusions and recommendations reached in the previous assessment are valid and applicable for the current application.

2.2. Methodologies

The approach followed by the FEEDAP Panel to assess the safety and the efficacy of Levucell® SB is in line with the principles laid down in Regulation (EC) No 429/2008\(^7\) and the relevant guidance documents: Guidance on the identity, characterisation and conditions of use of feed additives (EFSA FEEDAP Panel, 2017b), Guidance on the characterisation of microorganisms used as feed additives or as production organisms (EFSA FEEDAP Panel, 2018a), Guidance on the assessment of the safety of feed additives for the target species (EFSA FEEDAP Panel, 2017c) and Guidance on the assessment of the efficacy of feed additives (EFSA FEEDAP Panel, 2018b).

3. Assessment

The present opinion deals with the assessment of the safety and efficacy of Levucell® SB (\textit{Saccharomyces cerevisiae} CNCM I-1079) as a zootechnical feed additive (functional group: other zootechnical additives – reduction of carcass contamination with \textit{Salmonella} spp.) for turkeys for fattening.

3.1. Characterisation of the additive and conditions of use

The additive is composed of dried cells of the active agent \textit{Saccharomyces cerevisiae} CNCM I-1079. The strain is deposited at the Collection Nationale de Cultures de Microorganismes (CNCM), France, with the accession number CNCM I-1079.\(^8\) The strain is not been genetically modified.

The additive is marketed in two forms:

- Levucell® SB20 a fine, granulated free-flowing powder with a minimum concentration of \(2 \times 10^{10}\) colony forming units (CFU)/g,
- Levucell® SB10 ME and Levucell® SB10 ME TITAN, coated or microencapsulated forms with a minimum concentration of \(1 \times 10^{10}\) CFU/g.

The additive under assessment has the same composition and method of manufacture as those considered in a previous application (EFSA FEEDAP Panel, 2016a). The applicant has provided results on five batches for each form on batch-to-batch variation, purity, particle size and dusting potential.

The content of the active agent was from 3 to 6 (mean: 4.1) \(10^{10}\) CFU/g and from 1.7 to 2.0 \(10^{10}\) CFU/g (mean: 1.8) for the non-encapsulated and coated formulations, respectively.\(^9\)

The purity of the additive was evaluated only concerning the microbial parameters. Five batches of each formulation were tested for presence of viable yeasts, aerobic bacteria, solids, \textit{Salmonella}, \textit{Escherichia coli} and Enterobacteriaceae or coliforms, moulds.\(^9\) Based on the results, no concerns were identified.

Particle size distribution of three batches for each preparation of the product was measured by mechanical sieving. The highest percentage of particle of a size below 45 \(\mu\)m was 0.3\% in the non-encapsulated product. No particle of a size below 355 \(\mu\)m was found in the coated product.\(^10\)

The same batches analysed for particle size were also used for the evaluation of the dusting potential by the Stauber–Heubach method. Dusting potential for the non-encapsulated product produced an average of 0.6 g/m\(^3\) of dust, while the coated product was dust-free.\(^11\)

The identity and characterisation of the active agent was described in a previous opinion (EFSA FEEDAP Panel, 2016).

The additive is intended for use in feed for turkeys for fattening at the minimum recommended level of \(1 \times 10^9\) CFU per kg feed.

\(^7\) Commission Regulation (EC) No 429/2008 of 25 April 2008 on detailed rules for the implementation of Regulation (EC) No 1831/2003 of the European Parliament and of the Council as regards the preparation and the presentation of applications and the assessment and the authorisation of feed additives. OJ L 133, 22.5.2008, p. 1.

\(^8\) Technical dossier/Section II/Annex II_4b.

\(^9\) Technical dossier/Section II/Annex II_2.

\(^10\) Technical dossier/Section II/Annex II_3b.

\(^11\) Technical dossier/Section II/Annex II_3c.
3.2. Safety

The species *Saccharomyces cerevisiae* is considered by EFSA to be suitable for the Qualified Presumption of Safety (QPS) approach to safety assessment (EFSA, 2007; EFSA BIOHAZ Panel, 2017). This approach requires the identity of the strain to be conclusively established.

In the context of a previous opinion (EFSA FEEDAP Panel, 2016), the identity of the strain was confirmed as *S. cerevisiae*. Accordingly, this strain is presumed safe for the target species, consumers of products from animals fed the additive and the environment. Since no concerns are expected from other components of the additive, Levucell® SB is also considered safe for the target species, consumers of products from animals fed the additive and the environment.

EFSA evaluated the safety of Levucell® SB (non-encapsulated form) for the user in a previous opinion and concluded that it is not a skin or eye irritant or a skin sensitiser (EFSA FEEDAP Panel, 2017a,b,c). Considering the data on dusting potential, the user can be exposed by inhalation. The additive in non-encapsulated form should be considered as a respiratory sensitisier. The coated formulation (Levucell® SB10 ME Titan) is not considered to pose a risk by inhalation.

The FEEDAP Panel considers that the new use requested by the applicant would not introduce hazards/risks not already considered in previous assessments.

3.3. Efficacy

The additive is intended for use in turkeys for fattening as a zootechnical additive (functional group: other additives) for the reduction of *Salmonella* contamination on carcasses through its decrease in faeces.

The efficacy of Levucell® SB for the same purpose was previously established in chickens for fattening. Based on five efficacy studies in chickens for fattening the FEEDAP Panel concluded that there is some evidence that the addition of Levucell® SB to diets has a potential to aid the reduction of carcass contamination with *Salmonella* spp. and so to improve the quality of poultry products. The effective dose appears to be $2 \times 10^{10}$ CFU/kg feed (EFSA FEEDAP Panel, 2017a).

Since the mechanism of action of the additive can be reasonably assumed to be same, Levucell® SB can be presumed efficacious in turkeys for fattening at a dose of $2 \times 10^{10}$ CFU/kg feed without the need for additional studies.

3.4. Post-market monitoring

The FEEDAP Panel considers that there is no need for specific requirements for a post-market monitoring plan other than those established in the Feed Hygiene Regulation and Good Manufacturing Practice.

4. Conclusions

The additive is considered safe for turkeys for fattening, consumers of products from treated animals and the environment.

Levucell® is not a skin or eye irritant or a skin sensitiser. The additive in non-encapsulated form should be considered as a respiratory sensitiser. The coated formulation (Levucell® SB10 ME Titan) is not considered to pose a risk by inhalation.

The addition of the additive to diets for turkeys for fattening at a dose of $2 \times 10^{10}$ CFU/kg feed can aid the reduction of carcass contamination with *Salmonella* spp..
