Introduction

Esculentoside A (EsA) is a saponin isolated from the root of Phytolacca esculenta, and was identified as 30-[(β-D-glucopyranosyl(1-4)-β-D-xylopyranosyl)phytolaccagenin. The structure of this compound is shown in Fig. 1. Previous experiments have shown that it has strong anti-inflammatory effects, significantly decreasing the production of tumour necrosis factor (TNF) from LPS stimulated murine macrophages and platelet activating factor (PAF) from A$_23187$ stimulated rat macrophages. EsA also inhibited IL-1 production and phagocytic activity in murine macrophages. Prostaglandin E$_2$ was an arachidonic acid (AA) metabolite. In order to study the mechanism of the anti-inflammatory effect of EsA, this paper studied the effect of EsA on AA release from macrophages and the production of prostaglandin E$_2$ from murine peritoneal macrophages and rabbit synovial cells.

Materials and Methods

Reagents

RPMI-1640, MEM lipopolysaccharides (Escherichia coli 055:B5), calcimycin (ionophores, A$_23187$), zymosan, trypsin were purchased from Sigma (USA), [5,6,8,9,11,12,14,15H]arachidonic acid (8029 GBq/mmol) was purchased from Amersham. PGE$_2$ radio-immunoassay (RIA) kit was obtained from the Chinese Academy of
Preparation of murine macrophages

Thioglycolate medium (1 ml, 3%) was injected i.p. into the C57BL/6 mice. Four days later, the cells in the peritoneal cavity were harvested with D-Hank's solution, washed twice in RPMI-640 and adhered for 2 h at 37°C in a CO2 incubator. The nonadherent cells were decanted and the remaining adherent cells were digested with trypsin (0.25%) for about 3–4 min. RPMI-1640 containing 10% FCS was added to the culture bottle and the cell suspension was adjusted to 10^6/ml with RPMI-1640 containing 10% FCS and disposed at 1 ml/well in 24-well plates.

Rabbit synovial cells culture

Synovial cells were prepared from a rabbit (weighing 2500–3000 g). Briefly, the rabbit was killed by bleeding. Synovium was taken out under ascetic conditions and cut in 1–2 mm³. The synovium was directly adhered on to the bottle, MEM (including 20% FCS, 200 µg/ml glutamin) was added to the bottle. The medium was refreshed after 2–3 days. The synovium was taken out when the synovial cells confluenced.

[^3]H]arachidonic acid uptake by murine macrophages

The experiment was carried out as previously reported. Briefly, 10^7 macrophages in 1 ml medium (containing 10% FCS) were added to 35 mm culture dishes for 2 h. Nonadherent cells were washed away by D-Hank's solution.[^3]H]AA, 18500 Bq in 1 ml RPMI-1640 were added to each well for 4 h. The supernatant was decanted and the cells were washed twice. Zymosan, 400 µg/ml was added to each well after EsA in 1 ml RPMI-1640 at different concentrations was co-cultured with macrophages for 20 min. The supernatants were collected at 2, 5 and 15 h and radioactivity was counted in a β-scintillator.

Measurement of prostaglandin E2

The experiment was carried out as in Ref. 6. The rabbit’s synovial cells (2 x 10^5/ml) and murine peritoneal macrophages (1 x 10^6/ml) in 1 ml medium (MEM containing 10% FCS) was seeded in wells respectively and incubated for 24 h. The supernatants were decanted and the cells were washed with MEM three times. A23187 and LPS were added in the presence and absence of EsA. After 24 h incubation the supernatants were adjusted to pH 3.5 with 10% HCOOH and extracted with ethylacetate twice (2 ml each time). The organic section was evaporated and the residual was reconstituted with 200 µl RIA assay buffer. The PGE2 content was tested and expressed as ng/2 x 10^5 synovial cells and ng/10^6 macrophages respectively.

Statistics

Each experiment was carried out three times and the results presented here were representative of the three experiments. The same tendencies occurred in the parallel experiments. The results were expressed as the arithmetic mean ± SEM. The differences between the control group and treatment groups were analysed by Student’s t-test; P < 0.05 was regarded as significant.

Results

Total release of AA from murine macrophages

EsA (2.5–10 µmol/l) had no significant effect on total release of AA from zymosan (400 µg/ml) treated murine macrophages (Fig. 2).

PGE2 production from murine peritoneal macrophages

EsA (2.5–10 µmol/l) inhibited PGE2 production from unstimulated murine peritoneal macrophages. In A23187 stimulated murine peritoneal

![FIG. 2. Effect of EsA on total release of AA from [^3]H] AA prelabelled murine macrophages induced by zymosan (400 µg/ml). n = 4, mean ± SEM.](image)
macrophages, EsA (5–10 μmol/l) could significantly suppress the PGE₂ production; in LPS-treated groups EsA (10 μmol/l) could significantly inhibit PGE₂ production (Fig. 3).

**PGE₂ production from rabbit synovial cells**

The same results as for murine peritoneal macrophages were observed in rabbit synovial cells. EsA (2.5–10 μmol/l) inhibited PGE₂ production from unstimulated rabbit synovial cells. In A23187 and LPS-treated rabbit synovial cells, EsA (10 μmol/l) could significantly suppress the PGE₂ production (Fig. 3).

**Discussion**

The present study demonstrated that EsA suppressed the production of PGE₂ from murine peritoneal macrophages and rabbit synovial cells. EsA at lower concentrations could inhibit PGE₂ production from unstimulated macrophages and synovial cells. EsA inhibited PGE₂ production from stimulated cells is higher than that in unstimulated cells. Prostaglandins are products of oxidation of arachidonic acid. The cyclooxygenase (COX) enzyme is the first dedicated enzyme in prostaglandin synthesis. At present, there appear to be at least two COX isozymes: a constitutive enzyme denoted COX-I which is responsible for the physiological synthesis of prostaglandins in tissue, and an inducible form termed COX-II which appears to be the major enzyme responsible for inflammatory prostaglandin synthesis. Our studies in the present paper have shown that EsA could inhibit both physiological and inflammatory prostaglandins’ production from macrophages and synovial cells. PGE₂ is a metabolite of AA. We assumed that EsA inhibited PGE₂ production through its inhibitory effect on the release of AA. Previous experiments proved that released AA could be re-uptake by cell membrane. In the present research paper, our experiments confirmed that EsA had no effect on AA release in [³H]AA prelabelled murine macrophages. We did not know whether EsA could affect AA uptake by cell membrane or not. Further experiments about the effect of EsA on AA uptake by cell membrane, activity of cyclooxygenase, lipooxygenase or other pathways are needed to clarify the anti-inflammatory mechanism of EsA.
